►*FRONT END NOISE CORRECTION ("Chuckling" sound or a sharp "cracking" noise):* May be caused by looseness of lower support arm inner shaft attaching bolt nuts. Correct by installing a plain hardened steel washer, Studebaker No. 1539073 against the inner shaft boss. Install hug nut and tighten to 60-65 ft. lbs. Later production cars have hardened washer installed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*SPEEDSTER FRONT SPRING SPACER NOTE:* Two front spring spacers, Studebaker Part No. 526830 are used on the left side only. One spacer is located between lower suspension arm and insulator, and the other is located between frame and upper insulator. These spacers used in production beginning with Car Serial 7166614.

►*CAR LEVELING NOTE: Speedster Front Spring Spacers, Part No. 526830 can be used to level any 1950-55 model passenger car.*

Kingpin Inclination–5-1/4° at 0° camber.

Caster–Neg. 1° to Neg. 2-1/2°. Not more than 3/4° variation between wheels.

Camber–0° to Pos. 1°. 1/2° more camber favored on driver's side.

Toe-In–1/16-1/8". **Adjust right hand tie rod only** for toe-in after left hand tie rod has been adjusted for straight-ahead position (with steering wheel centered) and center auxiliary tie rod has been adjusted so that steering gear arm and auxiliary steering arm parallel. **RHD Car Note**–Make toe-in adjustments at left hand tie rod.

Toe-Out on Turns–With outer wheel at 20°, inner wheel should be 22-1/2–23-1/2°.

STEERING

Manual: Ross Cam & Twin Lever or Saginaw Worm & Roller types.
See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.

Power Steering: Saginaw. Integral type. Power unit and control valve assembly built into steering gear.
See "Saginaw (GM) Power Steering" in Steering Section.

►*POWER STEERING PUMP BRACKET STUD BREAKING CORRECTION:* Breakage of these two special screws (either above or below the hex head) may be due to looseness of the screws in the block. Make sure both screws are tightened to the same torque as other cylinder head screws. It is important to keep these bolts tight.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

BRAKES

Wagner Lockheed Hydraulic. Self-centering (with Bendix-type shoes). Parking brake applies rear wheel service brakes.
See "Wagner Lockheed Self-Centering" in Brake Section.

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary lining is 7/32" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeak. This lining is applied to the full length of the shoe and is marked "secondary" and "top", and should be installed as marked.

►*PRIMARY LINING REPLACEMENT CAUTION:* Early models may have either long or short primary lining installed. When relining, the primary lining must be the same length for both front wheels and for both rear wheels.

Drums–Diameter 11" (front), 10" (rear).

Braking Power–62% (front), 38% (rear).

Wheel Cylinder Diameter–1-1/16" (front), 7/8" (rear).

Lining Dimensions	Width	① Length	Thickness
Front Wheels	2-1/4"	12"	② 3/16"
Rear Wheels	2"	10-29/32"	3/16"

①–See "Lining Length Note" above.

②–Front wheel secondary lining is 7/32". See "Front Wheel Secondary Lining Note" above.

Clearance–Lock shoes against drum with adjusting screw, then back off adjusting screw 8 notches, or more notches as required to free drum.

Standard Master Cylinder: On frame left side rail at base of brake pedal.

Checking Fluid–Access hole in front floor pan at left corner of drivers seat. Fluid should be maintained 1/2" below top of filler opening.

Removal–Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from its frame bracket and then from spring clip attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder. (*NOTE*–Hill-holder equipped cars have one line, Automatic Drive cars have two lines). Remove brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder. Insert forward mounting bolt to hold hill holder (or Anti-Creep solenoid valve) while master cylinder is off car.

Power Brakes: Hydrovac power unit used with standard master cylinder.
See "Hydrovac Power Unit" in Brake Section.

Checking Fluid–Same as for Manual Brakes (same master cylinder used).

Removal of Power Unit–Disconnect manifold vacuum supply hose at the power unit and disconnect stop light switch wires. Disconnect hydraulic lines from power unit (lines leading to master cylinder and to wheel cylinders). Remove power unit-to-bracket mounting bolts and remove unit from car.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite, Redmond and Bosch Electric type. *See "Auto-Lite Windshield Wiper 'Single End' Motors" and "Redmond Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: *See "Studebaker Air Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electrical, with individual reversible motors in each window. Control switches at each door with a master control switch located on left front door. *See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment (seat raises and lowers with a tilting action).
See "Power Seat Adjusters" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

ALL MODELS

TIGHTENING TORQUES: When tightening capscrews or bolt nuts retaining the parts listed below, use a torque indicating wrench and tighten to tensions listed.

ALL MODELS (EXC. 6226 ENGINE)

	Ft.Lbs.
Cylinder Head Stud Nuts	60-70
Cylinder Head Screws	60-70
Main Bearing Cap Bolts	65-75
Con. Rod Cap Bolt Nut 3/8-24 with Palnut	35-40
Con. Rod Cap Bolt Nut 3/8-24 with Lock Nut	40-45
Con. Rod Cap Bolt Nut 7/16"	50-55
Con. Rod Cap Bolt Nut 11/32"	33-38
Crankshaft Counterweight Bolt	60-70
Flywheel to Crankshaft Bolts	35-41
Camshaft Thrust Plate Bolts 4 Cyl.	20-26
Camshaft Thrust Plate Bolts 6 Cyl.	14-20
Camshaft Gear to Camshaft Bolt	30-40
Int. & Exh. Manifold Bolts	29-35
Rocker Arm Bracket to Head Nut	30-36
Spark Plugs to Cyl. Head	26-30
Engine Mounting (Center Bolt)	45-55

6226 ENGINE

	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts	30-35	360-420
Spark Plugs	30	360
Con. Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mounting Bolts	35-40	420-480
Camshaft Sprocket Nut	35-40	420-480
Int. & Exh. Manifolds	30-35	360-420
Vibration Dampener Bolt	100-130	1200-1560

CAUTION—Torque figures given are for clean and dry threads.

ENGINE

UNIVERSAL JEEP

ENGINE REMOVAL: To remove engine from chassis as required for such engine items as crankshaft and camshaft overhaul, perform the following operations in sequence.

1)—Drain cooling system, and remove battery. Disconnect and remove upper and lower radiator hoses, stay rod, radiator hold down bolts, and lift radiator out.

2)—Remove air cleaner. Disconnect cable at starter terminal and remove starter. Disconnect generator leads and ignition coil leads, and remove heat indicator bulb at cylinder head, and oil gauge pressure line. Disconnect engine ground strap, and remove two bolts in engine mounting on each side.

3)—Disconnect throttle control and choke control rods at carburetor, governor dash control at governor. Remove horn. Disconnect fuel and windshield wiper lines at fuel pump. Disconnect exhaust pipe at manifold.

4)—Disconnect rear end of engine stay cable at frame cross-member, and remove bell housing **leaving one bolt at each side to support engine weight.**

5)—Attach chain hoist to engine and take up just enough to support engine without binding remaining bell housing bolts, and remove these bolts. Swing engine forward to withdraw clutch shaft from bushing in flywheel, lift engine from chassis.

►***INSTALLATION CAUTION***—Place small amount of grease in clutch shaft bushing in flywheel before installing engine.

STA. WGN., SEDAN DEL., TRUCKS

1947-55 MODELS

ENGINE REMOVAL: NOTE—It is recommended that engine be removed from chassis for overhauling.

1)—Disconnect battery, drain cooling system, and remove the bolts and nuts attaching hood to hinge and remove hood. Remove radiator brace rods, and both upper and lower radiator hoses (heater hoses if so equipped). Remove radiator attaching screws and remove radiator.

2)—Disconnect fuel line and flexible windshield wiper hose at fuel pump. Remove carburetor air cleaner, and disconnect the carburetor choke and throttle controls.

3)—Remove starter motor wires and starting motor. Disconnect generator wires at generator, and coil wires at coil. If car is equipped with overdrive, tag overdrive control wires and remove them. Disconnect heat indicator and oil gauge wires.

4)—Disconnect exhaust pipe at manifold, and remove the nuts and bolts from front engine supports. Remove flywheel-to-bell housing attaching bolts.

5)—Attach a suitable lifting sling on engine, and raise engine high enough to release weight from front engine supports, then pull engine forward until clutch clears the bell housing. Lift engine from chassis.

1952-53 PASSENGER CARS

ENGINE REMOVAL: ***(CAUTION—Engine must be removed from below, and it is necessary that a dolly be used on which to lower the engine. Approximate 'Dolly" dimensions are: 40" long, 20" wide, 14" high).*** Proceed as follows:

1)—Drain radiator and block, remove fresh air duct, carburetor air cleaner, and disconnect battery at positive cable.

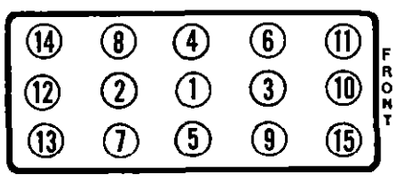
2)—Disconnect wires from: Temperature sender, Coil, Starter Solenoid, Generator, Oil Pressure sender, and Overdrive solenoid and Lockout switch. Tag the above wires for easier identification.

3)—Remove coil, disconnect heater hose at engine. Disconnect throttle link and remove choke control from carburetor. Disconnect accelerator pedal link from throttle bellcrank and push back into car. Disconnect fuel line and windshield wiper line at fuel pump.

4)—Remove radiator hoses. Remove steering idler arm bracket from frame, and pitman arm from steering gear cross-shaft. Disconnect right hand tie-rod at wheel end and swing steering linkage out of way.

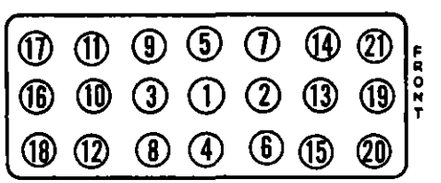
5)—Remove exhaust pipe. Remove splash guard, clutch arm support and clutch arm. Unhook pedal springs and disconnect pedal bracket from rear cross-member. Unhook hand brake cable from bellcrank on right side of rear cross-member, remove clip attaching cable to bell-housing and swing cable out of way.

6)—Remove battery cable from bell-housing (if attached). Disconnect and remove overdrive lockout cable. Disconnect speedometer cable, and gear shift rods at transmission, and disconnect front end of propeller shaft from transmission.



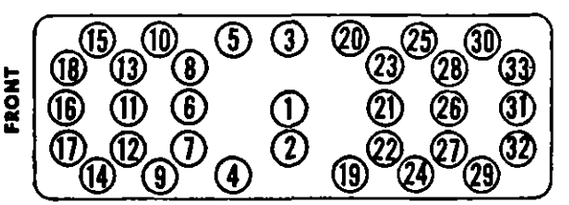
7)—Lower the car so that the engine support members rest on the dolly. Install blocks between dolly and engine front support brackets so that front cross-member will not twist when released. Remove three screws at each end of both front and rear cross-members and lift the car off engine. Watch engine at all sides while lifting to avoid interference and possible damage. If front cross-member does not come out from between sills freely, spread sills with a jack until it does. Lift car until engine can be rolled free.

CYLINDER HEAD



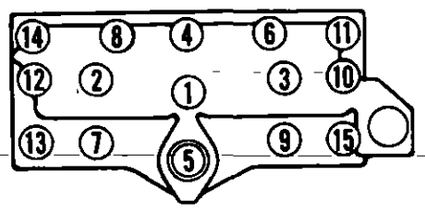
ALL MODELS

CYLINDER HEAD: Installation—Use a torque indicating wrench to tighten cylinder head stud nuts and capscrews, tighten in correct sequence as shown. Recheck with engine water at 150°F.

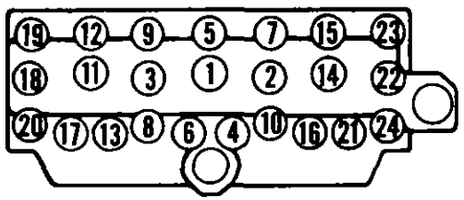


Tightening Torque—See Tightening (Torque Wrench) Specifications.

4 CYL. "L" HEAD ENGINES



6 CYL. "L-HEAD" ENGINE



6226 "L" HEAD ENGINE

CONTINUED FROM PRECEDING PAGE

4 CYL. "F-HEAD" ENGINE

6 CYL. "F-HEAD" ENGINE

ORIGINAL BORE & PISTONS

ALL MODELS (EXC. 6226 ENGINE)

BORE & PISTON SIZES: Engines originally equipped at factory with special oversize pistons may be identified by code letter stamped on engine following the engine number:

"B"—Pistons are .002" Oversize.

"AB"—Pistons .002" Oversize. Main and connecting rod bearings are Undersize (see Original Bearing Sizes following).

"C"—Piston Pins .002" Undersize.

4 CYLINDER MODELS

STANDARD BORE & PISTON SIZE VARIATION: bores and pistons are graded in four .0005" steps as shown in table below and are marked as follows:

Piston—Letter stamped on piston head.

Cylinder Bore—Letter stamped on top of block between valve ports and bore at center.

4 Cylinder Bore & Piston Sizes

Letter	Cylinder Bore Size	Piston Size
A	3.1255-3.1250"	3.1235-3.1230"
B	3.1260-3.1255"	3.1240-3.1235"
C	3.1265-3.1260"	3.1245-3.1240"
D	3.1270-3.1265"	3.1250-3.1245"

6 CYL. MODELS (EXC. 6226 ENG.)

STANDARD BORE & PISTON SIZE VARIATION: Cylinder bore and pistons are graded in six .0004" steps and are marked as follows:

Piston—Letter stamped on piston head.

Cylinder Bore—Similar letter stamped on top of block between valve ports and bore.

ORIGINAL BEARING SIZES

ALL MODELS (EXC. 6226 ENGINE)

MAIN & CONNECTING ROD BEARING SIZES: Engines originally equipped with special undersize mains and connecting rod bearings can be identified by code letter stamped on engine following the engine number:

"A"—Main & Con. Rod Bearings .010" Undersize.

"AB"—Main & Con. Rod Bearings .010" Undersize and Pistons Oversize (see Original Bore & Pistons).

"D"—Main Bearings .010" Undersize.

"E"—Connecting Rod Bearings .010" Undersize.

CRANKSHAFT & MAIN BEARINGS

ALL MODELS (EXC. 6226 ENGINE)

CRANKSHAFT SERVICING: Bearing Replacement—

►*CAUTION*—4 Cyl. engine must be removed from car for bearing replacement (bearings "doweled" in case and crankshaft must be taken out to remove and install bearings). 6 Cyl. bearings not doweled in this manner.

Make certain that oil holes in bearings line up with oil holes in crankcase. On 4 cylinder, see that bearings fit snugly on dowel pins in crankcase and bearing caps.

Rear Bearing Oil Seal (1946-Early 1953 4 Cyl. & 1946-53 6 Cyl.)—Consists of a wick type packing installed in grooves in bearing cap and crankcase. To install new packing, insert packing in groove, working both ends toward center with a round piece of wood or steel. With packing firmly seated in groove, cut off ends flush with surface. NOTE—Crankshaft must be removed to install packing in upper (crankcase) half of bearing.

►*NOTE:* Later "Lip" type seal (see below) can be used for replacement of above seals without removing crankshaft.

Rear Bearing Oil Seal (4 & 6 Cyl. 1953 & Later): ***Upper and lower halves of seal can be replaced without removing crankshaft from engine.*** Seal is neoprene with a steel back. Upper half of seal can be removed by using a suitable piece of strap steel (hack saw blade with teeth ground off). Rotate upper half of seal around shaft with steel strap until opposite end protrudes far enough to grasp end and remove. To install, coat both parts of seal with grease and install upper half by rotating it around crankshaft until it is in position with ends even at the engine block. Coat both ends of lower seal with Permatex before installing to insure good seal with upper half.

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case. When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. CAUTION—Do not cut off this protruding portion of the packing.

Front (Timing Cover) Oil Seal—Braided asbestos type impregnated with graphite and oil. Seal is installed in recess in inner face of timing chain cover and retained by steel retainer. To remove seal, pry out retainer and seal assembly.
CAUTION—Always use new steel retainer when installing new seal.

►**Production Change (Starting CJ-2A Eng. No. 62054, 4-63 Eng. No. 11080, All 2-WD & 4-WD Jeep Trucks)** New timing case cover (double baffle and spring loaded leather seal) and new crankshaft pulley (with polished surface for seal contact) used. This new cover and pulley can be installed as an assembly on earlier engines (either chain or gear drive).

6226 ENGINE

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front and rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket). Rear filler blocks (additional **upper filler block guard** in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger. Filler blocks can be removed and replaced without disturbing crankshaft as follows:

Front Filler Block (Lower) Servicing: Remove by taking out mounting capscrews and timing gear cover capscrews which enter the filler block. When installing filler block, first install oil pan side gaskets (No. 200266), install filler block (use Perma-tex), install new end gasket (No. 200267) on block.

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal). Remove and discard old gasket or seal. Install new seal (no. 204654) in same manner as described below for Rear Filler Block (Upper) Guard. Install lower filler block **after** upper filler block guard has been installed.

Rear Filler Block (Upper) Guard Servicing: Guard is seated in groove in crankcase and can be "rotated" out without disturbing crankshaft after lower filler block removed. Remove and discard old gasket or seal, clean out seal groove. Install new graphite impregnated seal (no. 204654), flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward the center (ends must extend slightly above flat surface of guard). **Do not use shellac or sealing compound in groove.**

►*CAUTION*—Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft. If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE FRONT COVER

ALL M DELS (EXC. 6226 ENGINE)

FRONT COVER OIL SEAL: Cover has double metal baffle and spring-loaded leather seal which contacts polished surface of crankshaft pulley hub. When installing seal, make certain that seal lip is inward or toward rear of engine.

FLYWHEEL

ALL MODELS (EXC. 6226 ENGINE)

Flywheel—Mounted on crankshaft flange by two special dowel bolts and four special head bolts. Whenever flywheel removed, make certain that arrow on flywheel center lines up with arrow on crankshaft flange when re-installed (to insure correct position of timing marks), tighten bolt nuts with a torque indicating wrench to 36-40 ft.lbs. and check flywheel run-out when installed. Run-out *must not exceed .008".*

New Flywheel or Crankshaft Installation—Taper dowel bolts should be replaced with new special snug fitting bolts supplied to eliminate necessity of reaming the special tapered holes. Assemble new parts as follows: Install flywheel on crankshaft (lining up arrows on both parts) using the four straight bolts previously used, tighten these bolts securely. Drill out tapered bolt holes with a 35/64" drill, ream these holes with a 9/16" (.5625") straight reamer, install special bolts, Part No. 116295 (with No. 52330 Lockwasher and No. 52804 Nut), in these holes and discard the tapered dowel bolts used previously. Tighten bolts to 36-40 ft.lbs. and check flywheel run-out (.008" max.).

CAMSHAFT & BEARINGS

ALL MODELS (EXC. 6226 ENGINE)

CAMSHAFT SERVICING: Removal—Drain radiator and cylinder block, remove radiator and grille, cylinder head, manifold, valves, and valve springs. Remove oil pump, fuel pump, oil pan, crankshaft pulley (use puller), fan and governor drive belts, and fan assembly. Remove nuts on front engine support rubber insulators (Jeep only). Remove timing gear cover, remove camshaft gear and thrust plate, block up all valve lifters (can be tied up with string *to manifold studs). On Jeep only, place jack under* crankcase (use block of wood on jack to avoid damage to oil pan), raise front end of engine to provide clearance for camshaft. Remove camshaft through front of engine.

Gear Puller Tool—Use Puller Tool No. W-172 to remove gear on engines equipped with timing gears.

Camshaft Front Bearing—Consists of a steel-backed, babbitt-lined bushing which takes thrust. When installing this bushing, make certain oil hole lines up with drilled oil hole in crankcase, stake bearing in place to prevent turning in service.

Camshaft Thrust Plate (On Engines with Timing Gears)—Thrust plate assembled behind gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little *clearance, or spacer can be dressed to provide* greater clearance.

Camshaft Thrust Plunger (On Engines with Timing Chain)—Plunger and spring should be installed in camshaft hub with round end out. Stationary pin on timing chain cover must be perpendicular so as to bear on spring-loaded plunger.

***INSTALLATION CAUTION*—Make certain that thrust washer installed in back of camshaft sprocket. Coat end of thrust pin on timing chain cover with cup grease when installing cover.**

VALVE SYSTEM

TAPPET CLEARANCE ADJUSTMENT

6226 ENGINE

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below). Remove right front wheel and access cover in fender splash shield for access to valve compartment. Remove spark plugs so that engine can be turned over by moving fan or fan belt. By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment.**

Fully Raise Valve	Then ADJUST Valve:
Nos. 1 and 3	Nos. 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos. 2 and 6	Nos. 7 and 11
Nos. 10 and 12	Nos. 1 and 3
Nos. 4 and 5	Nos. 8 and 9
Nos. 7 and 11	Nos. 2 and 6

ROCKER ARMS

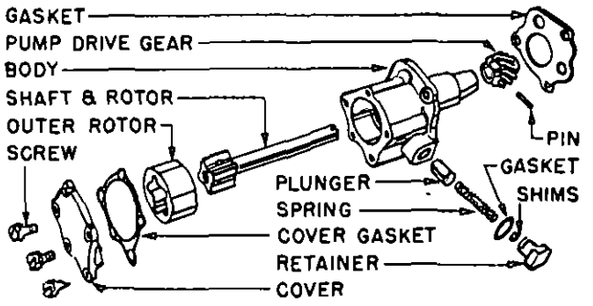
4 & 6 CYL. "F-HEAD" ENGINES

ROCKER ARM ASSEMBLY REMOVAL: Lock the rocker arms, shaft, brackets, and springs together as a unit by removing the cover studs in front and rear rocker arm shaft brackets and installing four 5/16"-24 thread set screws in the two front and two rear brackets in the same way the set screws are installed in center brackets. Remove the nuts on the six bracket studs and lift entire assembly off studs as a unit.

INSTALLATION: Check push rods, straighten or replace any that are bent. Place push rods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of push rods before installing nuts on bracket studs. Torque nuts to 30-36 ft. lbs. Remove four extra set screws from two front and two rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.

OILING SYSTEM

OIL PUMP



ALL MODELS (EXC. 6226 ENGINE)

OIL PUMP REMOVAL & OVERHAUL: (Removal)—Rotate engine until distributor rotor points to No. 1 firing position and timing mark on flywheel or vibration dampener is directly under pointer. On 4 Cyl. Models do not remove distributor (pump must be installed so gears mesh without moving rotor for correct engine timing). On 6 Cyl. Models, remove distributor. (CAUTION—Engine must not be rotated with oil pump removed). Remove pump mounting bolts and pull pump out as far as possible. Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (Note—It may be necessary to loosen engine support bolts for more movement). Check pump shaft for wear before disassembling pump by mounting it in a vise with a dial indicator bearing against shoulder on gear, at right angles to relief valve housing. Move gear toward, then away from indicator and note total reading. If this play exceeds .010", replace complete pump.

Disassembly: Remove cover screws, cover and gasket and shake outer rotor from housing. Remove relief valve retainer, gasket, shims, spring, and plunger. If rotor is to be replaced, file off one end of gear retaining pin, pull gear off shaft and remove shaft and inner rotor from housing. Clean all parts in solvent and check for wear, pits and scoring.

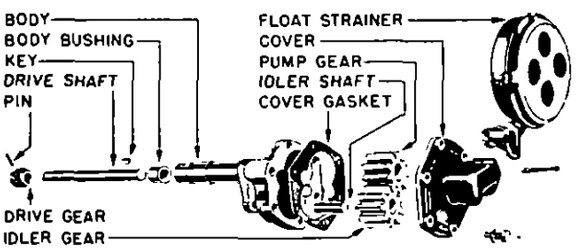
Checking Rotor Clearance: Position inner rotor with one lobe engaged between two lobes of outer rotor, then measure clearance of opposite inner rotor lobe and lobe of outer rotor. This clearance should not exceed .010". To check end clearance, place a small piece of .010" shim stock on inner rotor so that it does not overhang edge of rotor at any point. Install cover and gasket and tighten screws. If shaft can be turned by hand, end clearance is excessive. Install new cover and repeat test. If rotors still not tight, replace rotors.

Reassembly: Install relief valve, spring, gasket and retainer. If shims were removed, install them between spring and retainer. If new rotors installed, slide gear on shaft after installing shaft and rotor in housing. Position gear so there is not over .010" clearance between gear and pump housing and drill a 5/32" hole through pump shaft for retaining pin. Install pin and peen ends. Install cover and gasket and tighten screws.

OIL PUMP (ALL ENGINES EXC. 6226)

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



Installation (4 Cyl. Models): Check to see that timing marks on flywheel or vibration dampener are directly under pointer and distributor rotor is pointed toward No. 1 firing position. Insert pump in block with pump gear positioned so that it will engage camshaft gear and the distributor shaft drive key without moving distributor rotor. Installation can be made only in one position without moving distributor rotor as slot in drive gear and key on distributor shaft is machined off-center.

Installation (6 Cyl. Models): Make certain that No. 1 piston is on top dead center and that timing mark on flywheel or vibration dampener is directly under pointer. Install new gasket between pump and block and be sure that gasket matches pump intake and discharge ports. Start pump into mounting hole but do not engage gears. Insert a long screw driver through distributor hole and engage slot in pump drive gear. Rotate pump gear so that when meshed with camshaft gear, slot will be practically vertical with off-set to rear, as it enters camshaft gear. As pump is pushed in and gears are fully meshed, slot will be about 45° from vertical position. (NOTE—If gear is meshed one tooth away from the correct position, slot will be 36° off, which is readily noticeable). Install distributor and check ignition timing.

6226 ENGINE

OIL PUMP SERVICING: Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling. Service pump as follows:

Disassembly—Take out cotter pin and remove screen float assembly. Remove cover and gasket. Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear. remove idler gear (remove idler shaft if required). Take off lower drive gear (press fit and keyed to shaft).

6226 ENGINE OIL PUMP

Oil Pump Clearances—Check as follows:

1)—Pump Body Bushing: if over .005" clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to .500-.501".

2)—Pump Shaft: shaft diameter .4990-.4985".

3)—Lower Drive Gear: end of gear should be .001-.006" beyond gasket seat on pump body.

4)—*Upper Drive Gear: .002-.004" clearance between* underside of gear and upper end of pump body. Controlled by pressing lower drive gear on shaft until this clearance obtained.

NOTE—Cover plate should be replaced if worn from contact with gears, or if cracked.

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose). Replace by using drift inserted in distributor drive shaft bore from top of block. Install new bushing from below (must be flush with bottom of block).

Reassembly—Press upper drive gear on shaft with pin hole at right angles to tongue on shaft. Insert new pin and peen ends flush with gear. Install shaft and gear in pump body. Press lower drive gear on shaft (with key in place) until .002-.004" clearance obtained between upper drive gear and upper end of pump body. Press idler gear shaft in body, install idler gear. Install cover using new gasket and pin oil screen float assembly on cover. Check shaft and gears—must rotate freely when turned by hand.

Oil Pump Installation—Set #1 piston at top dead center. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx. parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut. Remove distributor shaft for cyl. head installation.

FRONT AXLE UNIVERSALS

ALL 4-WHEEL DRIVE MODELS

BENDIX CONSTANT-VELOCITY

NOTE: This 'constant velocity' universal joint used only on front axle shafts (at each front wheel).

SERVICING: With axle shaft assembly removed from housing, service universal as follows:

Disassembly: Drive out retainer pin locking center ball pin in outer axle shaft (pin located within shaft end yoke—use pin punch). Strike outer end of axle shaft on block of wood to cause center ball pin to move into recess in shaft and free center ball. Pull halves of joint apart as far as possible and bend shafts at sharp angle. Rotate center ball until grooved side lines up with one of the ball raceways, move adjacent ball past center ball and remove from joint. Remaining balls (including center ball) will then drop out.

Inspection & Servicing: Inspect raceways for wear, replace complete axle shaft and universal assembly if badly worn. Inspect center ball pin for wear, inspect all balls, replace balls if rough, grooved or with flat spots. CAUTION—If one or more balls being replaced, measure old ball with micrometer and replace with ball of exact same size unless larger balls needed to take up play. See Ball Service note following Reassembly (below).

Reassembly: If original balls not being re-used, see Ball Servicing Note below for selection of correct size balls. Clamp inner axle shaft in vise with universal yoke upward, place center ball in socket in end of shaft with groove and pin turned to one side. Drop center ball pin in recess in end of outer (wheel end) axle shaft, position this shaft on center ball, insert balls in three raceways. Bend shafts at sharp angle, turn center ball until groove lines up with fourth raceway, insert ball. Straighten shafts, turn center ball to align hole with center ball pin, install retainer pin, prick punch ends of pin to hold it in place securely. CAUTION—always use new retainer pin.

Ball Servicing Note: *Standard balls are .875" in diameter. If universal worn so that play evident, and raceways are in good condition, one or two larger balls (preferably .001", not more than .002" larger) may be used to take up play. Measure old ball with micrometer (std. diameter .875"). Balls are furnished in .001" steps from .003" undersize to .003" oversize. If all balls not same size, install larger balls diametrically opposite each other. CAUTION—all balls used must be within .001" of same size and total variation should not exceed .002".*

►*INSTALLATION NOTE: For axle shaft endplay adjustment (to center universal joint), see "FRONT AXLE" below.*

RZEPPA CONSTANT-VELOCITY

NOTE: This 'Constant Velocity' universal used only on front axle shafts (at each front wheel).

SERVICING: Axle shaft assembly removed from housing, service universal as follows:

Disassembly: Remove three screws retaining inner axle shaft in universal inner race, pull shaft out (retainer can be removed from shaft by taking out retainer ring on shaft). Lift out axle centering pin. Manipulate inner race and cage until all six balls have been taken out. Rotate inner race and cage assembly until pilot cup is exposed, lift pilot cup out. Turn cage until two of the bosses on outer race drop into elongated holes in cage, lift cage and inner race out. Remove inner race by rotating it until one boss drops into one of the elongated holes in the cage, shift race to one side and lift it out.

Inspection & Servicing: Inspect all parts for wear. Replace balls if rough, chipped, or with flat spots.

Reassembly: Reverse disassembly directions given above. Do not force parts into place which may cause damage.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

▷*INSTALLATION NOTE: For axle shaft endplay adjustment (to center universal joint), see "FRONT AXLE" below.*

FRONT AXLE

ALL 4-WHEEL DRIVE MODELS

Steering Knuckle Bearings: The steering knuckle is mounted on two "stub" kingpins with Timken roller bearings in ball ends of axle housing. Bearings are adjustable by adding or removing shims located under kingpin bearing caps (upper cap integral with steering arm). Disassemble bearings as follows:

Disassembly—With Axle Shaft & Universal Joint out, remove 8 screws holding oil seal retainers in place on inner face of knuckle support, remove oil seal retainer halves. Remove four nuts and lockwashers on lower bearing cap, remove bearing cap and bearing adjusting shims (under cap). Remove four nuts and lockwashers on upper bearing cap (steering arm), remove brake hose shield, steering arm, and bearing adjusting shims (under steering arm). Remove steering knuckle (CAUTION—Do not allow lower bearing cone and roller assembly to fall when knuckle is pulled off).

Bearing Adjustment—Install steering knuckle on axle housing (reverse order of disassembly directions) **without the oil seal** placing one each of the following shims under both the upper and lower bearing caps—.003", .005", .010", .030" (total shim thickness at each end .048"), tighten bearing cap stud nuts securely. Then check bearing tension by hooking spring scale in tie rod hole at end of steering arm and noting pull required to turn steering knuckle on axle end. This pull or bearing tension should be 25-35 in. lbs. with oil seals out. Adjust by adding or removing shims under bearing caps. CAUTION—Total shim thickness under upper and lower bearing caps must be equal. Shims furnished in thicknesses of 003", .005", .010", .030".

Oil Seal Replacement—Felt type mounted in metal retainers bolted on inner face of steering knuckle. When replacing oil seal, make certain that spherical surface of axle housing is not scored or scratched (smooth down any roughness with emery cloth), bolt seal retainer halves on housing using lockwashers under mounting screw heads, make certain that felts have good fit at center joint.

Wheel Bearing Adjustment: Jack up front wheel, remove hub cap, axle shaft nut and washer, driving flange capscrews, and flange (use puller on flange). Bend lip of adjusting nut lockwasher back to free nut, remove locknut. Tighten adjusting nut until wheel binds (turn wheel while tightening nut), back off nut 1/6 turn or until wheel rotates freely. Replace lockwasher and locknut, tighten locknut securely and bend ear of lockwasher up against nut to prevent loosening in service. Check adjustment of bearings by grasping front and rear of tire and shaking wheels from side to side. A barely perceptible shake should be felt in the bearings. Install flange shims and flange. On cars prior to Serial No. 37549 (CJ-3A), No. 44074 (4-WD), and No. 14284 (4-463), with Bendix Universals, check axle shaft endplay (below) before completing assembly. *NOTE*—On cars with Rzeppa Universals, disregard endplay note below and install shim pack of .060" under flange. No shims used in later cars, see "4-Wheel Drive Front Axle Change" below.

Axle Shaft Endplay Check (With Bendix Universal Joints)—Tighten the flange nut (do not install lockwasher), swing wheel to maximum left or right position with punchmark on end of axle shaft straight up or down. Back off flange nut until clearance between nut and flange is .050" (measure with feeler gauge). Tap end of shaft with a soft hammer (shaft will move in an amount equal to the endplay). Recheck clearance between nut and flange with a feeler gauge. **Subtract this measured clearance from the original .050" clearance.** If resulting figure is less than .015", add shims to shim pack under flange, if figure is more than .035", remove shims from shim pack under flange. With correct thickness of shim pack under flange, install axle shaft lockwasher, nut, and cotter pin.

4-Wheel Drive Front Axle Change—A change in endplay control of front axle shafts beginning with Serial No. 37549 (CJ-3A), No. 44074 (4-WD), and 14284 (4-463), eliminated the shim pack for endplay adjustment formerly located behind drive flange and added a flanged bushing on outer side of Universal Joint and a trust washer on inner side, centering Universal Joint directly under center line of spindle pivot points and allowing axle shaft to float in driving flange. This same change was made in the Rzeppa type, plus a snap ring added at outer end of shaft, giving the endplay control between the flanged bushing and the snap ring. In both types, replace the flanged bushing when endplay is excessive.

SPRING SHACKLES

JEEP & TRUCK MODELS

SPRING SHACKLES: Springs are fitted with "U" type shackle (front end of front springs, rear end of rear springs on Jeep; front end of front springs only on Trucks). Opposite end of all springs fitted with bronze bushing and conventional pivot bolt (rear shackle of rear springs on Trucks has same type bushing and bolt.) CAUTION—When removing springs, remove pivot bolt first, then remove bushings from "U" shackle. Install springs as follows:

Pivot Bolt Installation—Install bolts with head and grease fitting toward outside, tighten bolt nut with a torque indicating wrench to 27-30 ft.lbs.

"U" Shackle Installation—Install grease seal retainer and grease seal on each leg of "U" shackle, insert shackle through inner face of frame hanger and spring eye (threaded bushings installed with hexagonal head toward outside), hold shackle tightly against frame and start upper bushing on shackle (see Bushing Caution below) taking care that bushing is not cross-threaded on shackle or in spring eye. Turn bushing on shackle approximately halfway, then start lower bushing similarly, turn both bushings in alternately and evenly until heads of bushings are snug against frame bracket and bushing in spring eye is 1/32" away from spring (measured from inside hexagonal head to spring). Lubricate bushing with high-pressure lubricant, check shackles for binding by flexing spring. If shackle is tight, remove and re-install bushing.

BUSHING CAUTION—Left-hand threaded "U" shackles are used at left front spring and right rear spring (Jeep), at left front spring only (Trucks) with the left-hand threaded end down (toward spring eye) and special left-hand threaded bushings must be used with these shackles. Shackles may be identified by small boss forged on lower shank and bushings identified by groove around head. Right-hand shackles and bushings are unmarked.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate on outside of left frame side rail at front end on Nameplate on right side of instrument panel.
1946 Numbers—10,001 Up.
1948 Numbers—148,459 Up.
1949 Numbers—10,001 Up.

ENGINE NUMBER: Stamped on boss on right front *upper corner of cylinder block near water pump.*

TUNE-UP

COMPRESSION PRESSURE: 115 lbs. at cranking speed of 185 RPM. for Std. 6.48-1 Head.

VACUUM READING: Steady 17-21" idling at 7-10 MPH.

FIRING ORDER: 1-3-4-2. See diagram.

SPARK PLUG GAPS: .030".
***Plug Type**—Auto-Lite AN-7 or AN-7B, 14 mm.*

IGNITION: *See Coil, Condenser, and Distributor.*
Breaker Gap—.020" Limits .020-.024" (IGW-4177-1 & IGW-4189), .018-.022" (IAD-4008).
Cam Angle or Dwell—41° closed, 49° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Distributor.*

IGNITION TIMING: 5° BTDC. *NOTE—Road test car for timing modifications for fuel and operating conditions.*
►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*
Timing Procedure—*See Ignition Timing.*
Timing Mark—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter.
►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting Engine No. 175402.

CARBURETION: *See Carburetor & Carb. Equipment.*
Idle Setting—Idle screw 1-2 turns open (turn screw out for richer mixture.
Idle Speed—600 RPM. or 8 MPH.
Float Level—⅜" from top of float at free end to machined surface (gasket seat) on bowl cover. Invert to check (allow float to hang freely.
CAUTION—Do not compress spring in valve stem.
Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 4½ lbs. maximum.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No adjustment required. When installing assembly, see that thermostatic spring end rests on top of spring stop bracket on manifold.

CRANKCASE VENTILATOR: Remove and clean Vacuum Control Valve on manifold. *See Crankcase Ventilator (following CARB. EQUIPMENT) for data.*

VALVE TAPPET CLEARANCE: .016" All Valves, Hot or Cold. NOTE—Self-locking adjusting screws used.
Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: Willys No. 642073 (for Yale & Towne), No. 644001 (Hurd). In base of ign. coil.
Ignition Lock—Willys No. 661949 (for Yale & Towne), No. 644000 (for Hurd).

COIL: Auto-Lite Model IG-4314 or IG-4314A. Mounted on back of instrument panel with ignition switch in base.
Replacement Coil—Auto-Lite IG-3033XS with Service Bracket CE-12488.
Ignition Current—2.5 ampere idling, 5 stopped.

CONDENSER: Auto-Lite Part No. IGB-1025 (IGW-4177-1 & IGW-4189 Distr.), IGW-3139 (IAD-4008). Capacity—.20-.25 mfd. (IGB-1025), .23-26 mfd. (IGW-3139).

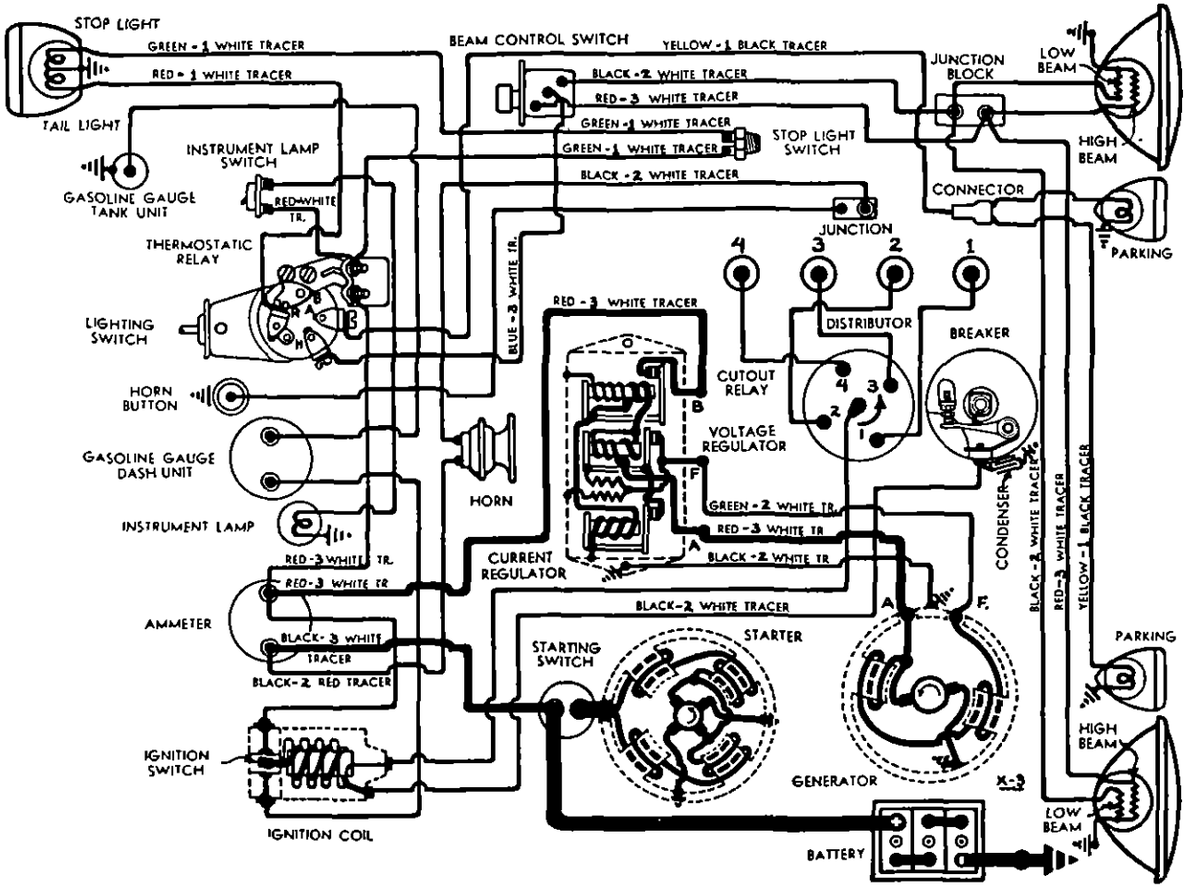
DISTRIBUTOR: Auto-Lite Model IGW-4177-1, IAD-4008, or IGW-4189. Single breaker, 4 lobe cam, full automatic advance type (vacuum spark control may be used with IGW-4189 distributor).
Breaker Gap—.020". Limits .020-.024" (IGW-4177-1 and IGW-4189), .018-.022" (IAD-4008).
Cam Angle—41° closed, 49° open.
***Breaker Arm Spring Tension**—17-20 ounces.*
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IAD-4008 & IGW-4177-1

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	250	0	500
3	580	6	1160
6	930	12	1860
9	1270	18	2540
11	1500	22	3000

Automatic Advance—IGW-4189

Start	350	0	700
2	560	4	1120
5	875	10	1750
8	1190	16	2380
11	1500	22	3000



Vacuum Spark Control (IGW-4189 Distr.) Auto-Lite *Model VC-4010 Unit:* Separate unit mounted on hold-down plate and linked to advance arm. Provides additional advance for all speeds above idling except for acceleration and wide open throttle operation when spark retarded by return spring within unit.

Vacuum Advance (for IGW-4189 Distr.)

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Distributor Removal: Mounted on right hand side of engine. To remove, take out hold-down screw in advance arm.
***Installation Note**—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to cylinder #1 firing position (see Timing), turn distributor rotor to #1 distributor cap segment position (see diagram), insert distributor drive shaft in drive housing on engine.*

CONTINUED ON NEXT PAGE

FIRST CIVILIAN JEEP

CONTINUED FROM PRECEDING PAGE

rock shaft back and forth until drive lug on end of shaft enters slot in drive coupling, push distributor down into place and install hold-down screw. Check Ignition Timing.

CAUTION—If Oil Pump removed, refer to Oil Pump Installation directions in Willys Shop Notes.

IGNITION TIMING

Standard Setting.. ....5° BTDC

►*IGNITION TIMING NOTE—Road test car for timing modifications for fuel and operating conditions.*

►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting Engine No. 175402.

Timing (Without Timing Light)—With #1 piston on compression, turn crankshaft until piston reaches firing position, with flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of flywheel housing below starter. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (press rotor clockwise to eliminate backlash), tighten clamp bolt. See that rotor is at #1 segment in distributor cap.

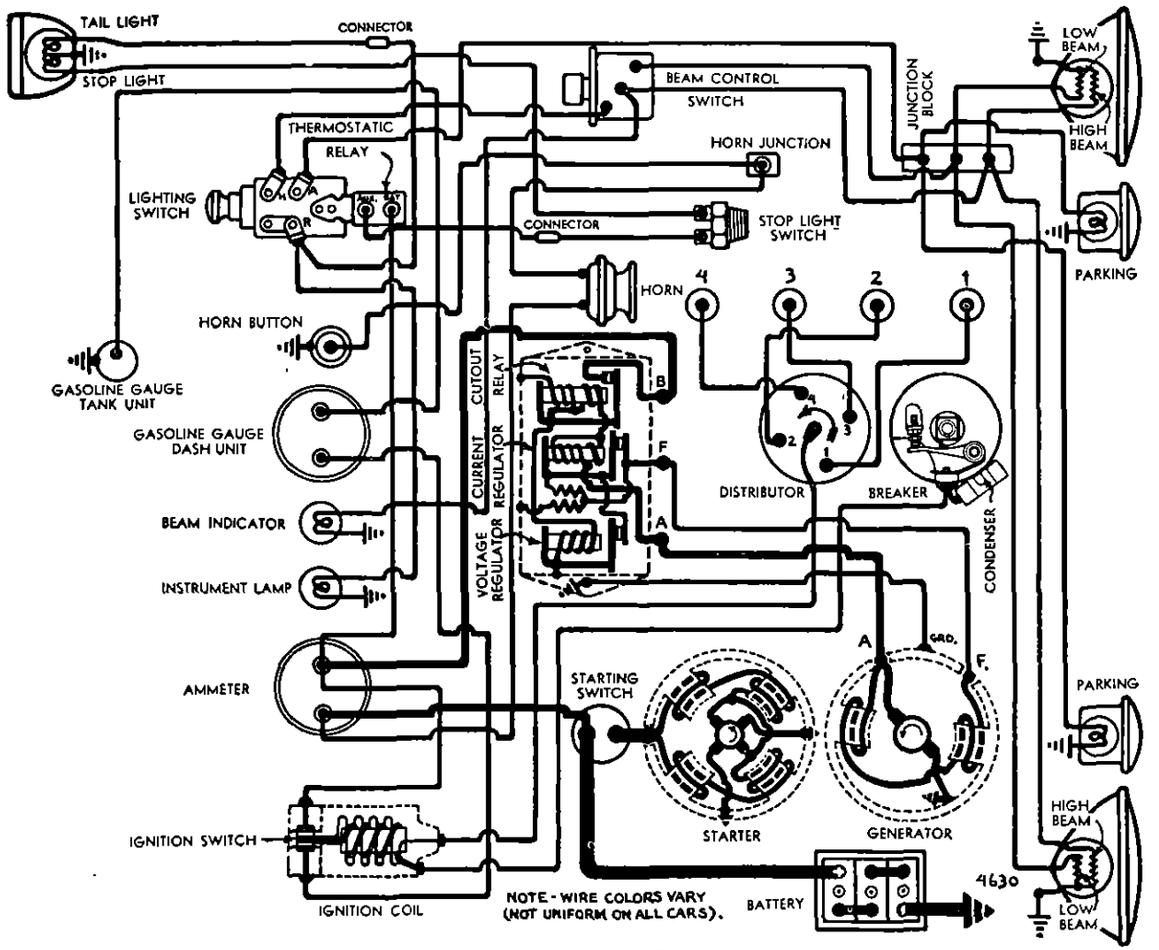
Timing (Using Timing Light—Engine Idling)—This method recommended by manufacturer. Direct timing light on flywheel, idle engine (engine must be warm), adjust distributor (as directed above) until timing mark is centered in inspection hole.

CARBURETOR

Carter WO Type 636SA superseding 596S & 636S. 1⅛" Single Barrel, downdraft, with manual choke control (interconnected with throttle to provide fast idle).

NOTE—Carburetor may be identified by Casting Number 458 (596S), 505 (636S) on face of flange.

See Carburetor Section for complete data.



Idle Adjustment—With engine warm (choke valve wide open and fast idle inoperative), set throttle stopscrew for idling speed of 600 Engine RPM or 8 MPH. Turn idle adjusting screw out until engine begins to roll, then turn screw in until engines fires smoothly. Final setting of idle screw should be 1-2 turns open. Recheck idle speed.

Accelerating Pump—No seasonal adjustment.

Float Level—⅜" from top of float at free end to machined surface (gasket seat) on cover with valve seated. To check, invert assembly and allow float to hang freely. Do not compress spring in valve stem.

Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

Fast Idle: Choke valve interconnected with throttle valve to open throttle to fast idle position when choke in use. No adjustment required.

LATER CIVILIAN JEEP

CARB. EQUIPMENT

Governor (Special Equip.): King-Seeley "Handy" Model 26510-400 (CJ-2A), 26510-354 (CJ-3A) Monarch or Novi Governors. Centrifugal types. Mounted on left front corner of cylinder head and driven by special belt from the crankshaft.

Setting—1000 to 2600 RPM of engine in steps of 200 RPM (in accordance with position of dash control lever which has nine settings).

Adjustment—***See Willys Shop Notes for directions.***

Air Cleaner: Oakes Model No. 613300. Oil-bath type. **Servicing**—Clean and refill oil reservoir to indicated level with same grade engine oil used in crankcase at 2000 mile intervals (when crankcase drained), or more often if required by operating conditions (twice daily for extremely dust field conditions).

Fuel Pump: AC Type AF No. 1538886 Diaphragm type (Std.), AC Type AM No. 1537409 (CJ-2A), No. 1539353 (CJ-3A) combination fuel-and-vacuum pump.

Replacement Pump—AC No. 572 (1538886), 7409 or 9306 (1537409), 9353 (1539353).

See Carburetion Equipment Section for data.

Pressure—3 lbs. (4½ lbs. max. at 1800 RPM).

Gasoline Gauge: Auto-Lite (Motometer) elec. type.

Dash Unit—Auto-Lite No. NG-10764D.

Tank Unit—Auto-Lite No. NG-10762T.

See Carburetion Equipment Section for data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Consists of Air Intake Pipe from Air Cleaner to Crankcase Oil Filler (Oil Filler Cap has gasket and must seat tightly to prevent air leaks at this point) and Air Outlet Pipe from Valve Chamber Cover to Intake Manifold. There is a Vacuum Valve at the manifold connection and this valve must close at idling speed for satisfactory engine idling performance.

Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. Remove and clean control valve when tuning engine or whenever system does not operate satisfactorily.

Vacuum Control Valve: Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold, clamp valve in vise and remove top of housing, withdraw valve and spring. Clean valve and valve seat thoroughly. Reassemble and re-install unit.

BATTERY

Auto-Lite (U.S.L.) Type PN-15. 6 volt, 15 plate, 100 Ampere Hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.2 minutes. Five-second voltage 4.15 volts.
Grounded Terminal—Negative (—) terminal grounded to frame at right end of front cross-member (CJ-2A), at starter (CJ-3A).
Engine-Ground—Strap connector between right front engine mounting leg (under generator) and engine mounting bracket on frame side rail.
Dimensions—Length 8 15/16". Wid. 7⅛". Hgt. 8⅝".
Location—In engine compartment on right side.

STARTER

Auto-Lite Model MZ-4113. Armature No. MZ-2089.
Drive—Special type Bendix Drive No. A2233.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—185 RPM, 150-175 amps., 5 volts.

Performance Data

Torque		RPM	Volts	Amperes
0	ft. lbs.	4300	5.5	70
.65	"	2500	5.5	100
2.55	"	1325	5.0	200
4.95	"	750	4.5	300
7.65	"	220	4.0	400
7.8	"	Lock	3.0	420
11.7	"	Lock	4.0	560

Removal: Starter flange mounted on right front face of flywheel housing. To remove, take out two flange mounting capscrews and one bolt in bracket at commutator end.

Starting Switch: Auto-Lite Model SW-4015. Mounted under floor to right of accelerator pedal. Operated manually by button on toeboard.

GENERATOR

Auto-Lite Model GDZ-4817-A. Armature GDZ-2006F. Two brush, shunt type with external vibrating voltage and current regulation. Ventilated by fan on drive pulley.
Maximum Charging Rate—35 amperes, 8.0 volts, 1900 RPM. Actual charging rate controlled by regulator and dependent on battery condition.
Charging Rate Adjustment—None. See Regulator.

Performance Data

Cold			Hot		
Amperes	Volts	RPM	Amperes	Volts	RPM.
0	6.4	925	0	6.4	1000
5	6.65	1060	5	6.65	1150
10	6.85	1200	10	6.85	1290
15	7.05	1340	15	7.05	1430
20	7.3	1480	20	7.3	1590
25	7.55	1620	25	7.55	1750
30	7.8	1760	30	7.8	1980
35①	8.0	1900	35	8.0	2250

①—Current Regulator setting. See Regulator data.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.6-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal: Conventional pivot mounting at right front of engine. To remove, take out clamp bolt above generator and two pivot bolts under generator. Slip off drive belt and lift generator out.

Belt Adjustment: Loosen clamp and pivot bolts, swing generator out away from engine until belt can be deflected 1" midway between generator and fan pulleys with thumb pressure.

REGULATOR

Auto-Lite Model VRP-4007C-2, or VRP-6003A. Voltage-Current Type. Regulator mounted on right side in engine compartment. Consists of Cutout Relay and vibrating type Voltage and Current Regulator units.
See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open measured at hinge end of core.

Voltage Regulator

Setting—7.35 volts (7.2-7.5) at 70°F. See Electrical Equip. Section for settings at other temperatures.

To Check—Connect ammeter in charging line at regulator "B" terminal (use short heavy leads), connect voltmeter between "B" terminal and ground. Operate generator at speed equivalent to 30 MPH. charging a full charged battery until voltage is steady (charging rate approx. 10 amperes). Note voltmeter reading which should agree with Setting given above.

To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. Increase tension to increase operating voltage, decrease tension to lower voltage. See Electrical Equipment Section for complete adjustment directions.

Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked "35" on cover).

To Check—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs, etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Note ammeter reading which should agree with Setting given above.

To Adjust—Same as for Voltage Regulator above.
Contact Gap & Air Gap—Same as Voltage Regulat'r.

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type. Upper and lower beams controlled by Beam Selector Switch on toeboard.
See Electrical Equipment Section for complete data.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center exactly 3" below lamp center height at 25 feet).

Switches

Lighting—Douglas No. A-457.
Beam Selector—Douglas No. 6351.
Instrument—Willys No. 635737 (first cars only). Controlled by lighting switch on later cars.
Stop Light—Willys No. A-1271.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Mounted on back of lighting switch. Protects lighting circuits by limiting current to 30 amperes. Vibrating thermostatic type. No adjustment.

HORNS: Sparton Model B-10419, Schwarze, or Auto-Lite Model HA-4033, HA-4037. Micro-vibrator type. **Horn Current**—8 amperes.

ENGINE

ENGINE SPECIFICATIONS: Own Make. Four cylinder, "L" Head type. Cylinder block and crankcase cast enbloc. Cylinders offset from center-line of crankshaft toward camshaft side of engine.
Bore—3⅛" (3.125-3.127"). **Stroke**—4⅜".
Displacement—134.2 cubic inches.
Rated Horsepower (SAE)—15.63
Developed Horsepower—60 at 4000 RPM.
Compression Ratio—6.48-1 Std. Cast Iron Head.
NOTE—7.0-1 Cylinder Head is optional.
Compression & Vacuum Reading—*See Tune-up data.*

ENGINE REMOVAL: *See Willys Shop Notes.*

ORIGINAL BORE & PISTON SIZES: *See Willys Shop Notes.*

ORIGINAL BEARING SIZES: *See Willys Shop Notes.*

TIGHTENING TORQUES: *See Willys Shop Notes.*

CYLINDER HEAD INSTALLATION: *See Willys Shop Notes.*

PISTONS: Lo-Ex aluminum alloy (Lynite, Bohn, Permite, or Arrowhead), "T" slot, Cam ground, tin-plated type with heat insulation groove above top piston ring. **Length**—3¾".
Weight—12.7 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top Land .017-.019". Skirt .003".

Replacement Pistons: Finished pistons furnished .0002", .010", .015", .020", .025", .030", .035", .040", .045" Oversize.

CAUTION—Pistons must not be "lapped in." This will destroy tin-plated surface.

Fitting New Pistons: Use .003" feeler stock, ½" wide, inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.008-.013"	.0005-.001"
Oil Contr.	3/16"	.008-.013"	.001-.0015"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: For Rebored Cylinders—Furnished .005", .010", .015", .020", .025", .030", .035", .045" Oversize.
Service Type Rings (for cylinders not rebored) furnished Std.—.009", .010-.019", .020-.029", .030-.039", .040-.049" Oversize.

PISTON PIN: Diameter .8117-.8119". Length 2 25/32". Pin is locked in connecting rod by clampscrew.
NOTE—On new pistons, pin hole is .8118-.8120" in

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

diameter and is diamond-bored and tin-plated.
Pin Fit in Piston—.0001-.0005" clearance or light thumb push fit with piston and pin at 70°F.

Replacement Pins: No oversizes are available.

CONNECTING ROD: Length—9.1845-9.1905". **Weight**—39.41 ozs.

Crankpin Journal Diameter—1.9385-1.9375". *See "Original Bearing Sizes" in Willys Special Data.*

Lower Bearing—Steel-backed, babbitt-lined, replaceable type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.

Clearance—.0005-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: None (no shims). Replace bearings. Do not file connecting rods or bearing caps. *See Willys Shop Notes for "Palnut" installation.*

NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in lower end of rod toward right of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type with integral counterweights (up to Jeep Engine Number 55137), removable counterweights (after above no.).

Journal Diameters—2.3340" (all bearings). *See "Original Bearing Sizes" in Willys Shop Notes.*

Bearings—Steel-backed, babbitt-lined, replaceable type. Bearing shells are dowelled in bearing caps and crankcase.

Clearance—.001-.0025" (.0005-.001" new).
NOTE—Replace bearings when clearance exceeds .006" or when endplay exceeds .018".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing Instructions in Willys Shop Notes.*

NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing. *See Engine Removal Instructions in Willys Shop Notes.*

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft sprocket thrust washer and sprocket. NOTE—Crankshaft sprocket must be removed with a gear puller in order to make endplay adjustments. Adjusting shims furnished .002", .004", .010" and .030" thick.

Endplay—.004-.006".

FLYWHEEL: Removal—*See Willys Special Data.*

CAMSHAFT: Four bearing. Non-adjustable chain drive (first), helical gear drive (later).
Journal Diameters—#1, 2.188"; #2, 2¼"; #3, 2 3/16"; #4, 1¾".
Bearings—Removable steel-backed, babbitt-lined bushing (front), machined in crankcase (all others).
Clearance—.002-.0035". Service limit .006" (front), .008" (all others).
Camshaft Removal—*See Willys Shop Notes for data.*

End Thrust (for Engines with Timing Chain Drive): End thrust taken by thrust washer behind camshaft sprocket and spring loaded plunger in forward end of camshaft which bears against stationary thrust pin on chain case cover. NOTE—Make certain that plunger and spring are in place when installing chain case cover.

End Thrust (for Engines with Timing Gear Drive): Taken by thrust plate assembled behind gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance.
Endplay—.003-.0055".

▷**Timing Case Cover (& Front Oil Seal) Change:** *See "Crankshaft & Main Bearings" in Willys Shop Notes.*

▷**Timing Chain (to Jeep Engine Number 44417):** Link-Belt, non-adjustable. Width 1". Pitch ½". Length 23½" or 47 links.

▷**Timing Gears (after Jeep Engine Number 44417):** Crankshaft gear cast iron. Camshaft gear Fibre with steel hub.

▷**NOTE—Jeep Engine with Timing Gears carry engine mark "J" ahead of engine number.**

Timing Gear Backlash—.000-.002".

Camshaft Setting (First Cars with Timing Chain): With #1 piston on top dead center, mesh chain with marks on sprockets adjacent and in line with a straightedge across the shaft centers.

NOTE—Camshaft sprocket mounting screw holes offset to insure correct position of sprocket on shaft.

Later Cars (With Timing Gears)—Mesh gears with marked tooth of camshaft gear opposite marked space between gear teeth on crankshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"①	5 3/4"
Exhaust	1 15/32"	.3725"②	5 13/16"

①—.372-.373". ②—.371-.372" (1950 Models).

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.0025-.0045"

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place to following dimensions:
Intake Guide—Top of guide 1 5/16" below top face of block. The shorter smaller-diameter section end of the guide should be up.
Exhaust Guide—Top of guide 1" below top face of block. Taper end (counter-bored end) of guide should be up.

Valve Springs: Install springs with closed-coil end up toward cylinder block. Spring free length 2½".

	Spring Pressure	Spring Length
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

Valve Lifters: Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004" Oversize.

Lifter Diameter—.6240-.6245".

Lifter Clearance—.0005-.002".
NOTE—Camshaft must be removed for lifter removal.
See Camshaft Removal instructions in Willys Shop Notes.

VALVE TIMING

Tappet Clearance: .016" All Valves, Hot or Cold.
NOTE—Tappet adjusting screws are "self-locking" type (no locknuts).

Valve Timing: See Camshaft Setting (above).
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

▷**Timing Mark Change (starting CJ-2A Jeep Engine No. 175402)**—Flywheel marked "5°" (for 5° BTDC.) and "T.C." (top dead center). "I.O." mark not carried and intake opening point on these engines must be estimated.

Valve Timing Check—Set tappet clearance #1 intake valve at .020". This valve should open with #1 piston 9° or .039" before top dead center with flywheel mark "I.O." centered in inspection hole on right front face of flywheel housing below starter. Reset tappet clearance to .016" running clearance.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain or timing gears. Oil pump mounted externally on left hand side of crankcase.
Crankcase Capacity—4 qts. (refill), 5 qts. (dry or whenever oil filter drained).

Normal Oil Pressure—40-50 lbs. (35 lbs. at 30 MPH., 10 lbs. at idling speed of 600 RPM).

NOTE—On first Universal Jeep, 50 lbs. gauge pressure equivalent to 25 lbs. actual pressure (oil pressure relief valve opens at 25 lbs.).

▷**Oil Pressure Regulator (Early Universal Jeep)**—Under plug on oil pump cover. Opens at 25 lbs. (50 lbs. gauge pressure). Adjustable by adding or removing shims located above spring in plug.

▷**Oil Pressure Regulator (Later Universal Jeep)**—Under plug on side of pump housing. Opens at 35 lbs. Adjustable by adding or removing shims located above spring in plug.

▷**Oil Pump (up to Jeep Engine Number 44417):** Planetary gear type mounted on left side of crankcase.
Oil Pump Servicing—*See Willys Shop Notes.*

▷**Oil Pump (after Jeep Engine Number 44417):** Rotor type pump mounted on left side of crankcase.
Oil Pump Servicing— *See Willys Shop Notes.*

Oil Filter: Purolator. On cylinder head bracket at right front corner of cylinder head with oil outlet connected to top of timing chain cover.
CAUTION—Filter should be drained at each crankcase oil change (2000 mile intervals) and filter element replaced at 8000 mile intervals for normal service.

Oil Pressure Gauge: Auto-Lite No. G-10763. Bourden tube type (not electric).

COOLING

Cooling System: Pressure type with pressure valve (relief valve) in filler cap.
Capacity—11 quarts with standard radiator.
NOTE—Special "Hot Climate" radiator Optl.
Pressure Valve—AC No. 846709 (Radiator Filler Cap). Opens at 3¾ lbs. (3¼-4¼ lbs.).

Water Pump: Centrifugal, packless, ball bearing type. *See Water Pump Section for complete data.*

Pump Removal—Loosen drive belt adjustment and remove belt, disconnect hose, remove pump mount-

ing screws. Lift out pump and fan assembly.

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In outlet elbow on cylinder head.

Setting—Starts to open 145-155°F. Fully open 170°F.

Temperature Gauge: Auto-Lite No. H-10765. Bourden tube type (not electric).

CLUTCH

Auburn (Atwood) Model 8501-23 (with Borg & Beck Driven Member). Single plate, dry disc type.

See Clutch Section for complete data.

►**Jeep CJ-3A Release Lever Interference Correction (causing premature clutch wear on first cars):** *See "Auburn Clutch" in Clutch Section.*

Facings—Woven (pressure plate side), Molded Asbestos (flywheel side). I.D. 5⅛". O.D. 8½". Thickness .135" (.132-.138").

Pedal Adjustment: Set pedal free travel to 1¼" (to provide 1/16" clearance between release bearing and clutch release levers). To adjust, loosen locknut on clutch fork connecting cable clevis at cross-shaft connection, screw cable end in or out of clevis, tighten locknut.

Removal: Remove Transmission & Transfer Case Assembly (see Transmission Removal below), remove flywheel bell housing. Mark clutch pressure plate and flywheel to insure re-installation in same relative position. Take out mounting screws in clutch cover flange, turning all screws out evenly to relieve spring pressure, remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS1-T90C (Floor Mtd. Gearshift), AS3-T90A (Steering Col. Mtd. Gearshift): Three-speed type. Constant-mesh, synchro-mesh, helical gears (Second & High), sliding spur gear (Low & Reverse).

See Transmission Section for complete data.

Transfer Case: Spicer Model 18. Two-speed auxiliary transmission and front-wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front-wheel drive engagement (left hand lever).

See Transmission Section for complete data.

Transmission Control (AS3-T90A Transmission only): Remote control type with gearshift lever mounted on steering column.

See Transmission Section for complete data.

Removal: Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shafts at universal joints (NOTE—If equipped with Power Take-off drive, remove front end of power take-off propeller shaft assembly). Disconnect speedometer cable at transfer case, brake cable, transmission shift rods at transmission case levers, and clutch release cable at cross-shaft bell-crank. Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross-member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and shift levers (NOTE—If Power Take-off used, remove power take-off shift lever plate screws and lift lever out). Remove bolts holding center cross-member at frame side rails and remove cross-member (CAUTION—with cross-member removed, engine and transmission weight will rest on support jacks). Remove bolts holding transmission on bell housing, force transmission to right until ball stud end can be disengaged from end of clutch control cross-shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

UNIVERSALS

Front & Rear Drive Propeller Shaft Joints: Spicer needle roller bearing types as follows:

1261-102X.....Transmission End—Front Drive
1261-1X.....Transmission End—Rear Drive
1268-104X ..... Axle End—Front & Rear

Front Axle Shaft Joint: Bendix or Rzeppa Constant-velocity type. One joint used at outer end of each shaft (within steering knuckle housing).

See "Universal Joints" in Willys Special Data.

Power Take-off Propeller Shaft Joints: Detroit Ball-and-Trunnion type. Two used (one at each end of shaft—no splined joint used).

FRONT AXLE

Spicer (Salisbury) Model 25. Full-floating, hypoid gear type. NOTE—Differential Assembly (Ring and Pinion Gear Assembly) is identical with Full-floating Rear Axle and is serviced in same manner.

See Spicer (Salisbury) Full-Floating Rear Axle in Rear Axle Section for complete data.

Ratio—5.38-1 Std.

Backlash—.005-.007". Shim adjustment.

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross-member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear ends of springs and lower the springs, remove axle assembly from beneath the car.

INSTALLATION CAUTION—Bleed brake lines after axle re-installed and brake lines connected.

Spring Shackle & Pivot Pin Installation—*See "Spring Shackles" in Willys Shop Notes.*

Axle Shaft & Universal Joint Assy Removal: Remove wheel, hub cap, axle shaft cotter pin, nut, and washer. Remove drive flange capscrews and washers, remove flange with a puller. Bend lip on bearing nut lockwasher out and remove locknut, lockwasher, adjusting nut, and bearing lockwasher. Remove wheel hub and bearing assembly (CAUTION—use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal assembly out of axle housing.

INSTALLATION CAUTION—Adjust front wheel bearings and bleed brake line when installation completed.

Steering Knuckle Bearing Disassembly & Adjustment: *See "Front Axle" in Willys Special Data.*

Wheel Bearing Adjustment: *See "Front Axle" in Willys Special Data.*

REAR AXLE

FULL-FLOATING TYPE
CJ-2A UP TO SERIAL NO. 13453

Spicer (Salisbury) Model 23-2. Full-floating, hypoid gear type with Hotchkiss Drive. NOTE—This axle used on first Universal Jeep models.

See Rear Axle Section for complete data.

Ratio—5.38-1 Std.

Backlash—.005-.007". Shim adjustment.

Removal: Support rear end of car securely with a chain hoist and support placed under frame ahead of rear springs, remove rear wheels. Disconnect rear shock absorbers, rear brake line (at frame connection), and propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove pivot bolts at front end of springs and lower the springs, remove axle assembly from beneath the car.

INSTALLATION CAUTION—Bleed brake lines after axle re-installed and brake lines connected.

Spring Shackle & Pivot Pin Installation—*See "Spring Shackles" in Willys Shop Notes.*

Axle Shaft Removal: Remove six capscrews and washers holding axle shaft driving flange on wheel hub, thread two of these screws into "extra" holes (between regular mounting screw holes) and turn screws up evenly to pull axle shaft out, withdraw axle shaft from housing.

Wheel Bearing Adjustment: Remove the six axle shaft flange screws, turn two of these screws into "extra" holes in flange to start shaft, withdraw axle shaft. Adjust bearings in same manner as front wheels (above). When re-installing axle shaft, make certain that gasket installed under flange.

REAR AXLE

SEMI-FLOATING TYPE
CJ-2A AFTER SERIAL NO. 13453 & ALL CJ-3A

Spicer (Salisbury) Model 23-1 or 41-2. Semi-floating, hypoid gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratio—5.38-1.

Backlash—.004-.008". Shim adjustment.

Removal: Support rear end of car securely with a chain hoist and supports placed under frame ahead of rear springs. Remove wheels. Disconnect rear shock absorbers, rear brake line (at frame connection), and rear brake cables and conduits. Disconnect propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of all weight, remove nuts on spring center clip "U" bolts, remove pivot bolts on front end of springs and lower springs, remove axle assembly from beneath car.

INSTALLATION CAUTION—Bleed brake lines after axle re-installed and brake lines connected.

Spring Shackle & Pivot Pin Installation—*See "Spring Shackles" in Willys Shop Notes.*

Axle Shaft Removal: Remove wheel, hub cap, and axle shaft nut. Use wheel puller to remove wheel hub. Disconnect brake line at wheel cylinder and parking brake cable. Take out bolts mounting back-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ing plate, remove dust shield, oil seal and brake backing plate (CAUTION—Do not lose wheel bearing adjusting shims located between backing plate and axle housing flange). Pull axle shaft and bearing assembly out of the housing.

Wheel Bearing Adjustment: Bearing endplay controlled by shims between backing plate and axle housing flange. To adjust, remove wheel hub and backing plate (see Axle Shaft Removal above), add or remove shims between backing plate and housing flange for correct endplay. NOTE—In original production, shims used only at left hand end of axle housing. Shims may be installed at right hand end of axle housing, if required, for correct clearance with new axle shaft.

Endplay—.003-.005".

SHOCK ABSORBERS

Delco—Model 1030-K (Front), 1031-K (Rear).

Monroe—Model K-11436 (Front & Rear).

Direct acting, hydraulic types. Shock absorbers on first cars are adjustable.

Adjustment: Remove mounting bolt at lower end, fully collapse shock absorber by pressing up on lower end until adjusting key within unit engages slot in adjusting plate (can be determined by feel), turn unit in clockwise direction until limit of adjustment is reached (full range of adjustment is four turns), back off adjustment by turning unit counter-clockwise exactly two turns for standard setting. CAUTION—See that adjusting key does not slip out of engagement with slot while making adjustment. NOTE—Later type shocks not adjustable.

Refilling: Requires dismantling of unit.

NOTE—Later type shocks not refillable.

FRONT SUSPENSION

Front Axle: Spicer (Salisbury) Model 25. Special full-floating driving unit. *See Front Axle data (above).*

Front Suspension: Special front-wheel drive unit with semi-elliptic springs. Steering knuckle mounted on taper roller bearings carried on two stub shafts in spindle housing.

Endplay—.001-.003".

Steering Knuckle Bearing Servicing & Adjustment: *See Front Axle data (above).*

Kingpin Inclination—7½° crosswise.

Caster—3°. No adjustment. If caster incorrect, check entire front end and correct by installing new parts.

Camber—1½°. No adjustment. Correct by installing new parts. Do not attempt to correct camber by cold bending or heating of parts.

Toe In—3/64-3/32" (1/32" each wheel). To adjust, first set each front wheel straight ahead (see Note below), then set toe in by shortening each tie rod approximately ½ turn. This procedure necessary to maintain correct position of steering idler arm.

NOTE—To set front wheels straight ahead, first set tie rod end of steering bell crank (idler lever on frame front cross-member) exactly at right angles to front axle. Check front wheels by using a straight edge or sighting along rear and front wheels. Adjust each tie rod (loosen end clamp bolts and turn rod) until front wheels are exactly straight ahead. Then make toe in adjustment as directed above. Tie rod lengths between ball end centers should be 20⅞" (left), 25⅝" (right).

Steering Geometry—With inner wheel turned 20°, outer wheel should be turned exactly 18°30'.

STEERING GEAR

Steering Gear: Ross Model T-12. Cam-and-Twin Lever type.

See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Four wheel, Hydraulic, Double anchor type. Hand lever applies independent brake on drive shaft at rear of transfer case.

See Brake Section for complete data.

Drum Diameter—9".

Lining—Width 1¾". Thickness .206-.216". Length per shoe 10 7/32" (forward shoes), 6 39/64" (rear shoes). NOTE—Manufacturer recommends use of new or replacement shoe assemblies with factory-installed linings.

Clearance—.008" toe, .005" heel, for each shoe.

Hand Brake: Mechanical type. Two-shoe, internal expanding type with drum mounted on drive shaft at rear of transfer case.

Drum Diameter—8".

Lining——Woven type. Width 1¾". Thickness .206-.216". Length per shoe 8⅛".

Hand Brake (Adjustment for Wear)—Make certain that hand brake cable and linkage operate freely. Lubricate if sticking or binding is evident. Place brake handle on instrument panel in "off" position. Rotate brake drum until one pair of adjusting holes (three pairs located on back face of drum) is opposite the adjusting screws (notched wheels) within the brake. Insert a screwdriver or adjusting tool through each hole and turn each adjusting screw equally until the brake shoes are snug against the drum (NOTE—with tool against edge of hole as a fulcrum, move outer end of tool out away from center of driveshaft to expand shoes). **Back off each adjusting screw 7 notches** to provide correct shoe clearance.

Linkage Adjustment—When brake shoes replaced or major adjustment required, check and adjust brake operating lever and cable as follows:

Brake Lever—The lever position is determined by adjustment of cam and will not change when new shoes or linings installed. Check clearance between closest point on lever and brake backing plate with brakes "off." This clearance should be 3/32". Adjust the special lever ball nut as required.

Brake Cable—Disconnect cable (remove clevis pin at brake operating lever. Place brake handle in "off" position. Make certain that brake operating lever position is correct (see above). Adjust clevis on brake operating lever end of cable so that clevis pin can just be inserted without changing position of brake handle or brake operating lever.

MODEL IDENTIFICATI N

Model	Year
4-63 Sta. Wgn. Sed. Del.	1946-50
VJ-2 Jeepster	1948
VJ-3 Jeepster	1949-50

SERIAL NUMBER: Stamped on plate on floor riser left of driver's seat and on plate on front end of left frame side rail.
ENGINE NUMBER: Stamped on water pump boss at front end of cylinder block.

TUNE-UP

COMPRESSION PRESSURE: 115 lbs. at 160 RPM.
VACUUM READING: Steady 17-21" idling at 7-10 MPH.
FIRING ORDER: 1-3-4-2. See diagram.
SPARK PLUG GAPS: .030".
Plug Type—*Auto-Lite Type AN-7. 14 mm. Metric*
IGNITION: Breaker Gap—.020". Limits .020-.024".
Cam Angle—50.8°.
Breaker Arm Spring Tension—17-20 ozs.
IGNITION TIMING: 5° BTDC. *NOTE—Road test car for timing modifications for fuel and operating conditions.*
►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*
Timing Procedure—*See Ignition Timing.*
Timing Mark—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter.
►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting 4-63 Engine No. 51379.
CARBURETION:
Idle Setting—Idle adjusting screw set for smooth idle with warm engine (on Carter Carb. ½-1½ turns open). For richer mixture, turn screw out on Carter, and Zenith 228 Series, in on Zenith 28 Series.
Idle Speed—600 RPM. or 8 MPH.
►*STUMBLE CORRECTION (738S, 768S, SA, 832S, CARBURETORS)—See "Carter YF" in Carburetor Section for complete data.*
Float Level (Carter 613S) 5/16" from top of machined projection on bowl cover to top of soldered seam on free end of float (float inverted).
Float Level (Carter 738S) 9/32" from float (float inverted) at free end to float chamber cover.
(Zenith)—1½" from top of float to gasket seat on bowl cover with needle valve seated (float inverted).
Accelerating Pump—(Carter) No seasonal adjust.
(Zenith)—3 grooves in pump plunger stem. Engage hairpin cotter as follows: Center Groove normal setting, Upper (min. stroke) Hot Weather, Lower (max. stroke) Cold Weather.
Fuel Pump Pressure: 3 lbs. (4½ lbs. max. at 1800 RPM).
CRANKCASE VENTILATOR: Remove and clean the vacuum control valve. *See Crankcase Ventilator (following Carb. Equipment) for directions.*
MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely with spring end on top of manifold stop bracket.
VALVE TAPPET CLEARANCE: .016" All Valves, Hot or Cold. NOTE—Adjusting screws self-locking type.
Valve Timing Check—*See Valve Timing.*

IGNITION

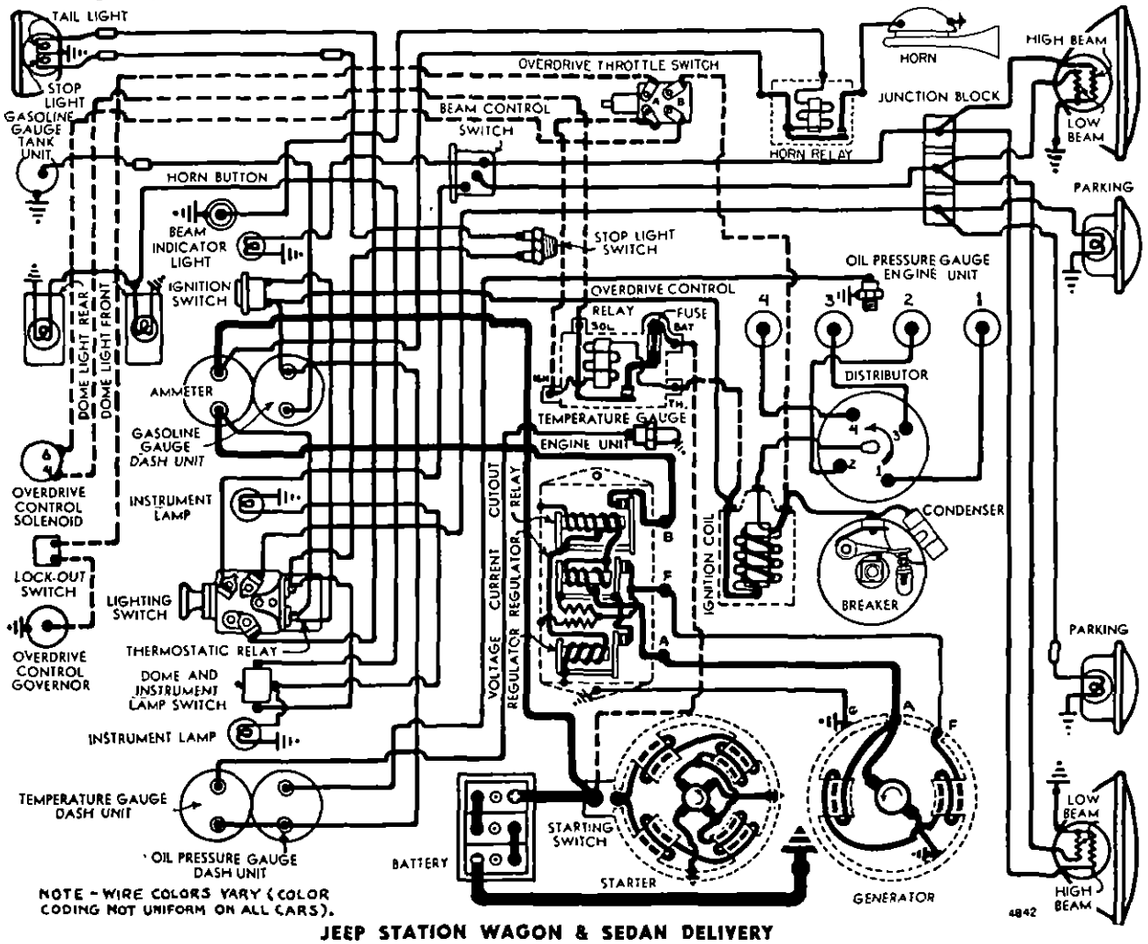
IGNITION SWITCH: Douglas or Mitchellock Switch.
COIL: Auto-Lite Model IG-4090A or IG-6009. Service Coil Model IG-8005 (with IG-1798S Service Bracket).
Ignition Current—2.5 amperes idling, 5 stopped.
CONDENSER: Auto-Lite Part No. IGB-1025.
Capacity—.20-.25 microfarad.
DISTRIBUTOR: Auto-Lite Model IGW-4129 or IGW-4189. Full automatic advance type with separate vacuum control unit linked to distributor assy.
Breaker Gap—.020". Limits .020-.024".
Cam Angle—50.8°.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGW-4129

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	300	0	600
2	550	4	1100
5	930	10	1860
7	1190	14	2380
9.5	1500	19	3000

Automatic Advance—IGW-4189

Start	350	0	700
2	560	4	1120
5	875	10	1750
8	1190	16	2380
11	1500	22	3000



Vacuum Spark Control Unit: Auto-Lite Mod. VC-4010. Unit mounted on hold-down plate and linked to advance plate.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Removal: Distributor is mounted on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in mounting plate.
Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to Cylinder #1 firing position (see Timing), turn distributor shaft until rotor is in #1 firing position (at #1 segment in distributor cap—see diagram). Insert distributor drive shaft in housing on engine, rock shaft back and forth until drive lug on end of shaft enters drive coupling, push distributor down into place, install hold-down screw, check timing.
CAUTION—If oil pump removed, refer to Oil Pump installation directions in Willys Shop Notes.

JEEP STATION WAGON & SEDAN DELIVERY

CONTINUED FROM PRECEDING PAGE

IGNITI N TIMING

Standard Setting..... 5° BTDC

►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting 4-63 Engine No. 51379.

Timing (Using Timing Light—Engine Idling)—This method recommended by manufacturer. Direct timing light at flywheel through inspection hole in front face of housing below starter, idle engine (engine must be warm), adjust distributor (as directed above) until timing mark is centered in inspection hole.

CARBURETOR

CARTER

Carter WA-1 No. 613S. 1¼", Single Barrel, Downdraft type with manual choke control.

Casting Number on Flange—485.

Carter YF Type 738S, 1¼" Single barrel downdraft type with manual choke control and "Diaphragm" type accelerating pump and metering rod control.

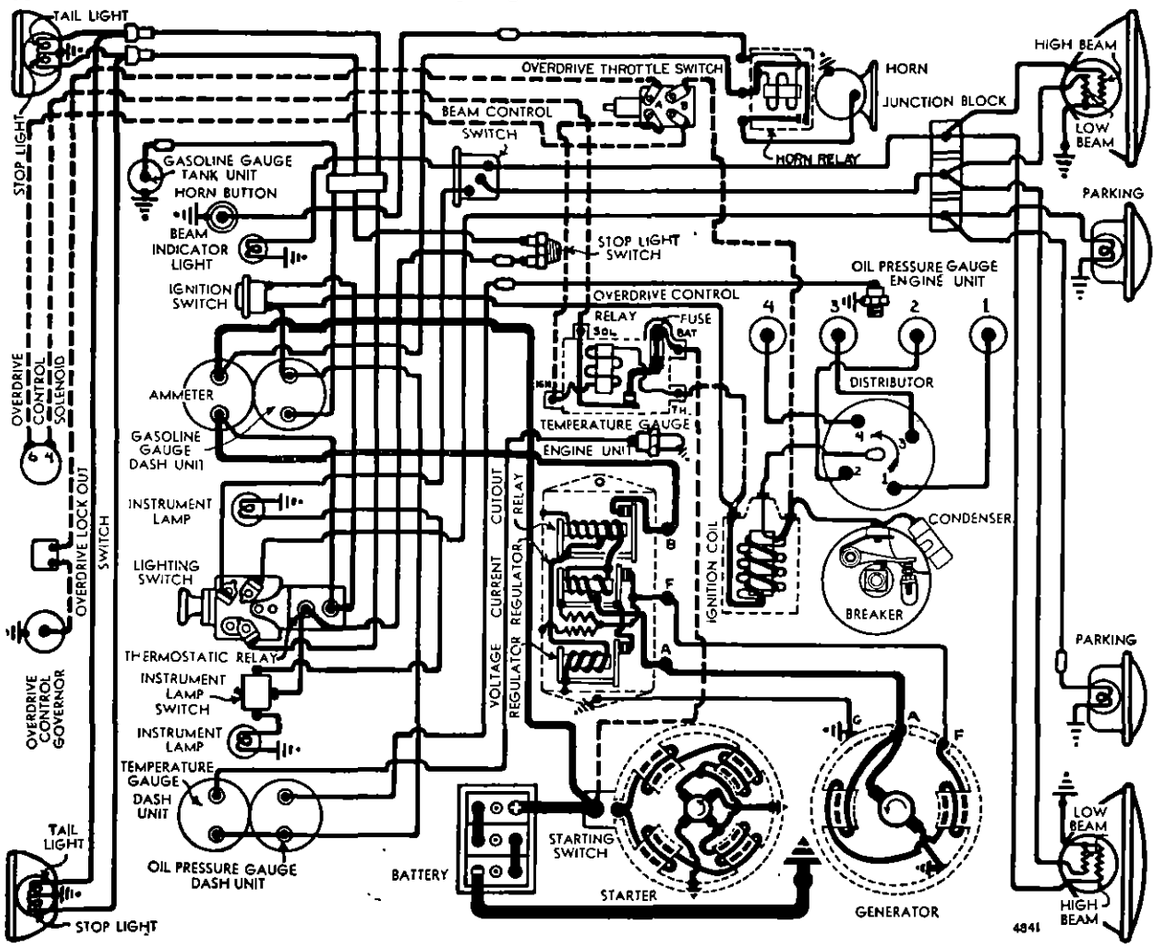
See Carburetor Section for complete data.

►*STUMBLE CORRECTION (738S, 768S, SA, 832S, CARBURETORS)—See "Carter YF" in Carburetor Section for complete data.*

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***

Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

ZENITH



Zenith Model 228AV10 & 28BV10—Single barrel, downdraft with manual choke control.

Outline No.—(228AV10) 10760, (28BV10) 10569-A. On round metal tag riveted on top of float bowl cover. Use in ordering parts.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***

Metering Jets—***See Zenith Jet Specifications in Carburetor Section.***

JEEPSTER MODELS

CARB. EQUIPMENT

Fast Idle: Interconnected linkage by which choke valve lever opens throttle to fast idle position when carburetor choked for starting.
Setting—No adjustment required.

Air Cleaner: Oakes Model 616615 Oil-wetted type Std., Model X616150 Oil-bath type Optl.
Servicing (Oil-wetted type)—Clean filter element and re-oil at 2000 mile intervals or more often if required by operating conditions.
Servicing (Oil-bath type)—Clean filter and fill with same oil used in engine crankcase at 2000 mile intervals (at oil change). Capacity approx. 1¼ pts.

Fuel Pump: AC No. 1537409 (1946-48), No. 1539306 (1949). Combination fuel-and-vacuum pump.
Replacement Pump—AC No. 7409 or 9306 (for 1537409), 9306 (for 1539306).
See Carburetion Equipment Section for data.
Pressure—3 lbs. (4½ lbs. max. at 1800 RPM).

Gasoline Gauge: King-Seeley Electric Type.
Dash Unit—King-Seeley No. 42570.
Tank Unit—King-Seeley No. 41285.
See Carburetion Equipment Section for data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation type. Air Intake Pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase and Air Outlet Pipe (from valve chamber cover to intake manifold) allows fumes from crankcase to be sucked into intake manifold. There is a vacuum control valve at the manifold connection and this valve **must close at idling speed**
Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. Remove and clean vacuum control valve when tuning engine or if system operating incorrectly.
Vacuum Control Valve—Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold. Disassemble valve by clamping in vise and removing top, withdraw valve and spring. Clean valve and valve seat thoroughly.

BATTERY

Auto-Lite PN-15. 6 volt, 15 plate, 100 Amp. Hr.
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Engine Ground—At right front engine mounting.
Location—On right side of dash under hood.

STARTER

Auto-Lite Model MZ-4137. Armature MZ-2214.
Drive—Overrunning clutch and manual pinion shift
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM., 150-175 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
2.55 "	1325	5.0	200
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420

Starter Removal—Flange mounted on right front face of flywheel housing. To remove, disconnect starting linkage and battery cable, take out two flange mounting capscrews and bolt in bracket at commutator end.
Starting Switch—Auto-Lite SW-2677A. Mounted on starter and operated by pinion shift lever.
See Electrical Equipment Section for complete data.

GENERAT R

Auto-Lite Model GDZ-4817A, Armature GDZ-2006F. Two brush with voltage and current regulation.

Charging Rate Adjustment—None. See Regulator.

Maximum Charging Rate—35 amperes, 8.0 volts, 1900 RPM. and above. Actual charging rate controlled by regulator and dependent on the battery.

Cold Performance Data			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
10	6.85	1200	10	6.85	1290
20	7.3	1480	20	7.3	1590
30	7.8	1760	30	7.8	1980
35①	8.0	1900	35	8.0	2250

①—Current Regulator setting. See Regulator data.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35-53 ozs. (new brushes).

Field Current—1.60-1.78 amperes at 6.0 volts.

Motoring Current—4.16-4.60 amps. at 6.0 volts.

Removal: Take out pivot and clamp bolts.

Belt Adjustment—Loosen clamp and pivot bolts, swing generator out until belt deflection midway between fan and generator pulleys is 1".

REGULATOR

Auto-Lite VRP-4007C-2. Voltage-Current Type. NOTE—Regulator cover sealed. Warranty void if seals broken.

See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).

Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).

Contact Gap—.015" minimum.

Air Gap—.031-.034" with contacts open measured at hinge end of core.

Voltage Regulator

Setting—7.35 volts (7.2-7.5) at 70°F. See Electrical Equipment Section for other temperatures.

Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*

Contact Gap—.012" min. (armature against stop pin)

Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked "35" on cover).

Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*

Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25').

Beam Indicator—On left side of instrument panel. Lighted when Upper Beams in use.

Switches

Lighting—Willys No. 645292.

Instrument—Willys No. 641732.

Beam Selector—Willys No. 640260.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Mounted on light ing switch. Vibrating thermostatic type. Protects lighting circuits by limiting current to 30 amps.

FUSES: Overdrive—20 ampere. On control relay.

HORNS: Sparton #C-5992 or B-10419, Auto-Lite HA-4033 or HA-4037. Vibrator type single horn controlled by relay. Auto-Lite HW-4007 (Low Pitch), HW-4008 (High Pitch) twin horns.

ENGINE

ENGINE SPECIFICATIONS: Own. Four Cylinder, "L" Head type.

Bore—3⅛" (3.125-3.127"). *See Willys Special Data for Original Bore Sizes.*

Stroke—4⅜". **Displacement**—134.2 cu. ins.

Developed H.P.—63 at 4000 R.P.M. **Rated H.P.**—15.63

Compression Ratio—6.48-1 Std. Cast Iron Head.

Compression & Vacuum Reading: *See Tune-up data.*

ORIGINAL BORE & PISTON SIZES: *See Willys Shop Notes.*

ORIGINAL BEARING SIZES: *See Willys Shop Notes.*

TIGHTENING TORQUES: *See Willys Shop Notes.*

CYLINDER HEAD INSTALLATION: *See Willys Shop Notes.*

ENGINE REMOVAL: *See Willys Special Data.*

PISTONS: Lo-Ex aluminum alloy (Lynite, Bohn, Permite, or Arrowhead). "T" slot, Cam ground, tin or brass plated type.

Weight—12.7 ozs. (stripped), **Length**—3¾".

Removal—Pistons and rods removed from above.

Clearance—.017-.019" top, .003" skirt.

Replacement Pistons: Finished pistons are furnished .0002", .010", .015", .020", .025", .030", .035", .040", .045" Oversize.

Fitting New Pistons: Use .003" feeler stock, ½" wide, between piston and cylinder wall on side opposite slot. Pull to withdraw feeler must be 5-10 lbs.

Installing Pistons: T-slot toward valve side of engine (opposite side from oil spray hole in lower end of connecting rod).

PISTON RINGS: Two compression rings, one oil control ring per piston, all above pin. Oil ring groove has oil drainage holes.

Ring	Width	End Gap	Side Clearance
Compr. (#1, 2)	3/32"①	.008-.013"	.0005-.001"
Oil (#3)	3/16"②	.008-.013"	.001-.0015"

①—.0925-.0935" ②—.1860-.1865"

Installing Rings—Compression ring mark "TOP" (on side of rings) upward and inner bevel edge on top ring upward. Rings have taper face.

Replacement Rings (for Rebored Cyls.): Rings furnished .005", .010", .015", .020", .025", .030", .035", .045" Oversize.

Service Type Rings (for Cylinders not Rebored)—Furnished 1) Std.-.009", 2) .010-.019", 3) .020-.029", 4) .030-.039", 5) .040-.049" Oversize.

PISTON PIN: Pin is locked in rod by clampscrew. **Diameter**—13/16" (.8117-.8119"). **Length** 2 25/32"

Pin Fit in Piston—.0001-.0005" clearance or light thumb push fit with piston at 70°F.

Replacement Pins: No oversizes are available.

CONNECTING ROD: Length—9.1845-9.1905". **Weight**—39.41 ozs.

Crankpin Journal Diameter—1.9385-1.9375". *See "Original Bearing Sizes" in Willys Special Data.*

Lower Bearing—Replaceable steel-backed, babbitt lined type. No shims. CAUTION—Oil spray hole in bearing upper half must line up with oil hole in rod.

Clearance—.0005-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: None (replace the bearings). Do not file connecting rods or bearing caps. NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Palnut Installation—*See Willys Shop Notes.*

Replacement Bearings: Furnished Std. size and .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in rod toward right side of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type.

Journal Diameters—2.3341" (all bearings). *See "Original Bearing Sizes" in Willys Shop Notes.*

Bearings—Replaceable steel-backed, babbitt lined type. No shims. Bearing shells are dowelled in bearing caps and crankcase.

Clearance—.001-.0025" (.0005-.001" new).

NOTE—Replace bearings when clearance exceeds .006" or when endplay exceeds .018".

Bearing Adjustment: None (replace bearings). Do not file bearing caps. *See Crankshaft Servicing Instructions in Willys Shop Notes.*

NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing.

Replacement Bearings: Furnished Std. size and .010", .020", .030" Undersize.

End Thrust: Taken by flanged face of No. 1 (front bearing and thrust washer in back of crankshaft gear. Adjusted by adding or removing shims behind the thrust washer. NOTE—Crankshaft gear must be removed with a gear puller for endplay adjustment. Shims furnished .002", .004", .010", .030" thick.

Endplay—.004-.006".

FLYWHEEL: Removal—*See Willys Special Data.*

CAMSHAFT: Four bearing with helical gear drive.

Journal Diameters—#1, 2.188"; #2, 2¼"; #3, 2 3/16"; #4, 1¾".

Bearings—Removable steel-backed, babbitt-lined bushing (front), machined in crankcase (all others).

Clearance—.002-.0035". Service limit .006" (front), .008" (all others).

Camshaft Removal—*See Willys Shop Notes.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance.

Endplay—.003-.0055".

►**Timing Case Cover (& Front Oil Seal) Change:** *See "Crankshaft & Main Bearings" in Willys Special Data.*

Timing Gears: Crankshaft gear Cast Iron, Camshaft gear Fiber with steel hub. **Backlash**—.000—.002".

Camshaft Setting: Mesh marked tooth of camshaft gear opposite marked space between teeth of crankshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.373"	5 57/64"
Exhaust	1 15/32"	.3725"	5 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.0025-.0045"

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place as follows:

Intake Guide—Top of guide 1 5/16" below top face of block. Smaller diameter section upward.

Exhaust Guide—Top of guide 1" below top face of block. Counter-bored end of guide upward.

Valve Springs: Install springs with closed coil end up toward cylinder block. Spring free length 2½".

	Spring Pressure	Spring Length
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Valve Lifters: Mushroom type. In reamed holes in block. Service by installing .004" oversize lifters.
NOTE—Camshaft must be removed for lifter removal. *See Camshaft Removal in Willys Shop Notes.*
Lifter Diameter—.6240-.6245". Clearance .0005-.002".

VALVE TIMING

Tappet Clearance: .016" All Valves, Hot or Cold.
NOTE—Tappet adjusting screws are self-locking
Valve Timing—See Camshaft Setting above.
Intake—Open 9° BTDC. Close 50° ALDC.
Exhaust—Open 47° BLDC. Close 12° ATDC.
▷**Timing Mark Change (starting 4-63 Engine Number 51379)**—Flywheel marked "5°" (for 5° BTDC.) and "T.C." (top dead center). "I.O." mark not carried and intake opening point must be estimated.
Valve Timing Check—Set tappet clearance #1 intake valve at .020". This valve should open with #1 piston 9° or .039" BTDC. with flywheel mark "I.O." centered in inspection hole in right front face of flywheel housing. Reset tappet clearance at .016".

LUBRICATION

Engine Oiling System: Pressure to crankshaft, conrod, and camshaft bearings, and to timing gears.
Crankcase Capacity—4 qts. refill.
Normal Oil Pressure—35 lbs. at 30 MPH. (10 lbs. idling at 600 RPM).
Oil Pressure Regulator—Opens at 35 lbs. Located under plug on side of pump housing. Adjustable by adding or removing shims above spring within plug.
Oil Pump: New rotor type pump mounted externally on left side of crankcase.
Oil Pump Servicing—*See Willys Shop Notes.*
Oil Pressure Gauge: King-Seeley Electric type.
Dash Unit—King-Seeley No. 42565.
Engine Unit—King-Seeley No. 40767.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure type, relief valve in cap.
Capacity—11 quarts.
Pressure Valve—AC No. 846709 (Filler Cap). Opens at 3¾ lbs. (3¼-4¼ lbs.).
Water Pump: Centrifugal, belt-driven, packless type.
See Water Pump Section for complete data.
Removal—Loosen drive belt adjustment, remove belt, disconnect hose. Remove pump mounting screws and lift out pump and fan assembly.
Thermostat: Harrison. In outlet on cylinder head. Starts to open at 145-155°F. Fully open at 170°F.
Temperature Gauge: King-Seeley Electric type.
Dash Unit—King-Seeley No. 42575.
Engine Unit—King-Seeley No. 7000.
See Miscellaneous Section for complete data.

CLUTCH

Auburn (Atwood) Model 8501-19. Single plate, dry disc type with Borg & Beck 11735 Driven Member.
NOTE—Model 8501-19 has neoprene driving lug inserts and Return Clip Springs.
See Clutch Section for complete data.
▷**Clutch Facing Change & Return Clip Spring Installation to correct Clutch Chatter & Noise**—*See "Auburn Clutch" in Clutch Section.*
Facings—Moulded type. I.D. 5⅛" (5.094-5.156"), O.D. 8½" (8.520-8.480"). Thickness ⅛" (.132-.138").
Pedal Adjustment: Free travel 3/4" (provides 1/16" clearance between release levers and bearing). To adjust, loosen locknut and turn adjusting nut on connector link at clutch fork, tighten locknut.
Removal: Remove transmission (see Transmission Removal below), remove flywheel bell housing. Mark clutch pressure plate and flywheel to insure reinstallation in same position. Take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch and driven member.

TRANSMISSION

Without Overdrive.....Warner AS1-T96E
4-63 with Overdrive.....Warner AS12-T96
VJ-2 & VJ-3 with Overdrive.....Warner AS18-T96
Three-speed, helical gear type. Constant-mesh, (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data
Transmission Control: Remote control type with gearshift lever mounted on steering column.
See Transmission Section for complete data
Removal: Disconnect shift rods at transmission. On Overdrive cars, disconnect wires from solenoid and rail switch, disconnect overdrive control cable and conduit, remove rubber mounted saddle support at rear end of overdrive, take off overdrive governor assembly. Disconnect front universal joint at transmission. Support engine weight on jack under flywheel bell housing, remove frame cross-member with rubber insulators attached. Place jack under engine to support engine. Back out four screws holding transmission to bell housing approximately ¾". Pull transmission back to bolt heads which will provide opening between the two housings and relieve pressure on clutch release fork in bell housing. Using a long screwdriver through opening in side of bell housing, pry the clutch release fork from engagement with clutch release bearing carrier. Remove four transmission attaching screws, and pull transmission back until clutch shaft clears bell housing and remove the assembly.

OVERDRIVE

Warner Type R10B (part of AS12-T96 & AS18-T96 Transmission Assemblies). New solenoid operated, governor controlled with throttle "kick-down".
See Transmission Section for complete data.
▷*NOTE*—Beginning Serial No. 91904 (4-63) & All VJ-3 Cars, Overdrive is new "centered ring gear" type with one rear bearing only (2 used previously).
Control Relay—Auto-Lite Model HRT-4001.
Overdrive Governor—Auto-Lite Model TGE-4002.
Transmission Solenoid—Delco-Remy 1118132.
Removal: Remove as a unit with transmission. Removal instructions same as for regular transmission (above) after governor and solenoid wires and lockout control disconnected and overdrive case-to-cross-member bolts removed.

UNIVERSALS

1949-50 MODELS

Spicer Model 1261-102X (Front—All Models), 1278-101X (Rear—All Models without Overdrive & First Cars with Overdrive), 1268-111X (Rear—Later models with Overdrive). Needle roller bearing type.

1946-48 MODELS

Detroit Series 4100. Ball & Trunnion type.

REAR AXLE

Spicer (Salisbury) Model 23-1. Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratio—4.88-1 Std., 4.56-1 & 5.38-1 Optl.
Backlash—.004-.008" Shim adjustment.
Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs and lower springs, remove axle assembly
Axle Shaft Removal: Remove the wheel & hub assembly (use wheel puller), disconnect brake line at wheel cylinder, remove nuts on bolts holding backing plate and brake assembly on housing, remove dust shield, oil seal, and backing plate (with brake assembly). CAUTION—Do not lose bearing adjusting shims located between backing plate and flange on axle housing. Remove axle shaft and bearing.
Wheel Bearing Adjustment—Endplay .003-.005". Adjust by adding or removing shims between backing plate and axle housing flange (at each wheel). See axle shaft removal (above).
NOTE—Shims installed on **left hand** end of axle housing only in production. Shims can be installed on right hand end of axle housing, if necessary, for correct endplay.

SHOCK ABSORBERS

Delco—Model 1030-C (Front), 1031-Q (Rear).
Monroe—Model K-18004 (Front), K-18005 (Rear).
Direct acting, hydraulic, adjustable (first cars).
NOTE—Shock absorbers are sealed and cannot be refilled or serviced.

FRONT SUSPENSION

Planadyne Type. Independent, linked parallelogram type with transverse spring.
▷**Replacement Spring Caution:** *See Willys Front Suspension for recommended replacement springs.*
See Front Suspension Section for complete data.
Kingpin Inclination—5½° crosswise.
Caster—1° No adjustment.
Camber—1½° (1¼-1¾°).
Toe In—1/8-3/16".
▷*See Willys Front Suspension for Toe In adjustment.*

STEERING GEAR

Ross T-12, No. 13108. Cam-and-Twin Lever type.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic, self-centering. Hand lever applies rear wheel brakes.
See Brake Section for complete data.
Drums—Chrome-nickel type. Diameter 9.948".
Lining—Molded type. Width 1¾". Thick .182-.192" Length per wheel 19".
Clearance—.008" Toe, .005" Heel each shoe.
NOTE—No anchor pin adjustment provided. Brake shoes should be centralized by hard brake application (and then released) before adjustments made.
Hand Brake: See Service Brakes above.
Adjustment—Tighten link rod adjustment at lever on cross-member for slight drag with hand lever set two-notches "on" (must be free when released).

MISC. MECHANICAL

Windshield Wiper: Vacuum type, cable operated.
See Miscellaneous Section for data.

M DEL IDENTIFICATION

SERIAL NUMBER: (Station Wagon) At left of driver's seat on floor riser, (Jeepster) On under edge of cowl above glove box door.

Model	Year
6-63 (Sta. Wgn. & Sedan Del.)	1948-49-50
673-SW (Sta. Wgn.)①	1950-51
673-VJ (Jeepster)①	1950-51
685 (Station Wagon)②	1952-53

①—"L-Head" Engine. ②—"F-Head" Engine.

ENGINE NUMBER: On upper front corner of engine block on right side.

►*ENGINE NUMBER NOTE—Letters following engine number denote the following:* (A)—Crankshaft journals (main & connecting rod) .010" UNDERSIZE. (B)—Cylinder bores .010" OVERSIZE. (AB)—Both above conditions exist in engine.

TUNE-UP

COMPRESSION PRESSURE: ("L-Head" Engine)—125 lbs. at 160 RPM (Cranking speed).

"F-Head" Engine—115 lbs. minimum, with all cylinders equal within 15 lbs.

VACUUM READING: Steady 18-21" idling at 600 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .030".

Plug Type—Champion J-7 ("L-Head" Engine); J-8 "F-Head" Engine).

►*Tighten Spark Plugs to 26-30 ft. lbs. torque.*

DISTRIBUTOR: Breaker Gap—.020" (.018-.022").

Cam Angle—39° ± 3°.

Breaker Arm Spring Tension—17-20 ozs.

Automatic & Vacuum Advance—*See Ignition.*

Condenser Capacity—(IGC-4514) .20-.25 mfd. (IAT-4007, 4007A) .21-.25 mfd.

IGNITION TIMING: 5° BTDC. *NOTE—Road test car for timing modifications for fuel and operating conditions.*

►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*

Timing Procedure—*See Ignition Timing.*

Timing Mark—Grooved line on vibration dampener rim in line with pointer on timing gear cover on right side.

Octane Selector Setting—Set to just eliminate ping with engine pulling hard.

CARBURETION: Carter WA1, Type 645S or Zenith Model 228AV10. (1948-50).

Idle Setting—Idle adjusting screw set for smooth idle with warm engine (on Carter Carb. 1-2 turns open). For richer mixture, turn screw out.

Idle Speed—600 RPM. or 6 MPH.

Float Level (Carter)—5/16" from top of machined projection on bowl cover to top of soldered seam on free end of float with cover assembly inverted.

(Zenith)—45/64" plus or minus 1/64" from upper edge of float seam at free end of float to gasket seat on bowl cover with cover assembly inverted.

Accelerating Pump—(Carter) No adjustment.

(Zenith)—3 grooves in pump plunger stem. Engage hairpin cotter as follows: Center Groove normal setting, Upper (min. stroke) Hot Weather, Lower (max.) Cold.

Choke Setting: No adjustment required.

Fuel Pump Pressure: 3½-4½ lbs. at 1800 RPM.

CARBURETION: Zenith Series 31, Assembly No. 11119 (1950-Early 1951); No. 11307 (Late 1951).

►*1950-51 ENGINE IDLING CORRECTION (Correct Idle Adjustment Cannot be Made): See "Zenith Model 31 Carburetor" in Carburetor Section for complete data.*

Idle Setting—Idle screw approximately 1½ turns open. Turn screw out for richer mixture.

Idle Speed—600 RPM. or 6 MPH.

Float Level—Top of float flush (plus or minus 1/32") with bottom of checking gauge C161-169 with needle valve closed (remove air horn and gasket, place gauge on top edge of bowl, press down on float lever directly above needle valve to raise float to valve closed position).

Accelerating Pump—No seasonal adjustment.

CARBURETION: Carter YF Type 924S, (1952 & Early 1953); 2071S (Late 1953).

Idle Setting—1-2 turns open (turn screw out for richer mixture).

Idle Speed—550 RPM.

Float Level—9/32" from top of float at free end to gasket seat on cover (Gauge T-109-26). Check by inverting cover and allow float to hang free.

►*CAUTION—Do not compress spring in intake needle (will give incorrect reading and wrong setting).*

Accelerating Pump—Diaphragm type. No adjustment.

Fast Idle Setting: Lip on fast idle arm should contact boss on body casting with choke valve wide open. Adjust by bending fast idle link at offset.

Choke Setting: Manual type. No adjustment required.

Fuel Pump Pressure: 3½-4½ lbs. at 1800 RPM.

CRANKCASE VENTILATOR: Remove and clean the vacuum control valve. *See "Crankcase Ventilator" (following Carb. Equipment) for directions.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No adjustment. Valve must operate freely.

VALVE TAPPET CLEARANCE: ("L-Head" Engines)—.016" Intake & Exhaust.

"F-Head" Engines—.018" Intake, .016" Exhaust. COLD.

Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: Douglas or Mitchellock. Willys No. 641720.

COIL: Auto-Lite IG-6009 (First Cars), CR-6009 (Later cars). On right side of engine.

NOTE—Serial Nos. at which coil changed: (673-SW) No. 10994, (673-VJ) No. 10530.

Ignition Current—2.5 amperes idling, 5 stopped.

CONDENSER: Auto-Lite. IG-2671 (IGC Distributors), IAT-3076L (IAT Distributors).

Capacity—.20-.25 mfd., (IGC Distr.), .21-.25 mfd., (IAT Distr.).

DISTRIBUTOR: Auto-Lite Models as follows: Full automatic advance type with separate vacuum spark control (IGC Distr.), integral type vacuum control (IAT Distr.).

Year	Distr. No.
1948-50	IGC-4513 & IGC-4514
1950 (Late) & 1951	IAT-4007
1952-53	IAT-4007A

Breaker Gap—.020". Limits .018-.022".

Cam Angle—39° ± 3°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGC-4513 & 4514, IAT-4007

Degrees	Distr. R.P.M.	Degrees Eng.	R.P.M.
Start	350	0	700
1	375	2	750
7	550	14	1100
11	1300	22	2800
12	1500	24	3000

Automatic Advance—IAT-4007A

Degrees	Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start		300	0	600
1		400	2	800
4		725	8	1450
8		1150	16	2300
9.5		1300	19	2600

Octane Selector: 20° advance or retard adjustment at distributor. See Ignition Timing.

Vacuum Advance—IGC-4513 & 4514, IAT-4007

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
1°	2°	5½"
3°	6°	9¼"
5°	10°	13"
6°	12°	15"

Vacuum Advance—IAT-4007A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5⅛"
1°	2°	6⅝"
3°	6°	9⅝"
5°	10°	12½"
6°	12°	14"

Distributor Removal: On right side of engine. To remove, disconnect vacuum line, take out hold-down screw in vacuum unit mounting bracket.

Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to #1 cylinder firing position (see Timing), turn distributor shaft until rotor opposite #1 segment in cap (see diagram), install distributor on engine, rocking shaft slightly to engage drive coupling, push distributor down into place, install hold-down screw, check timing.

CAUTION—If oil pump has been removed, see Oil Pump data in Willys Special Data.

IGNITION TIMING

Standard Setting ..... 5° BTDC.

►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*

NOTE—See Octane Selector Setting to compensate for special fuel and operating conditions.

Timing Marks—Line on rim of vibration dampener and pointer on timing gear cover. Flywheel also marked ("TC" on flywheel in line with horizontal center-line of inspection hole, right front face of housing.

Timing (Engine not Running)—With #1 piston on compression, turn engine until piston reaches firing position (5° BTDC) with line on vibration damper aligned with pointer on right side of timing gear cover. Loosen vacuum control link screw in distributor quadrant, center pointer on scale, tighten screw. Loosen clampscrew on hold-down plate, rotate entire distributor assembly until contacts begin to open, tighten clampscrew, see that rotor at #1 segment in distributor cap, check plug connections.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Timing (Using Timing Light—Engine Idling). This method recommended by manufacturer. Direct timing light at vibration dampener, idle engine (engine must be warm), adjust distributor (as directed above) until timing mark lines up with pointer.
Octane Selector Setting—If engine pings on heavy pull, loosen vacuum control link screw at distributor quadrant, retard spark slightly by rotating distributor counter-clockwise. For High Octane Fuel, spark can be advanced by rotating distributor clockwise.

CARBURETOR

CARTER WA-1

Carter WA1 No. 645S. 1¼" Single Barrel, Downdraft type with manual choke control.
See Carburetor Section for complete data.

►**Carburetor Jet Calibration Production Change**—*See "Carter WA-1" in Carburetor Section.*

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Interconnected linkage by which choke valve lever opens throttle to fast idle position when carburetor choked for starting.
Setting—No adjustment required.

ZENITH 31A11

Zenith Series 31A11, Assembly 11119 & 11307 (1950-51). Single barrel downdraft type with manual choke.

See Carburetor Section for complete data.

►*1950-51 ENGINE IDLING CORRECTION (Correct Idle Adjustment Cannot be Made): See "Zenith Model 31 Carburetor" in Carburetor Section for complete data.*

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Zenith Jet Specifications in Carburetor Section.*

Fast Idle: Fast idle cam serving as stop for throttle stopscrew is linked to choke valve lever and rotated to fast idle position when choke closed for starting.
Setting—No adjustment required.

ZENITH 228AV10

Zenith Model 228AV10—Single barrel, downdraft type with manual choke control.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Zenith Jet Specifications in Carburetor Section.*

Fast Idle: Fast idle cam serving as stop for throttle stopscrew is linked to choke valve lever and rotated to fast idle position when choke valve closed for cold starting.
Setting—No adjustment required.

CARTER YF

Carter Model YF No. 924S (1952-Early 1953), 2071S (Late 1953). 1¼" Single barrel downdraft type with manual choke.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, & Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle: Lip on fast idle arm should contact boss on body casting with choke valve **wide open.** Adjust by bending fast idle link at offset.

Choke: Manual type.

CARB. EQUIPMENT

Air Cleaner: Oil wetted type (Std.), Oil bath type (Optl.).

Fuel Pump: AC Combination Fuel & Vacuum type, (Std.).

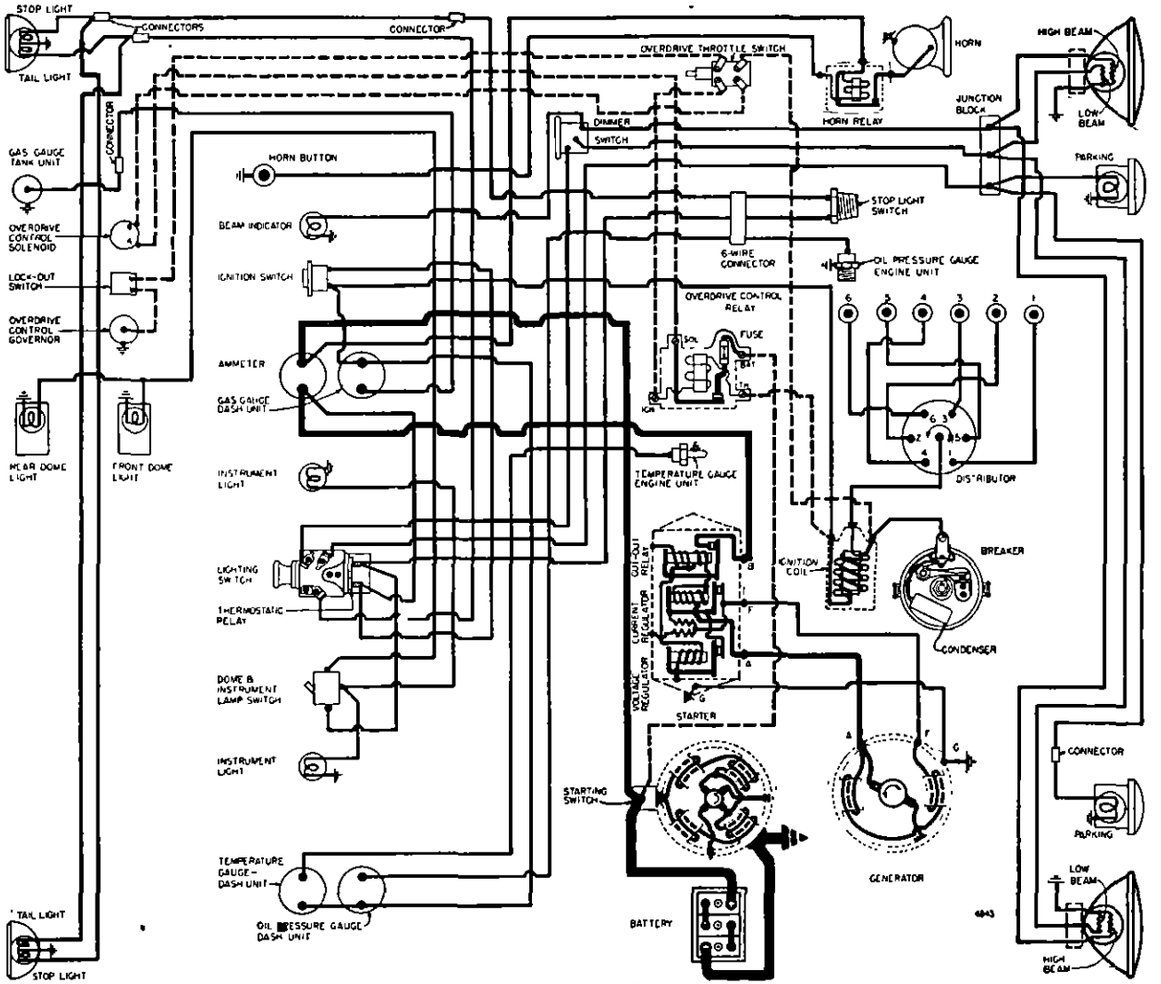
Replacement Pump—AC No. 9245 (1948-50 & Early 1952), No. 9993 (Late 1952 & 1953).

Pump Pressure—3½-4½ lbs. at 1800 Eng. RPM.
See Carb. Equipment Section for complete data.

Gasoline Gauge (1948-50): King-Seeley Electric (Not "CV").

Dash Unit—King-Seeley No. (1948) 41310, (1949-50) 42570.

Tank Unit—King-Seeley No. 41248.
See Carb. Equipment Section for complete data.



Gasoline Gauge (1950-53): King-Seeley Electric "CV" (constant voltage) type with voltage regulator.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—King-Seeley No. 44534 (1950), 45727 (1951-53).
Tank Unit—King-Seeley No. 44506 (all).
Gauge Voltage Regulator—*See Misc. Electrical for data.*
See Carburetion Equipment Section for complete data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air intake pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase, air outlet pipe (from valve cover to

CONTINUED ON NEXT PAGE

1948-50 MODELS

CONTINUED FROM PRECEDING PAGE

manifold) allows fumes from crankcase to be sucked into intake manifold. Vacuum control valve at manifold connection **must close at idling speed** for satisfactory idling performance.

NOTE—Clean Vacuum Control Valve when engine tuned up.

Cleaning Vacuum Control Valve—Remove control valve by disconnecting pipe and unscrewing valve from manifold. Disassemble valve; withdraw valve and spring, clean valve and valve seat thoroughly.

Servicing—Make certain all connecting pipes tight and that oil filler cap gasket seals cap tightly. Remove and clean control valve when tuning engine or whenever system does not operate satisfactorily.

BATTERY

Auto-Lite PN-15 or Willard HW-1-100. 6 volt, 15 plate, 100 Ampere Hour capacity (20 hr. rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) grounded at starter.
Engine Ground—Strap at left front engine mount.
Location—Right hand side of dash in engine compt.

STARTER

Auto-Lite Model MZ-4137 (1948-Early 1950), MZ-4162 (Late 1950 & 1951), MCH-6203 (1952-53).

►*NOTE—Starter solenoid switch and key starting used with MCH-6203 starter.*

Armature—MZ-2217 (MZ-4137), MZ-2330 (MZ-4162), MCH-2088 (MCH-6203).
Drive—(MZ Starters)—Overrunning clutch and positive pinion shift actuated by pedal.
Drive—(MCH-Starters)—Bendix "Folo-thru" type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM., 150-175 amps., 5 volts.

Performance Data—MZ-4137, 4162

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.①	5000	5.5	60
0	ft. lbs.②	4000	5.0	68
4.4	"	Lock	2.0	280

①—Without Bendix. ②—With Bendix.

Performance Data—MCH-6203

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4300	5.0	65
6.0	"	Lock	2.0	335

Starting Switch (MZ Starters)—Auto-Lite No.2077A Mounted on starter and operated by pinion shift lever.
Starting Switch (MCH Starters)—Auto-Lite No. SS-4018. Mounted on starter and operated by ignition switch (key starting).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite GDZ-4817A (1948-Early 1950), GDZ-6001D (Late 1950-Early 1953), GGW-4801D (Late 1953). Two brush types.

Armature—Auto-Lite No. GDZ-2006F (GDZ-4817A Gen.), GGY-2006F (GDZ-6001D Gen.), GGW-2006F (GGW-4801D Gen.).
Charging Rate Adjustment—None. See Regulator.

Performance Data—GDZ-4817A, 6001D

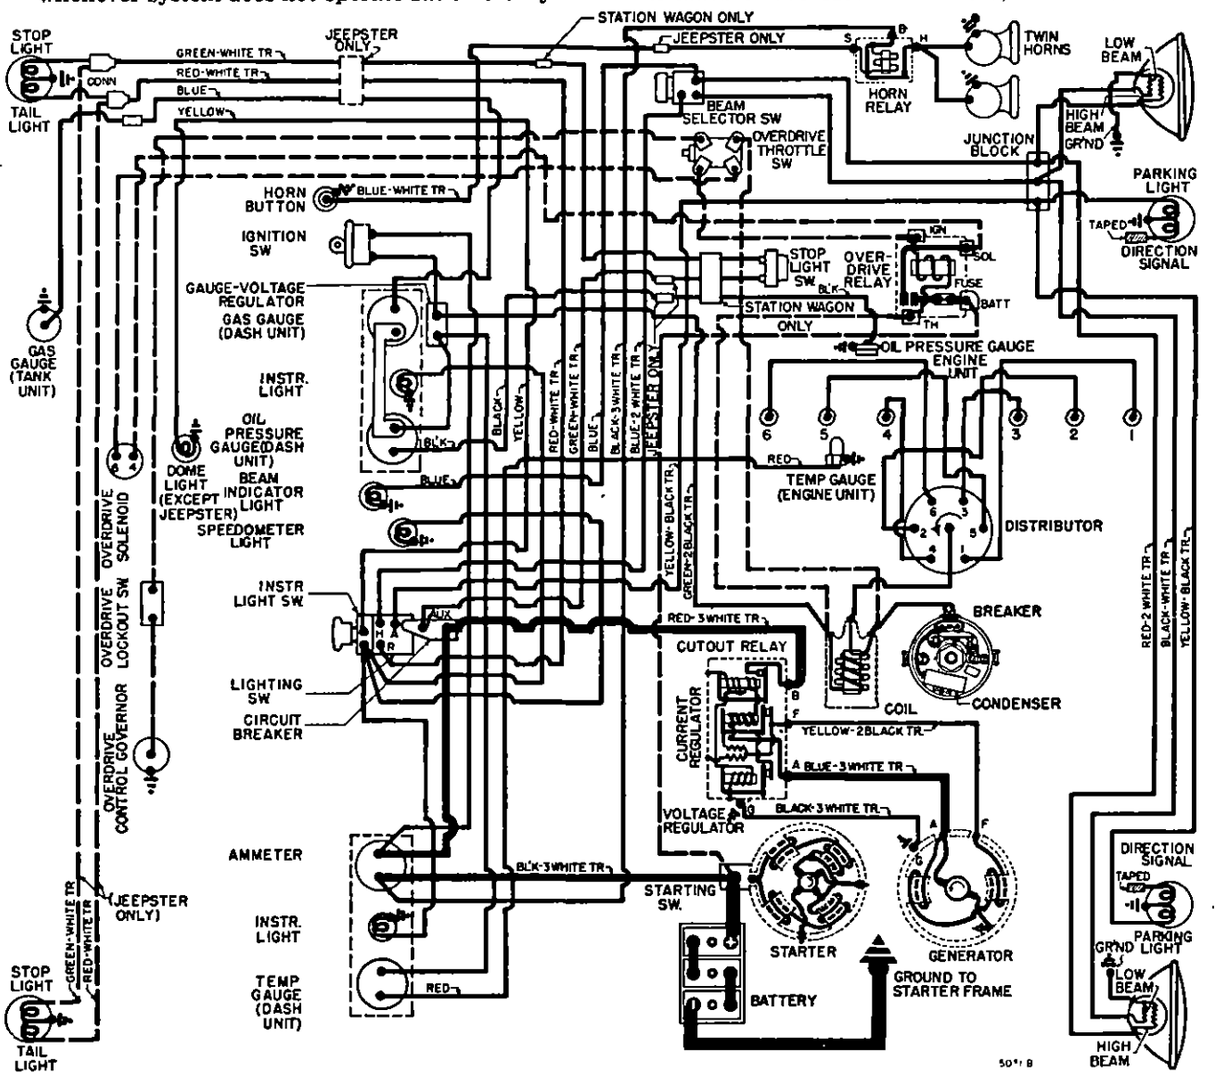
Amperes	Volts	Cold—R.P.M.—Hot
0	6.4.	870-970 — 950-1050
17.0	8.0.	1350-1500 — 1550-2350
35.0	8.0.	1800-2000 — 2150-2350

Performance Data—GGW-4801D

Amperes	Volt	Cold—R.P.M.—Hot
0	6.4.	870-970 — 950-1050
40.0	8.0	1800-2000 — 2150-2350
45.0	8.0	1925-2125 — 2350-2550

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.3-1.5 (GDZ); 1.4-1.5 (GGW) amperes at 5.0 volts.
Motoring Current—3.9-4.4 (GDZ), 4.8-5.3 (GGW) amperes at 5.0 volts.

Belt Adjustment: 1" deflection (thumb pressure) midway between generator and pump pulleys. To adjust, loosen all mounting bolts, pull generator away from engine.



REGULATOR

Auto-Lite Models—Voltage & Current types as follows:

Regulator No.	Use with Gen. No.
VRP-4007C-2	GDZ-4817A
VRP-6003A	GDZ-4817A, 6001D
VBE-6105A	GGW-4801D

See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay
Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).

1950-EARLY 1952 MODELS
LATE 1952-53 MODELS—SEE 1952-53 2-WHL. DRIVE DIAGRAM

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (measured at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. after 15 minutes operation charging at 10 amperes (VRP), one-half maximum charging rate (VBE).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator—(VRP)

Setting—34-36 amperes (marked '35' on cover).
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VBE)

▷*SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.*

	Test A—Operating Amperes	Test B
VBE-6105A	52	45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.
Test B—After fifteen minutes additional operation with current regulator operating (load applied to hold voltage to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type. Upper and lower beams controlled by Beam Selector Switch on toeboard.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead with hot spot center 3" below lamp center height at 25 ft.
Beam Indicator—On left side of instrument panel (above Radio). Lighted when upper beams in use.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: 30-ampere type. Mounted on lighting switch. Vibrating thermostatic type. Protects lighting circuits by vibrating to limit current. No adjustment.
FUSES: Overdrive—20 ampere. On control relay.
GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter which is designed to maintain constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on instrument cluster and connected between ignition switch and gauge circuits. See Wiring Diagram.
HORNS: Auto-Lite or Sparks-Withington.
Horn Relay—Willys No. 643889.

ENGINE

"F-HEAD 1952-53

ENGINE SPECIFICATIONS: Own Make. 6 Cyl. "F-Head" type (Intake valves in head, exhaust valves in block).
Bore—3⅛". **Stroke**—3½".
Displacement—161 cu. ins. **Rated H.P.**—23.44.
Developed Horsepower—90 at 4200 RPM.
Compression Ratio—7.6-1.
▷**ALL OTHER ENGINE DATA:** *See 1952-53 Willys Aero Passenger Car pages.*

"L-HEAD" 1948-51

ENGINE SPECIFICATIONS: Own. "6-63" (1948-50), "Lightning" (1950-53). 6 Cylinder, L-Head type.

	Bore	Stroke	Displacement
1948-50	3"	3½"	148.44 cu. in.
1950-53	3⅛"	3½"	161 cu. in.

	Compr. Ratio	Rated HP	Developed HP
1948-50	6.42-1	21.6	72 at 4000 RPM
1950-53	6.9-1	23.44	75 at 4000 RPM

Compression & Vacuum Reading—*See Tune-Up.*

ORIGINAL BORE & PISTON SIZES: *See Willys Shop Notes.*

ORIGINAL BEARING SIZES: *See Willys Shop Notes.*

TIGHTENING TORQUES: *See Willys Shop Notes.*

CYLINDER HEAD INSTALLATION: *See Willys Shop Notes.*

PISTONS: Aluminum alloy, "T" slot, cam ground, tin or brass plated type. **Length**—3".
Weight—9.67 ozs., stripped.
Removal—Pistons and rods removed from above.
Clearance—.016-.0185" (top), .0015" (skirt).
Replacement Pistons: Furnished .005", .015", .020", .045" Oversize.
Fitting New Pistons: Use .0015" feeler gauge ½" wide between piston and cylinder wall on side opposite slot. Pull required to withdraw feeler must be 5-10 lbs.
Installing Pistons: T-slot toward left (valve) side of engine (opposite side from oil spray hole in rod).
PISTON RINGS: Two compression rings, one oil ring per piston, all above pin. Oil drain holes in oil ring groove.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"①	.010-.016"	.002-.004"
Compr. (#2)	3/32"①	.010-.016"	.0015-.0035"
Oil (#3)	3/16"②	.010-.016"	.001-.0025"

①—.0925-.0935". ②—.1860-.1865".

Installing Rings: Compression ring mark "TOP" (on side of rings) and bevel on inner edge must be UP.
Replacement Rings: Furnished in sets of Std. to .009", .010", .020", .030", .040" Oversize.
PISTON PIN: Locked in rod by clampscrew.
Diameter—.7497". **Length**—2 17/32".
Pin Fit in Piston—.0001-.0005" or a light thumb push fit at normal room temperature.
NOTE—Pin hole in piston diamond-bored to inside diameter of .7498-.7500".
Replacement Pins: Furnished Standard size only.
CONNECTING ROD: Length—6.343-6.347".
Crankpin Journal Diameter—1.875". *See "Original Bearing Sizes" in Willys Special Data.*
Lower Bearing—Replaceable steel-backed, babbitt lined type. No shims. CAUTION—Oil spray hole in bearing upper half must line up with oil hole in rod.
NOTE—Palnuts used as locknuts on rod bolts.
Clearance—.0004-.0025". **Sideplay**—.004-.010".
Bearing Adjustment: None (replace bearings). Do not file rods or bearing caps.
Palnut Installation—*See Willys Special Data.*
Replacement Bearings: Furnished Std. size and .010", .020" Undersize.
Installing Rods: Rods not offset. Install with oil spray hole in lower end toward right (away from camshaft) on all rods.
CRANKSHAFT: Four bearing with integral counterweights. Vibration dampener on forward end.
Journal Diameters—2.250" all Bearings. *See "Original Bearing Sizes" in Willys Special Data.*
Bearings—Replaceable steel-backed, babbitt lined type. No shims.
Clearance—.0009-.003".
Bearing Adjustment: None (replace bearings). Do not file bearing caps. Bearings can be removed and replaced without removing crankshaft.
Rear Bearing Oil Seal Servicing—*See "Crankshaft & Main Bearings" in Willys Special Data.*
Replacement Bearings: Furnished Std. size and .010", .020" Undersize.
End Thrust: Taken by #1 front bearing (flanged type) and thrustwasher in back of crankshaft gear. Adjusted by adding or removing shims behind thrust washer. Shims furnished .002" thick.
NOTE—Crankshaft gear must be removed with a gear puller for endplay adjustment.
Endplay—.004-.006".
FLYWHEEL: Removal—*See Willys Special Data.*
CAMSHAFT: Four bearing with helical gear drive.
Journal Diameters—#1, 1.8755-1.8760"; #2, 1.8425-1.8435"; #3, 1.8110-1.8120"; #4, 1.6245-1.6250".
Bearings—Removable steel-backed, babbitt-lined bushing (Front), machined in crankcase (all others). Front bearing reamed to 1.877" diameter.
Clearance—.001-.0025".
Camshaft Removal—*See Willys Special Data.*
End Thrust—Taken by thrust plate assembled behind camshaft gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance.
Endplay—.003-.0055".
Timing Gears: Crankshaft gear Cast Iron. Camshaft gear Fibre with steel hub.
Gear Backlash—.000-.002".
Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) on crankshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 3/8"	.34075-.3415"	4½"
Exhaust	1 9/32"	.3395-.3405"	4½"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.284"	.0015-.00325"
Exhaust	45°	.306"	.0025-.0045"

Valve Guides: Removable type. Remove guides from above with puller. Install new guides with driver or press guides down until upper end ⅞" below upper edge of valve seat (taper end up).
Valve Springs: Springs can be installed with either end up. Free length 1 57/64".

	Spring Pressure	Length
Valve Closed	50 lbs.	1 5/8"
Valve Open	105 lbs.	1 21/64"

Valve Lifters: Mushroom type. In reamed holes in block. Service by installing oversize lifters.
Camshaft Removal—*See Willys Special Data.*
Lifter Diameter—.597-.605". **Length**—2".
Clearance in Block—.0005-.002".

VALVE TIMING

Tappet Clearance: .016" All Valves, Hot or Cold.
NOTE—Adjusting screws self-locking type.
Valve Timing: See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—Set tappet clearance #1 intake valve at .020". This valve should be about to open (clearance taken up) with #1 piston 5° or

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

.007" BTDC. with flywheel mark "5°/" centered in inspection hole in right front face of housing below starter. Reset tappet clearance to .016".

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings and to timing gears.

Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—35 lbs. at 30 MPH., or 2000 RPM.

Oil Pressure Regulator—Opens at 25 lbs. Located on oil pump housing. Adjustable by adding or removing *shims from above spring within plug.*

►**1948-50 Low Oil Pressure:** If oil pressure less than 5 lbs. at idling speed with latest type oil gauge units installed (see Oil Gauge below), check main and connecting rod bearing clearance, oil pressure relief valve for sticking open, and timing gear jet oil hole size not greater than #54 drill.

Oil Pump: Internal Rotor type. Mounted externally on left side of crankcase.

Oil Pump Servicing—*See Willys Special Data.*

Oil Pressure Gauge (1948-50): King-Seeley Electric. (Not "CV").

►*CAUTION*—Gauge changed in production—correct Dash and Tank units must be used together.

Before Serial No. 13291

Dash Unit—King-Seeley No. 41305 (0-30-80 dial).
Engine Unit—King-Seeley No. 40767 (80 lb. type).

Beginning Serial No. 13291

Dash Unit—King-Seeley No. 42565 (0-20-50 dial).
Engine Unit—King-Seeley No. 40790 (50 lb. type).
See Miscellaneous Section for complete data.

Oil Pressure Gauge (1950-53): King-Seeley Electric "CV" (constant voltage) with voltage regulator.

Dash Unit—King-Seeley No. (First Cars) 45537, (Later Cars) 45729.

Engine Unit—King-Seeley No. 44030 (all).
See Miscellaneous Section for complete data.

Crankcase Ventilation: *See special data following "Carb. Equipment."*

COOLING

Cooling System: Pressure type with relief valve in radiator filler cap.

Capacity—8¾ qts. (9½ qts. with heater).

Pressure Valve—AC No. 846740. In filler cap. Opens at 3¾ lbs. (3¼-4¼ lbs.).

Water Pump: Centrifugal, packless type with special sealed ball bearing shaft (no lubrication required).
See Water Pump Section for complete data.

Removal—Loosen and remove drive belt, disconnect hose, remove pump mounting screws. Lift out pump and fan assembly.

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: *Harrison. In outlet on cylinder head.* Starts to open at 145-155°F. Fully open at 173°F.

Temperature Gauge (1948-50): King-Seeley Electric (Not "CV").

Dash Unit—King-Seeley No. (1948) 41315, (1949-50) 42575.

Engine Unit—King-Seeley No. 7000.
See Miscellaneous Section for complete data.

Temperature Gauge (1950-53): King-Seeley Electric "CV" (constant voltage) with voltage regulator.

Dash Unit—King-Seeley No. (First Cars) 45545, (Later Cars) 45729; **Engine Unit**—No. 44200 (all).
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-19 (1948-50), 8501-36 (1950-53). Single plate type with Borg & Beck Driven Member.

NOTE—Clutch has neoprene driving lug inserts and Return Clip Springs for quieter operation.
See Clutch Section for complete data.

►**Clutch Return Clip Spring Installation to correct disengagement noise**—*See "Auburn Clutch" in Clutch Section.*

Facings—Molded (flywheel side), woven (pressure plate side). I.D. 5⅛". O.D. 8½". Thickness .132-.138".

Pedal Adjustment: Pedal free travel 1" (provides 1/16" clearance between release bearing and clutch levers). To adjust, loosen locknut and turn adjusting nut on connector link at clutch fork, tighten locknut.

Removal: Remove transmission (see Transmission Removal), remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS37-T96 (Std. Trans.). AS28-T96 (Sta. Wgn. with Overdrive). AS30-T96 (Jeepster with Overdrive). Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gear-shift lever on steering column.
See Transmission Section for complete data.

Removal: Remove floor boards, take off bell housing inspection cover, disconnect clutch throw-out bearing retracting spring. Disconnect transmission control rods and speedometer cable at transmission case. Disconnect propeller shaft at universal joints and remove shaft. Support engine with jack placed under bell housing, remove rear engine support bolts from cross-member under transmission case, raise rear end of engine so that transmission clears cross-member (CAUTION—use care that fan blades do not damage radiator). Remove transmission to bell housing bolts, pull transmission straight back to clear clutch shaft, remove from car.

OVERDRIVE

Warner Type R10 (part of Transmission Assy.). New solenoid operated, governor controlled type overdrive (no centrifugal pawls) with throttle operated "kickdown." *See Trans. Section for complete data.*

Control Relay—Auto-Lite Model HRT-4001.

Overdrive Governor—Auto-Lite Model TGE-4002.

Transmission Solenoid—Delco-Remy Model 1118132

Removal: Remove as a unit with the transmission. Removal instructions same as for regular transmission (above) after governor and solenoid wires and lock-out control cable disconnected and overdrive case-to-cross-member bolts removed.

UNIVERSALS

1948—TO SERIAL NO. 11494

Spicer Model 1261-102X (Front), 1268-111X (Rear). Needle roller bearing type.

1948-53—AFTER SERIAL N . 11494

Detroit Universals Series 4100. Ball-and-trunnion type.

REAR AXLE

Spicer (Salisbury) Model 23-1. Semi-floating, Hypoid Gear type with Hotchkiss drive.
See Rear Axle Section for complete data.

Ratio—4.88-1 (without O.D.), 5.38-1 (with O.D.).

Backlash—.004-.009". Shim adjustment.

Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs. Remove axle assembly.

Axle Shaft Removal: Remove wheel and hub assembly (use wheel puller), disconnect brake line at wheel cylinder, remove nuts on bolts holding backing plate and brake assembly on housing, remove dust shield, oil seal, and backing plate (with brake assembly). CAUTION—Do not lose bearing adjusting shims located between backing plate and flange on housing. Remove axle shaft and wheel bearing.

Wheel Bearing Adjustment—Endplay .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See axle shaft removal (above).

SHOCK ABSORBERS

Monroe or Gabriel. Direct acting, hydraulic type.

FRONT SUSPENSION

Planadyne Type. Independent, linked parallelogram type with transverse spring (spring acts as lower control arm). *See Front Suspension Sect. for data.*

Kingpin Inclination—5° crosswise.

Caster—1° No adjustment.

Camber—1½°. Limits 1¼-1¾°.

Toe-In—1/16-⅛". *See Willys Front Suspension in Front Suspension Section for Toe-In Adjustments.*

STEERING GEAR

Ross Model T-12. Cam-and-Twin Lever type.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic, self-centering type. Hand lever applies rear wheel service brakes. *See Brake Sect. for complete data.*

Wheel Cylinders—Diameter: Front 1", Rear 7/8".

Drums—Chrome-nickel type. Diameter 10".

Lining—Moulded type (all shoes). Width 1.760". Thickness .182-.192". Length per shoe: 10 11/16" forward shoe, 8 5/16" reverse shoe.

Clearance—.008" toe, .005" heel, for each shoe. NOTE—No anchor pin adjustment provided. Brake shoes should be centralized by hard brake application (and then released) before adjustments made.

Hand Brake: See Service Brakes (above).

Adjustment—Tighten link rod adjustment (cable equalizer connector) at brake lever on frame cross-member for slight drag with hand lever set two notches "on". Release hand lever and make certain that brakes free of any drag.

MISC. MECHANICAL

Windshield Wipers: Vacuum type, cable operated.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

Model	Year
2WD & 4WD Trucks	1947-50
4X4-63 Sta. Wgn.	1949-50
473-HT & 473-4WD Trucks	1950-51
4X4-73 Sta. Wgn.	1950-51
475-4WD Truck	1952-53
4X475 Sta. Wgn. & Sedan Del.	1952-53

SERIAL NUMBER: On plate on outside of left frame side rail at front end, or on floor riser to left of driver's seat.

ENGINE NUMBER: (1947-49) Stamped on top of water pump boss at front of engine, (1950-53) Stamped on upper front corner of engine on right side.

►*ENGINE NUMBER NOTE—Letters following engine number denote the following:* **(A)**—Crankshaft journals (main & connecting rod) .010" UNDERSIZE. **(B)**—Cylinder bores .010" OVERSIZE. **(AB)**—Both above conditions exist in engine.

TUNE-UP

COMPRESSION PRESSURE: 115 lbs. at 160 RPM. ("L-Head" Engine), 130 lbs. at 200 RPM ("F-Head" Engine).

VACUUM READING: 17-21" idling at 7-10 MPH.

FIRING ORDER: 1-3-4-2. See diagram.

SPARK PLUG GAPS: .030".

Plug Type—Auto-Lite AN-7 or Champ. J-7, 14 mm.

DISTRIBUTOR: Breaker Gap—.020" (.018-.022")

Cam Angle—See Ignition.

Breaker Arm Spring Tension—17-20 ozs.

Condenser Capacity—(IGB-1025) .20-.25 mfd., (IAT-4008 Distr.) .21-.25 mfd.

IGNITION TIMING: 5° BTDC. *NOTE—Road test car and modify timing for fuel and operating conditions.*

►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*

Timing Mark ("L-Head" & First "F-Head" Engines)—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter.

►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting 2T Engine No. 13887, 4T Engine Number 14251.

Timing Mark (Later "F-Head" Engines)—Engines with 4½" starter DO NOT have timing marks on flywheel (Notch on inner edge of crankshaft pulley indicates TDC when lined up with boss on timing gear cover. TO TIME THESE ENGINES AT 5° BTDC, make new timing mark (if not already done) by notching pulley ¼" **clockwise** from old notch.

CARBURETION:	Carter Carb. No.
1947-49 & Early 1950①	③636S, SA, ④738S
1950 (Early)②	④768S, SA
1950 (Late) & 1951②	④832S, SA, SB
1952 (Early)②	④832SB
1952 (Late) & 1953②	④951S

①—"L-Head" Engine. ②—"F-Head" Engine. ③—Carter "WO" Carburetor. ④—Carter "YF" Carburetor.

►*ACCELERATION STUMBLE OR FLAT SPOT CORRECTION (Carter 832SB & 951S): See "Carter YF" Carburetor in Carburetor Section for complete data.*

►*STUMBLE CORRECTION (738S, 768S, SA, 832S, CARBURETORS)—See "Carter YF" in Carburetor Section for complete data.*

Idle Setting: Idle screw ½-1½ turns open (Carter WO Carb.), 1-2 turns open (Carter YF Carb.). Turn screw out for richer mixture.

Idle Speed—600 RPM. or 6 MPH.

Float Level (WO Carb.)—⅜" from top of float at free end to gasket seat on cover with needle valve closed (invert assembly).

Float Level (YF Carb.)—5/16" from bottom of float to gasket seat on cover with cover assembly inverted and needle valve seated.

►*CAUTION—Do not compress spring in valve stem (allow float to hang freely on inverted cover assembly).*

Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 4½ lbs. maximum.

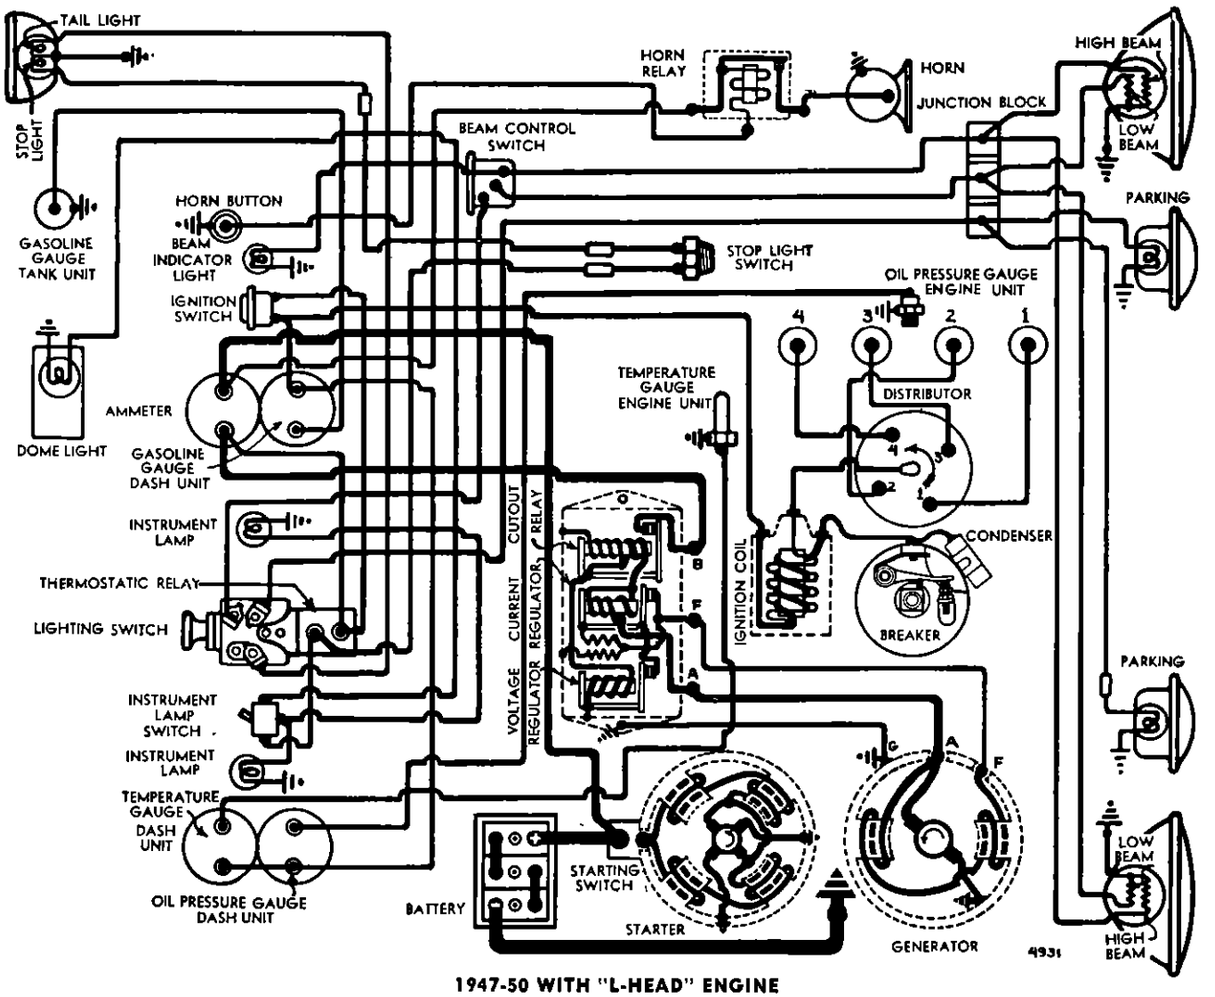
CRANKCASE VENTILATOR: Remove and clean vacuum control valve. *See Crankcase Ventilator (following Carb. Equipment) for directions.*

MANIFOLD HEAT CONTROL ("L-Head" Engine): Automatic thermostatic valve must operate freely (no adjustment required). Spring end must rest on top of stop bracket.

VALVE TAPPET CLEARANCE: ("L-Head" Engine)—.016" (Intake & Exhaust—COLD).

"F-Head" Engine—.018" (Intake—COLD). .016" (Exhaust—"Thompson Roto-Valve"). .012" (Exhaust—"Eaton Free Valve"). Adjust with engine COLD.

IGNITION



COIL: Auto-Lite No. IG-4090A or IG-6009 ("L-Head" Engines). No. CR-6009 ("F-Head" Engines).

Ignition Current—2.5 amperes idling, 5 stopped.

CONDENSER: Auto-Lite No. IGB-1025 (IGW Distributors); IAT-3076L (IAT Distributors).

Capacity—(IGB-1025) .20-.25 mfd., (IAT-3076L) .21-.25 mfd.

CONTINUED ON NEXT PAGE

1947-50 WITH "L-HEAD" ENGINE

CONTINUED FROM PRECEDING PAGE

DISTRIBUTOR: Auto-Lite models as follows: Full automatic advance type with separate vacuum control (IGW Distr.), integral type vacuum control (IAT Distr.).

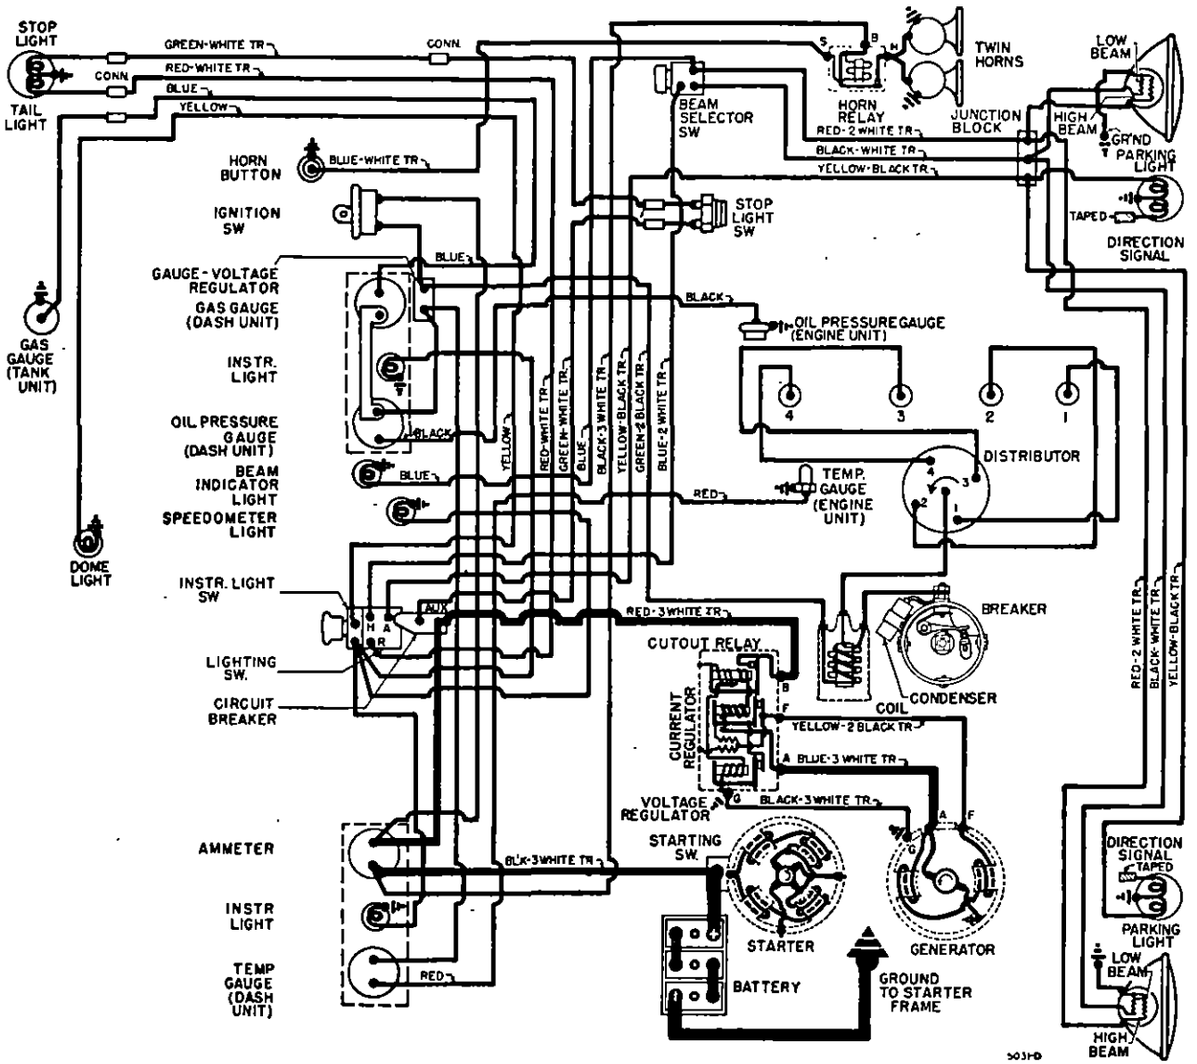
Year	Distr. No.
1947-50 (Early)①	IGW-4189
1950 (Early)②	IGW-4189A
1950 (Late), 1951 & 1952 Early②	IAT-4008
1952 (Late) & 1953	IAT-4008B

①—"L-Head" Engine. ②—"F-Head" Engine.

Breaker Gap—.020" Limits .018"-.022"

Cam Angle—50.8° (IGW-4189). 42° ± 3° (Others).

Breaker Arm Spring Tension—17-20 ozs.



Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGW-4189

Start	350	0	700
2	560	4	1120
5	875	10	1750
8	1190	16	2380
11	1500	22	3000

Automatic Advance—IGW-4189A & IAT-4008

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	300	0	600
1	400	2	800
4	650	8	1300
10	1800	20	3600
11	2000	22	4000

1950-EARLY 1952 MODELS WITH "F-HEAD" ENGINE
LATE 1952-53 MODELS—SEE 1952-53 2-WHL. DRIVE DIAGRAM

Automatic Advance—IAT-4008B

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	300	0	600
1	425	2	950
6	1050	12	2050
10	1575	20	3150
11	1700	22	3400

Vacuum Spark Control: Auto-Lite Type VC-4010. (IGW-4189 Distr.). VC-4010A (IGW-4189A Distr.).

Vacuum Advance—IGW-4189

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Vacuum Advance—IGW-4189A, IAT-4008

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4¾"
1°	2°	5⅜"
3°	6°	6¾"
4°	8°	7⅜"
5°	10°	8"

Vacuum Advance—IAT-4008B

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5⅛"
1°	2°	6⅝"
3°	6°	9⅝"
5°	10°	12½"
6°	12°	14"

Distributor Removal: On right side of engine. To remove, disconnect vacuum line, take out hold-down screw in mounting plate.

Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to #1 cylinder firing position (see Timing), turn distributor shaft until rotor is at #1 segment (see diagram), install distributor on engine, rocking shaft slightly to engage drive coupling, push distributor down into place, install hold-down screw, check ignition timing.

CAUTION—If oil pump has been removed, see Oil Pump Installation under "Oil Pump" in Willys Special Data.

IGNITION TIMIN

Standard Setting ..... 5° BTDC.

NOTE—Road test car for timing modifications for fuel and operating conditions.

►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*

Timing Mark ("L-Head" & First "F-Head" Engines)—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter. (See Timing Mark Change following).

►**Timing Mark Change**—Flywheel marked "5°" (replacing "IGN/") starting 2T Engine No. 13887, 4T Engine Number 14251.

Timing Mark (Later "F-Head" Engines)—Engines with 4½" starter DO NOT have timing marks on flywheel (Notch on inner edges of crankshaft pulley indicates TDC when lined up with boss on timing gear cover). TO TIME THESE ENGINES AT 5°

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BTDC, make new timing mark (if not already done) by notching pulley ¼" clockwise from old mark.

Timing Using Timing Light—Direct timing light on timing mark (flywheel or crankshaft pulley) and adjust distributor until correct timing mark aligned with center of inspection hole or boss on timing gear cover.

CARBURETOR

Carter Types as follows: Single barrel downdraft type with manual choke control.

Model Year	Carter Carb. No.
1947-49 & Early 1950①	③636S, SA ④736S
1950 (Early)②	④768S, SA
1950 (Late) & 1951②	④832S, SA, SB
1952 (Early)②	④832SB
1952 (Late) & 1953②	④951S

①—"L-Head" Engine. ②—"F-Head" Engine ③—Carter "WO" Carburetor. ④—Carter "YF" Carburetor.

►***STUMBLE CORRECTION (738S, 768S, SA, 832S, CARBURETORS)—See "Carter YF" in Carburetor Section for complete data.***

See Carburetor Section for complete data.

►**768S Carburetor conversion to 768SA—*See "Carter YF Downdraft" in Carburetor Section.***

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle: Interconnected linkage by which choke valve lever opens throttle to fast idle position when carburetor choked for starting.

Setting (WO)—No adjustment required.

Setting (YF)—Lip on fast idle arm should contact boss on body with choke valve wide open. Adjust by bending connector rod at offset.

CARB. EQUIPMENT

Air Cleaner: Oil-wetted type (Std.), Oil bath type (Optl.).

Fuel Pump: AC Combination Fuel & Vacuum type.

Replacement Pump—AC No. 9106 or 9307 ("L-Head" Engine); No. 9562 ("F-Head" Engine).

Pressure—4½ lbs. maximum.

See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley electric. ***NOTE—Voltage Regulator K-S No. 45557 used with 1950 & Later gauges.***

Dash Unit—King-Seeley No. 41310 (1947-48); No. 42570 (1949); No. 45534 (1950); No. 45727 (1951-53).

Tank Unit—King-Seeley No. 41285 (Truck), 41248 (Sta. Wgn.) (1947-49). No. 44506 (Truck & Sta. Wgn.) (1950-53).

See Carburetion Equipment Section for complete data.

Gauge Voltage Regulator—King-Seeley No. 45557. ***See Misc. Electrical for data.***

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type—Air intake pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase, air outlet pipe (from valve cover to manifold) allows fumes from crankcase to be sucked into intake manifold. Vacuum control valve at manifold connection **must close at idling speed** for satisfactory idling performance.

NOTE—Clean Valve when tuning engine.

Cleaning Vacuum Control Valve—Remove control valve by disconnecting pipe and unscrewing valve from manifold. Disassemble valve, withdraw valve and spring, clean valve and valve seat thoroughly.

Servicing—Make certain all connecting pipes tight and that oil filler cap gasket seals cap tightly. Remove and clean control valve when tuning engine or whenever system does not operate satisfactorily.

BATTERY

Auto-Lite Type PN-15—6 Volt, 15 Plate, 100 Ampere Hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Grounded Terminal—Negative (--) at starter.

Engine Ground—Strap at right front engine mount.

Location—Right hand side of dash in engine compt.

STARTER

Auto-Lite Model MZ-4137 (1947-Early 1950), MZ-4162 (Late 1950, 1951 & Early 1952), MCH-6207 (Late 1952 & 1953).

Armature—Auto-Lite No. MZ-2214 (MZ-4137). MZ-2330 (MZ-4162), MCH-2088 (MCH-6207).

Drive—(MZ-4137 & 4162)—Manual pinion shift operated by starter pedal.

Drive—(MCH-6207)—Bendix "Folo-thru" type.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—160 RPM., 150-175 amps., 5 volts.

Performance Data—MZ-4137, 4162

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.①	5000	5.5	60
0 ft. lbs.②	4000	5.0	68
4.4 "	Lock	2.0	280

①—Without Bendix. ②—With Bendix.

Performance Data MCH-6207

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	4300	5.0	65
6.0 "	Lock	2.0	335

Starting Switch (MZ-4137 & 4162): Auto-Lite No. SW-2677A. Mounted on starter and operated by pinion shift lever.

MCH-6207—Auto-Lite No. SS-4018 (Early), SS-4018A (Later). Ignition key starting with magnetic switch.

See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GDZ-4817A (1947-Early 1950). GDZ-6001D (Late 1950-Early 1953). GGW-4801D (Late 1953). Two brush type with voltage and current regulation.

Armature—Auto-Lite No. GDZ-2006F (GDZ-4817A Gen.), GGY-2006F (GDZ-6001D Gen.), GGW-2006F (GGW-4810D Gen.).

Charging Rate Adjustment—None. See Regulator.

Performance Data—GDZ-4817A, 6001D

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 — 950-1050
17.0	8.0	1350-1500 — 1550-1700
35.0	8.0	1800-2000 — 2150-2350

Performance Data—GGW-4801D

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 — 950-1050
40.0	8.0	1800-2000 — 2150-2350
45.0	8.0	1925-2125 — 2350-2550

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35-53 ozs. (new brushes).

Field Current—1.3-1.5 (GDZ); 1.4-1.5 (GGW) amperes at 5.0 volts.

Motoring Current—4.16-4.60 amperes (GDZ); 4.8-5.3 (GGW) at 5.0 volts.

Belt Adjustment: Loosen clamp and pivot bolts, swing generator out away from engine until belt can be deflected 1" midway between generator and fan pulleys with thumb pressure.

REGULATOR

Auto-Lite Models—Voltage & Current types as follows:

Regulator No.	Use With Gen. No.
VRP-4007C-2 or 6003A	GDZ-4817A
VRP-6003A	GDZ-6001D
VBE-6105A	GGW-4801D

NOTE—Regulator cover sealed. Warranty void if seals broken.

See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).

Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).

Contact Gap—.015" minimum.

Air Gap—.031-.034" with contacts open measured at hinge end of core.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. after 15 minutes operation charging at 10 amperes (VRP), one-half maximum charging rate (VBE).

Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*

Contact Gap—.012" min. (armature against stop pin).

Air Gap—.048-.052" with contacts just opening.

Current Regulator—(VRP)

Setting—34-36 amperes (marked '35' on cover).

Contact Gap—.012" min. (armature against stop pin).

Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VBE)

►***SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.***

Test A—Operating Amperes—Test B

VBE-6105A ..... 52 ..... 45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.

Test B—After fifteen minutes additional operation with current regulator operating (load applied to hold voltage to 6.7-6.9 volts).

Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Beam Indicator—On left side of instrument panel.

Switches

Lighting—Willys No. 800369 (1947-Early 1951), No. 801274 (Late 1951-53).

Beam Selector—Willys No. 801903.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: 30 ampere type. Mounted on lighting switch. Vibrating thermostatic

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

type. Protects lighting circuits by vibrating to limit current. No adjustment.

HORNS: Auto-Lite or Sparks-Withington.

GAUGE VOLTAGE REGULATOR: King-Seeley. Consists of thermo-bimetal interrupter unit designed to maintain constant voltage of 5 volts (regardless of generator charging fluctuations) on gauge feed circuit. Unit-mounted on instrument panel cluster and connected between ignition switch and gauge circuits. See Wiring Diagram.

ENGINE

"L-HEAD" 1947-EARLY 1950

ENGINE SPECIFICATIONS: Own Make. Four cylinder, "L" Head type. Cylinder block and crankcase cast enbloc. Cylinders offset from center-line of crankshaft toward camshaft side of engine.

Bore—3⅛" (3.125-3.127"). ***See Willys Special Data for Original Bore Sizes.***

Stroke—4⅜".

Displacement—134.2 cubic inches.

Rated Horsepower (SAE)—15.63.

Developed Horsepower—60 at 4000 RPM.

Compression Ratio—6.48-1 Std. Cast Iron Head.

NOTE—7.0-1 Cylinder Head is optional.

Compression & Vacuum Reading—*See Tune-up data.*

►**ALL OTHER ENGINE DATA:** ***See 1946-51 Jeep, Universal Model.***

"F-HEAD" LATE 1950-53

ENGINE SPECIFICATIONS: Own 4 Cyl. Hurricane "F" Head type (Intake valves in head, exhaust valves in block).

Bore—3⅛". Stroke—4⅜".

Displacement—134.2 cu. ins.

Developed H.P.—72 at 4000 RPM. Rated H.P. 15.63.

Compression Ratio—Cast iron heads. Painted to indicate ratio—6.9 (Blue), 7.4 (Black), 7.8 (Yellow).

►**ALL OTHER ENGINE DATA:** ***See 1950-53 2-Whl. Dr. Station Wagon, Sedan Delivery, Jeepster with Hurricane "F-Head" Engine.***

VALVE TIMING

VALVE TAPPET CLEARANCE: ("L-Head" Engine)—.016" (Intake & Exhaust—COLD).

"F-Head" Engine—.018" (Intake—COLD)..**016"** (Exhaust—"Thompson Roto-Valve"). **.012"** (Exhaust—"Eaton Free Valve"). Adjust with engine COLD.

VALVE TIMING: All Engines

Intake Valves—Open 9° BTDC. Close 50° ALDC.

Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

Valve Timing Check—Set tappet clearance for #1 intake valve to .020" ("L-Head" Engines), .026" ("F-Head" Engines). Rotate crankshaft clockwise until piston in #1 cylinder is ready for intake stroke. Since intake valve starts to open at 9° BTDC, position TDC mark on flywheel or crankshaft pulley in center of hole in flywheel housing or in line with boss on timing gear cover, then estimate the 9° BTDC point in relation to the TDC mark and 5° BTDC mark, (5° BTDC mark is approximately ¼" clockwise from TDC mark). No. #1 intake tappet should JUST BE TIGHT against valve stem, indicating that timing is correct. Reset tappet clearance to correct setting.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain or timing gears. Oil pump mounted externally on left hand side of crankcase.

Crankcase Capacity—4 quarts.

Oil Pressure—35 lbs. at 35 MPH.

Oil Pressure Regulator—Under plug on side of pump housing. Opens at 35 lbs. Adjustable by adding or removing shims located above spring in plug.

Oil Pump: Rotor type pump mounted on left side of crankcase.

Oil Pump Servicing—*See Willys Special Data.*

Oil Filter: Purolator. On cylinder head bracket at right front corner of cylinder head with oil outlet connected to top of timing chain cover.

CAUTION—Filter should be drained at each crankcase oil change (2000 mile intervals) and filter element replaced at 8000 mile intervals for normal service.

Oil Pressure Gauge: King-Seeley Electric type.

Year	Dash Unit	Motor Unit
1947	42020	40767
1948	41305	40767
1949	42565	40790
1950	45537	44030
1951-53①	45729	44030

①—Voltage Regulator No. 45557 used in gauge circuit. ***See Misc. Electrical.***

See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure type with pressure valve (relief valve) in filler cap.

Capacity—11 qts.

Pressure Valve—Radiator Filler Cap. Opens at 3¾ lbs., (1947-51), 7 lbs. (1952-53).

Water Pump: Centrifugal, packless, ball bearing type. ***See Water Pump Section for complete data.***

Removal—Loosen and remove drive belt, disconnect hose. Remove pump mounting screws, lift out pump and fan assembly.

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Harrison. In outlet elbow on cylinder head. Starts to open at 145-155°F. Fully open at 170°F.

Temperature Gauge: King-Seeley electric.

Year	Dash Unit	Motor Unit
1947-48	41315	7000
1949	42575	7000
1950	45545	44200
1951①	45734	44200
1952-53①	45734	44220

①—Voltage Regulator No. 45557 used in gauge circuit. ***See Misc. Electrical.***

See Miscellaneous Section for complete data.

CLUTCH

Auburn Models 8501-19 ("L-Head" Engines); 8501-36 (1950-52 "F-Head" Engines); 8501-39 (1953), with Borg & Beck Driven Member. Single plate dry disc type.

See Clutch Section for complete data.

►**Clutch Facing Change & Return Clip Spring Installation to correct Clutch Chatter & Noise—*See "Auburn Clutch" in Clutch Section.***

Facings—Molded (flywheel side), Woven (pressure plate side). I. D. 5⅛". O. D. 8½". Thickness .132-.138".

Pedal Adjustment: Pedal free travel 1¼" (for 1/16" clearance between release bearing and clutch levers). To adjust, loosen locknut and turn adjusting nut on connector link at clutch fork, tighten locknut.

Removal: Remove transmission (see Transmission Removal), remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

TRANSMISSION

2-WHL. DRIVE

Warner Model AS1-T90E (2-WD before Serial No. 22536), AS39-T96 (473-HT). Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). ***See Transmission Section for complete data.***

Transmission Control (2-WD Before Serial No. 22536). Remote control type with gearshift lever on steering column. ***See Transmission Section for complete data.***

Removal: ***See Willys 2-Wheel Drive Station Wagon (1946-50) for complete data.***

4-WHL. DRIVE

Warner Model AS3-T90A (4-WD before Serial No. 34787), AS1-T90C (4-WD after No. 34787 & 473-4WD). Constant-mesh, synchro-mesh, helical gears (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

Transfer Case: Spicer or Warner. Two-speed auxiliary transmission and front-wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front-wheel drive (left hand lever).

See Transmission Section for complete data.

Transmission Control (4-WD before Serial No. 34787). Remote control type with gearshift lever on steering column.

See Transmission Section for complete data.

Removal: Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shaft at front and rear universals. Disconnect speedometer cable at transfer case, brake cable, transmission shift rods at transmission case levers (remote control type) or remove shift levers (floor mounted gear shift), and clutch release cable at cross-shaft bell-crank. Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross-member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and levers. Remove bolts holding center cross-member at frame side rails and remove cross-member. (CAUTION—with cross-member removed, engine and transmission weight will rest on jacks). Remove bolts holding transmission on bell

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

housing, force transmission to right until ball stud end can be disengaged from end of clutch control cross-shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

UNIVERSALS

2-WHL. DRIVE

Detroit Ball-and-Trunnion Type. Two used (First Trucks), three used (Later Trucks). NOTE—Later trucks have two propeller shafts with support bearing and intermediate universal at cross-member.

4-WHL. DRIVE

Front & Rear Drive Propeller Shaft Joints: Spicer needle roller bearing type.

Replacement Journal & Bearing Kit—Spicer No. 5-21X.

Front Axle Shaft Joint: Bendix or Rzeppa Constant-Velocity type. One joint used on outer end of each shaft (within steering knuckle housing).

See "Universal Joints" in Willys Special Data.

▷*1953 RZEPPA TYPE UNIVERSAL PRODUCTION CHANGE*—The inner shaft retainer and three screws have been eliminated, making it possible to pull the shaft end from the joint without dismantling joint.

Power Take-off Propeller Shaft Joints: Detroit Ball-and-trunnion type. Three used (additional joint at intermediate support bearing on cross-member.

FRONT AXLE

4-WHL. DRIVE

Spicer (Salisbury) Model 25. Full-floating, hypoid gear type. Differential assembly (ring and pinion gear assembly) is same as Spicer Rear Axle.

See Spicer (Salisbury) Full Floating Rear Axle in Rear Axle Section for complete data.

Ratio—5.38-1.

Backlash—.005-.007". Shim adjustment.

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross-member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower the springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange capscrews and remove flange with a puller *(CAUTION*—do not lose shim pack under drive flange). Bend lip on bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly *(CAUTION*—use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

▷*INSTALLATION CAUTION*—Adjust front wheel bearings and bleed brakes after installation completed.

Steering Knuckle Bearing Disassembly & Adjustment: *See "Front Axle" in Willys Special Data.*

Wheel Bearing Adjustment: *See "Front Axle" in Willys Special Data.*

REAR AXLE

1947-51 2-WHL. & 4-WHL. DRIVE

Timken Model No. 51540. Semi-floating, spiral bevel gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratio—5.38-1 Std. Optl. Ratios (2-WD only) 4.88-1 and 6.17-1.

Backlash—.004-.018". Shim adjustment.

Removal: Support rear end of truck securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables and propeller shaft at rear universal. Place support jacks under axle housing to relieve springs of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs to floor. Remove axle assembly.

Axle Shaft Removal: Remove wheel and hub assembly (use wheel puller), remove nuts on bolts holding backing plate and brake assembly, remove dust shield, oil seal, and backing plate. Remove axle shaft and wheel bearing. CAUTION—Do not lose bearing adjusting shims.

Wheel Bearing Adjustment—Endplay .003-.005". Adjust by adding or removing shims between backing plate and flange on axle housing. See axle shaft removal above for dismantling instructions.

1949-53 4-WHL. DRIVE

Spicer (Salisbury) Model 41-2 (1949-51); Model 44-1 (1952-53). Semi-floating Hypoid gear type with Hotchkiss drive.

See Rear Axle Section for complete data.

Ratio—5.38-1.

Backlash—.004-.008". Shim adjustment.

Removal: Support rear end of truck securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables and propeller shaft at rear universal. Place support jacks under axle housing to relieve springs of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs to floor. Remove axle assembly.

Axle Shaft Removal: Remove wheel and hub assembly (use wheel puller), remove nuts on bolts holding backing plate and brake assembly, remove dust shield, oil seal, and backing plate. Remove axle shaft and wheel bearing. CAUTION—Do not lose shims.

Wheel Bearing Adjustment—Endplay .003-.005". Adjust by adding or removing shims between backing plate and flange on axle housing.

SHOCK ABSORBERS

Gabriel. Hydraulic, direct acting, adjustable type.

FRONT SUSPENSION

2-WHL. DRIVE

Front Axle: "I" beam type with reverse Elliot ends. Conventional type with semi-elliptical springs.

Kingpin Inclination—7½° crosswise.

Caster—4¾° (1947-49), 3° (1950-51).

Camber—1°.

Toe-In—3/64-3/32".

4-WHL. DRIVE

Front Axle: Spicer Model 25. Special full-floating driving unit. *See Front Axle data.*

Front Suspension: Special front wheel drive unit with semi-elliptical springs. Steering knuckle mounted on taper roller bearings carried on two stub shafts.

Front Suspension Adjustments—*See Willys Jeep (1952-55) for complete data.*

Kingpin Inclination—7½° (All).
Caster—3° **Camber**—1½°. **Toe-In**—3/64-3/32".

STEERING GEAR

Ross Model T12, No. TA-13018, Cam-and-Twin Lever

See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Four Wheel Hydraulic, self-centering type. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Drum Diameter—11".

Lining—Molded type. Width 2", Thickness 3/16". Length per wheel 22 1/16".

Clearance—.008" toe, .005" heel for each shoe.

Hand Brake: See Service brakes above.

MISC. MECHANICAL

Windshield Wiper: Vacuum type, cable operated.

See Miscellaneous Section for data.

MODEL IDENTIFICATI N

Model	Year
473-SW (Sta. Wgn.)	1950-52
473-SD (Sed. Del.)	1950-52
473-VJ (Jeepster)	1950-51
475 (Sta. Wgn. & Sed. Del.)	1953

SERIAL NUMBER: (Sta. Wgn. & Sed. Del.). On floor riser to left of drivers seat. (Jeepster) On under edge of cowl above glove box door.

ENGINE NUMBER: Stamped on upper front corner of engine on right side.

►*ENGINE NUMBER NOTE—Letters following engine number denote the following:* (A)—Crankshaft journals (main & connecting rod) .010" UNDERSIZE. (B)—Cylinder bores .010" OVERSIZE. (AB)—Both above conditions exist in engine.

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. (125-145 lbs. depending on compression ratio) and equal within 10 lbs. for all cylinders.

VACUUM READING: Steady 17-21" idling.

FIRING ORDER: 1-3-4-2. See diagram.

SPARK PLUG GAPS: .030".
Plug Type—Auto-Lite AN-7 or Champ. J-7. 14 mm.

DISTRIBUTOR: Breaker Gap—.020" (.018-.022")
Cam Angle—41° (IGW-4189A); 40° ± 3° (IAT-4008, 4008B).
Breaker Arm Spring Tension—17-20 ozs.
Condenser Capacity—.20-.25 mfd. (IGW-4189A Distr.), .21-.25 mfd. (IAT-4008, 4008B Distr.).

IGNITION TIMING: 5° BTDC. *NOTE—Road test car and modify timing for fuel and operating conditions.*

►*IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.*
Timing Procedure—See Ignition Timing.
Timing Mark (Early 1950 Engines)—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter.
Timing Mark (Later Engines)—Engines with 4½" starter DO NOT have timing marks on flywheel (Notch on inner edge of crankshaft pulley indicates TDC when lined up with boss on timing gear cover). TO TIME THESE ENGINES AT 5° BTDC, make new timing mark (if not already done) by notching pulley ¼" clockwise from old notch.

CARBURETION:	Carter Carb. No.
1950 (Early)	768S, SA
1950 (Late) & 1951	832S, SA, SB
1952 (Early)	832SB
1952 (Late) & 1953	951S

►*ACCELERATION STUMBLE OR FLAT SPOT CORRECTION: See "Carter YF" Carburetor in Carburetor Section for complete data.*
Idle Setting—Idle screw 1-2 turns open (turn screw out for richer mixture).
Idle Speed—600 RPM.
Float Level—5/16" top of float to gasket seat on cover with valve seated (cover assembly inverted). CAUTION—Do not compress spring in valve stem (allow float to hang freely on inverted cover).
Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 4½ lbs. maximum.

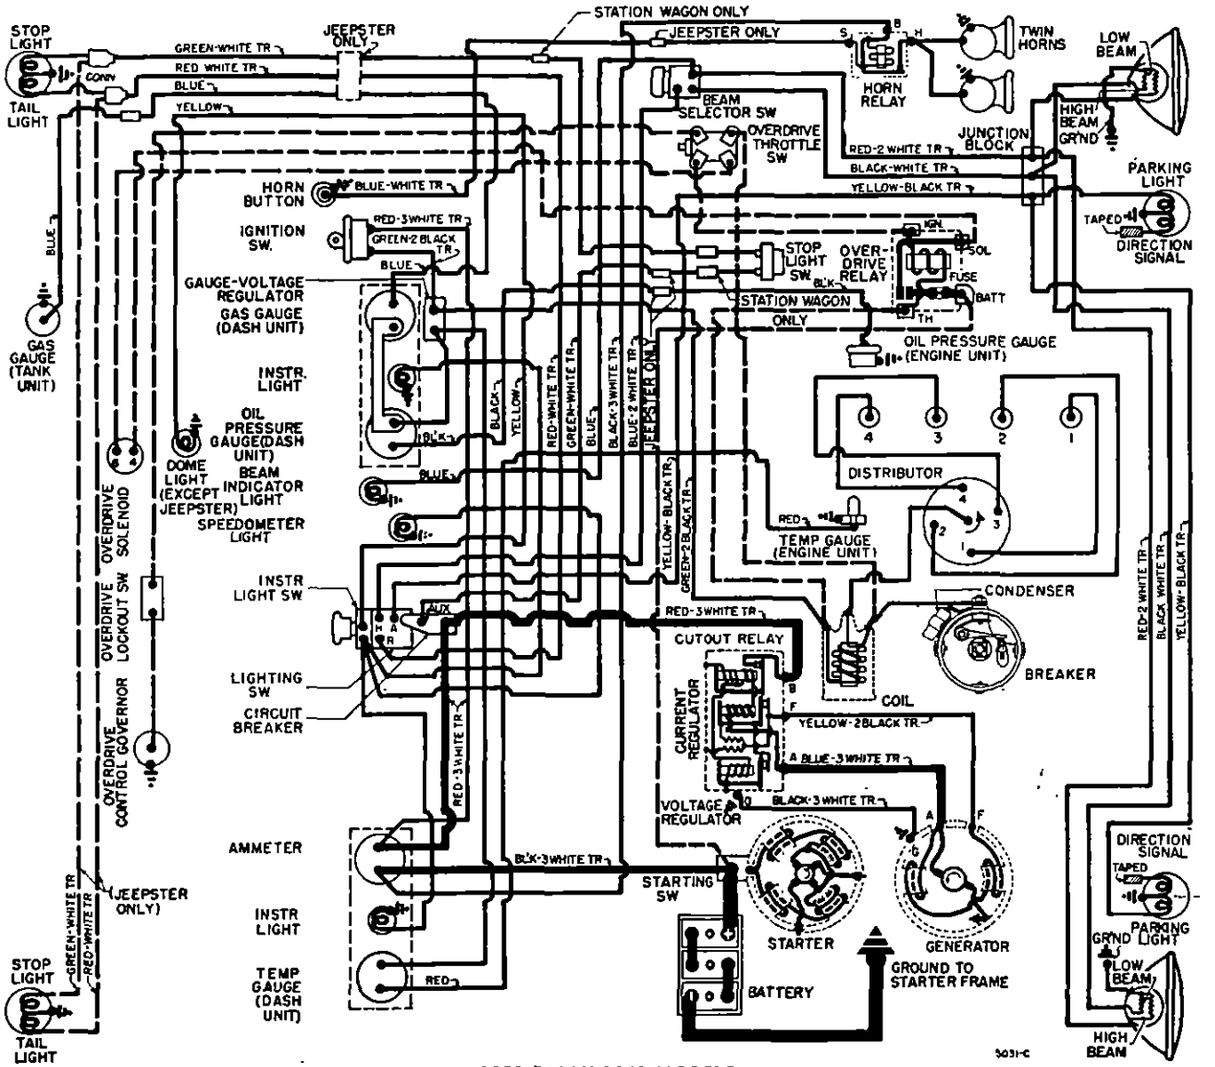
MANIFOLD HEAT CONTROL: No control valve used. Intake manifold is in cylinder head, controlled by head temperature.

VALVE TAPPET CLEARANCE: .018" (Intake). .016" (Exhaust—"Thompson Roto-Valve"). .012" (Exhaust—"Eaton Free-Valve." Adjust all valves with engine COLD.

IGNITI N

IGNITION SWITCH: Douglas or Mitchellock Switch.

COIL: Auto-Lite No. IG-6009 (First Cars), CR-6009 (Later Cars). On right side of engine.
Ignition Current—2.5 amperes idling, 5 stopped.



CONDENSER: Auto-Lite Part No. IGB-1025 (IGW-4189A Distr.), IAT-3076L (IAT-4008, 4008B Distr.).
Capacity—.20-.25 mfd. (IGW-4189A), .21-.25 mfd. (IAT-4008, 4008B).

DISTRIBUTOR: Auto-Lite Model IGW-4189A (Early 1950), IAT-4008 (Late 1950, 1951 & Early 1952), IAT-4008B (Late 1952 & 1953). Full automatic advance type with separate vacuum spark control (IGW Distr.) and integral vacuum spark control (IAT Distr.).
Breaker Gap—.020", Limits .018-.022".
Cam Angle—41° (IGW-4189A); 40° ± 3° (IAT-4008, 4008B).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGW-4189A, IAT-4008

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	300	0	600
1	400	2	800

11	1700	22	3400

Vacuum Spark Control Unit: Auto-Lite No. VC-4010A (IGW-4189A Distr.). Separate unit linked to advance plate.

Vacuum Advance—IGW-4189A, IAT-4008

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4¾"
1°	2°	5⅜"
3°	6°	6¾"
4°	8°	7⅜"
5°	10°	8"

Vacuum Advance—IAT-4008B

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5⅛"
1°	2°	6⅝"
3°	6°	9⅝"
5°	10°	12½"
6°	12°	14"

Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to #1 cylinder firing position (see Timing), turn distributor shaft until rotor is at #1 segment (see diagram), install distributor on engine, rocking shaft slightly to engage drive coupling, push distributor down into place, install hold-down screw, check ignition timing.

CAUTION—If oil pump has been removed, see Oil Pump Installation under "Oil Pump" in Willys Special Data.

IGNITION TIMING

Standard Setting ..... **5° BTDC**

Timing Mark (Early 1950 Engines)—Flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of housing below starter.

Timing Mark (Later Engines)—Engines with 4½" starter DO NOT have timing marks on flywheel (Notch on inner edge of crankshaft pulley indicates TDC when lined up with boss on timing gear cover). TO TIME THESE ENGINES AT 5° BTDC, make new timing mark if not already done) by notching pulley ¼" **clockwise** from old notch.

Timing (Without Timing Light)—With #1 piston on compression, turn crankshaft until piston reaches firing position, with flywheel mark "IGN/" (5° BTDC setting) centered in inspection hole in right front face of flywheel housing below starter. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (press rotor clockwise to eliminate backlash), tighten clamp bolt. See that rotor is at #1 segment in distributor cap.

Timing Using Timing Light—(Engine Running)—This method recommended by manufacturer. Direct timing light through inspection hole at flywheel, idle engine (engine must be warm), adjust distributor (as directed above) until "TC/" mark centered in inspection hole.

CARBURET R

Carter YF Types as follows: Single barrel downdraft type with manual choke control and "diaphragm" type accelerating pump and metering rod control.

Model Year	Carter Carb. No.
1950 (Early)	768S, SA
1950 (Late) & 1951	832S, SA, SB
1952 (Early)	832SB
1952 (Late) & 1953	951S

See Carburetor Section for complete data.

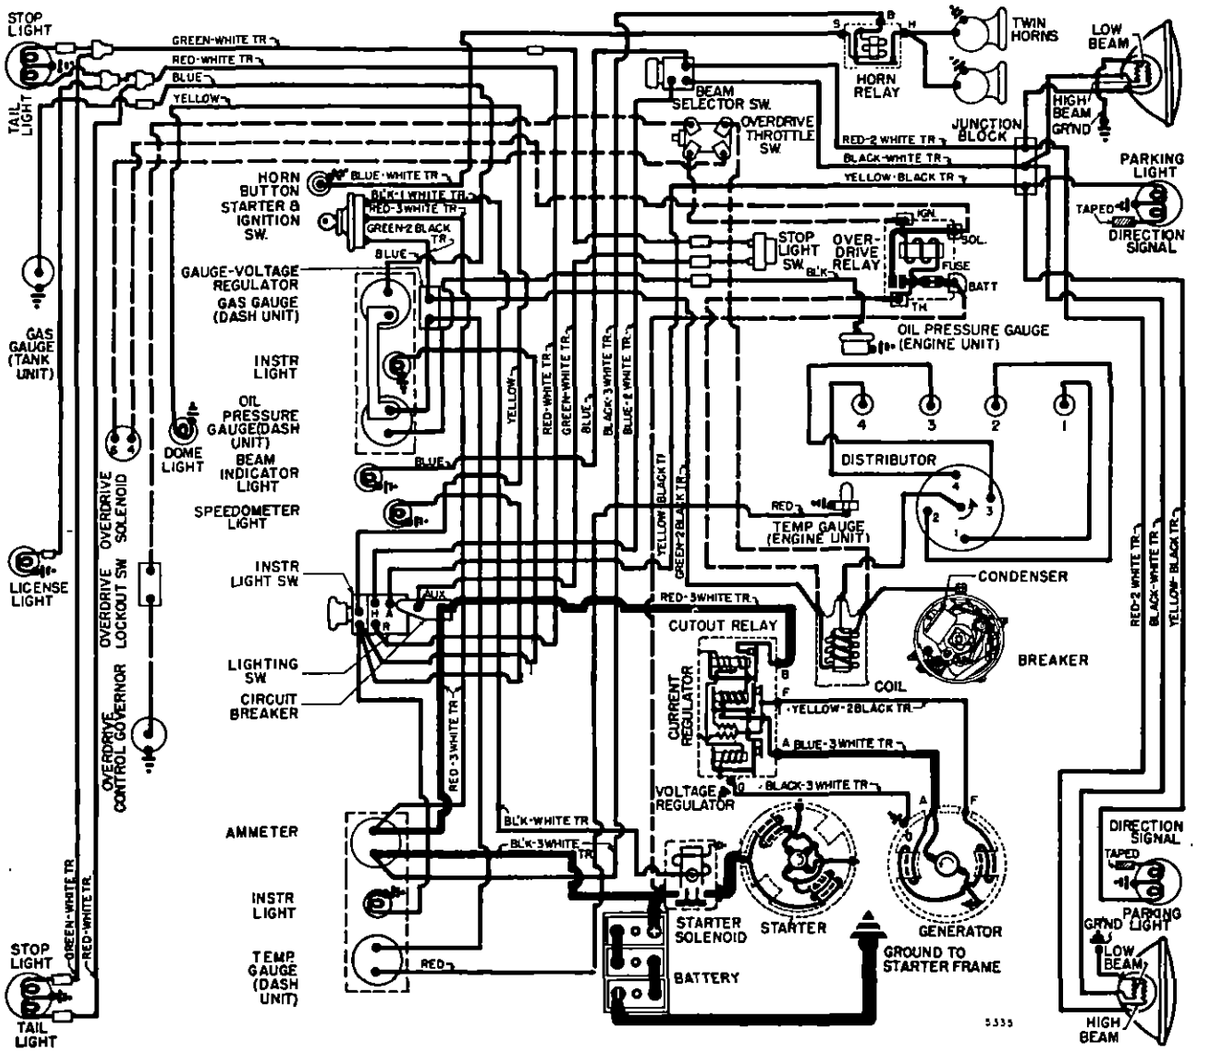
►***ACCELERATION STUMBLE OR FLAT SPOT CORRECTION: See "Carter YF" Carburetor in Carburetor Section for complete data.***

►**768S Carburetor conversion to 768SA**—*See "Carter YF Downdraft" in Carburetor Section.*

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle: Interconnected linkage by which choke valve lever opens throttle to fast idle position when carburetor choked for starting.



Setting—Lip on fast idle arm should contact boss on body with choke valve wide open. Adjust by bending connector rod at offset.

CARB. EQUIPMENT

Air Cleaner: Oil wetted type (Std.), Oil bath type (optional).

Fuel Pump: AC combination fuel & vacuum type.

Replacement Pump—AC No. 9562.

LATE 1952-53 MODELS

Pressure—3 lbs. (4½ lbs. max. at 1800 RPM.)
See Carburetion Equipment Section for data.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit—King-Seeley No. 45534 (1950); No. 45727 (1951-53).
Gauge Voltage Regulator—King-Seeley No. 45557.
See Misc. Electrical for data.
Tank Unit—King-Seeley No. 44506 (all).
See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite Type PN-15—6 Volt, 15 Plate, 100 Ampere Hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) grounded at starter.
Location—Right hand side of dash in engine compt.

STARTER

Auto-Lite Model MZ-4137 (Early 1950), MZ-4162 (Late 1950, 1951 & Early 1952), MCH-6207 (Late 1952 & 1953).
Armature—Auto-Lite No. MZ-2214 (MZ-4137), MZ-2330 (MZ-4162), MCH-2088 (MCH-6207).
Drive—(MZ-4137 & 4162)—Manual pinion shift operated by starter pedal.
Drive—(MCH-6207). Bendix "Folo-thru" type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM., 150-175 amps., 5 volts.

Performance Data—MZ-4137, 4162

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.①	5000	5.5	60
0 ft. lbs.②	4000	5.0	68
4.4 "	Lock	2.0	280

①—Without Bendix. ②—With Bendix.

Performance Data MCH-6207

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 "	Lock	2.0	335

Starting Switch (MZ-4137 & 4162): Auto-Lite No. SW-2677A. Mounted on starter and operated by pinion shift lever.
MCH-6207—Auto-Lite No. SS-4018 (Early), SS-4018A (Later). Ignition key starting with magnetic switch.
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GDZ-4817A (Early 1950). GDZ-6001D (Late 1950-Early 1953). GGW-4801D (Late 1953). Two brush type with voltage & current regulation.
Armature—Auto-Lite No. GDZ-2006F (GDZ-4817A Gen.), GGY-2006F (GDZ-6001D Gen.), GGW-2006F (GGW-4801D Gen.).
Charging Rate Adjustment—None. See Regulator.

Performance Data—GDZ-4817A, 6001D

Amperes	Volts	Cold—R.P.M.—Hot	
0	6.4	*870-970*	*950-1050*
17.0	8.0	1350-1500	1550-2350
35.0	8.0	1800-2000	2150-2350

Performance Data—GGW-4801D

Amperes	Volt	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
40.0	8.0	1800-2000	2150-2350
45.0	8.0	1925-2125	2350-2550

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.3-1.5 (GDZ); 1.4-1.5 (GGW) amperes at 5.0 volts.
Motoring Current—4.16-4.60 amperes at 5.0 volts.
Belt Adjustment: 1" deflection (thumb pressure) midway between generator and pump pulleys. To adjust, loosen all mounting bolts, pull generator away from engine.

REGULATOR

Auto-Lite Models—Voltage & Current types as follows:

Regulator No.	Use with Gen. No.
VRP-6003A	GDZ-4817A, 6001D
VBE-6105A	GGW-4801D

NOTE—Regulator cover sealed. Warranty void if seals broken
See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.3-6.8 volts (set to 6 4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open measured at hinge end of core.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. after 15 minutes operation charging at 10 amperes (VRP), one-half maximum charging rate (VBE).
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator—(VRP)

Setting—34-36 amperes (marked '35' on cover).
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VBE)

►*SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.*

Test A—Operating Amperes—Test B
VBE-6105A ... 52 ... 45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.
Test B—After fifteen minutes additional operation with current regulator operating (load applied to hold voltage to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type. Upper and lower beams controlled by Beam Selector Switch on toeboard.
See Electrical Equipment Section for complete data.
Beam Indicator—On left side of instrument panel. Lighted when upper beams in use.

Switches

Lighting—Willys No. 800369 (1950-Early 1951), No. 801274 (Late 1951-1953).
Beam Selector—Willys No. 801903.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: 30 ampere type. Mounted on lighting switch. Vibrating thermostatic type. Protects lighting circuits by vibrating to limit current. No adjustment.
HORNS: Auto-Lite or Sparks Withington. Operated by relay.
Horn Relay—Willys No. 643889.
GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on instrument cluster and connected between ignition switch and gauge circuits. See Wiring Diagram.

ENGINE

ENGINE SPECIFICATIONS: Own "Hurricane" Four Cylinder "F" Head type (intake valves in head, exhaust valves in block).
Bore—3⅛". Stroke—4⅜".
Displacement—134.2 cu. in.
Developed H.P.—72 at 4000 RPM. **Rated H.P.**—15.63.
Compression Ratio—Cast iron heads. Painted to indicate ratio—*6.9 (Blue), 7.4 (Black), 7.8 (Yellow).* Used for following service.

	Domestic — Ratio — Export
Under 5000 ft.	7.4-1 — 6.9-1
Over 5000 ft.	7.8-1 — 7.4-1

CYLINDER HEAD & TIGHTENING TORQUES: *See Willys Special Data.*
ENGINE REMOVAL: *See Willys Special Data.*
PISTONS: Lo-Ex aluminum alloy (Lynite, Bohn, Permite), "T" slot, Cam ground, brass or tin-plated type with heat insulation groove above top piston ring.
Original Bore & Pistons—*See Willys Special Data.*
Length—3¾".
Weight—12.5 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top Land .017-.019". Skirt .003".
Replacement Pistons: Std. and .010", .020", .030", .040" Oversize.
Fitting New Pistons: Use .003" feeler stock, ½" wide, inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.
Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).
PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.008-.013"	.0005-.001"
Oil Contr.	3/16"	.008-.013"	.001-.0015"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Replacement Rings: **For Rebored Cylinders**—Furnished .010", .020", .030", .040" Oversize.
Service Type Rings (for cylinders not rebored) furnished Std.—.009", .010-.019", .020-.029", .030-.039" .040-.049" Oversize

PISTON PIN: **Diameter**—13/16". **Length**—2 25/32". Pin is locked in connecting rod by clampscrew.
Pin Fit in Piston—.0001-.0005" clearance or light thumb push fit with piston and pin at 70°F.

Replacement Pins: No oversizes are available.

CONNECTING ROD: **Length**—9 3/16".
Weight—39.41 ozs.
Original Bearing Sizes—*See Willys Special Data.*
Crankpin Journal Diameter—1.9385-1.9375".
Lower Bearing—Steel-backed, babbitt-lined, replaceable type. CAUTION—Oil spray hole in upper half of bearing must line up with hole in rod.
Clearance—.0005-.0025". **Sideplay**—.005-.009".

Bearing Adjustment: None (no shims). Replace bearings. Do not file connecting rods or bearing caps. NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in lower end of rod toward right of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type with removable counterweights.
Original Bearing Sizes—*See Willys Special Data.*
Journal Diameters—2.3340".
Bearings—Steel-backed, babbitt-lined, replaceable type. Bearings shells are dowelled in bearing caps and crankcase.
Clearance—.001-.0025".
NOTE—Replace bearings when clearance exceeds .006" or when endplay exceeds .018".
Rear Bearing Oil Seal—*See Crankshaft & Main Bearings in Willys Special Data.*

►*1953 REAR MAIN OIL SEAL PRODUCTION CHANGE—Neoprene type seal replaces rope type. See "Crankshaft & Main Bearings" in Willys Special Data.*

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instructions in Willys Special Data.*
NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing.

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft sprocket thrust washer and sprocket. NOTE—Crankshaft sprocket must be removed with a gear puller in order to make endplay adjustments. Adjusting shims furnished .002", .004", .010" and .030" thick.
Endplay—.004-.006".

FLYWHEEL: **Removal**—*See Willys Special Data.*

CAMSHAFT: Four bearing, helical gear drive.
Journal Diameters—Front (#1) 2.188", (#2) 2¼", (#3) 2 3/16", (#4) 1¾".
Bearings—Removable steel-backed, babbitt-lined bushing (front), machined in crankcase (all others).
Clearance—.001-.0025". Service limit .006" (front), .008" (all others).

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance.
Endplay—.003-.0055".

Timing Gears: Crankshaft gear, steel. Camshaft gear; fibre with steel hub.
Gear Backlash—.000-.002".

Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) on crankshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	2"	.3733-.3738"	4 25/32"
Exhaust	1 15/32"	.371 -.372"	5.710"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.351"	.002-.00375"

Valve Rotator (Exhaust)—On exhaust valve stem. Turns valve in service to provide longer operating period between valve grinds.
Rocker Arm Assembly Removal—*See "Valve System" in Willys Special Data.*

Valve Guides: Removable type in block (exhaust), in cylinder head (intake).

Valve Springs: Free Length (Intake) 1 31/32", (Exhaust) 2½". Install with closed coil end upward toward block (exhaust), down towards head (intake).

Intake Valve Springs	Pressure	Length
Valve Closed	73 lbs.	1 21/32"
Valve Open	160 lbs.	1 3/8"
Exhaust Valve Springs		
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

Valve Lifters: Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004" Oversize.
Lifter Diameter—.6240-.6245".
Lifter Clearance—.0005-.002".
NOTE—Camshaft must be removed for lifter removal.

VALVE TIMING

Tappet Clearance: (Hot or Cold) .018" Intake, .016" Exhaust, (.012" with Free Type Valve).
NOTE—Self-locking tappet adjusting screws used for exhaust valves. Adjusting screw with locknut on rocker arm on cylinder head used for intake valves.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—Set Tappet clearance for #1 intake valve to .026". Rotate crankshaft clockwise until piston in #1 cylinder is ready for intake stroke. Since intake valve starts to open at 9° BTDC, position TDC mark on flywheel or crankshaft pulley in center of hole in flywheel housing or with boss on timing gear cover, then estimate the 9° BTDC point in relation to TDC mark and 5° mark (5° mark is approximately ¼" clockwise from TDC mark). No. 1 intake tappet should JUST BE TIGHT against valve stem, indicating that timing is correct. Reset tappet clearance to correct setting.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain or timing gears. Oil pump mounted externally on left hand side of crankcase.
Crankcase Capacity—4 quarts.
Oil Pressure—35 lbs. at 35 MPH.
Oil Pressure Regulator—Under plug on side of pump housing. Opens at 35 lbs. Adjustable by adding or removing shims located above spring in plug.

Oil Pump: Rotor type pump mounted on left side of crankcase.
Oil Pump Servicing—*See Willys Special Data.*

Oil Pressure Gauge: King-Seeley "CV" (Constant Voltage) electric type with gauge voltage regulator.
Dash Unit—King-Seeley No. 45537 (1950), No. 45729 (1951-53).
Engine Unit—King-Seeley No. 44030 (all).
See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure type with pressure valve (relief valve) in filler cap.
Capacity—11 qts.
Pressure Valve—Radiator Filler Cap. Opens at 3¾ lbs. (1950-51), 7 lbs. (1952-53).

Water Pump: Centrifugal, packless, ball bearing type. *See Water Pump Section for complete data.*
Removal—Loosen and remove drive belt, disconnect hose. Remove pump mounting screws, lift out pump and fan assembly.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Harrison. In outlet elbow on cylinder head. Starts to open at 145-155°F. Fully open at 170°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) electric type with gauge voltage regulator.
Dash Unit—King-Seeley No. 45545 (1950), No. 45734 (1951-53).
Engine Unit—King-Seeley No. 44200 (1950-51), No. 44220 (1952-53).
Gauge Voltage Regulator—*See Misc. Electrical for data.*
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-36 (1950-52), 8501-39 (1953), With Borg & Beck Driven Member. Single plate dry disc type.
NOTE—Clutch has neoprene driving lug inserts and Return Clip Springs for quieter operation.
See Clutch Section for complete data.
Facings—Molded (flywheel side), woven (pressure plate side). I.D. 5⅛". O.D. 8½". Thickness .132-.138"

Pedal Adjustment: Pedal free travel 1" (provides 1/16" clearance between release bearing and clutch levers). To adjust, loosen locknut and turn adjusting nut on connector link at clutch fork, tighten locknut.

Removal: Remove transmission (see Transmission Removal below), remove flywheel bell housing. Mark clutch pressure plate and flywheel to insure re-installation in same position. Take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch and driven member.

TRANSMISSION

Warner Model AS-37-T96 (Std. Trans.). AS-28-T96 (Sta. Wgn. with Overdrive). AS-30-T96 (Jeepster with Overdrive). Constant-mesh, synchro-mesh

(second & high), sliding gear (low & reverse).

Transmission Control: Remote control type with gear-shift lever mounted on steering column.

See Transmission Section for complete data.

Removal: Remove floor boards, take off bell housing inspection cover, disconnect clutch throw-out bearing retracting spring. Disconnect transmission control rods and speedometer cable at transmission case. Disconnect propeller shaft at universal joints and remove shaft. Support engine with jack placed under bell housing, remove rear engine support bolts from cross-member under transmission case, raise rear end of engine so that transmission clears cross-member. Remove transmission to bell housing bolts, pull transmission straight back to clear clutch shaft, remove from car.

OVERDRIVE

Warner Type R10 (part of AS28-T96 & AS30-T96 Transmissions). Solenoid operated, governor controlled type with throttle operated "kick-down." Overdrive is new "centered ring gear" type.

See Transmission Section for complete data.

Control Relay—Auto-Lite Model HRT-4001.

Overdrive Governor—Auto-Lite Model TGE-4002.

Transmission Solenoid—Delco-Remy Model 1118132.

Removal: Remove as a unit with the transmission. Removal instructions same as for regular transmission (above) after governor and solenoid wires and lock-out control cable disconnected, and overdrive case-to-cross-member bolts removed.

UNIVERSALS

Detroit Series 4100. Ball-and-trunnion type.

REAR AXLE

Spicer (Salisbury) Model 23-1. Semi-floating, Hypoid Gear type with Hotchkiss drive.

See Rear Axle Section for complete data.

Ratio—	Without O.D.	With O.D.
Sta. Wgn. & Sed. Del.	4.88-1	5.38-1
Jeepster	4.56-1	4.88-1

Backlash—.004-.009". Shim adjustment.

Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs. Remove axle assembly from beneath car.

Axle Shaft Removal: Remove wheel and hub assembly (use wheel puller), disconnect brake line at wheel cylinder, remove nuts on bolts holding backing plate and brake assembly on housing, remove dust shield, oil seal, and backing plate (with brake assembly). CAUTION—Do not lose bearing adjusting shims located between backing plate and flange on housing. Remove axle shaft and wheel bearing.

Wheel Bearing Adjustment—Endplay .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See axle shaft removal (above).

SHOCK ABSORBERS

Monroe or Gabriel. Direct acting type.

FRONT SUSPENSION

Planadyne Type. Independent, linked parallelogram type with transverse spring (spring acts as lower control arm).

See Front Suspension Section for complete data.

Kingpin Inclination—5° crosswise.
Caster—1° No adjustment.
Camber—1½°. (1¼-1¾° limits).
Toe-In—1/16-1/8".

►***See Willys Front Suspension for Toe-in adjustment procedure.***

STEERIN GEAR

Ross Model T-12. Cam-and-Twin Lever type.

See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic, self-centering type. Hand lever applies rear wheel service brakes.

NOTE—These self-centered brakes do not have anchor pin adjustment.

See Brake Section for complete data.

Drums—Chrome nickle. Diameter 10".

Lining (473-SW, SD, VJ)—Molded type. Width 1.760", Thickness 3/16". Length per shoe—10 11/16" (forward shoe—all wheels), 8 5/16" (rear shoe—all wheels),

Clearance—.008" toe, .005" heel, for each shoe.

NOTE—No anchor pin adjustment provided. Brake shoes should be centralized by hard brake application (and then released) before adjusting.

Hand Brake: See Service Brakes (above).

Adjustment—Tighten link rod adjustment (cable equalizer connector) at brake lever on frame cross-member for slight drag with hand lever set two notches "on". Release hand lever and make certain that brakes free of any drag.

MISC. MECHANICAL

Windshield Wipers: Vacuum type, cable operated.

See Miscellaneous Section for data.

MODEL IDENTIFICATION

Year	Engine	Model
1952, Early 1953	4 Cyl. "L"	CJ-3A
1953-54-55	4 Cyl. "F"	①CJ-3B
1953	4 Cyl. "F"	②CJ-3FJ
1955	4 Cyl. "F"	①CJ-5

①—1955 Model Designation as follows: 57348 (CJ-3B), 57548 (CJ-5).
②—Same as CJ-3B.

SERIAL NUMBER: On floor riser to left of driver's seat.
Starting Serial Number—10001 Up. All Models.

ENGINE NUMBER: Located as follows:
"L" Head Engine—Stamped on engine upper front corner of block.
"F" Head Engine—Stamped on top of water pump boss.

►*ENGINE NUMBER NOTE—Letters following the engine number denote the following:* **(A)**—Crankshaft journals diameters (main & connecting rod) machined .010" UNDERSIZE. **(B)**—Cylinder bores machined .010" OVERSIZE. **(AB)**—Both above conditions exist in engine.

TUNE-UP

COMPRESSION PRESSURE: 4 Cyl. "F" Head Engine 130 lbs. (125-145 lbs. depending on compr. ratio) and equal within 10 lbs. for all cylinders.
4 Cyl. "L" Head Engine—115 lbs. at 185 RPM. with all cylinders equal within 10 lbs.

VACUUM READING: 17-21" idling.

FIRING ORDER: 1-3-4-2. See Diagram.

SPARK PLUG GAPS: All Engines—.030".
Plugs—Champion J-8, 14 mm. Tighten to 26-30 ft. lbs.

DISTRIBUTOR:	Auto-Lite No.
CJ-3A	IAD-4008
CJ-3B	IAD-4008A
CJ-5	IAD-4041

Breaker Gap—.020". Limits .018-.022".
Cam Angle—(4-Cyl.) 47° ± 3°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

IGNITION TIMING: 5° BTDC. *NOTE—Road test car for timing modifications for fuel and operating conditions.*

►*IGNITION TIMING CHANCE NOTE—The above setting supersedes previous recommended setting.*
Timing Mark (4 Cyl. Engines)—Notch on fan drive pulley rim should be aligned with correct mark on timing gear cover. Gear cover has two lines marked "5" (5° BTDC), and "T" (TDC).

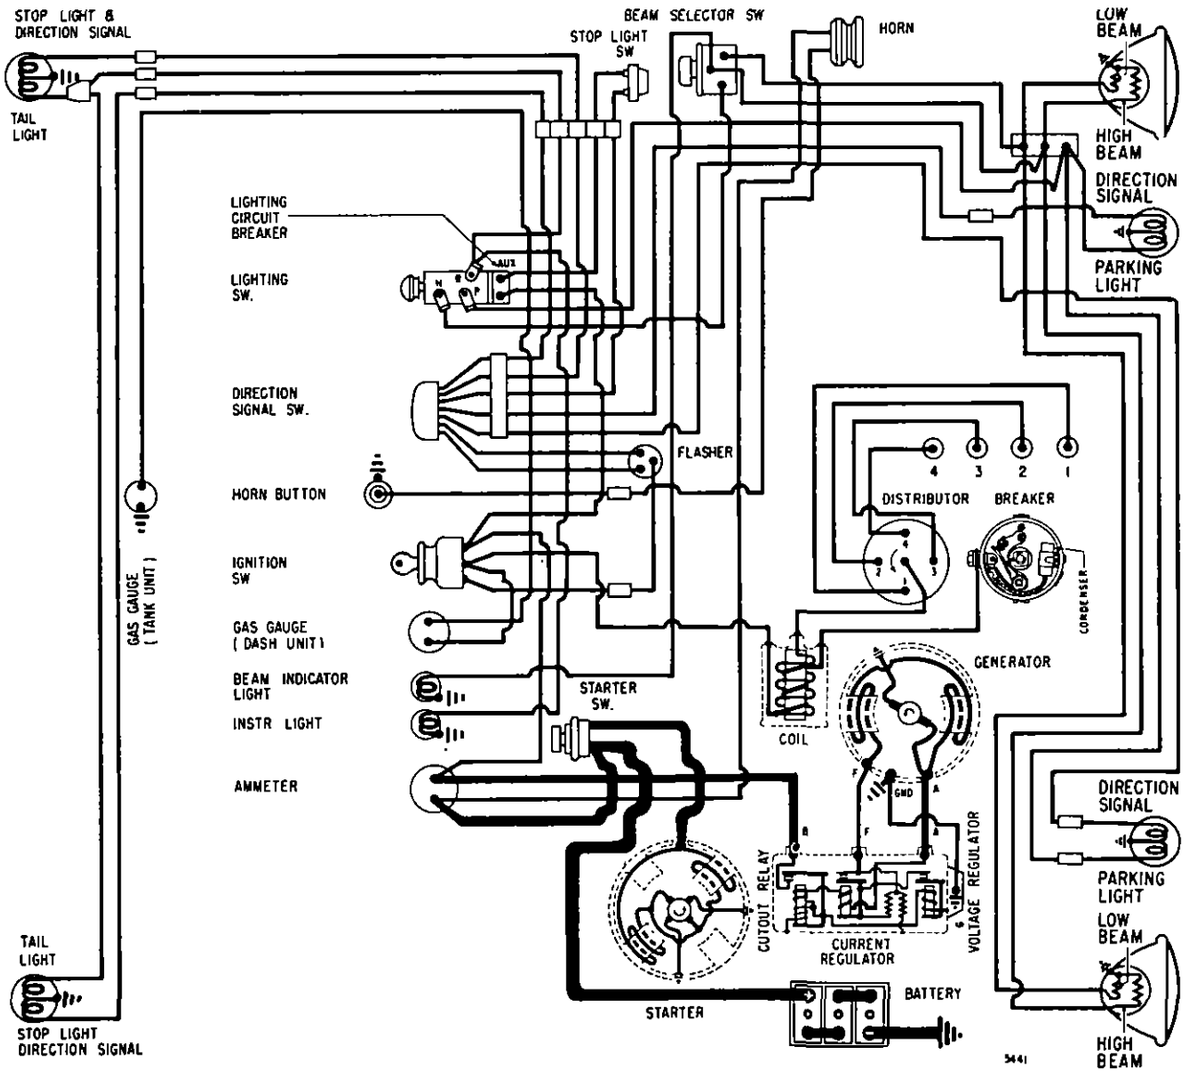
►*TIMING MARK CAUTION (EARLY 4 CYL. ENGINES):* On engines with flywheel timing marks, marks will not be visible if 4½" starter used. If notch on inner edge of crankshaft pulley indicates TDC when aligned with boss on timing gear cover, rework timing mark for timing at 5° BTDC as follows: Make new timing notch in pulley ¼" clockwise from old mark (facing front of engine).
Timing Procedure—*See Ignition Timing.*

COIL: Auto-Lite No. CR-6009 (All Models).
Ignition Current—2.5 amperes idling, 5 amperes at 6.3 volts stopped.

CONDENSER: Auto-Lite No. IGW-3139.
Capacity—.23-.26 microfarad.

CARBURETOR (CJ-3A): Carter WO Type 636SA, 1⅛" single barrel downdraft type, with manual choke.

Idle Setting—Idle screw 1-2 turns open (turn screw out for richer mixture).
Idle Speed—600 RPM or 8 MPH.
Float Level—⅜" from top of float at free end to machined surface (gasket seat) on bowl cover. Invert to check (allow float to hang free).



►***CAUTION—Do not compress spring in valve stem.***
Accelerating Pump—No seasonal adjustment.

CARBURETOR (CJ-3B & CJ-5): Carter YF-938S, SA. 1¼" single barrel downdraft type with manual choke control.

►***1953 CJ-3B JEEP IMPROVED IDLE OPERATION UNDER STEEP ANGLE CONDITIONS (Carter YF-938S Carburetor): See "Carter YF" in Carburetion Section.***
Idle Setting—¾-1¾ turns open. Turn screw out for richer mixture.
Idle Speed—600 RPM or 6 MPH.
Float Level—5/16" from bottom of float to gasket seat on cover with cover assembly inverted so that needle valve is seated.

►***CAUTION—Do not compress spring in valve stem (allow float to hang freely on inverted cover assembly).***
Accelerating Pump—No seasonal adjustment.

CONTINUED ON NEXT PAGE

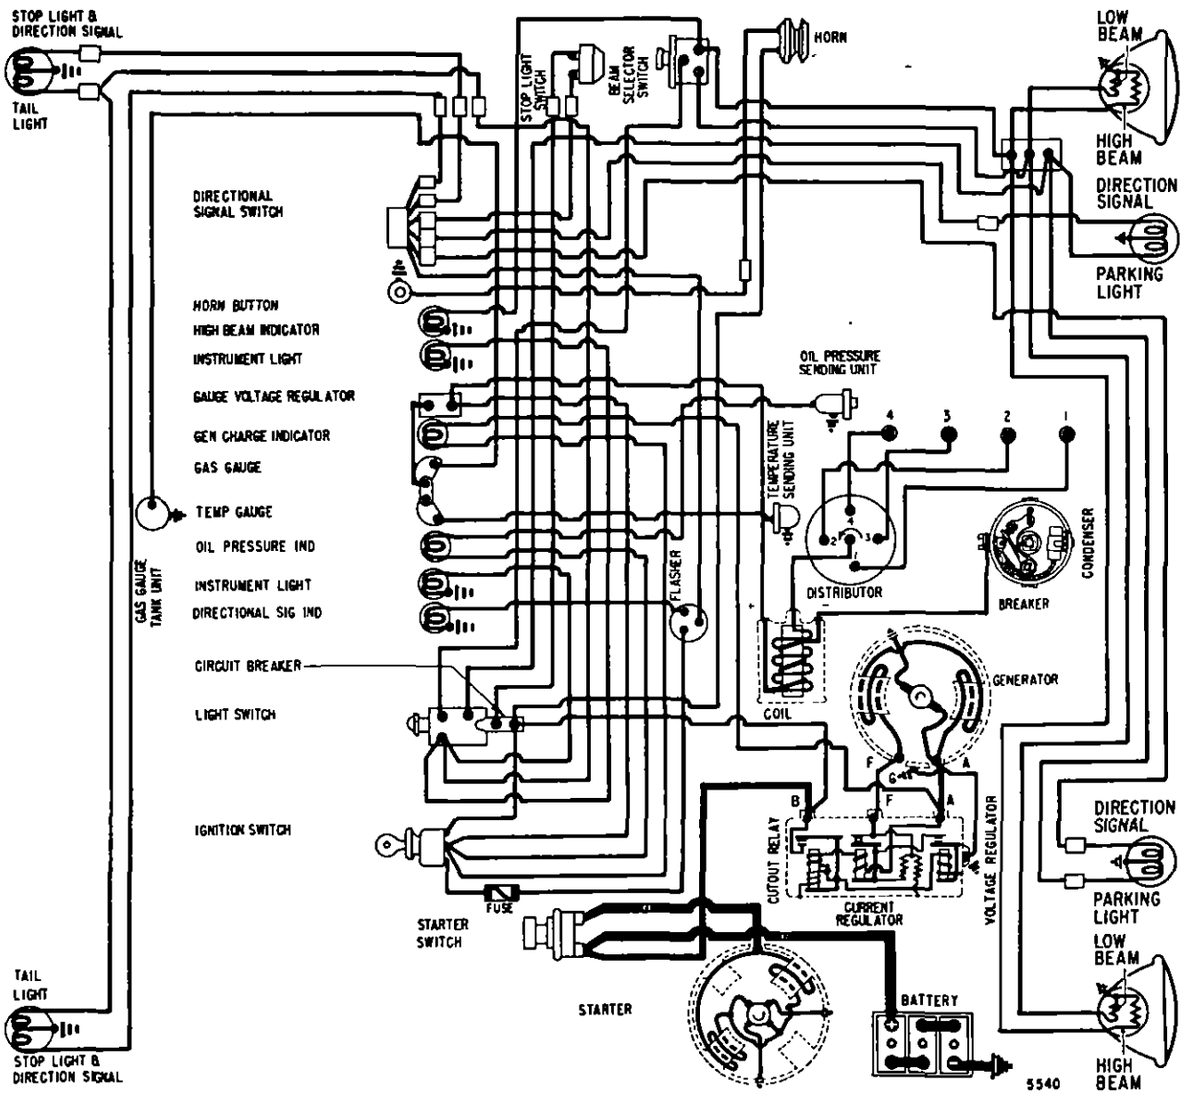
CJ-3B JEEP (SEE 1946-51 JEEP FOR CJ-3A DIAGRAM)

CONTINUED FROM PRECEDING PAGE

Fast Idle Setting: Lip on fast idle cam should contact boss on body casting with choke valve wide open. Adjust by bending fast idle link at offset.

Choke Setting: Manual type. No adjustment required.

CRANKCASE VENTILATOR: Remove and clean vacuum control valve on manifold. *See CRANKCASE VENTILATOR (following Carb. Equipment).*



MANIFOLD HEAT CONTROL: (CJ-3A Jeep)—Automatic thermostatic type, no adjustment. Valve must operate freely. **("F" Head Engines)**—No control valve (intake passages located in cylinder head).

VALVE TAPPET CLEARANCE: ("L" Head Engine)—.016", all valves hot or cold. **("F" Head Engine)**—.018" (Intake), .016" (Exhaust —With "Thompson Roto-Valve"). .012" (Exhaust —With "Eaton Free Valve"). *Adjust "F" Head Engine valves with engine cold.*

IGNITION

IGNITION SWITCH: Douglas or Mitchellock.

COIL: Auto-Lite No. CR-6009. On right side of engine.
Ignition Current—2.5 amperes idling, 5 amperes at 6.3 volts stopped.

CJ-5 JEEP MODEL

CONDENSER: Auto-Lite No. IGW-3139.
Capacity—.23-.26 microfarad

DISTRIBUTOR: Auto-Lite No. IAD-4008 (CJ-3A); IAD-4008A (CJ-3B); IAD-4041 (CJ-5). Full automatic advance type without vacuum control.
Breaker Gap—.020". Limits .018-.022".
Cam Angle—47° ± 3°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IAD-4008

Distributor	R.P.M.	Engine	R.P.M.
Degrees		Degrees	
Start	250	0°	500
3°	580	6°	1160
6°	930	12°	1860
9°	1270	18°	2540
11°	1500	22°	3000

Automatic Advance—IAD-4008A, 4041

Distributor	R.P.M.	Engine	R.P.M.
Degrees		Degrees	
Start	300	0°	600
1°	425	2°	850
6°	1050	12°	2100
10°	1575	20°	3150
11°	1700	22°	3400

Octane Selector: 20° advance or retard adjustment at distributor. See Ignition Timing.
Vacuum Spark Control: None used on IAD type distributors.
Distributor Removal: On right side of engine. To remove, take out hold-down screw in mounting bracket.
Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to No. 1 cylinder firing position (see Timing), turn distributor shaft until rotor opposite No. 1 segment in cap (see diagram), install distributor on engine, rocking shaft slightly to engage drive coupling, push distributor down into place, install hold-down screw, check timing.
►***CAUTION—If oil pump has been removed, see Oil Pump data in Willys Special Data.***

IGNITION TIMING

Standard Setting ..... 5° BTDC.
►***TIMING NOTE—Road test car for timing modifications for fuel and operating conditions.***
►***IGNITION TIMING CHANGE NOTE—The above setting supersedes previous recommended setting.***
Timing Mark (4 Cyl. Engines)—Notch on fan drive pulley rim should be aligned with correct mark on timing gear cover. Gear cover has two lines marked "5" (5° BTDC), and "T" (TDC).
►***TIMING MARK CAUTION (EARLY 4 CYL. ENGINES):*** On engines with flywheel timing marks, marks will not be visible if 4½" starter used. If notch on inner edge of crankshaft pulley indicates TDC when aligned with boss on timing gear cover, rework timing mark for timing at 5° BTDC as follows: Make new timing notch in pulley ¼" clockwise from old mark (facing front of engine).
Timing—Direct timing light at vibration dampener (or flywheel through hole in housing), idle engine, adjust distributor until correct mark on flywheel or dampener lines up with center of hole in housing or line on timing gear cover.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Octane Selector Setting—If timing light not available, road test car and set timing for light detonation when accelerating with wide open throttle. If engine pings on heavy pull, retard spark slightly by rotating distributor counter-clockwise.

CARBURETOR

CARTER WO

Carter WO Type 636SA. 1⅛" single barrel, downdraft type, with manual choke control (interconnected with throttle to provide fast idle).
See Carburetor Section for complete data.
Idle Adjustment—With engine warm (choke valve wide open and fast idle inoperative), set throttle stopscrew for idling speed of 600 RPM or 8 MPH. Turn idle adjusting screw out until engine begins to roll, then turn screw in until engine fires smoothly. Final setting of idle screw should be 1-2 turns open. Recheck idle speed.
Accelerating Pump—No seasonal adjustment.
Float Level—⅜" from top of float at free end to machined surface (gasket seat) on cover with valve seated. To check, invert assembly and allow float to hang freely. Do not compress spring in valve stem.
Metering Rods & Jets—*See Carter Jet Specification Table in Carburetor Section for complete data.*
Fast Idle: Choke valve interconnected with throttle valve to open throttle to fast idle position when choke in use. No adjustment required.
Choke Control: Manual type.

CARTER YF

Carter YF Type 938S, SA. 1¼" single barrel downdraft type with manual choke.
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up.*
Metering Rods & Jets—*See Carter Jet Tables in Carburetor Section for complete data.*
Fast Idle: Interconnected linkage by which choke valve lever opens throttle to fast idle position when carburetor choked for starting.
Setting—Lip on fast idle arm should contact boss on body with choke valve wide open. Adjust by bending connector rod at offset.
Choke Control: Manual type.

CARB. EQUIPMENT

Air Cleaner (All Models): Oil-bath type Std.
Servicing—Clean and refill oil reservoir to indicated level with same grade engine oil used in crankcase at 2000 mile intervals (when crankcase drained), or more often if required by operating conditions (twice daily for extreme dusty field conditions).
Fuel Pump: AC. Combination fuel-and-vacuum type.
Replacement Pump—AC No. 9562 (CJ-3A); No. 4032 (CJ-3B & CJ-5).
See "AC Fuel Pumps" in Carburetion Section.
Pressure—3½-4½ lbs. (AC No. 9562); 2½-3¾ lbs. (AC No. 4032).
Gasoline Gauge (CJ-3A & CJ-3B): Auto-Lite electric type.
Dash Unit—Auto-Lite No. 10764A.
Tank Unit—Auto-Lite No. 10762A.
See "Gasoline Gauges" in Carburetion Section.
Gasoline Gauge (CJ-5): King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—King-Seeley No. 46007 (100 MPH Speedometer); King-Seeley No. 46001 (80 MPH Speedometer).
Tank Unit—King-Seeley No. 44456.
See "Gasoline Gauges" in Carburetion Section.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air intake pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase. Air outlet pipe (from valve cover to manifold) allows fumes from crankcase to be sucked into intake manifold. Vacuum control valve located at manifold connection (exc. CJ-3B Jeep), on valve chamber cover (CJ-3B).
▷*CAUTION—Vacuum control valve must close at idling speed for satisfactory idling performance and should be cleaned when engine tuned up.*
Cleaning Vacuum Control Valve—Remove control valve by disconnecting pipe and unscrewing valve from manifold. Disassemble valve, withdraw valve and spring, clean valve and spring seat thoroughly. Make certain all connecting pipes tight and that oil filler cap seals cap tightly. Remove and clean control valve when tuning engine or whenever engine does not operate satisfactorily.

BATTERY

Auto-Lite or Willard. 6 volt, 15 plate, 100 ampere hr. capacity (20 hr. rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) grounded at starter.
Engine Ground—Strap at left front engine support.
Location—In engine compartment on right side.

STARTER

Auto-Lite No. MZ-4162 (CJ-3A); MCH-6207 (CJ-3B & CJ-5).
Armature—Auto-Lite No. MZ-2330 (MZ-4162), MCH-2088 (MCH-6207).
Drive (MZ Starter)—Manual pinion shift operated by starter pedal.
Drive (MCH Starter)—Bendix "Folo-thru" type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. with new brushes.

Performance Data—MZ-4162

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.①	5000	5.5	60
0 ft. lbs.②	4000	5.0	68
4.4 ft. lbs	Lock	2.0	280

①—Without Bendix. ②—With Bendix.

Performance Data—MCH-6207

	RPM	Volts	Amperes
0 ft. lbs	4300	5.0	65
6.0 ft. lbs	Lock	2.0	335

Starting Switch—(CJ-3B) Auto-Lite SW-4015 (Early), SW-4015A (Later). (CJ-3A)—Auto-Lite No. SW-2677A (On starter, operated by starting pedal).

GENERATOR

Auto-Lite No. GDZ-6001D (CJ-3A & Early CJ-3B). GGW-4801D (Late CJ-3B & CJ-5). Two brush type with voltage & Current regulation.

Armature—GGY-2006F (for GDZ-6001D). **GGW-2006F** (for GGW-4801D).
Maximum Charging Rate—(GDZ-6001D) 35 amperes. (GGW-4801D) 45 amperes, both at 8.0 volts cold with discharged battery (controlled by regulator).
Charging Rate Adjustment—None (see Regulator).

Performance Data—GDZ-6001D

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	870-970 — 950-1050
17.0	8.0	1350-1500 — 1550-1700
35.0	8.0	1800-2000 — 2150-2350

Performance Data—GGW-4801D

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	870-970 — 950-1050
40.0	8.0	1800-2000 — 2150-2350
45.0	8.0	1925-2125 — 2350-2550

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. with new brushes.
Field Current—(GDZ) 1.3-1.5 amps. (GGW) 1.4-1.5 amps., both at 5.0 volts.
Motoring Current—(GDZ) 3.9-4.4 amps. (GGW) 4.1-4.6 amps., both at 5.0 volts.
Belt Adjustment: ½-⅝" deflection with thumb pressure midway between generator and pump pulley.

REGULATOR

Auto-Lite VRP-6003A (used with GDZ-6001D generator). VBE-6105A (used with GGW-4801D generator). Voltage & Current type. On right side of engine compartment.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seal broken.

Cutout Relay

Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (measured at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. after 15 minutes operation charging at 10 amperes (VRP), one-half maximum rate (VBE).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VRP)

Setting—34-36 amperes (marked '35' on cover).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VBE)

▷*SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.*

	Test A—Operating Amperes	Test B
VBE-6105A	52	45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.
Test B—After fifteen minute additional operation with current regulator operating (load applied to hold voltage to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: "Sealed Beam" type. Upper and lower beams controlled by Beam Selector Switch on toe board.
See Electrical Equipment Section for complete data.
Beam Indicator—On left side of instrument panel. Lighted when upper beam in use.

Switches

Lighting—Willys No. 801274. Instrument light controlled by rotating switch knob.
Beam Selector—Willys No. 801903.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: 30 ampere type. Mounted on lighting switch. Vibrating thermostatic type. Protects lighting circuits. No adjustment.

FUSES: Overdrive—20 amperes. On control relay.

HORNS: Auto-Lite No. HA-4037.

ENGINE

ENGINE SPECIFICATIONS: 4 Cyl. "L" Head, and 4 Cyl. "F" Head engines of own make.

►*NOTE—4 Cyl. "L-Head" Engine used on CJ-3A Jeep, 4 Cyl. "F-Head" Engine used on CJ-3B Jeep.*

Bore—3⅛". Stroke—4⅜".

Displacement—134.2 cu. ins. **Rated H.P.**—15.63.

Model	Compr. Ratio	Developed HP
CJ-3A	6.48-1	60 at 4000 RPM
CJ-3B	6.9-1①	72 at 4000 RPM
CJ-5	6.9-1①	75 at 4000 RPM

①—7.4-1 & 7.8-1 optional ratios.

Compression Ratio ("F" Head Engine)—Cast iron head. Heads painted to indicate ratio: 6.9-1 (Blue); 7.4-1 (Black), 7.8-1 (Yellow).

CYLINDER HEAD & TIGHTENING TORQUES: *See Willys Special Data.*

ENGINE REMOVAL: *See Willys Special Data.*

PISTONS: Lo-Ex Aluminum alloy (Lynite, Bohn, Permite, or Arrowhead), "T" slot, cam ground, tin plated type with heat insulation groove above top piston ring. **Length**—3¾".

►*PISTON OVERSIZE NOTE—Letter "B" or "AB" following engine number indicates that cylinders and pistons are .010" OVERSIZE.*

►*CAUTION—"L" Head & "F" Head pistons are different, do not interchange.*

Removal—Pistons and rods removed from above.

Clearance—Top Land—.017-.019". **Skirt**—.003.

Replacement Pistons: Finished pistons furnished .010", .020", .030", .040" Oversize.

CAUTION—Piston must not be lapped in. This will destroy tin plated surface.

Fitting New Pistons: Use .003" feeler stock, ½" wide, inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left side) of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.002-.004"
Compr. (#2)	3/32"	.007-.015"	.0015-.0035"
Oil Contr.	3/16"	.007-.015"	.001-.0015"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: For Rebored Cylinders—Furnished Std. and .010", .020", .030", .040" Oversize. **Servicing Ring Sets**—Furnished in following sizes for oversize range noted: Standard (0 to .010" O.S.), .020" O.S. (.011" to .024"), .030" O.S. (.025" to .034"), .040" O.S. (.035" to .049").

PISTON PIN: Diameter .8117-.8119". **Length** 2 25/32". Pin is locked in connecting rod by clampscrew.

NOTE—On new pistons, pin hole is .8120-.8122" in diameter and is diamond-bored and tin-plated.

Pin Fit in Piston—.0001-.0005" clearance or light thumb push fit with piston and pin at 70°F.

Replacement Pins: No oversizes are available.

CONNECTING ROD: Length 9 3/16" center-to-center. **Weight**—33.4 ozs.

►*JOURNAL DIAMETER UNDERSIZE NOTE—The letter 'A' following the engine number indicates that main and connecting rod journals are .010" UNDERSIZE.*

Crankpin Journal Diameter—1.9385-1.9375".

Lower Bearing—Steel-backed, babbitt-lined, replaceable type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.

Clearance—.0001-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: None (no shims). Replace bearings. Do not file connecting rods or bearing caps. NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in lower end of rod toward right of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type with removable counter-weights.

►*JOURNAL DIAMETER UNDERSIZE NOTE—The letter 'A' following the engine number indicates that main and connecting rod journals are .010" UNDERSIZE.*

Journal Diameters—2.3341-2.3331" (all main journals).

Bearings—Steel backed, babbitt-lined, replaceable type. Bearing shells are dowelled in bearing caps and crankcase.

Clearance—.0014-.0029".

NOTE—Replace bearings when clearance exceeds .006" or when endplay exceeds .018".

Rear Bearing Oil Seals—*See Crankshaft & Main Bearings in Willys Special Data.*

►*REAR MAIN OIL SEAL PRODUCTION CHANGE—Neoprene type seal replaces rope type. See Willys Special Data.*

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instructions in Willys Special Data.*

NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing.

Replacement Bearings: Furnished Standard & .010", .020", .030" Undersize.

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft sprocket thrust washer and sprocket. NOTE—Crankshaft sprocket must be removed with a gear puller in order to make endplay adjustments. Adjusting shims furnished .002", .004", .010" and .030" thick.

Endplay—.004-.006".

FLYWHEEL: Removal—*See Willys Special Data.*

►*FLYWHEEL RING GEAR REPLACEMENT CAUTION:* Different flywheels used as follows: 97 **teeth** (CJ-3A with Old Type Std. Bendix Drive); 124 *teeth* (CJ-3A through Serial Number 30973 with overrunning clutch type drive); 129 **teeth** (All Models after CJ-3A, Serial No. 30973 with Bendix "Folo-thru" type drive. *CAUTION—Replacement ring gear must have the same number teeth as the original.*

CAMSHAFT: Four bearing, helical gear drive.

Journal Diameters—#1 2.1855-2.1860", #2 2.1215-2.1225", #3 2.590-2.600", #4 1.6225-1.6230".

Bearings—Removable steel-backed, babbitt-lined bushing (front), machined in crankcase (all others). **Clearance**—.001-.0025". Service limit .006" (front), .008" (all others).

Camshaft Removal—*See Willys Special Data.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled behind plate. If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance.

Endplay—.003-.0055".

Timing Gears: Crankshaft gear, steel. Camshaft gear, fibre with steel hub.

Gear Backlash—.000-.002".

Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) on crankshaft gear.

VALVES: ("L" Head Engine)

Valve	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5 51/64"
Exhaust	1 15/32"	.3725"	5 51/64"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.0025-.0045"

Valves ("F" Head Engine)

Valve	Head Diam.	Stem Diam.	Length
Intake	2"	.3733-.3738"	4.937"
Exhaust	1 15/32"	.371-.372"	5.909"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.351"	.002-.00375"

►*EXHAUST VALVES ("F" HEAD ENGINE) NOTE—Thompson "Roto-Valve" or Eaton "Free Valve" rotators used.*

Valve Guides ("L" Head Engines): Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place to following dimensions:

Intake Guide—Top of guide 1 5/16" below top face of block. The shorter, smaller-diameter section end of guide should be up.

Exhaust Guide—Top of guide 1" below top face of block. Taper end (counter-bored end) of guide should be up.

Valve Guides ("F" Head Engine): Removable type. Drive guides out with Tool W-240. To install, use W-240 with correct adapters to install guides:

Intake Guide—Drive guide in with taper end toward valve seat until inner end flush with port wall at guide hole.

Exhaust Guide—Drive guide down in block with taper end up toward valve seat until upper end 1" below top face of cylinder block.

Valve Springs: *CAUTION—Intake valve springs on "F" Head Engines are different than other valve springs. See Spring Data below.*

Valve Springs ("L" Head Engine)

Free Length—2½" (Intake and Exhaust).

Intake & Exhaust	Spring Pressure	Length
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1¾"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Springs ("F" Head Engine)
Free Length—1 31/32" (Intake), 2½" (Exhaust).

Intake	Spring Pressure	Length
Valve Closed	73 lbs.	1 21/32"
Valve Open	160 lbs.	1 3/8"
Exhaust	**Spring Pressure**	**Length**
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

Valve Lifters: Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004" oversize.
Lifter Diameter—.6240-.6245".
Lifter Clearance—.0005-.002".
NOTE—Camshaft must be removed for lifter removal and replacement.

VALVE TIMING

Tappet Clearance: ("L" Head Engine)—.016", all valves hot or cold. ("F" Head Engine)—.018" (Intake), .016" (Exhaust —With "Thompson Roto-Valve"). .012" (Exhaust—With "Eaton Free Valve"). Adjust "F" Head Engine valves with engine cold.

NOTE—Adjusting screws are self-locking type.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—Adjust No. 1 cylinder Intake valve lash to .020" ("L" Head Engine), .026" ("F" Head Engine) with tappet resting on low side of cam lobe. Rotate crankshaft until No. 1 cylinder is coming toward top of cylinder on exhaust stroke, then continue to rotate crankshaft until No. 1 intake tappet is JUST TIGHT against valve stem indicating that valve is about to open. Check position of ignition timing mark on crankshaft pulley (5° BTDC) and estimate crankshaft position (5° mark should be approximately ¼" before reference point on timing gear cover). Reset tappet clearance to correct running clearance as given above.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, timing gears; and to rocker arm assembly on "F" Head Engine.
Crankcase Capacity—4 quarts.
Oil Pressure—35 lbs. at 35 MPH.
Oil Pressure Regulator—Under plug on side of pump housing. Opens at 40 lbs. Adjustable by adding or removing shims located above spring in plug.

Oil Pump: Rotor type pump mounted on left side of crankcase.
Oil Pump Overhaul—*See Willys Special Data.*

Oil Filter: Purolator. On cylinder head bracket at right front corner of cylinder head with oil outlet connected to timing gear cover.

▷*CAUTION*—Filter should be drained at each crankcase oil change (2000 mile intervals) and filter element replaced every 8000 miles (normal service).

Oil Pressure Gauge: (CJ-3A)—Auto-Lite No. 121250-A; (Early CJ-3B)—Auto-Lite No. 11987-A; (Late CJ-3B & CJ-5)—Auto-Lite No. 121250-A. Bourdon tube type, not electric.

COOLING

Cooling System: Pressure type with pressure valve (relief valve) in filler cap.
Capacity—11 qts. (12 qts. with Heater).
Pressure Valve—Radiator filler cap. Opens at 7 lbs.

Water Pump: Centrifugal, packless, ball bearing type. *See Water Pump Section for complete data.*
Removal—Loosen and remove drive belt, disconnect hose. Remove pump mounting screws, lift out pump
Belt Adjustment—See Generator Belt Adjustment.

Thermostat: Harrison. In water outlet elbow in cylinder head. Starts to open at 151°F (148°F min.).

Temperature Gauge (Exc. CJ-5): Auto-Lite No. 12149-A (CJ-3A); No. 11986-A (Early CJ-3B); No. 12149-A (Late CJ-3B). Bourdon tube type. Not electric.

Temperature Gauge (CJ-5): King-Seeley "CV" (Constant Voltage) electric type.
Dash Unit—K-S No. 46832 (with 100 MPH Speedometer). No. 46833 (with 80 MPH Speedometer).
Engine Unit—K-S No. 44230.

CLUTCH

Rockford Model 8½ RM or Auburn No. 8501-39. With Borg & Beck driven member. Single plate dry disc type. See Clutch Section for complete data.
Facings—Woven asbestos. I.D. 5⅛". O.D. 8½".
Thickness .135" (.132-.138").

Pedal Adjustment: Set pedal free travel to 1" (to provide 1/16" clearance between release bearing and clutch release levers). Adjust length of clutch control cable at clevis. Screw cable end in or out of clevis. Tighten locknut.

Removal: Remove transmission (Transmission & Case Assembly), see below. Remove flywheel bell housing. Mark clutch pressure plate and flywheel to insure installation in same position. Remove clutch cover screws evenly to remove spring pressure, then remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS1-T90C (Floor Mounted Gearshift). Three speed type. Constant-mesh, synchro-mesh, helical gears (second & high), sliding spur gear (low & reverse).
See Transmission Section for complete data.

Transfer Case: Spicer or Warner. Two-speed auxiliary transmission and front-wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front-wheel drive engagement (left hand lever).
See Transmission Section for complete data.

Removal: Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shafts at universal joints (NOTE—If equipped with Power Take-off drive, remove front end of power take-off propeller shaft assembly). Disconnect speedometer cable at transfer case, brake cable, transmission shift rods at transmission case levers, and clutch release cable at cross-shaft bell-crank. Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross-member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and shift levers (NOTE—If Power Take-off used, remove power take-off shift lever plate screws and lift lever out). Remove bolts holding center cross-member at frame side rails and remove cross-member (CAUTION—with cross-member removed, engine and transmission weight will rest on support jacks). Remove bolts holding transmission on bell housing force transmission to right until ball stud end can be disengaged from end of clutch control cross-shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

UNIVERSALS

Front & Rear Drive Propeller Shaft Joints: Spicer needle roller bearing type.

Front Axle Shaft Joint: Bendix or Rzeppa Constant Velocity type. One joint used at outer end of each shaft (within steering knuckle housing).

▷*1953 RZEPPA TYPE UNIVERSAL JOINT PRODUCTION CHANGE:* The inner shaft retainer and three screws have been eliminated, making it possible to pull the shaft end from the joint without dismantling the joint.
See "Universal Joints" in Willys Special Data.

Power Take-off Propeller Shaft Joints: Detroit Ball-and-Trunnion type. Two used (one at each end of shaft—no splined joint used).

FRONT AXLE

Spicer (Salisbury) Model 25—Full-floating, hypoid gear type. Differential assembly (ring and pinion gear assembly) is identical with Spicer Model 23-2 and is serviced in same manner.
See Spicer (Salisbury) Full Floating Rear Axle in Rear Axle Section for complete data.
Ratio—5.38-1.
Backlash—.005-.007". Shim adjustment.

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross-member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower the springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange capscrews and remove flange with a puller (*CAUTION*—do not lose shim pack under drive flange). Bend lip on bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly (*CAUTION*—use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

▷*INSTALLATION CAUTION*—Adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment: Tighten inner adjusting nut until wheel binds (turn wheel while adjusting), then back nut off 1/6 turn, install lockwasher and locknut and make certain nut locked by turning lockwasher ear up. Check axle shaft endplay.
Axle Shaft Endplay Checking & Adjustment—Tighten the axle shaft nut against the flange (do not install lockwasher), swing wheel to maximum

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

left or right position with punchmark on end of axle shaft straight up or down. Back off flange nut until clearance between nut and flange is .050" (measure with feeler gauge). Tap end of shaft with a soft hammer (shaft will move in an amount equal to the endplay). Recheck clearance between nut and flange with a feeler gauge. **Subtract this measured clearance from the original .050" clearance.** If resulting figure is less than .015", add shims to shim pack under flange, if figure is more than .035", remove shims from shim pack under flange. With correct thickness of shim pack under flange, install axle shaft lockwasher, nut, and cotter pin.

Steering Knuckle Bearing Disassembly & Adjustment: *See "Front Axle" in Willys Special Data.*

Wheel Bearing Adjustment: *See "Front Axle" in Willys Special Data.*

REAR AXLE

Spicer Model 44-2. Semi-floating hypoid gear type with Hotchkiss drive.
See "Spicer Rear Axle" in Rear Axle Section.

Ratio—5.38-1.
Backlash—.004-.008". Shim adjustment.

Removal: Support rear end of truck securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables and propeller shaft at rear universal. Place support jacks under axle housing to relieve springs of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs to floor. Remove axle assembly.

Axle Shaft Removal: Remove wheel and hub assembly (use wheel puller), remove nuts on bolts holding backing plate and brake assembly, remove dust shield, oil seal, and backing plate. Remove axle shaft and wheel bearing. CAUTION—Do not lose shims.

Wheel Bearing Adjustment—Endplay .003-.005". Adjust by adding or removing shims between backing plate and flange on axle housing.
NOTE—Shims installed on **left hand** end of axle housing only in production. Shims can be installed on right hand end of axle housing, if necessary, for correct endplay.

SHOCK ABSORBERS

Monroe. Direct acting, hydraulic type. Not adjustable or refillable. Serviced by replacement.

FR NT SUSPENSI N

Front Axle: Spicer (Salisbury) Model 25. Special full-floating driving unit. *See Front Axle data (above).*
Front Suspension: Special front-wheel drive unit with semi-elliptic springs. Steering knuckle mounted on taper roller bearings carried on two stub shafts.
Endplay—.001-.003".
Kingpin Inclination—7½° crosswise.
Caster—3°. No adjustment. If caster incorrect, check front end, correct by installing new parts.
Camber—1½°. No adjustment. Correct by installing new parts. Do not attempt to correct camber by cold bending or heating of parts.
Toe-In—3/64-3/32" (1/32" each wheel). To adjust, first set each front wheel straight ahead (see Note below), then set toe-in by shortening each tie rod approximately ½ turn. This procedure necessary to maintain correct position of steering idler arm.
NOTE—To set front wheels straight ahead, first set tie rod end of steering bell crank (idler lever on frame front cross-member) exactly at right angles to front axle. Check front wheels by using a straight edge or sighting along rear and front wheels. Adjust each tie rod (loosen end clamp bolts and turn rod) until front wheels are exactly straight ahead. Then make toe-in adjustment as directed above. Tie rod lengths between ball end centers should be 20⅞" (left), 25⅝" (right).
Toe-out on Turns—With inner wheel turned 20°, outer wheel should be turned exactly 18°30'.

STEERING GEAR

Steering Gear: Ross Model T-12. Cam-and-Twin Lever
See Steering Gear Section for complete data.

BRAKES

JEEP CJ-3A

Service Brakes (CJ-3A Jeep): Bendix (Lockheed) Four-wheel Hydraulic, double anchor type. Hand lever applies independent brake on drive shaft at rear of transfer case.
See Brake Section for complete data.
Drum Diameter—9".
Lining—Width 1¾". Thickness .206-.216". Length per shoe 10 7/32" (forward shoes), 6 39/64" (rear shoes). NOTE—Manufacturer recommends use of new or replacement shoe assemblies with factory-installed linings.
Clearance—.008" toe, .005" heel, for each shoe.

Hand Brake: Mechanical type. Two-shoe, internal expanding type with drum mounted on drive shaft at rear of transfer case (See Hand Brake Adjustment following).

Drum Diameter—8".
Lining—Woven type. Width 1¾". Thickness .206-.216". Length per shoe 8⅛".

JEEP CJ-3B & CJ-5

Service Brakes (CJ-3B & CJ-5 Jeeps): Bendix-Lockheed hydraulic, self-centering type. Hand lever applies independent brake on drive shaft at rear of transfer case.
See "Bendix-Lockheed" in Brake Section.

Drum Diameter—9".
Whl. Cyl. Diameter—1" (Front), ¾" (Rear).
Lining—Molded asbestos. Width 1¾", Thickness .206-.216", Length per shoe 10 7/32" (primary or forward shoe), 6 39/64" (secondary or rear shoe).
Clearance—.008" toe, .005" heel, for each shoe.
NOTE—On self-centering type brakes, centralize shoes by hard brake application before making adjustment.
Braking Power—65% Front, 35% Rear.

Hand Brake: Mechanical type. Two-shoe internal expanding type with drum mounted on drive shaft at rear of transfer case (See Hand Brake Adjustment following).
Drum Diameter—8".
Lining—Width 1¾", Thickness .206-.216", Length per shoe 8⅛".

HAND BRAKE ADJUSTMENT

Hand Brake (Adjustment for Wear)—Make certain that hand brake cable and linkage operate freely. Lubricate if sticking or binding is evident. Place brake handle on instrument panel in "off" position. Rotate brake drum until one pair of adjusting holes (three pairs located on back face of drum) is opposite the adjusting screws (notched wheels) within the brake. Insert a screwdriver or adjusting tool through each hole and turn each adjusting screw equally until the brake shoes are snug against the drum (NOTE—with tool against edge of hole as a fulcrum, move outer end of tool out away from center of driveshaft to expand shoes). **Back off each adjusting screw 7 notches** to provide correct shoe clearance.

MISC. MECHANICAL

Windshield Wipers: Vacuum type, individual wiper motors.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

1952 Models	Body Type	Serial No. Prefix
675 Aero Lark	2 Dr. Sedan	652-KA2

475A—Aero Lark	Dlx. 4-Dr. Sdn	453-KB1

SERIAL NUMBER: On plate on left front door hinge post.
Serial Numbers—10001 up, with model prefix as listed in Model Identification above.

ENGINE NUMBER: Stamped on pad on top right front corner of cylinder block.

▷*ENGINE NUMBER NOTE—Letters following engine number denote the following:*
A—Crankshaft journals .010" UNDERSIZE (all).
B—Cylinder bores are .010" OVERSIZE.
AB—Both above conditions exist in engine.

TUNE-UP

COMPRESSION PRESSURE: 115 lbs. minimum, with all cylinders equal within 10 lbs.

VACUUM READING: Steady 18-21" at idling speed.

FIRING ORDER: (675, 685) 1-5-3-6-2-4. See diagram. (475) 1-3-4-2. *See 1950-53 2-Whl. Dr. Diagram.*

SPARK PLUG GAPS: .030".
Plugs—Champion Type J8. 14 mm. metric.

▷***Tighten Spark Plugs to 26-30 ft. lbs. torque.***

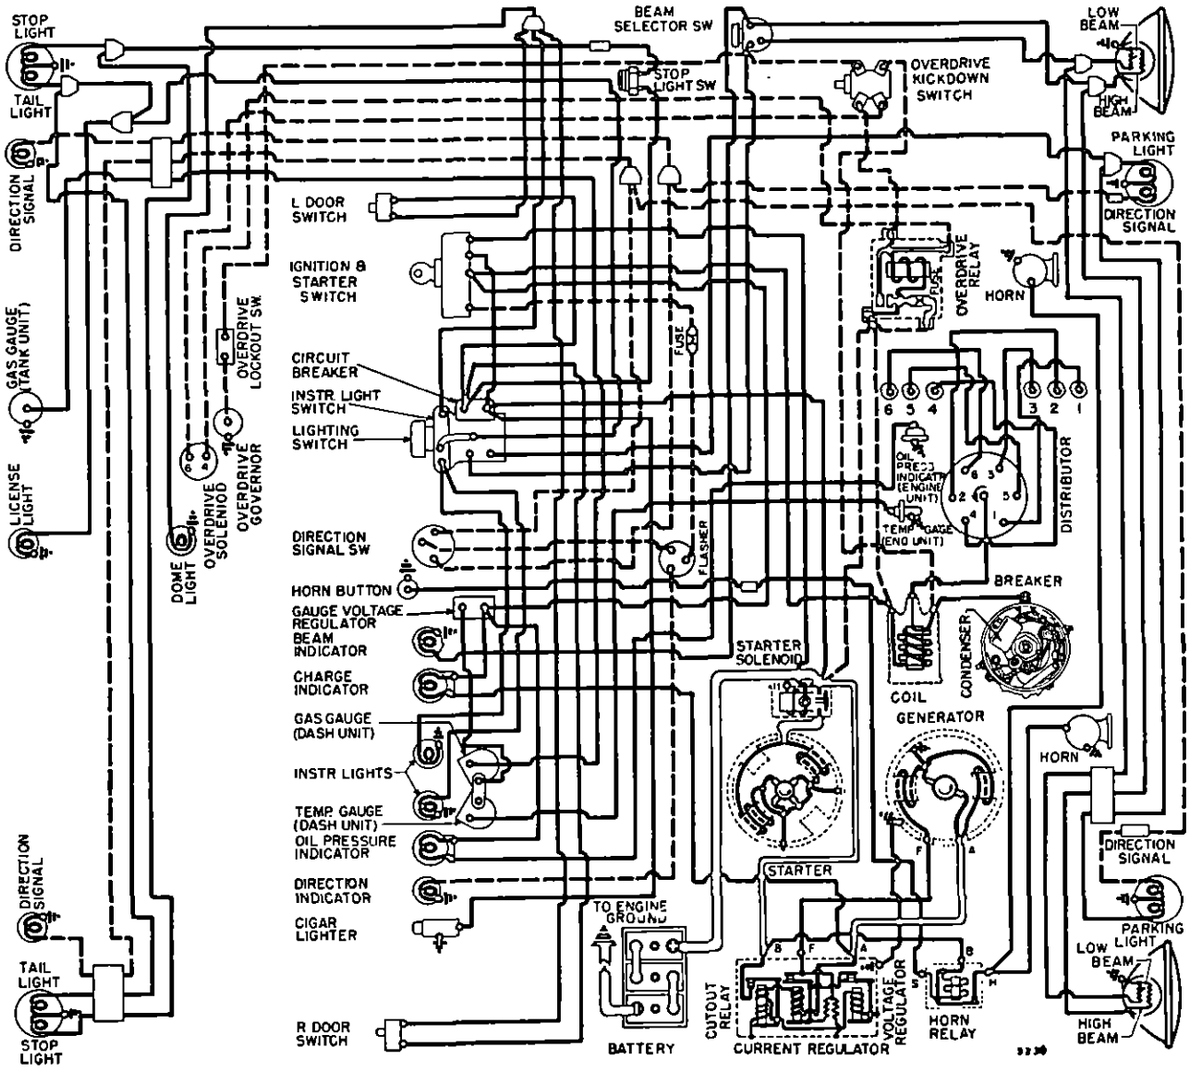
DISTRIBUTOR: Auto-Lite. "IAT" type with full automatic advance and vacuum spark control.

Model	Distr. No.
475 (1953)	IAT-4008B
675 (Early 1952-53)	IAT-4007
675 (Late 1953)	IAT-4017
685 (1952-Early 1953)	IAT-4007A
685 (Late 1953)	IAT-4017A

Breaker Gap—.020". Limits .018-.022".
Cam Angle—39°±3° (6 Cyl.); 40°±3° (4 Cyl.).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

IGNITION TIMING: 5° BTDC. Adjust for slight ping on hard acceleration in high gear.
Timing Mark (4 Cyl.): Notch on rim of crankshaft pulley aligned with correct mark on timing gear cover. Cover has two lines marked "5" (5° BTDC), and "T" (TDC).
Timing Mark (6 Cyl.): Fifth mark before top dead center mark "0" on vibration dampener and pointer on timing gear cover. Vibration dampener marked with 15-1° graduations before top dead center mark "0" and 5-1° graduations after this mark.
Timing Procedure—*See Ignition Timing.*

COIL: Auto-Lite CR-6009. On right side of engine.
Ignition Current—5 amperes at 6.3 volts (stopped).



CONDENSER: Auto-Lite No. IAT-3076L.
Capacity—.21-.25 microfarad.

CARBURETION: Carter YF No. 937S (675); No. 924S (685—1952 & Early 1953); No. 2071S (685—Late 1953); No. 938S (475). 1¼" single barrel downdraft type with manual choke.

▷*1952 PASS. CAR ROUGH IDLE CORRECTION—See "Carter YF Carburetor" in Carburetor Section for complete data.*
Idle Setting (924S, 937S)—1-2 turns open (turn screw out for richer mixture).
Idle Setting—(938S, 2071S) ¾-1¾ turns open (turn screws out for richer mixture.
Idle Speed—600 RPM (475), 550 RPM (675), 575 RPM (685). *CAUTION—Exact idle speed extremely important on 685 Hydra-Matic Drive Cars.*
Float Level—9/32" (924S, 937S); 5/16" (938S, 2071S). From top of float at free end to gasket seat on cover, Gauge T109-26 (924S, 937S), T109-107 (938S, 2071S). Check with cover inverted and float hanging freely.

▷*CAUTION—Do not compress spring in intake needle (will give incorrect reading and wrong setting).*
Accelerating Pump—No adjustment.
Fast Idle Setting: Lip on fast idle arm should contact boss on body casting with choke valve wide open. Adjust by bending fast idle link at offset.
Choke Setting: Manual type. No adjustment required.
Fuel Pump Pressure: 3½-4½ lbs.
MANIFOLD HEAT CONTROL: (675) Automatic thermostatic type, no adjustment. Valve must operate freely. (685, 475) No control valve (intake manifold passages in cylinder head).
VALVE TAPPET CLEARANCE: (675) .016" All valves,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

(685, 475) .018" (Intake—COLD). .016" (Exhaust—Thompson "Roto-Valve"). .012" (Exhaust —"Eaton Free-Valve"). Adjust with engine COLD.

IGNITION

IGNITION SWITCH: Combination ignition and starting switch. Turn key to right, past the "On" position, to start.

COIL: Auto-Lite CR-6009. On right side of engine.
Ignition Current—5 amperes at 6.3 volts (stopped).

CONDENSER: Auto-Lite No. IAT-3076L.
Capacity—.21-.25 microfarad.

DISTRIBUTOR: Auto-Lite. "IAT" type with full automatic advance and vacuum spark control.

Model	Distr. No.
475 (1953)	IAT-4008B
675 (Early 1952-53)	IAT-4007
675 (Late 1953)	IAT-4017
685 (1952-Early 1953)	IAT-4007A
685 (Late 1953)	IAT-4017A

Breaker Gap—.020". Limits .018-.022".
Cam Angle—39°±3° (6 Cyl.); 40°±3° (4 Cyl.).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IAT-4007, 4017

Start	0°	5⅛"
1°	2°	6⅝"
3°	6°	9⅝"
5°	10°	12½"
6°	12°	14"

Installation Note—If crankshaft has been turned with distributor off engine, install distributor as follows: Turn crankshaft to No. 1 cylinder firing position (see Timing), turn distributor shaft until rotor is at No. 1 segment, install distributor on engine, rocking shaft slightly to engage drive coupling, push distributor down into place, install hold-down screw, check timing.

►*CAUTION—If oil pump has been removed see "Oil Pump" in Willys Special Data.*

IGNITION TIMING

Standard Setting.....5° BTDC
Timing Mark (4 Cyl.): Notch on rim of crankshaft pulley aligned with correct mark on timing gear cover. Cover has two lines marked "5" (5° BTDC), and "T" (TDC).
Timing Mark (6 Cyl.): Fifth mark before top dead center mark "0" on vibration dampener and pointer on timing gear cover. Vibration dampener marked with 15-1° graduations before top dead center mark "0" and 5-1° graduations after this mark.
Timing (using Timing Light)—Connect timing light to #1 spark plug, direct light on right side of vibration dampener. Disconnect vacuum advance line (to prevent vacuum advance operating), idle engine. Loosen distributor mounting screw and adjust distributor until ignition mark on dampener appears in line with pointer. Tighten mounting screw and connect vacuum line.

CARBURETOR

Carter Model YF No. 937S (675); No. 924S (685—1952 & Early 1953); No. 2071S (685—Late 1953); No. 938S (475). 1¼" single barrel downdraft type with manual choke.
See Carburetor Section for complete data.

►*1952 PASS. CAR ROUGH IDLE CORRECTION (924S)—See "Carter YF Carburetor" in Carburetor Section for complete data.*

Settings (Idle Setting, Float Level & Accelerating Pump) *See Tune-Up data.*
Metering Rods & Jets—See Carter Jet Table in Carburetor Section for complete data.

Fast Idle: Lip on fast idle arm should contact boss on body casting with choke valve **wide open.** Adjust by bending fast idle link at offset.

Choke: Manual type.

CARB. EQUIPMENT

Air Cleaner: AC Oil Bath type standard equipment.
Fuel Pump: Carter No. M893S (Fuel only Std.); M794S (Combination Fuel & Vacuum Optional).
Pressure—3½-5½ lbs.
Gasoline Gauge: King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit—King-Seeley No. 46007.
Tank Unit—King-Seeley No. 44506.
See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite or Willard PN-15, 6 volt, 15 plate, 90 ampere hour capacity (20 hr. rate).
Grounded Terminal—Negative terminal.

STARTER

Auto-Lite Model MCH-6207 (4-Cyl.) MCH-6203 (6-Cyl.).
Armature—Auto-Lite No. MCH-2088.
Drive—Bendix "Folo-thru" type No. A3281.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 "	Lock	2.0	335

Starting Switch Note—Ignition key starting with Auto-Lite No. SS-4018 magnetic switch.

GENERATOR

Auto-Lite No. (Early) GDZ-6001D, (Late) GGW-4801D. Two brush type with current and voltage regulation.
Armature—Auto-Lite No. (for GDZ-6001D) GGY-2006F, (for GGW-4801D) GGW-2006F.
Maximum Charging Rate—(GDZ) 35 amperes. (GGW) 45 amperes, both at 8.0 volts.

Performance Data—GDZ-6001D

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	870-970 — 950-1050
17.0	8.0	1350-1500 — 1550-1700
35.0	8.0	1800-2000 — 2150-2350

Performance Data—GGW-4801D

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	870-970 — 950-1050
40.0	8.0	1800-2000 — 2150-2350
45.0	8.0	1925-2125 — 2350-2550

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—(GDZ) 1.3-1.5 amps., (GGW) 1.4-1.5 amps, both at 5.0 volts.
Motoring Current—(GDZ) 3.9-4.4 amps., (GGW) 4.1-4.6 amps., both at 5.0 volts.

Belt Adjustment: ½" to ⅝" deflection with thumb pressure midway between generator and pump pulleys.

REGULATOR

Auto-Lite No. (for GDZ-6001D Gen.) VRP-6003A, (for GGW-4801D Gen.) VBE-6105A. Voltage-Current Regulator.

►*CURRENT REGULATOR NOTE—VBE Current Regulator is "Temperature Compensated" type.*

Cutout Relay
Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts hot).
Cuts Out—4.1-4.8 volts (4-5 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70°F. after 15 minutes operation charging at 10 amperes (VRP), one-half maximum rate (VBE).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VRP)
Setting—34-36 amperes (marked "35" on cover).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator—(VBE)

►*SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A—Operating Amperes	Test B
VBE-6105A	52	45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.
Test B—After 15 minutes additional operation with current regulator operating (load applied to hold to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Lighting Switch—Pulls out for headlights and parking lights. Rotating switch to right dims instrument

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

cluster lights. When turned to extreme left, it lights dome light.

MISC. ELECTRICAL

CIRCUIT BREAKER: 30 amperes. On main lighting switch. Protects entire lighting system.

FUSES: Clock—1 ampere. in clock lead.
Directional Signal—14 amperes. In flasher lead.
Overdrive—20 ampere. On control relay.

HORNS: Auto-Lite No. HW-4021 (Low Pitch), **HW-4022** (High Pitch). NOTE—Sparton horns also used

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermobimetal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on instrument cluster and connected between ignition switch and gauge circuits. See wiring diagram.

ENGINE

▷*SEE 1950-53 WILLYS 2-WHL. DR. STATION WAGON, SEDAN DELIVERY, JEEPSTER PAGES FOR 4 CYLINDER "F-HEAD" ENGINE DATA.*

ENGINE SPECIFICATIONS: 6 Cyl. "F" Head, and 6 Cyl. "L" Head types of own make.
Bore—3⅛". **Stroke**—3½".
Displacement—161 cu. in. **Rated H.P.** 23.44.
Developed Horsepower—("L" Head) 75 @ 4000 RPM. ("F" Head) 90 at 4200 RPM.
Compression Ratio—("L" Hd.) 6.9-1. ("F" Hd.) 7.6-1.
Compression & Vacuum Readings—*See Tune-Up.*

ENGINE REMOVAL: *See Willys Special Data.*

TIGHTENING TORQUES & CYLINDER HEAD: *See Willys Special Data.*

PISTONS: Aluminum alloy, "T" slot, cam ground, tin or brass plated type. **Length**—3".

▷*PISTON OVERSIZE NOTE—Letter "B" or "AB" following engine number indicates that cylinders and pistons are .010" OVERSIZE.*
Weight—10.9 ozs.
Removal—Pistons and rods removed from above.
Clearance—.018-.021" (top), .0021" (skirt).

Replacement Pistons: Furnished .010", .020", .030", .040", oversize.

Fitting New Pistons: Use .003" feeler gauge ½" wide between piston and cylinder wall on side opposite slot. Pull required to withdraw feeler should be 5-10 lbs.

Installing Pistons: T-slot toward left (valve side) of engine (opposite side from oil spray hole in rod).

PISTON RINGS: Two compression rings, one oil ring per piston, all above pin. Oil drain holes in oil ring groove.

Ring	Width	End Gap	Side Clearance
Top (Comp.)	3/32"	.007-.015"	.002-.004"
Center (Comp.)	3/32"	.007-.015"	.0015-.0035"
Bottom (Oil)	3/16"	.007-.015"	.001-.0025"

Installing Rings: Compression ring mark "TOP" (on side of ring) and bevel on inner edge must be up.

Replacement Rings: Ring sets furnished in following sizes for oversize range noted: Standard (0 to .010" O.S.), .020" O.S. (.011" to .024"), .030" O.S. (.025" to .034"), .040" O.S. (.035" to .049").

PISTON PIN: Locked in rod.
Diameter—.7497". **Length**—2 21/32".
Pin Fit in Piston—.0001-.0005". Light thumb push fit at normal room temperature.
NOTE—Pins furnished with piston only, not separately.

CONNECTING ROD: Length 6.345". **Wgt.** 22.5 ozs.

▷*JOURNAL DIAMETER UNDERSIZE NOTE—The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" UNDERSIZE.*
Crankpin Journal Diameter—1.875".

▷*CAUTION—Oil spray hole in bearing upper half must be lined up with hole in rod.*
Clearance—.0001-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: None. Replace bearings.

Replacement Bearings: Furnished Std., .001", .002", .010", .011", .012", .020", .030", undersize.

Installing Rods: Rods not offset. Install with spray hole in lower end toward right side (away from camshaft), on all rods.

CRANKSHAFT: Four bearing with integral counterweights. Vibration dampener on forward end.

▷*JOURNAL DIAMETER UNDERSIZE NOTE—The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" UNDERSIZE.*
Journal Diameters—2.25" all bearings.
Bearings—Replaceable steel-backed, babbitt-lined type, no shims.
Clearance—.0009-.003".

Bearing Adjustment: None. Replace bearings.

Rear Main Oil Seal: *See Crankshaft & Main Bearings in Willys Special Data.*

Replacement Bearings: Furnished Std. .001", .002", .010", .020", .030" undersize.

End Thrust: Taken by No. 1 (front bearing), and thrust washer in back of crankshaft gear. Adjusted by removing or adding shims behind thrust washer. Shims furnished .002" thick.
NOTE—Crankshaft gear must be removed with gear puller for endplay adjustment.
Endplay—.004-.006".

FLYWHEEL: Removal—*See Willys Special Data.*

CAMSHAFT: Four bearing with helical gear drive.
Journal Diameters—(1) 2"; (2) 1 31/32"; (3) 1 15/16"; (4) 1¾".

▷*CAUTION—"L" Head & "F" Head engine camshafts not interchangeable.*
Bearings—Front Only. Babbitt lined, steel backed.
NOTE—Other camshaft bearings are machined in case.
Clearance—.001-.0025".
Camshaft Removal—*See Camshaft & Bearings in Willys Special Data.*

End Thrust: Taken by thrust plate assembled behind camshaft gear with a spacer assembled behind plate. If end thrust not within limits, replace timing gear and thrust plate. Dressing face of thrust plate may be required to reduce its thickness for correct clearance.
Endplay—.004-.007".

Timing Gears: Crankshaft gear cast iron, camshaft gear fibre.

▷*CAUTION—Timing gears are not interchangeable on "F" & "L" Head Engines.*
Gear Backlash—.000-.002".

Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) on crankshaft gear.

Valves ("L" Head Engine)

Valve	Head Diam.	Stem Diam.	Length
Intake	1⅜"	.3407-.3415"	4 17/32"
Exhaust	1 9/32"	.3395-.3405"	4⅝"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.284"	.0015-.00325"
Exhaust	45°	.300"	.0025-.0045"

▷*EXHAUST VALVE NOTE—Thompson "Roto-Valve" or Eaton "Free-Valve" used on "F-Head" Engine exhaust valves.*

Valves ("F" Head Engine)

Valve	Head Diam.	Stem Diam.	Length
Intake	1¾"	.3733-.3738"	4 17/32"
Exhaust	1 9/32"	.3395-.3405"	4⅝"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.300"	.0025-.0045"

Valve Seat Width—3/64", (All Valves).

Valve Guides ("L" Head Engine): Removable type. Remove valve guides from above with puller. Install new guides with driver or press guides down until upper end is ⅞" below upper edge of valve seat (taper end up).

Valve Guides ("F" Head Engine): Removable type. Drive guides out with Tool W-240. To install, use Tool W-240 with correct adapters and drive guides into head and cylinder block until top of guide is ⅞" from top of valve seat (taper end toward seat).

Valve Springs: *CAUTION—Intake valve springs on "F" Head engines are different than other springs. See Spring data below.*

Valve Springs ("L" Head Engine)

Intake & Exhaust	Spring Pressure	Length
Valve Closed	50 lbs.	1 5/8"
Valve Open	105 lbs.	1 21/64"

Free Length—1 57/64".

Valve Springs ("F" Head Engine)

Intake	Spring Pressure	Length
Valve Closed	73 lbs.	1 21/32"
Valve Open	153 lbs.	1 13/32"

Free Length—1 31/32".

Exhaust	Spring Pressure	Length
Valve Closed	50 lbs.	1 5/8"
Valve Open	105 lbs.	1 21/64"

Free Length—1 57/64".

Valve Lifters: Mushroom type, in reamed holes in block. Service by installing oversize lifters.
Lifter Removal—Camshaft must be removed first. *See "Camshaft & Bearings" in Willys Special Data.*
Lifter Diameter—.6240-.6245" **Length**—2".
Clearance in Block—.0005-.002".

Rocker Arm Removal & Installation—*See Valve System in Willys Special Data.*

VALVE TIMING

Tappet Clearance: ("L-Head" Engine)—.016" Intake & Exhaust, (Hot or Cold). "F-Head Engine—.018" Intake—COLD. .016" (Exhaust—Thompson "Roto-Valve"). .012" (Exhaust—"Eaton Free-Valve"). Adjust with engine cold.

Valve Timing: See Camshaft Setting above.

"L-Head" Engine
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

"F-Head" Engine
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

Valve Timing Check—Adjust No. 1 cylinder Intake valve lash to .020" ("L" Head Engine), .026" ("F" Head Engine) with tappet resting on low side of cam lobe. Rotate crankshaft until No. 1 piston is coming toward top of cylinder on exhaust stroke, then continue to rotate crankshaft until the 9° BTDC mark on dampener is aligned with pointer on timing case cover. With the crankshaft in this

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

position, No. 1 intake tappet should be JUST TIGHT against valve stem, and indicates that valve timing correct. Reset tappet clearance.

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, camshaft bearings, timing gears, and on "F" Head Engine to rocker arm shaft.
Crankcase Capacity—5 qts. (675, 685), 4 qts. (475).
Normal Oil Pressure—35 lbs. at 35 MPH. Safe oil pressure is 6 lbs. at idle, 20 lbs. min. at 2000 RPM.
Oil Pressure Regulator: Located on oil pump housing. Adjustable by removing or adding shims from above spring within plug.
Oil Pump: Internal rotor type. Mounted externally on left side of crankcase.
Oil Pump Overhaul—*See Oil Pump in Willys Special Data.*
Oil Filter: Optl. Replace filter cartridge at 8000 mile intervals (more often in dusty areas).
Oil Pressure Indicator: King-Seeley Electric type oil pressure switch, operates light on instrument panel.
Dash Unit—Warning indicator light used. Light goes on when ignition switch turned on, and goes out when oil pressure rises.
Engine Unit—King-Seeley No. 47150.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure type with relief valve in radiator cap.
Capacity—11 quarts, (12 qts. with heater).
Pressure Valve—In filler cap. Opens at 7 lbs.
Water Pump: Centrifugal, packless type with special sealed ball bearing shaft (no lubrication required).
See Water Pump Section for complete data.
Belt Adjustment: See Generator Belt Adjustment.
Thermostat: Harrison. In water outlet in cylinder head. Starts to open at 151°F. (148° min.).
Temperature Gauge: King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit—King-Seeley No. 46011.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Rockford 8½ RM or Auburn 8501-39. With Borg & Beck driven member. Single plate dry disc type.
See Clutch Section for complete data.
Facings—Woven asbestos. I.D. 5⅛". O.D. 8½".
Thickness—.135" (.133-.138").
Pedal Adjustment: Pedal free travel 1½". To adjust, loosen locknut and turn adjusting nut on connecting link at clutch fork, tighten locknut.
Removal: Remove transmission (see Transmission Removal), remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation. Take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model AS-51-T96 (Std.). AS-50-T96 with R10 Type Overdrive (Optional). All helical gear type. Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See Transmission Section for complete data.
Transmission Control: Remote control type, with gearshift lever mounted on steering column.
See Transmission Section for complete data.
Removal: Disconnect the remote control rods and the front universal joint companion flange at the transmission. Disconnect speedometer cable at transmission and plug the opening. Place a jack under the flywheel housing to support engine weight and remove the rear crossmember support with rubber insulators attached. Unscrew the four transmission-to-bell housing bolts as far as possible and yet support transmission weight. Pull transmission back to bolt heads and insert a long screw driver through opening in bell housing and pry the clutch release fork from engagement with clutch release bearing carrier. Remove the transmission mounting bolts and remove transmission from car.

OVERDRIVE

Warner Type R10 (Part of Transmission Assembly). Solenoid operated, governor controlled type overdrive (no centrifugal pawls) with throttle operated "kick-down."
See Transmission Section for complete data.
Control Relay—Auto-Lite No. HRT-4001.
Overdrive Governor—Auto-Lite No. TGE-4002.
Overdrive Solenoid—Delco-Remy No. 1118155.
Overdrive Fuse—20 ampere. On relay.
Removal: Remove as a unit with the transmission. Removal instructions same as for regular transmission after governor and solenoid wires and lock-out control cable disconnected, and rubber mounted saddle support at rear of overdrive housing is removed.

HYDRA-MATIC DRIVE

Optl. on 685 Ace & Eagle. "Dual Range" type. Four speed automatic transmission and fluid coupling.
See Transmission Section for complete data.
►*TESTING & TROUBLE SHOOTING: See "Hyrda-Matic Drive" in Transmission Section.*
Lubrication: Check fluid level every 1000 miles, add fluid as required to maintain level at "F" mark on dipstick. Drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type "A."
Capacity—Approximately 8½ qts. (refill), 9½ qts. (after disassembly or overhaul).
Checking Fluid Level—Check only with engine and transmission at normal running temperature, engine running at correct 575 RPM. idling speed, and selector lever in Neutral "N" position. Remove access plate in front floor pan (right side under floor mat), clean all dirt from around filler cap, check level as indicated on dipstick on filler cap. Add fluid as required to bring level up to "F" mark on dipstick. *CAUTION—Do not overfill transmission case.*
►*OTHER HYDRA-MATIC SERVICE DATA—See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit Universals. Ball-and-trunion type.

REAR AXLE

Spicer (Salisbury) Model 23-1. Semi-floating, Hypoid gear type with Hotchkiss drive.
See Rear Axle Section for complete data.
Ratio—(675, 685) 4.1-1 (Std.). 4.56-1 (Overdrive).
Ratio—(475) 4.56-1 (Std.). 4.56-1 or 4.88-1 (Overdrive).
Backlash—.004-.008". Shim adjustment.
Removal: Support rear of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line at "T" block on axle housing, rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of spring, lower springs. Remove axle assembly from beneath car.
Axle Shaft Removal: Remove wheel and hub assembly, using wheel puller Tool W-230, disconnect brake line at rear wheel cylinder, remove nuts on bolts holding backing plate and brake assembly on axle housing. Remove dust sheld, oil seal, and backing plate and flange on housing. Remove axle shaft and wheel bearing.
Wheel Bearing Adjustment—Endplay .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See Axle Shaft Removal above.

SHOCK ABSORBERS

Monroe. Direct acting hydraulic type.

FRONT SUSPENSION

Independent linked parallelogram type of new design, with coil springs and direct acting shock absorbers. *See Front Suspension Section for complete data.*
►*FRONT SUSPENSION PRODUCTION CHANGE—Front suspension cross-member used on later cars. Kit No. 809562 available for all previous models.*
Kingpin Inclination—8°.
Caster—1° ± ½°.
Camber—1° ± ¼°.
Toe-In—3/32-5/32".
Toe Out on Turns—With inner wheel turned 20°, outer wheel should be turned 19°.

STEERING GEAR

Gemmer. Worm & Roller, or **Ross.** Cam & Twin Lever types. *See Steering Gear Sec. for complete data.*
►*STEERING GEAR REPLACEMENT CAUTION—Steering knuckle arms used with Ross Steering Gears are not the same as those used with Gemmer Steering Gears. If one type Steering Gear is replaced with the other type, STEERING KNUCKLE ARMS MUST BE CHANGED ALSO.*

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic, self-centering. Hand lever applies rear wheel brakes. *NOTE*—Brakes do not have anchor pin adjustment.
See Brake Section for complete data.
Drums—Cast Iron. Diameter 9".
Wheel Cyl. Diameter—1⅛" (Frt.), 13/16" (Rear).
Lining—Molded type, all shoes.

Shoes	Length	Width	Thickness
Primary	9⅞"	2"	.214"
Secondary	7 11/16"	1¾"	.214"

Clearance—.005" at heel of each shoe.
NOTE—No anchor pin adjustment provided. Brake shoes should be centralized by hard brake application (and then released) before adjustment made.
Braking Power—65% Front, 35% Rear.
Hand Brake: See Service Brakes.
Adjustment—Raise rear of car and pull hand brake lever up three notches, then tighten adjustment (brake equalizer connector) until rear brakes drag slightly. Release hand lever and check rear wheels for drag. The rear wheels must turn freely with brake lever released.

MISC. MECHANICAL

Windshield Wipers: Vacuum type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

1954 MODELS

Model Designation	Body Type & Engine
475-4WD	Truck (4 Cyl. F-Hd)
6226-4WD	Truck (6 Cyl. L-Hd)
4X475-SW	Sta. Wgn. (4 Cyl. F-Hd)
4X475-SD	Sedan Del. (4 Cyl. F-Hd)
4X6-226-SW	Sta. Wgn. (6 Cyl. L-Hd)
4X6-226-SD	Sedan Del. (6 Cyl. L-Hd)
685-SW	Deluxe Sta. Wgn. (6 Cyl. F-Hd)
CJ-3B & FJ	Jeep (4 Cyl. F-Hd)

►*1954 MODEL NOTE: All models are 4-Wheel Drive except DeLuxe Station Wagon.*

1955 MODELS

Type	Engine	Model Desig.
475 Sta. Wgn.	4 cyl. "F"	54747
475 Sedan Del.	4 cyl. "F"	54847

CJ-5 Univ. Jeep	4 cyl. "F"	57548
CJ-3B Univ Jeep	4 cyl. "F"	57348

SERIAL NUMBER: Located as follows:
All Station Wagons—On plate mounted on riser to left of drivers seat.
All 475-4WD Trucks—On plate mounted on dash under hood near steering tube.
Model 6226-4WD Truck—On plate mounted on dash near right hood hinge.

ENGINE NUMBER: Located as follows:
4 Cyl. "F" head. Stamped in top of water pump boss.
6 Cyl. 6-226 "L" head. Right top of cylinder block near front.
6 Cyl. 685 "F" Head. Stamped on right side of cylinder block at upper front.

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" main & connecting rod journals undersize.
"B" .010" cylinder bore and pistons oversize.
"AB" Both above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: Taken with wide open throttle. Should be equal to within 10 lbs. with 100 lbs. minimum.

Engine	Comp. Press.
475	125 lbs. at 185 RPM
6226	120 lbs. at 70 RPM
685	155 lbs. at 185 RPM

VACUUM READING: 17-21" at idling speed.

VALVE TAPPET CLEARANCE: Taken with engine cold.

Engine	Intake	Exhaust
475	.018"	.016"
685	.018"	.016"
6226	.014"	.014"

MANIFOLD HEAT CONTROL: (474 & 685) water thermostat controlled. (6226) none used.

IGNITION

FIRING ORDER: (4 cyl.) 1-3-4-2. (6 cyl.) 1-5-3-6-2-4. See diagram.
SPARK PLUG GAP: .030".
Spark Plug—Champion J8, 14mm.
COIL: Auto-Lite CR-6009.
Ignition Current—2.5 amperes idling, 5 amperes at 6.3 volts stopped.

DISTRIBUTOR: **Auto-Lite.** *If Delco-Remy used, see "Willys Pass. Cars".*

Model	1954	1955
475	A-L No. IAT-4008B	A-L No. IAT-4204A

IGNITION TIMING

Setting—5° BTDC (Exc. 6226 Eng.). 4° BTDC (6226 Eng.).
Timing Mark (475)—Timing gear cover. Notch on rim of fan pulley to align with correct mark on timing gear cover. Two lines on cover marked 5° (5° BTDC) and T(TDC)..
6226 & 685—Vibration dampener. Align correct graduation with pointer on timing gear cover. Damper marked "0" at TDC with 1° graduations before and after this point.

CARBURETOR

Model	Carter Carburetor No.
475 (1954-55)	YF-951S
685 (1954-55)	YF-2071S
6226 (Early 1954)	WGD-2052S, SA
6226 (Late 1954 & 1955)	WCD-2204S

CARTER YF

►*1955 MODEL "FLAT SPOT" ON ACCELERATION CORRECTION: See "Carter YF" in Carburetor Section.*
Idle Setting—¾-1¾ turns open (951S), 1-2 turns open (2071S). Turn screw out for richer mixture.
Idle Speed—600 RPM..
Float Level—(951S) 5/16"; (2071S) 9/32" from top of float at free end to gasket seat on cover with assembly inverted and float resting freely on intake needle.
CAUTION—Do not compress spring in intake needle.
Fast Idle: With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.
Automatic Choke Setting: None, Manual Choke.
►*OTHER DATA: See "Carter YF" in Carburetor Section.*
Fuel Pump Pressure: 3½-5½ lbs. at 1800 RPM.

CARTER WGD

Idle Setting—1/2-1-1/2 turns open. Turn out for richer mixture.
Idle Speed—550 RPM.
Float Level—9/32" between top of float and bowl cover with gasket removed and cover inverted.
Accelerating Pump—No seasonal adjustment.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fast Idle: .018-.023" throttle valve opening gauge T109-29) with choke valve closed and thermostatic coil housing, gasket and baffle plate removed.
Automatic Choke Setting: Set two points rich.
►*OTHER DATA: See "Carter WGD" in Carburetor Section.*
Fuel Pump Pressure: 3½-5½ lbs. at 1800 RPM.

CARTER WCD

Idle Setting—1-2 turns open. Turn screws out for richer mixture.
Idle Speed—500 RPM.
Float Level—3/16" between top of float and machined surface of casting (Gauge T109-28).
Accelerating Pump—No seasonal adjustment.
Fast Idle Setting: Two settings required.
Cam Clearance—Loosen choke valve lever clamp-screw on choke valve, insert .040" feeler gauge (T109-193) between lip of fast idle cam and boss on flange casting, hold choke valve tightly closed, remove all slack from linkage by pressing choke valve lever toward closed position, tighten choke valve lever clamp-screw.
Screw Setting—Hold choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite ports is .016" (T109-29). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.
Automatic Choke Setting: Centered (At Index).
►*OTHER DATA: See "Carter WCD" carburetors in Carburetor Section.*
Fuel Pump Pressure: 3½-5½ lbs. at 1800 RPM.

CARB. EQUIPMENT

Fuel Pump: AC No. 9562 (475), fuel & vacuum. **Carter No. M893S** (685), fuel only. **Carter No. M794S** (685), fuel & vacuum. **Carter No. M957S** (6226), fuel & vacuum.
Pressure—3½-5½ lbs. at 1800 RPM.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 45727 (all models).
Tank Unit—K-S No. 44506 (Exc. Trucks).
Tank Unit—K-S No. 44508 (Trucks).
See "Fuel Gauges" in Carburetion Section.

BATTERY

Auto-Lite or Willard. 6 volt, 15 plate, 100 ampere (20 hr. rate).

Battery Ground—Negative (—) ground. (4 cyl. Eng.) right side of engine. (6 cyl. Eng.) left side of engine.

Engine Ground—Strap from engine to frame at right front engine mounting.

STARTER

Auto-Lite. *If Delco-Remy used, see "Willys Pass. Car" data.*

Auto-Lite Numbers	Starter	Armature
475	MCH-6207	MCH-2088
6226	MCH-6210	MCH-2088
685	MCH-6203	MCH-2088

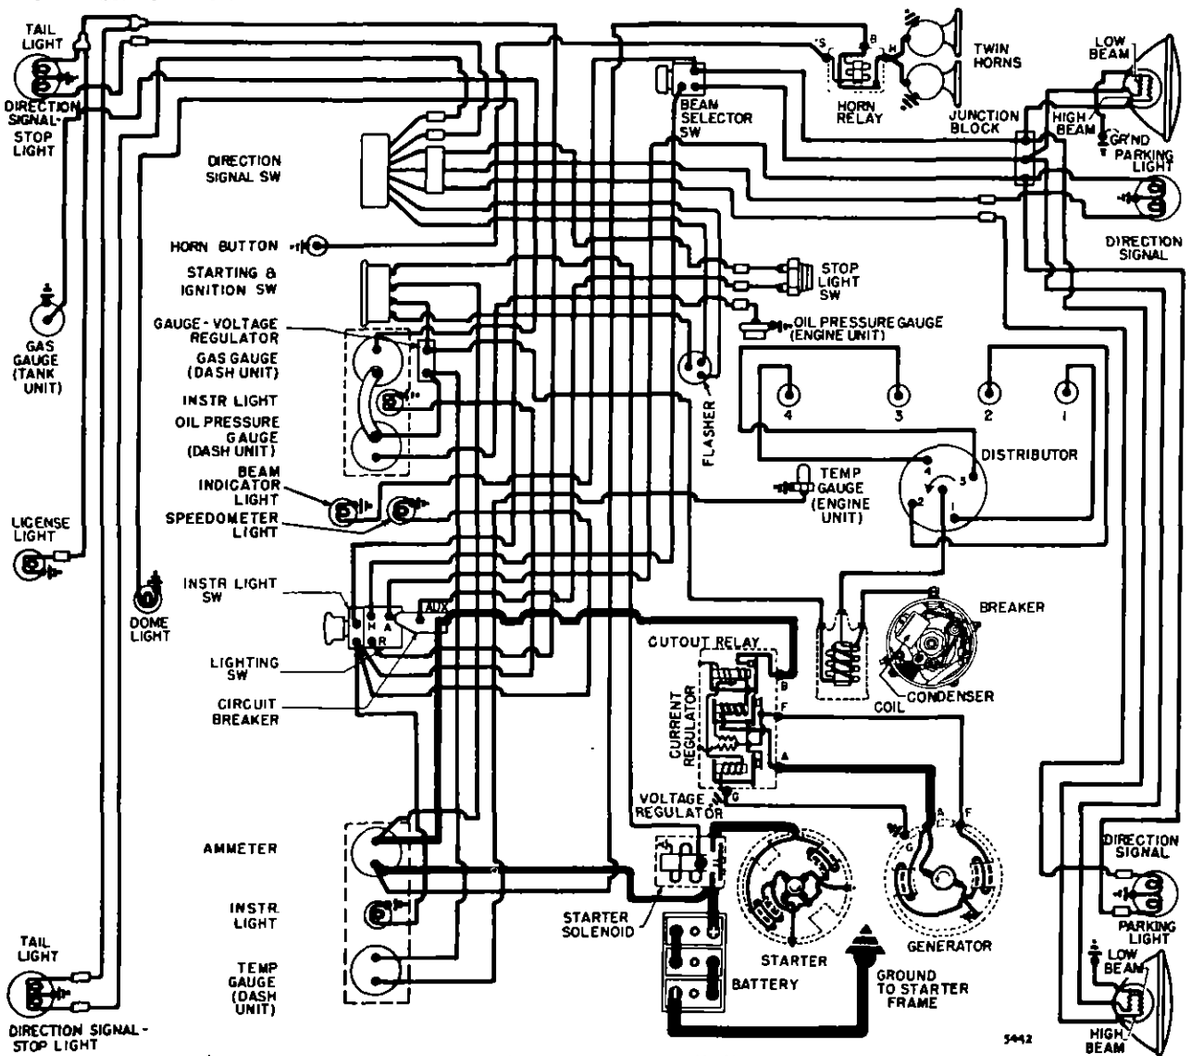
Drive—Bendix A3281 "Follow-thru" type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs.

Performance Data

Torque	R.P.M.	Volts	Amperes
0	4300	5.0	65
6.0	Lock	2.0	335

Starting Switch: Auto-Lite SSW-4012. Key starting (magnetic switch controlled by turning ignition switch past "ON" position.

GENERATOR



Auto-Lite GGW-4801D (475 & 685-B Eng.). **GGW-4801EN** (6226 Eng.).
Armature—Auto-Lite GGW-2006F (All Cars).

Performance Data

Amperes	Volts	Cold —RPM—	Hot
0	6.4	870-970	950-1050
40.0	8.0	1800-2000	2150-2350
45.0	8.0	1925-2125	2350-2550

Brush Spring Tension—35-53 ozs.
Field Current—1.4-1.5 Amperes at 5.0 volts.
Rotation—Counter-clockwise at commutator end.

CONTINUED ON NEXT PAGE

UTILITY MODELS WITH 4 CYL. "F" HEAD ENGINE
(SEE PASS. CAR DIAGRAM FOR 6-CYL. 6226 "L" HEAD ENGINE)

CONTINUED FROM PRECEDING PAGE

Belt Adjustment: 1/2-5/8" deflection with thumb pressure midway between generator and pump pulleys.

REGULATOR

Auto-Lite VBE-6105A. Voltage & Current type with "Temperature Compensated" Current Regulator.

Cutout Relay

Cuts In–6.3-6.8 Volts (set to 6.4-6.6 volts).
Cuts Out–4.1-4.8 Volts (4.6 amps. discharge).
Contact Gap–.015" minimum.
Air Gap–.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting–7.2-7.5 volts at 70° F *after 15 minutes operation charging at 1/2 maximum rate.*
Air Gap–.048-.052" with contacts just touching.
Checking & Adjusting–See *Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

Test A –Operating Amperes–	Test B
VBE-6105A 52	..... 45 (43-47)

Test A–After 15 minutes operation with current at 1/2 maximum rate.
Test B–After 15 minutes additional operation with current regulator operating (load applied to hold to 6.7-6.9 volts).
Air Gap–.048-.052" with contacts just touching.
Checking & Adjusting–See *Electrical Equip. Section.*

MISC. ELECTRICAL

Head Lamps: Sealed Beam. See *Electrical Equip. Section.*
Directional Signals: See *Electrical Equip. Section.*
Lighting Switch Removal: Loosen set screw on side of control knob and remove knob. Remove retaining nut and push switch through panel.
Stop Light Switch Location: At front end of brake master cylinder.
CIRCUIT BREAKER: 30 ampere. Thermal type on light switch.
FUSES: Direction Signal–14 amp., in flasher lead.
Radio–9 amp., in lead in radio.
Overdrive–20 amp., at overdrive relay.
Heater–14 amp. in lead to heater.
HORNS: Auto-Lite HAB-4603 (Low Pitch), HAB-4604 (High Pitch).

ENGINE

►*THREE DIFFERENT ENGINES USED AS FOLLOWS:*

6 CYL. "L" HEAD (6226 ENG.)

Bore–3-5/16", **Stroke**–4-3/8".
Displacement–226.2 cu. ins. **Rated HP**–26.3.
Developed Horsepower–115 at 3650 RPM.
Compression Ratio–7.3-1.

►*FOR ALL OTHER ENGINE DATA SEE WILLYS PASS. CAR (FOLLOWING).*

4 CYL. "F" HEAD (475 ENG.)

Bore–3 1/8". **Stroke**–4 3/8".
Displacement–134.3 cu. ins. **Rated HP**–15.63.
Developed Horsepower–75 at 4000 RPM.
Compression Ratio–6.9-1 (Std.). 7.4-1 (Optional).

►*FOR ALL OTHER ENGINE DATA SEE 1952-55 CJ-3A, CJ-3B, CJ-5 JEEP PAGES.*

6 CYL. "F" HEAD (685 ENG.)

Bore	Stroke	Displmnt.
3 1/8"	3½"	161 Cu. Ins.

Compr. Ratio	Rated HP	Developed HP
7.6-1	23.44	90 at 4200 RPM

Compression & Vacuum Reading–See *TUNE-UP.*

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" Undersize main and connecting rod journals.
"B" .010" Oversize cylinder bore and pistons.
"AB" both above conditions exist.

CYLINDER HEAD & GASKETS: See *"Cylinder Head & Manifolds" in Willys Special Data.*
TIGHTENING TORQUES: See *"Tightening Specifications" in Willys Special Data.*

PISTONS

Aluminum alloy, cam ground, T slot, Tin or Brass plated.
►*PISTON OVERSIZE NOTE:* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.
Weight–10.9 ozs.
Removal–Pistons and rods removed from above.
Fitting New Pistons: Place .003 x 1/2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove ribbon feeler should be 5 to 10 lbs.
Replacement Pistons: Std. and .010", .020", .030" and .040" Oversize.
Installing Pistons: "T" slot toward valve (left side) of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON PINS

Locked in rod with clamp screw.
Diameter–.7496-.7498".
Clearance in Piston–*.0000-.0004" max.* Push fit at 70° F.
Replacement Pins: Not furnished separately.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.023"	.002-.004"
Compr. (2nd)	3/32"	.007-.023"	.0015-.0035"
Oil	3/16"	.007-.023"	.001-.0025"

Replacement Rings: Ring sets furnished in following sizes for oversize noted: Standard (0-.010" O.S.), .020" O.S. (.011-.024"), .030" O.S. (.025-.034"), .040" O.S. (.035-.049").
Installing Rings: Compression ring marked "Top" (on side of ring) and bevel on inner edge must be up.

CONNECTING RODS

Length–6.345" (Center to Center).
Crankpin Journal Diameter–1.875".
►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" Undersize.
Bearings–Steel Backed Babbitt.
Clearance–.0001-.0025". **Side Play**–.004-.010".
Replacement Bearings: Std., .001", .002", .010", .011", .012", .020" and .030" Undersize.
Installing Rods: Rods not offset. Install with spray hole in lower end toward right side (away from camshaft) on all rods.

CRANKSHAFT

Journal Diameter–2.25" all bearings.
►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following the engine number indicates that the main and connecting rod journals are .010" Undersize.
Bearings–Steel Backed Babbitt.
Clearance–.0009-.003".
Replacement Bearings: Std., .001", .002", .010", .011", .012", .020" and .030" Undersize.
End Thrust: Taken by No. 1 (front main bearing), and thrust washer in back of crankshaft gear. Adjusted by removing or adding shims behind thrust washer. Shims furnished .002" thick.
NOTE–Crankshaft gear must be removed with gear puller for end play adjustment.
End Play–.004-.006".
Crankshaft Rear Main Bearing Oil Seal: See *"Front & Rear Filler Blocks" under "Crankshaft & Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.8770-1.8765", (2) 1.8445-1.8435", (3) 1.8130-1.8120", (4) 1.6260-1.6255".
►*CAUTION: 675-B and 685-B camshafts not interchangeable.*
Bearings–#1 steel backed babbitt. #2, 3, & 4 cast iron.
Clearance–.001-.0025".
End Thrust: Taken by thrust plate behind camshaft gear with spacer assembled behind plate. If end thrust not within these limits, replace timing gear and thrust plate. Dressing face of thrust plate may be required to reduce thickness for correct clearance.
End Play–.004-.007".
Timing Gears: Crankshaft gear Cast Iron, Camshaft gear fibre.
Gear Backlash–*.000-.002".*
Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) on crankshaft gear.
Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Willys Special Data.*

VALVES

Tappet Clearance: Intake .018", Exhaust .016" Cold.

Valve	Head Diam.	Stem Diam.	Length
Intake	1 3/4"	.3733-.3738"	4 17/32"
Exhaust	1 9/32"	.3395-.3405"	4 5/8"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	260"	.0007-.0022"
Exhaust	45°	360"	.0025-.0045"

►*EXHAUST VALVE NOTE:* Thompson type rotators used on exhaust valves.
Valve Seat Width: 3/64" (All valves).
Valve Springs: Intake & Exhaust springs not interchangeable. See table below.

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	73 lbs. at 1.66"	50 lbs. at 1 5/8"
Open	153 lbs. at 1.40"	105 lbs. at 1 21/64"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Free Length—1.968" (Intake), 1.890" (Exhaust).
Valve Guides: Removable type. Drive guides out with Tool W-240. To install, use Tool W-240 with correct adaptors and drive guides into head and cylinder block until top of guide is 7/8" from top of valve seat (taper end toward seat).
Rocker Arm Assembly Removal: *See "Valve System" in Willys Special Data.*
Valve Lifters: Mushroom type, in reamed holes in block. Service by installing oversize lifters.
Lifter Removal—Camshaft must be removed first. *See "Camshaft & Bearings" in Willys Special Data.*
Lifter Diameter—.6240-.6245". **Length**—2".
Clearance in Block—.0005-.002".

VALVE TIMING

See "Camshaft Setting" under Camshaft.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
NOTE—Set Intake valve tappet for timing .026" Cold.
Valve Timing Check—Set Intake tappet clearance as given above with tappet resting on low side of cam lobe. Rotate crankshaft until No. 1 piston is coming toward top of cylinder on Exhaust stroke, then continue to rotate crankshaft until the 9° BTDC mark on dampener is aligned with pointer on timing gear case. With crankshaft in this position No. 1 Intake tappet should be JUST TIGHT against valve stem if timing is correct. Reset tappet clearance to .018". *See "Camshaft Setting" under Camshaft.*

OILING SYSTEM

Crankcase Capacity: 4 quarts.
Normal Oil Pressure: 35 lbs. at 30 MPH (2000 RPM).
Pressure Regulator—Under plug on side of pump housing. Adjust to 35 lbs. pressure by adding or removing shims located above spring in plug.
Oil Pressure Indicator: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 45729.
Engine Unit—K-S No. 44030.
See "Oil Pressure Gauges" in Miscellaneous Section.
Oil Pump: Rotor type. On left side of crankcase.
Pump Overhaul—*See "Oil Pump" in Willys Special Data.*
Oil Filter: Fram or Purolator. Located on cylinder head bracket at right front corner of cylinder head with oil outlet connected to timing gear cover.

COOLING

Water Capacity: 12 quarts. Add 1 quart for heater.
Pressure Valve: Radiator filler cap. Opens at 7 lbs.
Thermostat: Harrison. In water outlet elbow in cylinder head. Opens at 163-168°.
Water Pump: Centrifugal, packless, ball bearing type.
See "Willys" in Water Pump Section.
Temperature Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 45734.
Engine Unit—K-S No. 44220.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Rockford 8½ RM, Auburn 8501-39, Borg & Beck 10A7, Single Plate type. Use as follows:
475 & 685 Engines—Rockford 8½ RM or Auburn 8501-39.
6226 Engine—Borg & Beck 10A7. Assembly No. 982.
See Clutch Section for complete data.
Clutch Disc—As follows: *(NOTE—Borg & Beck Clutch Disc used with Rockford Clutch).*

Engine	Borg & Beck No.	Auburn No.
475	381580	100020
685	382113 & 382231	100043
6226	381806	

Pedal Adjustment: 1¼" free travel (475 & 685 Engines). 1" free travel (6226 Engine). Loosen two locknuts on pedal adjusting link and adjust as necessary.
Removal: Remove transmission (and transfer case on 4-wheel drive models). See Transmission Removal (below). Remove flywheel bellhousing. Mark clutch and flywheel for installation in the same position. Remove clutch cover screws evenly to remove spring pressure, then remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

4 WHL. DRIVE

Warner AS1-T90J (6226 Eng.), **AS1-T90C** (475 Eng.). Three speed type. Constant mesh, synchro-mesh, helical gears (second & high), sliding spur gear (low & reverse).
See "Warner Transmissions" in Transmission Section.
Transfer Case: Spicer or Warner. Two speed auxiliary transmission and front wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front wheel drive engagement (left hand lever).
See Transmission Section for complete data.
Transmission Controls: *See "Transmission Controls" in Transmission Section.*
Removal: (4 Whl. Drive) Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shafts at universal joints *(NOTE*—If equipped with Power Take-off drive, remove front end of power take-off propeller shaft assembly). Disconnect speedometer cable at transfer case, brake cable, and clutch release cable at cross shaft bell crank (Jeep). Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and shift levers *(NOTE*—If Power Take-off used, remove power take-off shift lever plate screws and lift lever out). Remove bolts holding center cross-member at frame side rails and remove cross-member *(CAUTION* -With cross-member removed, engine and transmission weight will rest on support jacks). Remove bolts holding transmission on bell housing, force transmission to right until ball stud end can be disengaged from end of clutch control cross shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

2-WHL. DRIVE

Warner AS50-T96 with Overdrive (685 Engine). Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.
Transmission Control: Remote control type with gear-shift lever on steering column. *See "Transmission Controls" in Transmission Section.*
Removal: (2 Whl. Drive) Remove floor boards, take off bell housing inspection cover, disconnect clutch throw-out bearing retracting spring. Disconnect transmission control rods and speedometer cable at transmission case. Disconnect propeller shaft at universal joints and remove shaft. Support engine with jack placed under bell housing, remove rear engine support bolts from cross-member under transmission case, raise rear end of engine so transmission clears cross-member *(CAUTION* –Use care that fan blades do not damage radiator). Remove transmission bell housing bolts, pull transmission straight back to clear clutch shaft, remove from car.

OVERDRIVE

Warner R10. Part of transmission assembly. *NOTE—Lockout Switch not used on 1955 models.*
See "Warner R10 Overdrive" in Transmission Section.
Overdrive Controls: *See "Warner R10 & R11 Overdrive Controls" in Transmission Section.*
Removal: Same as for standard transmission after control wiring and cables removed.

UNIVERSALS

2-WHL. DRIVE

Spicer (Cross) or Detroit (Ball & Trunnion). One at each end of propeller shaft.

4 WHL. DRIVE

Drive Shaft Joints—Spicer (Cross) One used at front and rear of both front and rear propeller shafts.
Front Axle Shaft Joint—Rzeppa Constant Velocity type. One joint used at outer end of each shaft (within steering knuckle housing).
See "Universal Joints" in Willys Special Data.
Power Take-off Shaft Joints—Detroit Ball-and-Trunnion type. Two used (one at each end of shaft-no splined joint used).

FRONT AXLE

4 WHL. DRIVE

Spicer (Salisbury) Model 25. Full floating, Hypoid gear type. Differential assembly (ring and pinion gear assembly) is serviced in same manner as Spicer Rear Axles.
See "Spicer(Salisbury)" in Rear Axle Section.
Ratio—5.38-1 (Exc. 6226-4X4SW, 4WD). 4.88-1 (6226-4X4SW, 4WD).
Backlash—.004-.007". Shim Adjustment.
Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

steering linkage (at idler lever on frame front cross member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange cap screws and remove flange with puller, (*CAUTION*–do not lose shim pack under drive flange). Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly.((*CAUTION*–use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

►*INSTALLATION CAUTION:* Adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment: *See "Front Axle" in Willys Special Data.*

Steering Knuckle Bearing Disassembly & Adjustment: *See "Front Axle" in Willys Special Data.*

REAR AXLE

Spicer Model 44-2 (Exc. 475-4WD & 6226-4WD). Model 53 (475-4WD & 6226-4WD). Semi-floating hypoid gear type with Hotchkiss drive.

►*TIMKEN SPIRAL BEVEL REAR AXLE NOTE: These used intermittantly in production on 4-WD Trucks. See "Timken Rear Axle" in Rear Axle Section.*

See "Spicer Hypoid Semi-Floating" or "Timken Semi-Floating" in Rear Axle Section.

Axle Ratios

Model	Std. Trans.	O.D. Trans.
2-Wheel Drive	4.88-1	©4.88-1
4 Cyl. 4-Wheel Drive	5.38-1	
6 Cyl. 4-Wheel Drive	4.88-1©	

©–5.38-1 Optional.

Backlash–.004-.007". Shim adjusted.

Axle Shaft Removal: *See "Spicer Hypoid Semi-Floating" in Rear Axle Section.*

Rear Axle Assembly Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs. Remove axle assembly from beneath car.

Wheel Bearing Adjustment: End Play .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See "Axle Shaft Removal" above.

SHOCK ABSORBERS

Monroe or Gabriel. Direct acting type.

FRONT SUSPENSION

2 WHL. DRIVE

Planadyne Type. Independent, linked parallelogram type with transverse spring (spring acts as lower control arm).

See "Willys Front Suspension" in Front Suspension Section.

Kingpin Inclination–5° crosswise.

Caster–1° No adjustment.

Camber–1°.

Toe-in–1/16-1/8". *See "Willys Planadyne" in Front Suspension Section for Toe-in Adjustments.*

4 WHL. DRIVE

Special front-wheel drive unit with semi-elliptic springs. Steering knuckle mounted on taper roller bearings carried on two stub shafts.

End Play–.001-.003".

Kingpin Inclination–7-1/2°.

Caster–3°. No adjustment. If caster incorrect, check front end, correct by installing new parts.

Camber–1-1/2°. No adjustment. Correct by installing new parts. Do not attempt to correct camber by cold bending or heating of parts.

Toe-in–3/64-3/32". (1/32" each wheel) To adjust first set each front wheel straight ahead (see note below), then set toe-in by shortening each tie rod approximately 1/2 turn. This procedure necessary to maintain correct position of steering idler arm.

NOTE–To set front wheels straight ahead, first set tie rod end of steering bell crank (idler lever on frame cross member) exactly at right angles to front axle. Check front wheels by using a straight edge or sighting along rear and front wheels. Adjust each tie rod (loosen end clamp bolts and turn rod) until front wheels are exactly straight ahead. Then make toe-in adjustment as directed above. Tie rod lengths between ball end centers should be 20-7/8"(left), 25-5/8"(right).

Toe-Out on Turns–With inner wheel turned 20°, outer wheel should be turned exactly 19°.

STEERING

Ross T-12, No. 13108. Cam & *Twin* Lever type.
See "Ross Cam & Twin Lever" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" in Steering Section.*

BRAKES

Bendix-Lockheed (Self-Centering). Without anchor pin adjustment. Hand lever applies rear service brakes (Exc. Jeep). Independent brake on drive shaft at rear of transfer case (Jeep).

See "Bendix-Lockheed (Self-Centering)" in Brake Section.

Drums–Diameter 10"(2-Whl.Drive); 11" (4-Whl. Drove).

Wheel Cylinder Diameter–(Front) 1 1/8". (Rear) 1".

Model	Lining Length Primary	Secondary
2 Whl. Drive	10 11/16"	8 5/8"
4 Whl. Drive	12 1/4"	10"

Thickness–.212" (2 Whl. Drive); .187" (4 Whl. Drive).

Width–1¾" (2-Whl. Drive); 2" (4-Whl. Drive).

Braking Power–Front 65%. Rear 35% (2-Whl. Drive); Front 57%. Rear 43% (4-Whl. Drive).

Clearance–.005-.008" all models.

MISC. MECHANICAL

Windshield Wipers: Vacuum type. Single motor operates wiper arms by cable control.
See "Windshield Wipers" in Miscellaneous Section.

MODEL IDENTIFICATION

Model	Engine
1954 675-B Aero Lark	6 Cyl. "L" Head
1954 685-B Aero Lark	6 Cyl. "F" Head
1954 685-B Aero Eagle	6 Cyl. "F" Head
1954 685-B Aero Ace	6 Cyl. "F" Head
1954 6-226 Eagle	6 Cyl. "L" Head
1954 6-226 Ace	6 Cyl. "L" Head
1955 6-226-A Bermuda	①6 Cyl. "L" Head
1955 6-226-A Custom	①6 Cyl. "L" Head

①—1955 Model Designation as follows: 52567 (Bermuda), 52367 (Custom).

SERIAL NUMBER: Located on left front door pillar. **Starting Serial Number—10001 up.**

ENGINE NUMBER: Stamped on engine block as follows:
685-B & 6-226 Engines—Stamped at right top of cylinder block near the front.
675-B Engine—Stamped either on top of the water pump boss or on right side of cylinder block at upper front.

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" undersize main and connecting rod journals.
"B" .010" oversize cylinder bore and pistons.
"AB" both conditions above exist.

TUNE-UP

COMPRESSION PRESSURE: (675B) 135 lbs. at 185 RPM., (685B) 155 lbs. at 185 RPM., (6226) 120 lbs. at 70 RPM.

VACUUM READING: Steady 17-21" at idling speed.

VALVE TAPPET CLEARANCE: Set all tappets cold as follows:

Engine	Intake	Exhaust
6226	.014"	.014"
675B	.016"	.016"
685B	.018"	.016"

MANIFOLD HEAT CONTROL: (675B) Automatic thermostatic type (no adjustment). (685B) None (water thermostat controlled). (6226) None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAP: .030".
Spark Plug—Champion J8, 14 mm.

COIL: Auto-Lite CR-6009.
Ignition Current—2.5 amperes idling, 5 amperes at 6.3 volts stopped.

DISTRIBUTOR: Auto-Lite IAT-4017A (675-B & 685-B); IAT-4019 (1954 6-226); IAT-4206 (1955 6-226-A).
Condenser (IAT-4017A & 4019)—IAT-3076L. **Capacity** .23-.25 mfd.
Condenser (IAT-4206)—IAT-2015L. **Capacity** .21-.25 mfd.
Contact Point Set—Auto-Lite IGW-3028AS.
Breaker Gap—.020".
Cam Angle—39°±3°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance (IAT-4017A)

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
1	400	2	800
4	725	8	1450
8	1150	16	2300
9.5	1300	19	2600

Automatic Advance (IAT-4019 & 4206)

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	325	0	650
1	450	2	900
6.5	1200	13	2400

9	1675	18	3350

Vacuum Spark Control: Auto-Lite IAT-2023LE (IAT-4017A Distr.), Auto-Lite IAT-2023LD (IAT-4019 Distr.).

Vacuum Advance (IAT-4017A)

Distr. Degrees	Engine Degrees	Vacuum ("of HG)
Start	0	5-1/8
1	2	6-5/8
3	6	9-5/8
5	10	12-1/2
6	12	14

Vacuum Advance (IAT-4019 & 4206)

Distr. Degrees	Engine Degrees	Vacuum ("of HG)
Start	0	10
1	2	11
3	6	13
4	8	14
5	10	15

IGNITION TIMING

Setting—5° BTDC (Exc. 6-226 Eng.). 4° BTDC (6-226 Eng.).
Timing Mark—On Vibration Damper. Vibration Damper marked "0" at TDC with 1° graduations before and after this point. Align correct graduation with pointer on timing cover.

CARBURETOR

Car Model	Carter Carburetor No.
675B	YF 937S
685B	YF 2071S
6226	WGD 2052S, SA

CARTER YF

Idle Setting—3/4—1-3/4 turns open (937S), 1-2 turns open (2071S). Turn screw out for richer mixture.
Idle Speed—575 RPM.
Float Level—(937S) 5/16", (2071S) 9/32" from top of float at free end to gasket seat on cover with assembly inverted and float resting freely on seated needle.
CAUTION—Do not compress spring in intake needle.
Accelerating Pump—No seasonal adjustment.
Fast Idle: With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.
Automatic Choke Setting: None, Manual Choke.
►*OTHER DATA: See "Carter YF" in Carburetor Section.*
Fuel Pump Pressure: 5 lbs. Max. at 1800 RPM.

CARTER WGD

Idle Setting—1/2—1-1/2 turns open. Turn out for richer mixture.
Idle Speed—550 RPM Std. Trans., 425-450 RPM Hydra-Matic.
Float Level—9/32" between top of float and bowl cover with gasket removed and cover inverted.
Accelerating Pump—No seasonal adjustment.
Fast Idle—.018-.023" throttle valve opening (Gauge T109-29) with choke closed and thermostatic coil housing, gasket, and baffle plate removed.
Automatic Choke Setting: Set two points rich.
►*OTHER DATA. See "Carter WGD" in Carburetor Section.*
Fuel Pump Pressure: 5 lbs. Max. at 1800 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter 794S (675 & 685B). Carter M957S (6226).
Pressure—5 lbs. at 1800 RPM.
See "Fuel Pumps" in Carburetion Equipment Section.
Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—King-Seeley 46663.
Tank Unit—K-S No. 44506 (1954); No. 44521 (1955).
Regulator—K-S No. VR-46667.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Auto-Lite or Willard. 6 Volt, 15 plate, 90 Ampere (20 hr. rate).
Battery Ground—Negative (—) terminal.
Engine Ground—Strap from engine to frame at right front engine mounting.

STARTER

Auto-Lite Number	Starter	Armature
675B & 685B	MCH-6203	MCH-2088
6226 (Synchro-mesh)	MCH-6210	MCH-2012BS
6226 (Hydra-Matic)	MCH-6211	MCH-2012BS

Drive—Bendix A3281 "Folo-Thru" type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 ft. lbs.	Lock	2.0	335

Starting Switch: Auto-Lite SST-4012. Key starting (magnetic switch) controlled by turning key past "ignition on" position.

GENERATOR

Auto-Lite GGW-4801D (675B & 685B Eng.), **GGW-4801EN** (6226 Eng.).
Armature—Auto-Lite GGW-2006F (All models).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Amperes	Volts	Cold -RPM-	Hot
0	6.4	870-970	950-1050
40.0	8.0	1800-2000	2150-2350
45.0	8.0	1925-2125	2350-2550

Brush Spring Tension–35-53 ozs.
Field Current–1.4-1.5 amperes at 5.0 volts.
Rotation–Counter-clockwise at commutator end.
Belt Adjustment: 1/2-5/8" deflection with thumb pressure midway between generator and pump pulleys.

REGULATOR

Auto-Lite VBE-6105A. Voltage & Current type with "Temperature Compensated" Current Regulator.

Cutout Relay

Cuts In–6.3-6.8 Volts (Set to 6.4-6.6 Volts).
Cuts Out–4.1-4.8 Volts (4.6 amps. discharge).
Contact Gap–.015" minimum.
Air Gap–.031-.034 with contacts open (check at hinge end of core).

Voltage Regulator

Setting–7.2-7.5 Volts at 70° F *after 15 minutes operation charging at 1/2 maximum rate.*
Air Gap–.048-.052" *with contacts just touching.*
Checking & Adjusting–*See Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A – Operating Amperes –	Test B
VBE 6105A	52	45 (43-47)

Test A–After 15 minutes operation with current at 1/2 maximum rate.
Test B–After 15 minutes additional operation with current regulator operating (load applied to hold to 6.7-6.9 volts).
Air Gap–.048-.052" with contacts just touching.
Checking & Adjusting–*See Electrical Equip. Section.*

MISC. ELECTRICAL

Head Lamps: Sealed Beam. *See Electrical Equip. Section.*
Directional Signals: *See Electrical Equip. Section.*
Lighting Switch Removal: *Loosen set screw on side of* control knob and remove knob. Remove retaining nut and push switch through panel.
Stop Light Switch Location: Located in front end of brake Master Cylinder.
CIRCUIT BREAKER: 30 ampere. Thermal type on light switch.
HORNS: **Auto-Lite HAB-4603** (Low Pitch), **HAB-4604** (High Pitch).

ENGINE

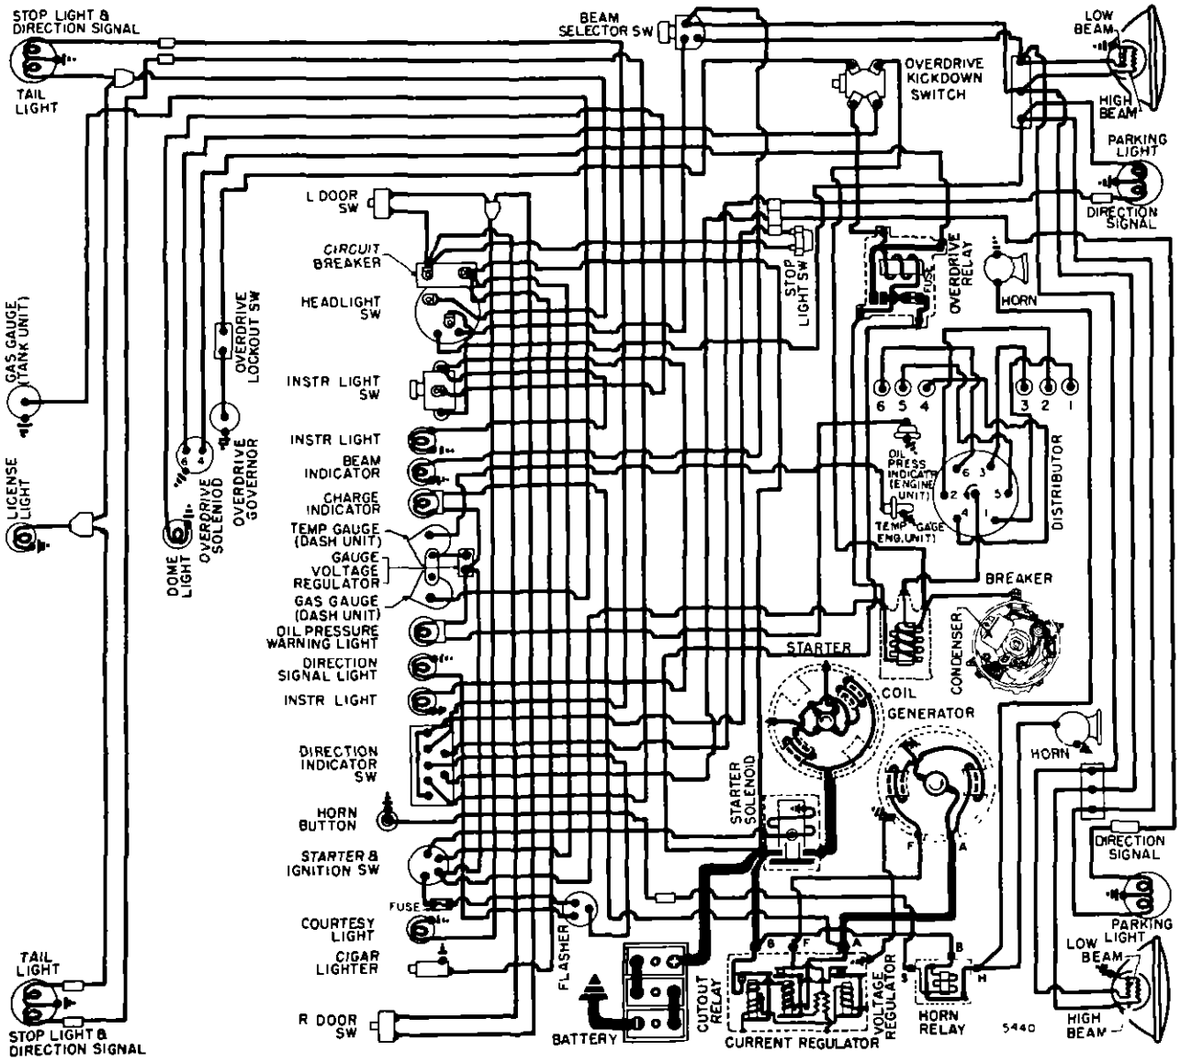
►*THREE DIFFERENT ENGINES USED AS FOLLOWS:*

6 CYL. "L" HEAD (675-B ENG.)

Bore–3 1/8". **Stroke**–3 1/2".
Displacement–161 cu. ins. **Rated HP**–23.44.
Developed Horsepower–75 at 4000 RPM.
Compression Ratio–6.9-1.
Compression & Vacuum Reading–*See TUNE-UP.*
►*FOR ALL OTHER ENGINE DATA SEE 1952-53 WILLYS PASSENGER CAR PAGES.*

6 CYL. "F" HEAD (685-B ENG.)

Bore–3 1/8". **Stroke**–3 1/2".
Displacement–161 cu. ins. **Rated HP**–23.44.
Developed Horsepower–90 at 4200 RPM.
Compression Ratio–7.6-1
Compression & Vacuum Reading–*See TUNE-UP.*
►*FOR ALL OTHER ENGINE DATA SEE 1952-53 WILLYS PASSENGER CAR PAGES.*



6 CYL. "L" HEAD (6-226 & 6-226-A ENG.)

ENGINE SPECIFICATIONS: 6 cyl. "L" head.
Bore–3-5/16". **Stroke**–4-3/8".
Displacement–226.2 cu. ins. **Rated HP.**–26.3
Developed Horsepower–115 at 3650 RPM.
Compression Ratio–7.3-1.
Compression & Vacuum Reading–*See TUNE-UP above.*
►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" Undersize main and connecting rod journals.
"B" .010" Oversize cylinder bore and pistons.
"AB" both above conditions exist.

CYLINDER HEAD & GASKET INSTALLATIONS: *See Willys Special Data.*

TIGHTENING TORQUES: *See Willys Special Data.*

CONTINUED ON NEXT PAGE

MODELS WITH 675-B & 685-B ENGINES

CONTINUED FROM PRECEDING PAGE

PISTONS

Aluminum alloy, steel band, T-slot Cam Ground, Tin Plated.

►*PISTON OVERSIZE NOTE:* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.

Weight—15.312 ozs. Less rings and pin.

Removal—Pistons and rods removed from above.

Fitting New Pistons: Place .0015" x 2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove feeler should be 5 to 10 lbs.

Piston Replacement—Std., .010", .020", .025", .030", .040", .050", and .060" Oversize.

Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON PINS

Floating type with lock ring at each end.

Diameter—.8591-.8593".

Clearance in Piston—.0001" (Selective Fit).

Replacement Pins: Std., .003" and .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Upper)	.0925-.0935"	.008-.016"	.002-.004"
Compr. (Lower)	.0925-.0935"	.008-.016"	.003-.007"
Oil (Top ring)	.1545-.1555"	.008-.016"	.006-.010"
Oil (Bottom ring)	.1545-.1555"	.008-.016"	.0025-.004"

Replacement Rings: Ring sets and single rings furnished in following sizes for oversize ranges indicated: Std. (Std.-.009"), .020" (.010-.029"), .030" (.030-.039"), .040" (.040-.049"), .060" (.050-.069").

Installing Rings: Side marked "Top" (compression rings) upward. Chrome plated ring must be installed in top (#1) ring groove.

CONNECTING RODS

Length—6.998"-7.002" (Center to center).

Crankpin Journal Diameter—2.0619-2.0627".

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings—Steel Backed Babbitt.

Clearance—.0005-.0015". **Side Play**—.006-.011".

Replacement Bearings: Std. and .001", .002", .010" and .012" Undersize.

Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. *NOTE*—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 forward), (#2, 4, 6 toward rear).

CRANKSHAFT

Journal Diameter—2.3744-2.3752".

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following the engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings—Steel Backed Babbitt.

Clearance—.0005-.0015".

Replacement Bearings: Std. and .001", .002", .010" and .012" Undersize.

End Thrust: Taken by #4 rear main bearing which is flanged type.

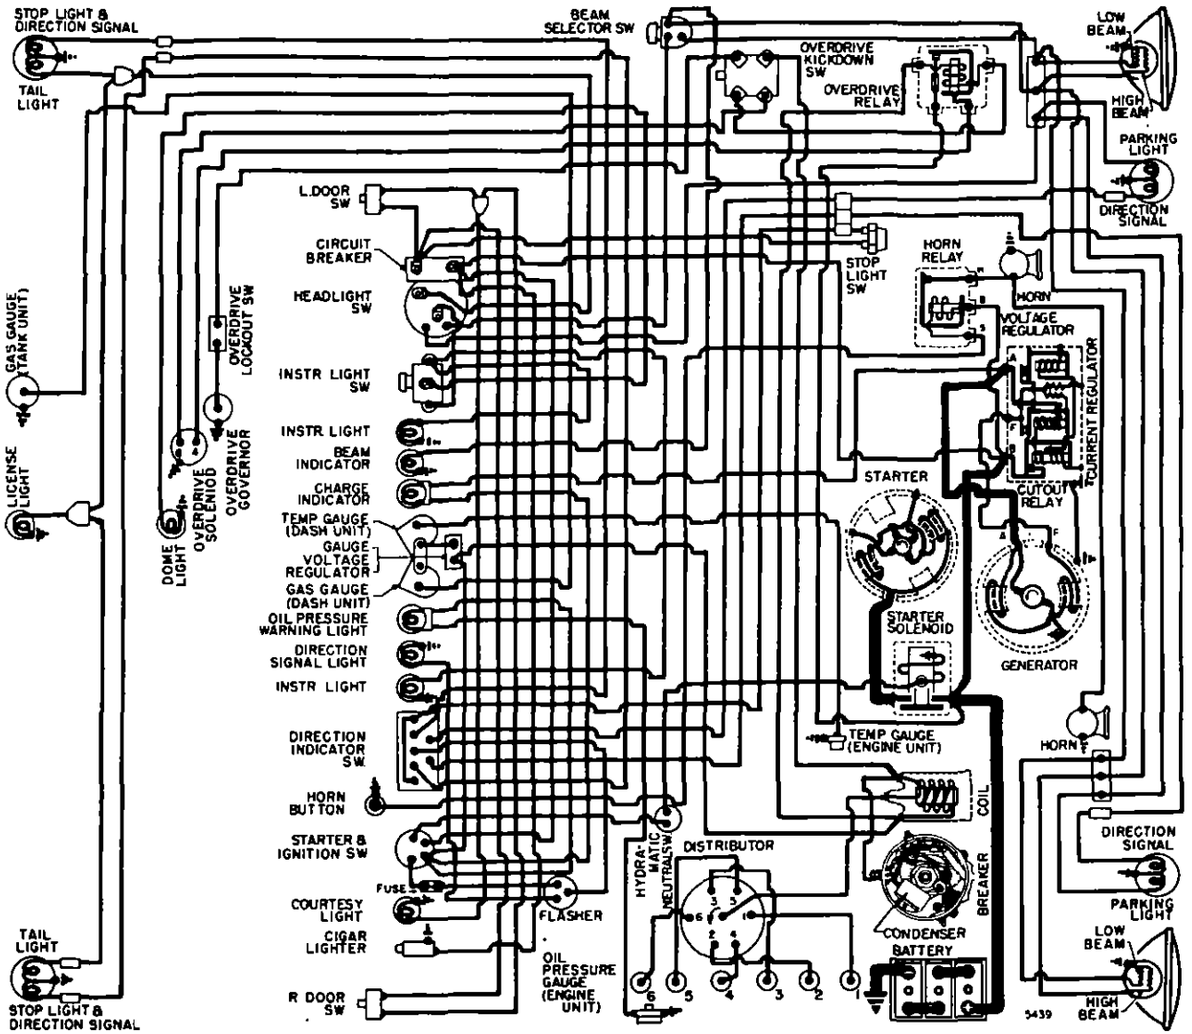
End Play—.002-.006".

Rear Bearing Oil Seal Installation: *See "Crankshaft and Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.8725-1.8735". (2) 1.8095-1.8105". (3) 1.7472-1.7485". (4) 1.2475-1.2485".

Bearings—Steel Backed Babbitt.



Clearance—.001-.003".

End Thrust: Taken by thrust plate on front of engine (between front bearing journal and hub of sprocket).

End Play—.003-.007".

Timing Chain: Non-adjustable type. Width 1". Pitch .500". Length 23" or 46 links.

►*TIMING CHAIN CAUTION: Morse and Link Belt chains used. Chains and sprocket interchangeable only in COMPLETE SETS.*

MODELS WITH 6-226 ENGINE

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES

Tappet Clearance: Intake and Exhaust .014" Cold.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.520"	.3406-.3414"	5.190"
Exhaust	1.328"	.3382-.3390"	5.200"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.3520"	.001-.003"
Exhaust	45°	.3315"	.0032-.0052"

Valve Seat Width: 5/64-3/32" (intake), 3/32-7/64" (exhaust).

NOTE–Rotators used on Exhaust valves.

Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides to inside diameter of .3432-3422".

Replacement Guides–Std., .0005" (marked "A"), .0055" (marked "L") to insure .0005-.003" press fit.

Guide Installation–Place guide (tapered end of guide toward top) in position in bore and drive in to correct position of 1-7/32" below top face of cylinder block.

Valve Springs: Intake & Exhaust valve spring interchangeable.

Free Length–1-31/32".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	51	1.672"
Open	118	1.312"

Valve Lifters: Mushroom type with self locking adjusting screws.

Diameter–.6855-.6860".

Clearance–Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.

Replacement Lifters–Furnished in Std. and the following oversizes marked as indicated: "B" is .001", "D" is .002", and "K" is .005" O.S.

VALVE TIMING

See *"Camshaft Setting" under CAMSHAFT above.*

Intake Valves–Open 10° BTDC. Close 60° ALDC.

Exhaust Valves–Open 55° BLDC. Close 10° ATDC.

Valve Timing Check–With .020" tappet clearance, #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark after top dead center "0" mark on dampener aligned with pointer at front of engine. Reset tappet to .014" clearance COLD.

OILING SYSTEM

Crankcase Capacity: 5 quarts.

Normal Oil Pressure: 20 lbs. at 2000 RPM. 6 lbs. at idle.

Pressure Regulator Valve–Located on oil pump housing. Adjustable by removing or adding shims from above spring within plug.

Oil Pressure Indicator–King-Seeley electric type oil pressure switch, operates light on instrument panel.

Dash Unit–Warning indicator light used. Light goes on when ignition switch turned on, and goes out when oil pressure rises.

Engine Unit–King-Seeley 47150.

Oil Pump: Internal rotor type. Mounted externally on left side of crankcase (675-B & 685-B). Attached to rear intermediate main bearing cap (6226).

Pump Overhaul–*See Willys Special Data.*

Oil Filter: Fram or Purolator. Located left side of engine (6226) right side of engine (675-B) on top of rocker arm cover (685-B). Replace cartridge every 8000 miles or more often should vehicle be operated under dusty conditions.

Crankcase Ventilation: Filter in Oil filler cap and ventilator tube attached to valve cover.

COOLING

Water Capacity: 11 qts. (675-B & 685-B); 13 qts. (6-226 & 6-226-A). Add 1 qt. for heater.

Pressure Valve–4 lbs. (675-B, 685-B). 7 lbs. (6226). Radiator filler cap.

Thermostat: Harrison (675-B & 685-B). Dole (6226) choke type. Harrison opens at 151°. Dole opens at 148-150°.

Water Pump: Centrifugal, prelubricated ball bearing. *See "Willys" in Water Pump Section.*

Pump Removal–675-B & 685-B) Remove fan belt, blades and pulley. Remove water pump to motor attaching bolts. **(6226)** Remove generator adjusting link (by removing pump bolt). Remove fan belt and remaining pump mounting bolts and remove pump.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) electric type.

Dash Unit–K-S No. 46665.

Engine Unit–K-S No. 44200 (1954); No. 44214 (1955).

Regulator–K-S No. VR-46667.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Rockford 8-1/2 RM, Auburn 8501-39, Borg & Beck 10A7. Single plate type. Used as follows:

(675-B & 685-B) Rockford 8-1/2 RM or Auburn 8501-39.

(6226) Borg & Beck 10A7. Assy. No. 982.

See Clutch Section for complete data.

Pedal Adjustment: (675-B & 685-B) 1-1/2" free travel. Lengthen or shorten the clutch control rod by loosening locknut and screwing adjusting nut in or out as required. Tighten locknut.

Pedal Adjustment: (6226) 1" free travel. Loosen two locknuts on pedal adjusting link. Turn nuts forward to increase or backward to decrease free travel. Tighten locknut.

Removal: Remove transmission (see Transmission Removal), remove flywheel bell housing. Mark pressure plate and flywheel to insure correct installation. Take out mounting screws in clutch cover flange (turn screws out evenly), remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Numbers	Std. Trans.	Overdrive
(675-B & 685-B)	AS51-T96	AS50-T96
(6226)	AS71-T86E	

See "Warner Transmissions" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect remote control rods and the front universal joint companion flange at transmission. Disconnect speedometer cable at transmission and plug opening. Place a jack under flywheel housing to support engine weight and remove rear crossmember support with rubber insulators attached. Loosen the four transmission-to-bell housing bolts as far as possible and yet support transmission weight. Pull transmission back to bolt heads and insert a long screwdriver through opening in bell housing and pry the clutch release fork from engagement with bearing carrier. Place a jack under the engine for support when transmission removed, then remove transmission mounting bolts and remove transmission from car.

OVERDRIVE

Warner R10. Part of transmission assembly. *NOTE–Lockout Switch not used on 1955 models.*

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Controls: *See "Warner R10 & R11 Overdrive Controls" in Transmission Section.*

Removal: Same as for standard transmission after control wiring and cables removed.

HYDRA-MATIC DRIVE

Dual Range. Four speed automatic transmission with fluid coupling.

See "Hydra-Matic Drive" in Transmission Section.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING AND TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication–Check fluid level every 1,000 miles and drain and refill Torus cover and Oil Pan every 25,000 miles.

Capacity–11 quarts.

Checking Fluid Level–Check only when engine and transmission at operating temperature, with selector lever in "N" position and engine idling at 575 RPM. Remove access plate from right front floor pan, clean all dirt from around filler cap, check level as indicated on dipstick and maintain level to "F" mark.

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer (Cross) (6226), **Detroit (Ball & Trunnion)** (675-B & 685-B). One at each end of propeller shaft.

REAR AXLE

Spicer Hypoid Semi-floating. *See "Spicer Hypoid Semi-floating" in Rear Axle Section.*

Axle Ratio

Model	Std. Trans.	Overdrive	Automatic
675-B, 685-B	4.1-1 (41-10)	4.56-1 (41-9)	
6226	3.54-1 (46-13)	4.1-1 (41-10)	3.31-1 (43-13)

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rear Axle Ratio Note–Ratio is stamped on metal tag attached to rear axle cover.
Backlash–.004-.007". Shim adjusted.
Axle Shaft Removal: Remove wheel and hub assembly. Disconnect brake line at rear wheel cylinder, remove nuts on bolts holding backing plate and brake assembly on axle housing. Remove dust shield, oil seal, and backing plate and flange on housing. Remove axle shaft and wheel bearing.
Rear Axle Assembly Removal: Support rear of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line at "T" fitting on axle housing, rear brake cables and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of spring, lower springs, remove axle assembly from beneath car.
Wheel Bearing Adjustment: End play .003-.007". Adjust by adding or removing shims from between backing plate and axle housing flange, at each wheel.

SHOCK ABSORBERS

Monroe or Gabriel. Direct Acting. Service by replacement.

FRONT SUSPENSION

Independent. Linked parallelogram type, with coil springs and direct acting shock absorbers.
See "Willys Front Suspension" in Front Suspension Section.
King Pin Inclination–8-1/4° crosswise.
Caster–Pos. 1° ± 1/2°.
Camber–Pos. 1° ± 1/4°.
Toe-in–3/32-5/32".
Toe-out on Turns–Outside wheel at 19°, inside wheel 20°.

STEERING

Ross Cam & Twin Lever (Except Power Steering). *See "Ross Cam & Twin Lever" in Steering Section.*
Gemmer Worm & Roller (Power Steering). *See "Gemmer Worm & Roller" in Steering Section.*
Power Steering: Monroe Hydraulic (685-B & 6226) Linkage type.
See "Monroe Power Steering" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" or "Ross Cam & Twin Lever" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller" or "Ross Cam & Twin Lever" in Steering Section.*

BRAKES

Bendix (Lockheed) Hydraulic. Self centering. Hand lever applies rear service brakes.
Drums–9".
Wheel Cylinder Diameter–Front 1-1/8", Rear 13/16".
Lining–Molded Asbestos.
Lining Specifications–As follows:

Shoe	Length	Width	Thickness
Primary	9-7/8"	2"	.214"
Secondary	7-11/16"	1-3/4"	.214"

Braking Power–65% front, 35% rear.
Clearance–.005-.008".

NOTE–No anchor pin adjustment provided. Brake shoes should be centralized by hard application (and then released) before adjustment made.
Master Cylinder: Located just ahead of brake pedal and filled from engine compartment.
Removal–Remove from engine compartment without disturbing other parts.
Checking Fluid–Check fluid level every 1,000 miles and keep full at all times.

MISC. MECHANICAL

Windshield Wipers: Vacuum type. *See Miscellaneous Section for complete data.*

FOR PREVIOUS MODELS & 1956 MODELS

BUICK

► *LATE 1955 SERIES 40 STROMBERG "WW" CARBURETORS: See 1956 "Stromberg WW (Buick) Carburetor" in Carburetion Section for data on this model.*

► *1954-56 DETONATION CORRECTION: See "IGNITION NOTES" in 1956 Buick Special Data (Pg. 6) for recommended procedure.*

► *1953-56 V8 REDUCING OIL FLOW TO VALVE MECHANISM ON CYLINDER HEAD·* If oil flow to rocker arms and pushrods is excessive, special reducer can be installed in oil lead in cylinder head. *See "VALVE SYSTEM" in 1956 Buick Special Data (Pg. 5) for recommended procedure.*

► *1955 BUICK HYDRAULIC LIFTER "LEAK DOWN" RATE CHANGE·* Hydraulic lifter test "leak-down" rate was changed to provide greater clearance between lifter body and plunger to reduce chance of sticking lifters. New specification is 9-30 seconds (superseding 12-40 seconds). Make this change on 1955 Buick Special Data Pg. 6 in 1955 Final Data (shown as 12-14 seconds).

► *1955-56 CRANKSHAFT REAR MAIN BEARING ALIGNMENT (To prevent wear on thrust surfaces):* When installing rear main bearing cap, thrust faces should be aligned as follows to prevent unequal wear Install rear main bearing cap leaving bolts loose, force crankshaft as far rearward as possible (to align front thrust faces), then force crankshaft as far forward as possible (to align front thrust faces). Hold shaft in this position while tightening bearing cap bolts to correct torque.

► *1953-55 REPLACEMENT "FLOATING" PROPELLER SHAFT (To Reduce Rear Axle Noise)· See 1956 Buick Rear Axle in Rear Axle Section for installation of this new type propeller shaft.*

► *1955-56 BUICK POWER BRAKE PEDAL SLOW RETURN OR NOT RETURNING TO RELEASED POSITION (Caused by Vacuum Leaks)· See "CHANGES, CAUTIONS" on 1956 Moraine Power Brakes in Brake Sect.*

CADILLAC

► *1956 ENGINE DETONATION (In Low Octane Areas): See "Ignition Timing" on 1956 Cadillac Page 17.*

► *1955 HYDRAULIC LIFTER PRODUCTION CHANGE & REPLACEMENT CAUTION* Improved Hydraulic Lifter with additional spring under ball check valve was used in production beginning approximately Engine No. 88700. This spring provides more accurate control of oil flow through lifter and reduces pump-up and valve float. *Use this new lifter, Part No. 5231375, as service replacement on 1955 engines (Previous lifter No. 5231260 can be used on 1949-54 engines).*

► *1949-55 REPLACEMENT WATER PUMP:* 1955 Water Pump Assembly No. 3630518 is furnished as service replacement on 1949-55 cars and will provide improved cooling. This pump can be identified by "C55" cast on upper left leg of body. *NOTE* - When installing this pump on 1954 engines, install No. 1462815 Nipple for heater hose take-off, and install a Tee in right hand heater hose between pump and Ranco Valve (connect left hand Ranco Valve to this tee).

CHEVROLET

► *REPLACEMENT INTAKE & EXHAUST VALVE SEAT ANGLE CHANGE.* To facilitate seating of valves with regular shop equipment (when re-using old valves or installing replacement valves), valve seat and valve face angle specifications can be changed as listed below. This will require refacing old or new valves to the "odd" angle listed and will allow valve seat in head to be finished to standard 30° or 45° as indicated.

Valve	Valve Face Angle	Valve Seat Angle
6 Cyl. Intake ①	29°	③ 30°
6 Cyl. Exhaust ②	44°	④ 45°
V8 All Valves ②	44°	④ 45°

① — Valves have 30° angle (must be reworked).
② — Valves have 45° angle (must be reworked).
③ — 31° on new engines. ④ — 46° on new engines.

► *1955 SIX CYLINDER POWERGLIDE THROTTLE LINKAGE ADJUSTMENT SPECIFICATION CHANGE·* When checking position of Transmission Throttle Valve Outer Lever (step 3 of Linkage Adjustment), install gauge in extreme **lower rear** bolt hole on left side cover on ALL cars and set lever to the dimension listed below. Make this change on Pg. 27 & 395 (1955 Final Data), or on Pg. 163 & 2653 (1955 Manual Edition).

1955 Early Cars (With First Type Throttle Valve Control Outer Lever No. 3720634 & Longer Throttle Valve Control Rod No. 3710631) - 6 3/8" (change from 7 3/32").

1955 Later Cars (With Later Type Throttle Valve Control Outer Lever No. 3720323 & Shorter Throttle Valve Control Rod No. 3715711) - 7 3/32" measured to lower rear bolt hole (change in checking hole location only).

► *1955 TRUCK (2ND SERIES) CASTER SPECIFICATION CHANGE: Caster on these trucks should be set to same specification as corresponding 1956 series. See 1956 Chevrolet Truck data on Pg. 48.*

► *1955 CHEVROLET 6 CYL. DISTRIBUTOR ROTATION:* Distributor rotation is Clockwise (viewed from above). Make this notation on 1955 Final Data Page 27 (in text) and on Page 28 (in diagram).

► *1955 CHEVROLET V8 POWERGLIDE LINKAGE ADJUSTMENT:* When adjusting linkage, Transmission Throttle Valve Outer Lever should be rotated Counter-clockwise to the open throttle position. Make this change on 1955 Final Data Page 33 (Col. 3, Line 7), and Page 396 (Col. 1, Line 11).

►*1955 SYNCHRO-MESH CARS HARD SHIFTING CORRECTION:* Can be corrected by installation of Transmission Control Conversion Kit, Chevrolet No 3731061, reinforcement of transmission control idler support, and installation of three new transmission gears as listed below *(NOTE*—These gears used in production beginning July, 1955). *See "1955 Chevrolet Synchro-mesh Transmission" in 1955 Annual Data or later Manual editions for transmission disassembly and re-assembly data.*

Chevrolet New Transmission Gears

Gear	New Part No.	Old Part No.
Low & Reverse	3725646	3845056
Counter Gear Assy.	3845201	3845051
Reverse Idler	3845203	3845052

CHRYSLER, DE SOTO, DODGE

► *1955 CHRYSLER, DE SOTO, DODGE, PLYMOUTH CO-AXIAL STEERING GEAR PRODUCTION CHANGE & OVERHAUL CAUTION:* On later steering gears, a new "D" section rubber piston ring seal without metal spacer or backing ring was used with a new piston as listed below. This ring replaced original "L" section ring seal which must not be used at any time. New "D" section piston ring seals can be used with original piston if installed as follows

"D" Section Piston Ring Seal Installation (On Original Piston) — Remove old "L" section piston ring seals and metal spacer or backing rings from piston, discard the "L" type neoprene rings. Install new "D" section rings on original piston, then install original metal spacer rings behind "D" rings (toward center of piston). *NOTE* - If necessary to replace the original metal spacer rings, use Assembly No. 1692657 (contains "D" rings and metal spacers).

Co-axial Power Steering Piston Assy.

Part	New Part No.	Old Part No.
Power Piston	1639169	1554388
"D" Sect. Ring Seal	1618789	1531420

FORD

► *1955 FORD V8 DISTRIBUTOR APPLICATION & MODIFICATION TO CORRECT DETONATION (Ford V8 Pass. Cars, Interceptor, Thunderbird)* Various distributors were used on these models as listed below. The Distributor Modification (to correct detonation) as listed on 1955 Final Data Page 97 should NOT be made on Distributor No. B5A-12127-B used on the 272 Engine with 2-Barrel Carburetor (will result in excessive spark advance and cause detonation). The later No. B5A-12127-F & B5S-12127-E distributors have this modification made in production.

Car Model	1955 V8 Distributors	Part N .
272 Eng. (Std. 2-Barrel Carb.)		B5A-12127-B
272 Eng. (Spec. 4-Barrel Carb.) ①		FEC-12127-A
272 Eng. (Spec. 4-Barrel Carb.)		B5A-12127-F
292 Interceptor & Thunderbird ①		B5S-12127-D
292 Interceptor & Thunderbird		B5S-12127-E

① - Early Cars - Modify Distributor.

►*1955 FORD & THUNDERBIRD V8 ENGINE ROUGH IDLE:* Can usually be corrected by this procedure:

1) Tappet Clearance Adjustment—Adjust with engine hot and idling, use .018" feeler as "GO" gauge, .020" feeler as "NO GO" gauge. This will insure tappet clearance being .019"± 001".

2) High Tension Coil & Spark Plug Wire Installation—If wires loosen at plug and coil connections, check location of pressure relief hole in boot. If this hole is too low, pierce a new .062" hole in the boot ½-¾" above lower edge of boot.

3) Carburetor Float Level—Check for fuel level fluctuation caused by burrs or rough areas on float hinge or pin, worn or ridged fuel inlet needle or seat, or incorrect float setting. Set fuel level at 11/16"±1/32" from top of bowl (2-Barrel Carburetors), ½"±1/32" from top of bowl (4-Barrel Carburetors). *See Carbur tor data in 1955 Annual Data or later Manual edition.*

►Se Data Sh ts f r additional Chang s & C rr cti ns

Form 1R—1956 E

IMPORTANT FACTORY PRODUCTION & RECOMMENDED CHANGES
FOR PREVIOUS MODELS & 1956 MODELS

FORD CONTINUED

►*1955 FORD & THUNDERBIRD BRAKE LINING & REPLACEMENT CAUTION:* Later cars have "shorter" Primary Shoe Brake Lining and modified brake shoes to reduce any tendency toward pulling or diving when brakes applied. *See "Ford Bendix" in 1956 Brake Section for installation cautions.*

►*1952-56 FORD 6 & 1954-56 FORD V8 EXHAUST VALVE STEM DIAMETER CHANGE (For Increased Stem Clearance):* Stem diameter has been decreased .0005" for increased stem clearance in guide to minimize valve sticking. These valves should be fitted to .0025-.0035" stem clearance and maximum clearance in service should be .006". *See "Valve System" in 1956 Ford Special Data for new valve sizes.*

►*1955 6 CYL. ENGINES WITH 1956 CAMSHAFTS & VALVE SPRINGS:* New 1956 type camshaft and valve springs were used on approximately 2000 1955 engines (Engines not marked). **Correct 1955 or 1956 Camshaft & Valve Springs must be used together.** *CAUTION—Use of wrong valve springs with either camshaft may cause early failure of camshaft or result in valve float at high speed.*

Camshaft Identification—Can be determined by cam lobe lift of .242" (1955), .273" (1956).

Valve Spring Identification—1955 springs have 7½ coils with lower coils closely spaced. 1956 springs have 7 equally spaced coils.

HUDSON

►*1955 HUDSON SIX DISTRIBUTOR ROTATION:* Distributor rotation on both Wasp & Hornet Six is Clockwise (viewed from above). Make this notation on 1955 Final Data Page 119. *NOTE* - Rotation shown in wiring diagrams (Pgs. 120 & 121) is correct.

►*1955 HUDSON V8 SLOW COLD STARTING & POOR WARM-UP CORRECTION: On cars with Carter WGD 2231S carburetor, refer to 1956 Carter WGD Carburetor in Carburetion Section for recommended changes.*

►*1955 HUDSON V8 ULTRAMATIC LINKAGE ADJUSTMENT CHANGE:* Manufacturer recommends that 1956 procedure and settings be used on these cars. *Refer to 1956 Hudson Hornet V8 Linkage Adjustment on Pg. 158.*

►*1955-56 HUDSON V8 VALVE SPRING BAFFLE INSTALLATION FOR IMPROVED OIL CONTROL:* On engines before Engine No. P-25589, valve spring baffles should be installed to divert oil from springs and valve stems (baffles used in production on later engines). *See 1956 NASH & HUDSON V8 SPECIAL DATA for installation instructions.*

LINCOLN

►*1955 LATE PRODUCTION "DEVIATED" ENGINES: For specifications and non-interchangeable parts, see "Engine" on Pg. 114 of 1956 Lincoln Special Data.*

►*1952-55 REPLACEMENT CAMSHAFTS (With Improved Wear Characteristics):* Shafts with added copper for better wear are now available. These shafts identified by letter "C" followed by two dimples between first two lobes at front of shaft and should be used as follows: **1952-54** Part EAD-6250-G, **1955** Part EBJ-6250-B.

►*1955 VALVE STEM OIL SEAL CHANGE (For Improved Oil Control):* New valve stem oil seal, Part No. B5A-6571-A, has a .100" longer skirt to protect greater area of valve stem from oil splash. This seal used in production on later 1955 engines.

►*1955 IDLE SPEED-UP CONTROL ON AIR CONDITIONED CARS:* This automatic throttle control device may be found on 1955 cars (increases engine idle speed to 800 RPM with air conditioning turned on and transmission selector lever in Neutral). *For adjustment, see "Carburetor" on 1956 Lincoln, Page 119.*

►*1952-56 EXHAUST VALVE STEM DIAMETER CHANGE:* Stem diameter decreased .0005" to provide increased stem clearance. *See "Valve System" in 1956 Lincoln Special Data for new valve sizes.*

►*1952-56 "SELF-LOCKING" VALVE ADJUSTING SCREWS: For installation of 1956 type self-locking adjusting screws and rocker arms, see "Valve System" in 1956 Lincoln Special Data.*

►*1952-56 CRANKSHAFT WITH INTEGRAL REAR OIL SLINGER & INSTALLATION OF SEPARATE FRONT OIL SLINGER (For improved Seal Operation): For installation of these parts, see "Crankshaft & Main Bearings" in 1956 Lincoln Special Data.*

MERCURY

►*1954-55 ENGINE CAMSHAFT SETTING CORRECTION:* Marks on both sprockets should be aligned with similarly marked links on timing chain with both sprocket marks toward **left** side of engine (not adjacent as previously stated). Make this change on the 1954 and 1955 Mercury data sheets.

►*1955 VALVE STEM OIL SEAL CHANGE (For Improved Oil Control):* New valve stem oil seal, Part No. B5A-6571-A has .100" longer skirt to protect greater area of valve stem from oil splash. This seal used in production on later 1955 engines. *NOTE* - This seal must be used with following service cylinder heads: **(1954)** No. B4A-6049-F, **(1955)** No. B5A-6049-J and B5S-6049-B.

►*1954-56 EXHAUST VALVE STEM DIAMETER CHANGE:* Stem diameter has been decreased .0005" to provide increased stem clearance. *See "Valve System" in 1956 Mercury Special Data for new valve sizes.*

►*1954-56 "SELF-LOCKING" VALVE ADJUSTING SCREWS: For installation of these parts, see "Valve System" in 1956 Mercury Special Data.*

NASH

►*1955 NASH V8 SLOW COLD STARTING & POOR WARM-UP CORRECTION: On cars with Carter WGD 2231S Carburetor, refer to 1956 Carter WGD Carburetor in Carburetion Section for recommended changes.*

►*1955 NASH V8 ULTRAMATIC LINKAGE ADJUSTMENT CHANGE:* Manufacturer recommends that 1956 procedure and settings be used on these cars. *See 1956 Nash Ambassador V8 Linkage Adjustment on Page 158.*

►*1955-56 NASH AMBASSADOR V8 VALVE SPRING BAFFLE INSTALLATION FOR IMPROVED OIL CONTROL:* On engines before Engine No. P-25589, valve spring baffles should be installed to divert oil from springs and valve stems (baffles used in production on later engines). *See "Valve System" in 1956 Nash & Hudson V8 Special Data for installation data.*

►*1956 NASH AMBASSADOR V8 ENGINE DETONATION OR PRE-IGNITION CORRECTION: See Distributor data under "Tune-Up" on 1956 Nash Ambassador V8 car model pages for recommended conversion of first type distributors to later type advance performance.*

PACKARD

►*1956 DETONATION IN LOW OCTANE FUEL AREAS (First Cars): See Distributor data in "Tune-Up" on 1956 Packard car model pages for recommended conversion of first type distributors to later type advance performance.*

PLYMOUTH

►*1954-56 PLYMOUTH 6 TAXICAB CARBURETOR IMPROVED ECONOMY (Carter BBS 2062S, SA; 2063S, SA Carburetors):* Improved gasoline economy can be secured by installing parts furnished in Carter Unitized Pkg. No. 195-67U. *See "Carter BBS" Carburetor in Carburetion Section.*

►*1955 PLYMOUTH CO-AXIAL STEERING GEAR PRODUCTION CHANGE & OVERHAUL CAUTION: See same item under Chrysler (above) for power piston seal ring change.*

PONTIAC

►*1955-56 ROCKER ARM STUD REPLACEMENT:* Tool set is now available to facilitate removal of old studs from cylinder head. *See Rocker Arms under "Valve System" in 1956 Pontiac Special Data for data.*

►*1955 OIL PUMP INSTALLATION CAUTION:* When installing Oil Pump in engine, a gasket No. 522103 should be used between the pump and the block to insure a good seal at this point. This gasket was used in production on later cars.

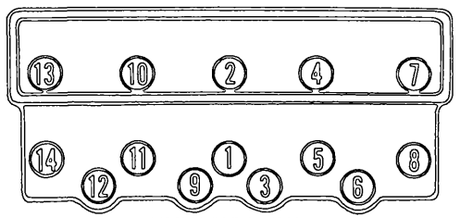
STUDEBAKER

►*1955 COMMANDER & PRESIDENT V8 HARD STARTING:* On early cars, this may be caused by fuel pump not priming quickly (due to valve warpage). On cars with fuel pump code dated before J-5-1 or J-5-2, improved fuel pump, Studebaker No. 535541, can be installed when this trouble experienced. All pumps code dated J-5-1 or J-5-2 and later are of this improved type.

►*1955 V8 ENGINE ROCKER ARM RETURN PASSAGE CAUTION:* Beginning with 1955 production, front oil return passages in cylinder block were discontinued to improve coolant circulation around No. 1 & 2 cylinders. A single oil return passage is used for each cylinder bank at the rear of the block. *DO NOT attempt to drill out front oil passages on these engines (would break through into water jacket).*

WILLYS

►*1954-56 WILLYS 6-226 ENGINE CYLINDER HEAD TIGHTENING SEQUENCE:* Manufacturer recommends that new tightening sequence be followed when installing cylinder head. *See Cylinder Head Tightening Diagram in 1956 Willys Special Data.*



TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	63-73
Intake Manifold	25-30
Exhaust Manifold	10-15
Oil Pan	6-15
Main Bearing Caps	100-110
Flywheel	50-55
Vibration dampener	100-110
Con Rod Caps	40-45
Piston Pin Clamp Bolt	25-30
Rocker Arm Support Bracket	30-35
Rocker Arm Cover	4-5
Engine Front Cover	20-25
Water Manifold	25-30

ENGINE MOUNTINGS

ENGINE MOUNTINGS: The engine and transmission assembly must rest in a normal position which does not impose any side strain on the three rubber mountings. To adjust, tighten engine front mounting pad stud nuts under supports on frame and tighten mounting bracket-to-crankcase bolts. Loosen upper mounting pad-to-bracket bolts. Disconnect torque tube from torque ball, then tighten transmission support-to-frame X member attaching bolts. Tighten transmission mounting pad-to-transmission support and to transmission rear bearing retainer. Tighten thrust pad-to-thrust plate stud nuts (rear) and loosen thrust pad-to-transmission support stud nuts (front). Remove shims located between thrust pad and transmission support. Shake engine sideways to let assembly rest freely and normally on all mounting pads, then install sufficient shims between thrust pad and transmission support to snugly fill the existing space. Tighten thrust pad front stud nuts and connect torque tube to torque ball. Tighten front mounting pad-to-bracket bolts.

CYLINDER HEAD & MANIFOLD

EXHAUST SIDE
BUICK V8 CYLINDER HEAD

CYLINDER HEAD & GASKET: When handling the thin crimped steel gasket, use care not to damage lacquered surface coat or kink sealing rings stamped in gasket. *(CAUTION—Do not coat lacquered surface of gasket with any type of sealing material and DO NOT RE-USE THE OLD GASKET as stamped sealing rings are flattened in a used gasket).* Right and left cylinder heads are identical except that the water inlet port is open at front end and is plugged at rear end as installed on engine. After installation of cylinder head, tighten all bolts a little at a time, about three times around, in sequence shown in diagram, finally tighten bolts to correct torque of 63-73 ft.lbs. in same sequence. After engine warmed up to correct operating temperature, recheck bolts for correct torque.

PISTON PINS

PRESS-FIT PISTON PIN REMOVAL & INSTALLATION: *CAUTION—Special tools (see Tool Note below) must be used to avoid damage to piston assembly parts.*

Pin Removal: Place piston and rod assembly in press. Using Piston Support J-6047-A (with full radial face up) under the Piston, place Drive Pin J-6047-4 in upper end of piston pin and press pin from rod and piston.

Pin Installation: Place Piston Support J-6047-5, Return Spring J-6047-3, and Guide Pin J-6047-2 in base plate of press. Use the piston support with the full radial face upward. Place rod in piston with oil spurt notch on same side as valve depressions in piston dome, lubricate piston pin and inside diameter of pin holes with Lubriplate. Insert pin into piston boss, pushing pin through to move rod over against opposite pin boss. Place small end of Drive Pin J-6047-4 in hole in upper (protruding) end of piston pin and position the assembly in the press. Make certain that all units are in alignment, then apply pressure and force pin through rod and piston until Guide Pin J-6047-2 stops downward travel.

▷*PISTON PIN TOOL NOTE (Press-fit Pins):* Special tool set consists of Piston Pin Remover & Replacer J-6047 (Base Plate, Piston Support, Guide Pins, & Spring) used in an arbor press or with 12 Ton Ram J-6180 (with Power Screw & Cross Yoke) adapted for this use by installation of screws furnished in Ram Adapter Kit J-6208.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT REAR OIL SEAL: Braided fabric seal fitted in groove behind slinger groove in crankcase and bearing cap. Vertical joint between cap and crankcase fitted with cork seals at each side.

Installation—With crankshaft removed, place new braided fabric seal in groove in crankcase with both ends extending out from bearing parting line, force seal in groove with hammer handle or smooth piece of wood so that seal seats within 1/16" of crankcase. Cut ends of seal off flush with crankcase (use razor blade or sharp knife). Repeat operation for bearing cap. Coat vertical grooves in cap with gasket cement (allow to set until tacky), use new cork gasket and fit into groove with putty knife (ends will project beyond cap). Place cap in vise to lightly compress seals in grooves, cut ends of cork seals flush with cap surface. Coat cork gaskets with vaseline, install cap in crankcase.

▷*CAUTION—Engine must be operated at slow speed when first started after new braided seal installed.*

ENGINE FRONT COVER

TIMING CHAIN COVER: Removal—Drain cooling system, remove radiator core, shroud, fan belt, fan and pulley, and vibration dampener. Take out all bolts attaching timing chain cover and water manifold to cylinder head heads and crankcase (DO NOT remove the five water pump mounting bolts). Remove cover and water pump as an assembly. *CAUTION—Use care to avoid damaging oil pan gasket.*

FRONT OIL SEAL: Installation – After removing braided fabric packing with a screw driver and tapping pressed steel shedder out of timing chain cover, work the new packing into the shedder, then drive shedder into recess in timing chain cover, using installer tool J-5250-2 through the seal to expand packing into place. Apply a light coating of vaseline to packing. *NOTE – A more effective seal will be made if butted ends of packing are installed in the upward position in timing chain cover.*

▷*CAUTION: Engine must be operated at slow speed when first started after braided packing seal installed.*

FLYWHEEL

FLYWHEEL REPLACEMENT: Flywheel or Ring Gear can be replaced separately on Synchro-mesh Cars (gear is shrink fit on flywheel), but must be replaced as an assembly on Dynaflow Drive Cars (gear is welded in place and not furnished separately).

Ring Gear Replacement (Synchro-mesh Cars): Remove old ring gear by drilling 5/16" hole in gear between two teeth, split the gear at this point with a chisel and remove the old gear. Polish several spots on new ring gear with emery cloth, heat gear uniformly on a hot plate or with a torch until polished spots turn blue which will indicate a temperature of approximately 600°F. *(CAUTION*—Heating gear in excess of 800°F. will destroy factory heat treatment). Install ring gear on flywheel with beveled end of teeth out or away from shoulder, allow gear to cool.

Installation of Flywheel (All Models): Make certain that flywheel and crankshaft flange are clean and free from burrs which might cause run-out (remove burrs with a mill file). Install flywheel and tighten all bolts evenly to 50-55 ft.lbs. torque. On Dynaflow Drive Cars, check flywheel run-out (see below). On all cars, check engine for vibration after transmission installed and correct any unbalance caused by replacement of parts. *See ENGINE BALANCING*

Flywheel Run-out (Dynaflow Drive Cars): Mount dial indicator on flywheel housing so that indicating stem bears on rear ground face of flywheel at inner side of large holes in rim. Turn flywheel making certain that crankshaft end thrust held in one direction and note run-out at flywheel face. Run-out must not exceed .008". If run-out exceeds .008" and cannot be corrected by tapping high side of flywheel with a mallet, remove flywheel and check for dirt or burrs between flywheel and face of crankshaft flange. If run-out still exceeds .008" after reinstallation of flywheel, check run-out of crankshaft flange rear face.

ENGINE BALANCING

▷*IF VIBRATION NOTED AFTER INSTALLATION OF CRANKSHAFT, FLYWHEEL, AND OTHER ROTATING PARTS, CORRECT THIS UNBALANCED CONDITION AS FOLLOWS:*

▷*CAUTION:* Procedure below will correct minor unbalance caused by replacement of individually balanced parts. Extreme vibration caused by parts abnormally out of balance, or different in weight from corresponding parts, should be corrected by replacement of these parts.

Critical Speed of Vibration—Determine speed at which vibration is most evident (use tachometer) and operate engine at this speed to check results from the following corrective procedures.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SYNCHRO-MESH ENGINE UNBALANCE CORRECTION:

1)—If clutch assembly has been removed and re-installed, make certain all clutch cover bolts are same type and length and that lockwasher used with each bolt See that alignment marks on clutch cover and flywheel (made before clutch removal) are together If vibration not caused by clutch, mark clutch cover and flywheel and remove clutch assembly

2)—Operate engine with clutch removed and check for vibration If vibration eliminated (indicating unbalance is in clutch), re-install clutch and balance the assembly as directed in step (3) following If vibration still present, balance the flywheel as follows Install one clutch cover bolt in successive flywheel bolt holes and operate engine with bolt in each location until a position is found in which vibration is eliminated (this test weight can be varied by using a shorter bolt or by adding washers to the bolt) When engine runs smoothly, remove bolt and drill shallow holes on DIAMETRICALLY OPPOSITE side of flywheel *(CAUTION*—use ⅜" drill and DO NOT drill any hole more than ¼" deep) When engine runs smoothly, re-install clutch as follows

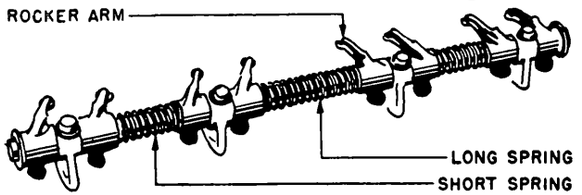
3)—Install clutch assembly *(CAUTION*—align marks made before removal), operate engine and check for vibration If vibration noted, balance clutch by installing plain washer successively under each mounting bolt lockwasher until engine runs smoothly *NOTE*—If necessary, plain washers can be installed on two adjacent bolts to obtain sufficient weight for clutch balance

DYNAFLOW DRIVE ENGINE UNBALANCE CORRECTION: *See Buick "Variable Pitch Dynaflow Drive" in Transmission Section.*

VALVE SYSTEM

OIL FLOW REDUCTION TO VALVE MECHANISM: Install plug, Part No. 1343643 (with .077" orifice) in both cylinder heads as follows: Remove rocker arm and shaft assembly from each cylinder head. Install plug, Part No. 1343643 in oil feed hole located within counterbore of front rocker arm mounting bracket bolt hole (this oil passage angles downward toward bottom of head, between front center head bolt and front valve). Drive plug into place with a 3/16" diameter punch or rod so that open end of plug is flush with edge of oil hole.

ROCKER ARMS



ROCKER ARM ASSEMBLY: One assembly mounted on each cylinder head (see illustration)

Disassembly: Remove cotter pin, flat washer, and spring washer from each end of shaft Pull mounting bolts out of support brackets, slide shaft out of rocker arms and brackets

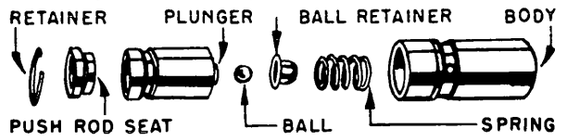
Reassembly: See illustration for location of parts Install longer spring at center of shaft and install rocker arms with offset (slant) toward center of shaft (two types of rocker arms used—see table below for proper location of each type) Turn shaft so that notch in one end of shaft is upward or toward top of bracket and install bolt through bracket and shaft to maintain this position *(CAUTION*—Notch must be upward to place rocker shaft oil holes in proper relationship to rocker arms)

Rocker Arms

Part No.	Location
1343454	4 Right Front & 4 Left Rear
1343455	4 Left Front & 4 Right Rear

BUICK V8 ROCKER ARM ASSEMBLY (ONE ASSEMBLY FOR EACH BANK)

Installation Make certain that notch in one end of rocker arm shaft is upward, position assembly on head with dowels engaging blind holes in brackets, tighten all bracket bolts evenly to 30-35 ft lbs



HYDRAULIC LIFTERS

Removal: Remove air cleaner disconnect all pipes and wires from carburetor and intake manifold, remove carburetor and manifold as an assembly Thoroughly clean cylinder heads, rocker arm covers, and adjacent areas to prevent dirt entering engine Remove rocker arm cover and rocker arm assemblies, remove pushrods Remove valve lifter cover lift out individual valve lifters and ***place them in numbered compartments of a holding fixture to insure re-installation in original position in engine.***

Disassembly: Use a push rod to hold down the push rod seat in lifter while removing plunger retainer from body with Retainer Remover J-5238 Remove push rod seat and plunger from lifter body Body bore above plunger may be caked with carbon and varnish In this case, place lifter in large end of Plunger Remover Tool J-4160-A, with plunger inward While holding lifter with thumb, rap open end of remover against a block of wood with just enough force to jar plunger from body

►*IMPORTANT NOTE*—Disassemble one lifter at a time to avoid interchanging parts Be careful not to score or nick lifter parts

Cleaning and Inspection: Wash all parts in a suitable carbon solvent and remove all trace of carbon and varnish Inspect plunger and lifter body for scoring or other damage that would prevent free movement Inspect lower end of lifter body for nicks or identations If any exist, replace complete lifter assembly Dry lifter parts with air, then install

HYDRAULIC VALVE LIFTER

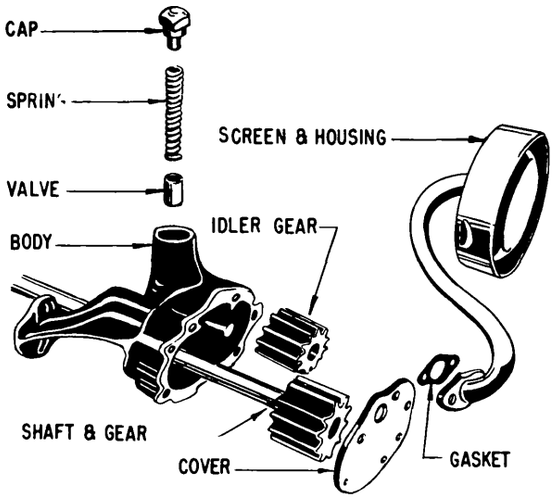
plunger in lifter body without other parts and check for free movement Plunger should drop of own weight into body bore

Reassembly: Test check ball travel before reassembling lifter (see Testing below) It is recommended that all parts be rinsed in clean kerosene and then assembled without drying (this will eliminate all lint and dust adhering to parts) Hold plunger in vertical position with feed hole up, install check ball, ball retainer, spring, and body over the plunger Invert assembly and install push rod seat and plunger retainer in end of body, use handle of tool J-5238 to depress these parts until retainer engages groove in body Test lifter for "leak down rate" (see Testing below) Protect lifter assembly by wrapping in clean paper until it is installed in the engine

Testing: (Check Ball Travel)—Install Sleeve KMO-30-K on Test Fixture J-5095, to mount dial indicator so that stem of indicator bears squarely on upper end of pin in attachment Place a new ball check in seat in lifter plunger, then hold plunger and ball firmly against attachment arm with plunger centered over pin and stepped flange While holding ball and plunger firmly in place set dial indicator to "0" Remove plunger and ball, place ball in retainer, and install these parts on plunger Center plunger over pin and stepped flange of check attachment and while pressing plunger and retainer firmly against attachment arm, note dial indicator reading Ball travel must be 004-008" to insure satisfactory lifter operation

Leakdown Rate—Prepare a special test fluid by placing 20 ozs, of Special Buick Oil for Dynaflow Drive in a clean and accurate container, then fill container to the "one gallon" mark with kerosene Stir and shake container to thoroughly mix oil and kerosene Clean cup of Test Fixture J-5095 and fill it to within ½" of top with test fluid Install Gauge Sleeve J-5180-5 in cup, install Gauge Rod Nose J-5182-2 in ram Swing weight arm up out of the way, raise the ram and place the valve lifter (top side up) in the sleeve in cup Make certain lifter is completely covered by fluid Lower ram to rest in lifter push rod seat, then lower weight arm to rest on roller of ram Operate lifter plunger through its full travel to force out all air by using a pumping action on weight arm Continue pumping until considerable resistance is built up in lifter and a definite grab point is felt at top of the stroke, when indicator pointer is at bottom of the scale Finally pump vigorously for approximately 10 additional strokes to make sure all air is out of lifter (NOTE—If one stroke offers noticeable weak resistance during the last 10 strokes, replace the check ball in lifter and repeat leakdown test to this point) Raise arm to allow lifter plunger to come up to its retainer, then lower the arm to rest on ram roller As the pointer starts moving upward, start rotating fluid cup by turning handle one revolution every two seconds Use a stop watch to check time required for pointer to move from lower to upper mark on scale (upper mark labeled "8-in-line" or "V-8") The leakdown rate, (time between marks) must be 12-14 seconds Check doubtful lifters 3-4 times and replace any lifter which does not test within these limits

OILING SYSTEM



OIL PUMP

OIL PUMP: Gear Type. Driven by distributor shaft which is driven from camshaft through spiral gears.

Disassembly: Carefully pry screen out of housing, remove attaching screws and remove parts in following order Pump Inlet, Gasket, Screen Housing, Gasket Body Cover, Shaft & Gear, and Idler Gear Remove plug on side of body and take out pressure regulator spring and valve

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BUICK V8 OIL PUMP

Cleaning & Inspection: Wash screen and all pump parts in solvent and dry with air. See that oil pressure valve operates freely in body and that hole is not oversize, check spring for wear, distortion or collapsed coils. Inspect pump body, gears, and shaft for wear or scoring Check gear end clearance by installing gears in body and placing straightedge across cover flange Clearance between straightedge and face of gears must be less than .004" and gears must turn freely. For other clearances, see table:

Oil Pump Clearances

Drive Shaft Bearing Clearance	001- 0025"
Idler Gear Bearing Clearance	.001- 0025"
Driving Gear Backlash	.003- 006"
Pump Gears Backlash	.006-.012"
Pump Gear End Clearance in Body	.0005-.004"
Regulator Valve Clearance in Body	.003-.006"

Reassembly: Reverse disassembly procedure above.

Installation: Install oil pump with gasket on crankcase, turning pump shaft as required to engage driving tongue on distributor shaft. Install pump attaching bolts with lockwashers, then tighten bolts alternately a little at a time with one hand while turning pump shaft back and forth through gear lash with other hand. Pump shaft must be free of bind when bolts are securely tightened. If shaft binds, rap pump body lightly with a rawhide mallet.

IGNITION NOTES

CHECKING TIMING MARK LOCATION: If the timing mark on the balancer is suspected of being off, it may be checked by removing the balancer and checking the timing mark in relation to keyway. Draw a straight line approximately 7" long on a clean piece of white paper, then using a compass, draw a 1½" diameter circle in center of straight line. Place balancer (with pulley mounting bolt holes upward) over circle drawn on paper so that centerline passes through center of balancer keyway. The timing mark should be located .100" (approx. 3/32") clockwise from centerline at outside diameter of balancer.

►*CHECKING FOR PROPER DISTRIBUTOR CAM (Improper cam will cause rotor tip to burn badly at one corner):* Remove rotor and hold straight edge (6" steel rule) flat against the counter-clockwise edge of rotor positioning slot and angling down towards the breaker cam. If correct cam is installed, the straight edge will be on the counter-clockwise side of the nearest cam lobe. If improper cam is installed, the straight edge will be toward the clockwise side of the nearest lobe.

SPARK PLUG CABLE WIRING AFTER WORK ON ENGINE (To prevent mis-firing): Cables should be arranged in following order in grommets on cylinder head to prevent consecutively firing plug cables from being adjacent to each other:

Right Bank Cables—Arrange cables in following order in grommet on head and at entrance to spark plug cover: 3, 5, 7, 1 (front to rear). Arrange #1 plug cable over rear cover stud and #5 spark plug, under #3 spark plug, and over front cover stud Arrange #3 plug cable under rear cover stud and #5 spark plug This will prevent #1 and #3 cables from being parallel

Left Bank Cables—Arrange cables in following order in grommet on head and at entrance to spark plug cover: 4, 6, 2, 8 (front to rear). Arrange #2 plug cable under rear cover stud and #6 spark plug, and over #4 spark plug Arrange #4 plug cable over rear cover stud and under #6 spark plug.

DETONATION CORRECTION (ALL SERIES): Proceed as follows:

1) Check spark plug cable wiring (see above)
2) Check for excessive oil consumption Correct as necessary
3) Check initial distributor setting and if necessary reset to 5° BTDC
4) Check to see if centrifugal and vacuum advance of distributor falls within specified limits Check distributor for dwell angle variation. Dwell should not vary more than 3° total between idle speed and 1500 RPM
5) Make sure fuel is highest octane conveniently available
6) If the above procedures do not correct the detonation the initial distributor setting may be retarded to TDC without any noticeable loss in performance or economy If detonation still occurs, remove all traces of carbon from combustion chambers

►*NOTE: Also see "Engine" on Car Page for lowering compression ratio.*

ELECTRICAL NOTES

DIRECTIONAL SIGNAL SWITCH STICKING CORRECTION: If the trip mechanism in signal switch housing sticks, and does not return to "off" position after a turn is completed, it may be caused by centering pins being bent or trigger spring hanging up on lever. Correct as follows: Remove steering wheel and check centering pins for straightness. Remove trigger spring and sand off any burrs under the tangs. Lubricate trigger spring with Lubriplate, and reassemble, making sure spring operates freely in tangs.

BRAKE NOTES

PARKING BRAKE RELEASE ROD TRUNNION ADJUSTMENT: Disconnect battery and lower the fuse block to gain access to release rod trunnion. With parking brake in fully released position, disconnect trunnion from release rod lever trigger. Push trigger toward cowl as far as possible, and while holding trigger in this position, lengthen release rod by turning trunnion until it extends approximately ¼" beyond hole in trigger while holding release rod lightly against spring pressure. Connect trunnion to release rod lever trigger. After this adjustment has been performed, approximately 1/8" clearance should exist between knob and escutcheon. Clearance at this point can be obtained by loosening screw in knob and positioning knob as required to obtain specified clearance. Tighten knob screw.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate on left front door pillar post and on left frame side rail.
Starting Serial Number—001001 (at each plant).

►*SERIAL NUMBER NOTE: Serial number (example 4C2001001) includes the following identification data in sequence:*

Series ①	Year ②	Assy. Plant ③	Serial No.
4	C	2	001001

①—See Series Designation following.
②—Year designation (1956).
③—See Assembly Plant Designation following.

Series Designation

4—40 Special	6—60 Century
5—50 Super	7—70 Roadmaster

Assembly Plant Designation

1	Flint	5	Wilmington
2	South Gate	6	Atlanta
3	Linden	7	Framingham
4	Kansas City	8	Arlington

ENGINE NUMBER: Stamped on outside of left bank of cylinders on extension of top face of block between middle branches of exhaust manifold.

►*ENGINE NUMBER NOTE: Dash following engine number indicates that cylinder bores and pistons are .010" Oversize. NOTE—Do not confuse dash with vertical groove on pad designating Series 40.*

TUNE-UP

►*DETONATION CORRECTION (ALL SERIES): See "Ignition Notes" in Buick Special Data.*

►*STALLING & LOADING UP DURING FIRST FEW MILES IN COLD WEATHER CORRECTION (CARS WITH ROCHESTER CARBURETOR): Install Choke Modification Kit, Part No. 7009948. See "Rochester 4GC Carburetor" in Carburetion Section.*

►*ROUGH ENGINE IDLE CORRECTION: This condition may be caused by the use of an incorrect vacuum switch piston which allows a vacuum leak at the switch. The piston used on Carter 4-Barrel Carb., has a horizontal slot while the piston used with all other carburetors is slotted vertically.*

►*SPARK PLUG CABLE ROUTING (To prevent misfiring): See "Ignition Notes" in Buick Special Data.*

COMPRESSION PRESSURE: 140 lbs. (Series 40 Synchromesh); 160 lbs. (Series 40 Dynaflow); 170 lbs. (Other Series). At cranking speed (140 RPM). All cylinders must be equal within 10 lbs.

VACUUM READING: 15.5" (minimum) with engine idling at 450 RPM. *NOTE - This is lower than for previous models and is caused by new engine design.*

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatically controlled valve in forward end of left exhaust manifold. Valve must operate freely.

IGNITION

►*BURNED DISTRIBUTOR ROTOR TIP CORRECTION (May be caused by improper distributor cam):* If distributor rotor is badly burned at one corner of the tip, check to determine if the proper cam is being used. *See "Ignition Notes" in Buick Special Data.*

FIRING ORDER: 1-2-7-8-4-5-6-3.
Cylinders—RIGHT BANK 1-3-5-7. LEFT BANK 2-4-6-8.

SPARK PLUG GAP: .030-.035".
Spark Plugs - AC 44. 14 mm. Torque to 25 ft. lbs.

COIL: Delco-Remy 1115087. 12 Volt.
Ignition Current—2.5 amps. idling, 4.5 amps. stopped.
Resistor—Delco-Remy 1927809. On cowl near ignition coil. Resistance 1.4-1.65 ohms, at 75°F.

►*COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil. This resistor is by-passed during cranking by a lead from starter solenoid-to-coil.*

DISTRIBUTOR: Delco-Remy 1110861. 12 Volt.
Condenser—Delco-Remy 1869704 (Closed-end terminal), 1928111 (Open-end terminal). **Capacity** .18-.23 mfd.
Contact Point Set—Delco-Remy 1924499.
Breaker Gap—.0125-.0175".
Cam Angle—26-33° (with .016" gap).

►*BREAKER GAP CAUTION:* Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set point gap.
Breaker Arm Spring Tension—19-23 ozs.
Rotation—Clockwise viewed from above.

►*DISTRIBUTOR REMOVAL NOTE:* Removal of distributor can be facilitated by use of Special Wrench J-5727 (Kent-Moore) or S-9832 (Snap-On).

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0-1.5	375	0-3	750
6-8	850	12-16	1700
9.5-11.5	1450	19-23	2900
11-13.5	1750	22-27	3500

Vacuum Spark Control: Delco-Remy 1116090.
Plunger Travel—7/32".

Vacuum Advance

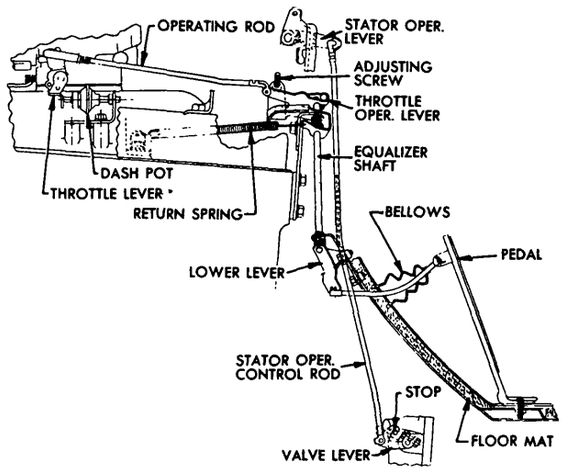
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	6.5-8.5
9-10.5	18-21	11.5-15

IGNITION TIMING

Setting—5° BTDC exactly.

►*DETONATION CORRECTION:* Ignition timing can be retarded to TDC without noticeable loss in performance.

►*IGNITION TIMING CAUTION: Lower engine idle speed to not exceed 350 RPM when setting ignition timing with timing light. Reset to 450 RPM when completed.*
Timing Mark—Timing indicator marked with four lines indicating 0°, 2.5°, 5°, 7.5° BTDC, located on right side of timing chain cover below fuel pump. Line up mark on fan drive pulley (Series 40), harmonic balancer (other series) with correct line (5°) on timing indicator for normal operating conditions.

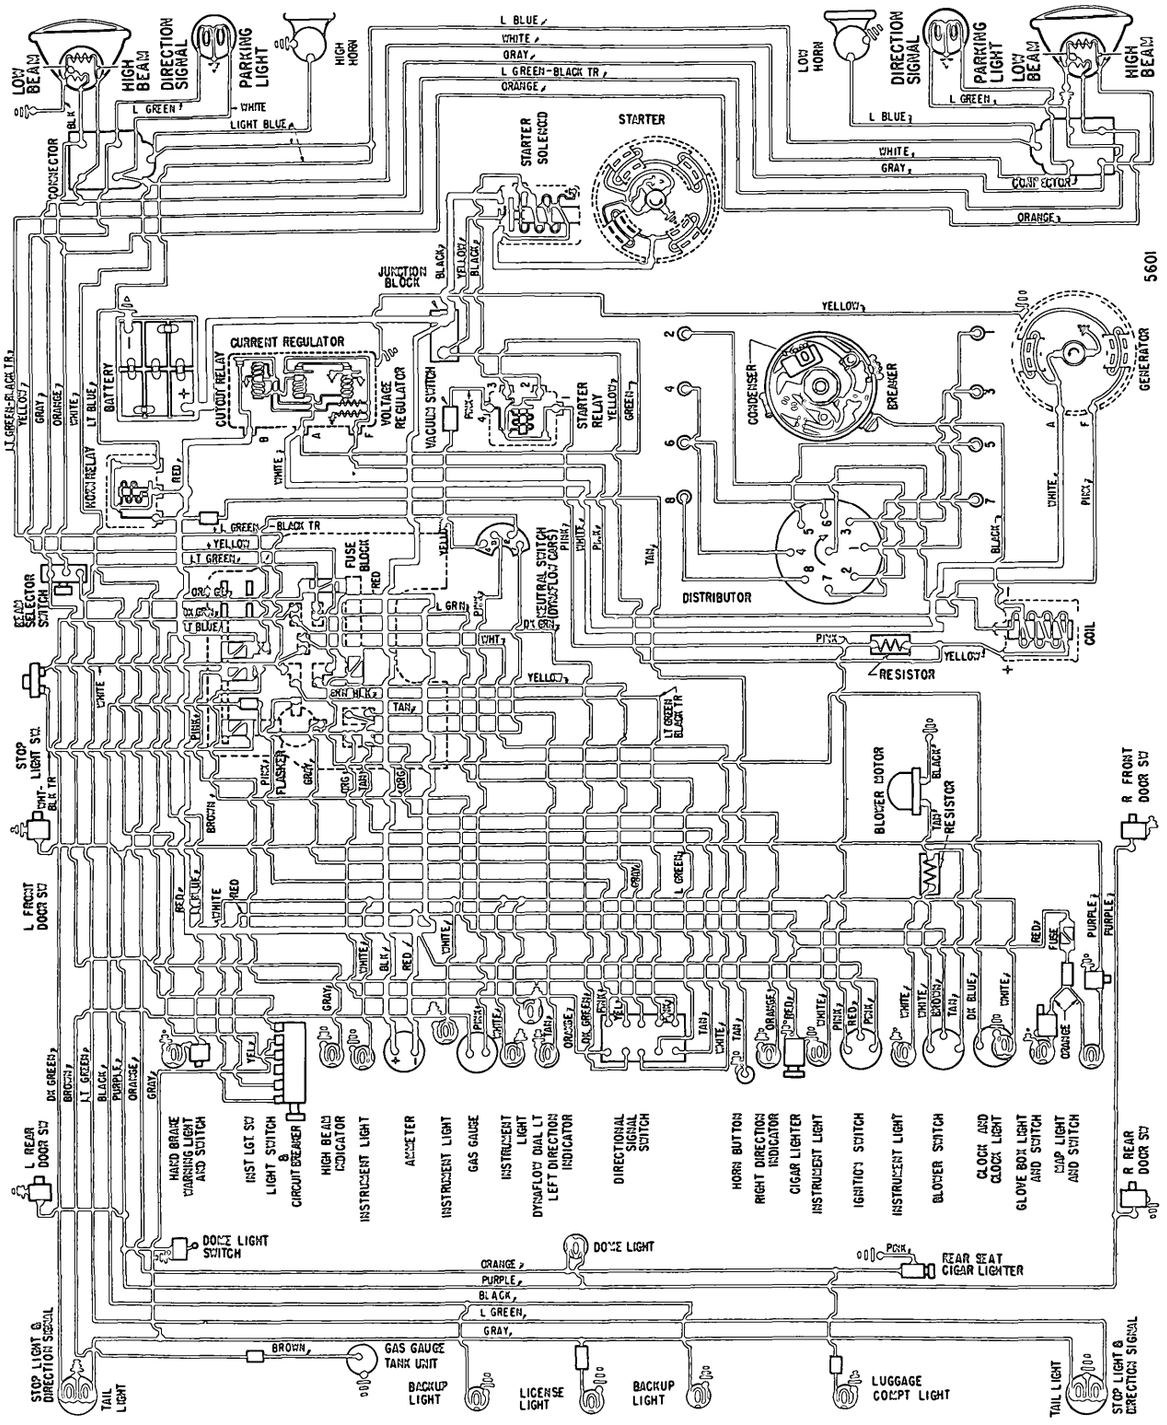


►*CHECKING FOR IMPROPERLY LOCATED TIMING MARKS ON ENGINE BALANCER: See "Ignition Notes" in Buick Special Data.*

CARBURETOR

►*CARBURETOR APPLICATION: "Carter" and "Stromberg" 2-Barrel carburetors used on Series 40. "Carter" and "Rochester" 4-Barrel carburetors used on other Series.*

►*1956 SERIES 40 & 60 FAILURE TO OBTAIN FULL THROTTLE CORRECTION: If a Series 50 & 70 accelerator pedal stop is installed on Series 40 & 60, throttle cannot be opened fully. Series 50 & 70 stops is 1 1/8" long. Series 40 & 60 stop is 5/8" long.*



►***WATER IN AUTOMATIC CHOKE HOUSING CORRECTION:*** **This condition is caused by improper location of heat tube which is pressed into exhaust manifold. Correct by replacing exhaust manifold.**

DYNAFLOW THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT: Adjust idle speed to 450 RPM. Disconnect throttle return spring. Disconnect throttle rod from lever on equalizer shaft. Back off stator pick-up lever adjusting screw on Dynaflow cars until screw end is flush with lever. Adjust throttle rod at carburetor so 5/8" of thread is exposed. Press accelerator against floor mat, hold throttle wide open and hold rod at hole in operating lever. Adjust lever on equalizer shaft to obtain 1/16" distance between rod and hole in lever. Tighten clamp and connect rod. With throttle closed to idle position, a minimum clearance of 1/16" must exist between equalizer lower lever and stop lug in mounting bracket. Adjust operating rod as necessary to obtain this clearance. On Dynaflow cars, depress accelerator pedal against floor mat, then turn stator pick-up lever adjusting screw against lever until all vertical play is removed from stator operating rod. Turn screw back 1/2 turn.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

DASHPOT ADJUSTMENT (Dynaflow Cars): Adjust dash pot only after throttle linkage has been adjusted and engine is at normal operating temperature. Rotate fast idle cam to extreme cold idle position (choke closed), hold throttle lever against .030" feeler gauge placed between stop screw and highest step of fast idle cam. Adjust dashpot until it just clears arm of throttle lever, tighten locknut. With transmission in Direct Drive and brakes firmly applied speed engine up to about 1500 RPM and immediately release throttle, noting engine operation as throttle valves close. If engine stalls from too rapid closing of throttle valves, move dashpot forward until its action prevents engine stalling. If excessive time is required for throttle valves to reach closed position, move dashpot rearward. Tighten locknut after each adjustment. If proper control cannot be obtained by adjustment, replace dashpot.

CARTER 2-BARREL WGD

2378S (Synchro-mesh), 2400S (Dynaflow)

▷*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7. LEFT barrel 2-3-5-8.*

Idle Setting–¼-1¼ (2378S), ½-1½ (2400S) turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed–450 RPM. (Selector lever in Neutral on Dynaflow Cars).

Float Level–¼" (Gauge T109-31) between top of float (at center) and bowl cover.

Fast Idle Setting: .015" throttle opening or clearance between valve and wall on side opposite idle ports with choke valve tightly closed. Adjust by bending choke connector rod at lower angle.

Automatic Choke Setting: Centered (on index).

▷*OTHER DATA: See "Carter WGD Carburetors" in Carburetion Section.*

Dynaflow Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4½ - 6½ lbs. at pump outlet.

STROMBERG WW

Code 7-105 & 7-105A

▷*1956 SERIES 40 (EARLY) LEANNESS CORRECTION (Cars with Code 7-105 Carburetors):* Install carburetor kit, Buick Part No. 1392722 consisting of new idle tubes, main metering jets, and main discharge jets. After modification, change Code No. to 7-105A.

▷*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls 1-4-6-7, LEFT barrel 2-3-5-8.*

Idle Setting–1¾ turns. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed–450 RPM. (Selector lever in neutral on Dynaflow Cars).

Float Level–3/16" below top edge of bowl (without gasket), with needle valve seated.

▷*OTHER DATA: See "Stromberg WW (Buick) Carburetor" in Carburetion Section.*

Dynaflow Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4½ - 6½ lbs. at pump outlet.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARTER WCFB 4-BARREL
2347S

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7, LEFT barrels 2-3-5-8.*
Idle Setting–1 1/8 turns open Adjust both screws alike. Turn screws out for richer mixture.
Idle Speed–450 RPM with Dynaflow Selector lever in neutral.

►*OTHER DATA: See "Carter WCFB Carburetor" in Carburetion Section.*

Dynaflow Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4½ - 6½ lbs. at pump outlet.

ROCHESTER 4GC 4-BARREL
7009200

►*STUMBLE ON LIGHT ACCELERATION (DURING COLD WEATHER) CORRECTION:* Change the accelerating pump spring from .041" to .042" wire diameter. *See "Rochester 4GC Carburetor" in Carburetion Section.*

►*STALLING OR LOADING UP WITH COLD ENGINE:* Install new Automatic Choke parts. See "Rochester 4-Barrel Carburetor on Pg. 82. NOTE: Carburetors stamped "C" on lower left corner of brass tag have these new parts and do not require modification.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7, LEFT barrels 2-3-5-8.*
Idle Setting–Adjust idle mixture screws for smooth idle and recheck for correct idle speed.
Idle Speed–450 RPM with Dynaflow Selector lever in neutral.

►*OTHER DATA: See "Rochester 4GC Carburetor" in Carburetion Section.*

Dynaflow Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4½ - 6½ lbs. at pump outlet.

CARB. EQUIPMENT

Fuel Pump: AC. **Replacement No.** 4304.
Pressure - 4½ - 6½ lbs. at pump outlet.

►*LIGHT ENGINE KNOCK CORRECTION & FUEL PUMP ARM PRODUCTION CHANGE:* A light engine knock caused by early pressed steel type fuel pump arm striking timing chain cover can be corrected by replacing fuel pump with one having a forged arm, or pump with later type pressed steel arm (identified by daub of green paint on cover).
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: AC. Electric type.
Dash Unit - AC No. 1518438 (Red & Green background on dial), No. 1518765 (Plain Black background on dial).
Tank Unit - AC No. 1518138 (Series 40 & 60), No. 1518137 (Series 50 & 70).
See "Fuel Gauges" in Carburetion Section.

BATTERY

Delco 3KMR62. *12 Volt.* 9 Plate, 62 Ampere Hour capacity (20 hr. rate).
Ground Terminal - Negative (–) terminal.
Engine Ground - Between engine and cowl.

STARTER

Delco-Remy 1107646. *12 Volt.* **Armature** - 1926626.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 35 ozs. min.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3500	10.1	95
11 ft. lbs.	Lock	5.2	460

Starting Switch: Delco-Remy Solenoid 1119760. *12 Volt.* Starter solenoid controlled by separate relay, Delco-Remy 1116876, and Accelerator Vacuum Switch (on carburetor). *See "Starter Controls" in Electrical Equipment Section.*

Accelerator Vacuum Switch: Carter 192-11U (Carter & Stromberg 2-Barrel), 192-21U (Carter 4-Barrel).

►*STARTER RELAY PRODUCTION CHANGE:* A new starter relay, Part No. 1116921 (made waterproof by dipping in vinyl plastic) replaces starter relay, Part No. 1116876.

Accelerator Vacuum Switch Setting–*See data on each carburetor type in Carburetor Section.*

Dynaflow Neutral Safety & Back-Up Light Switch: Delco-Remy 1998101. Mounted on steering column jacket under cowl. Connected in starter control circuit so that starter operative only when selector lever in "N" Neutral, or "P" Parking position.

Adjustment–*See "Buick Dynaflow Drive" in Transmission Section.*

►*NEUTRAL SAFETY & BACK-UP LIGHT SWITCH CONNECTION CAUTION: Wires must be connected in correct order as shown on wiring diagram.*

GENERATOR

Delco-Remy. *12 Volt.* As follows:

Model	Generator	Armature
Early (Without Air Cond.)	1102008 ①	1923535
Late (Without Air Cond.)	1102053 ②	1932900
All (With Air Cond.)	1102051 ②	1932900

①-With pulley. Delco-Remy 1102005 (without pulley).
②-With pulley. Delco-Remy 1102061 (without pulley).

Performance Data - Cold

Generator	Amperes ①	Volts	RPM
1102008	30	14	2150
1102051	35	14	2300
1102053	35	14	2300

①-Not maximum output. See Regulator.

Brush Spring Tension - 24-32 ozs.
Field Current - 1.48-1.72 amps. (1102005 Gen.), 1.62-1.82 amps. (1102051 & 1102053 Gen.). All at 12.0 volts.
Rotation - Counter-clockwise at commutator end.

Belt Adjustment: 3/8" belt deflection with normal thumb pressure midway between generator and fan pulleys.
NOTE: On air conditioned cars, deflection should be ½" midway between fan and compressor pulleys.

REGULATOR

Delco-Remy No.	Use with Generator No.
1119003	1102008
1119168 ①	1102051
1119162	1102053

①-Delco-Remy No. 1119162 Regulator is service replacement for No. 1119168.

►*REGULATOR GROUNDING CORRECTION: See "Delco-Remy 1119000 Series Regulator" in Electrical Section.*

►*NOTE: Specifications below are for "Normal" settings. See "Delco-Remy 1119000 Series Regulator" in Electrical Section.*

Cutout Relay
Cuts In - 11.8-13.5 volts (hot).
Contact Gap - .020"
Air Gap - .020" (with contacts just closed).

Voltage Regulator
Setting - 13.8-14.8 volts (hot).
Air Gap - .075" with armature pressed down to point where contacts just opening.
Checking & Adjusting - *See Electrical Section.*

Current Regulator
Setting (1119003) - 30 amperes (hot).
Setting (1119162 & 1119168) - 35 amperes (hot).
Air Gap - .075" with armature pressed down to point where contacts just opening.
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*

►*DIRECTION SIGNAL SWITCH STICKING CORRECTION: See "Electrical Notes" in Buick Special Data.*

Lighting Switch Removal: Disconnect battery cable from junction block and disconnect wires from lighting switch. Pull switch knob out to last notch, then depress spring loaded latch button on switch body while pulling rod and knob assembly out of switch. Remove switch mounting nut with wrench J1589 and remove switch and escutcheon from instrument panel.

Stop Light Switch: (Location)–On brake pipe distributor fitting near master cylinder on left side at transmission support.

FUSES: Located on fuse panel under cowl unless otherwise specified.
Back-Up Light - 10 amps.
Dome & Luggage Compartment Light - 20 amps.
Electric Clock - 2 amps.
Heater & Defroster - 20 amps.
Parking Brake Warning Light - 10 amps.
Stop & Direction Signal Lights - 9 amps.
Cigar Light - Special fuse in back of lighter.
Air Conditioner Motor - 15 amps. (in wiring connector near switch).
Air Conditioner Blower - 20 amps. (in fuse block)
Air Conditioner Clutch Contr l - 5 amps. (in fuse block).
Glove Box Light - 2 amps. (in wiring connector).

CIRCUIT BREAKER: 22 amperes. Vibrating type on Headlight Switch.

HORNS: D lc -R my. No. 1999769 (Low Note), No. 1999770 (High Note). *12 Volt.*

Horn R lay: Delco-Remy 1116781. *12 Volt.*

C ntacts Cl s —2.75-4.0 volts.
Contact Gap—.025". **Air Gap**—.015" (closed).

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own 90° V8 (All Series).

Seri s	B r	Stroke	Displacement
All	4.00"	3.20"	322 cu. ins.

S ri s	C mp. Rati	Rated HP	①Dev. HP
40 (Synchro-mesh)	7.6-1	51.2	
40 (Dynaflow)	8.9-1	51.2	220
50, 60, 70	9.5-1	51.2	255

①- At 4400 RPM.

Compression & Vacuum Reading—*See TUNE-UP.*

►*ENGINE IDENTIFICATION NOTE:* See Engine Number for suffix digit designating each series. Series 40 engine also has vertical groove 3/8" wide and 1/8" deep) cast in engine number pad approximately 1¼" to rear of pad centerline.

►*ENGINE COMPRESSION RATIO NOTE:* Same cylinder head used for all engines. Different compression ratios on Series 40 is secured by the use of different pistons. Head gaskets are the same on all models (.015" thick). *See Piston data bel w.*

►*ENGINE DETONATION (Low Octane Areas):* If octane rating of available fuel results in detonation complaints, this condition can be corrected by lowering the compression ratio as follows:
S ri s 40 (Synchr -mesh) - 7.35 - 1 compression ratio can be obtained by using cylinder head gasket, Part No. 1343995 (.045" thick).
Series 40 (Dynafl w) - 8.4-1 compressi on ratio can be obtained by using cylinder head gasket, Part No. 1343995 (.045" thick).

Seri s 50, 60, 70 (Dynaflow) - 8.4-1 compression ratio can be obtained by using cylinder head gasket, Part No. 1343995; and engine pistons, Parts No. 1392566.

►*ENGINE KNOCK AT IDLE SPEED OR UNDER LIGHT LOAD CORRECTION (Due to loose harmonic balancer):* Check the balancer hub flat washer to see that it does not bottom against crankshaft, and that balancer bolt does not bottom in tapped hole in crankshaft. If either or both conditions exist, install a second flat washer between present washer and balancer hub, so that clearance exists between washer and crankshaft.

►*FAN SHROUD RATTLE CORRECTION:* Drill a 9/32" hole in bottom of shroud approximately 5/16" from edge of shroud and install a rubber bumper, Part No. 503865.

►*EXHAUST MANIFOLD STUD BREAKAGE CORRECTION:* When installing a new stud, drill out the old hole to .368" (size "U" drill) and thread with a 7/16"-14 tap. Install a 7/16" stud and file out flange holes to accommodate the larger stud.

ENGINE MOUNTINGS: *See "Engine Mountings" in Buick Special Data*

OIL PAN REMOVAL: Disconnect steering idler arm bracket from right frame side rail and lower steering linkage for clearance, then remove pan. *CAUTION*—Do not allow bracket to turn on idler arm (will change toe-in adjustment).

CYLINDER HEAD & GASKET: Same cylinder head and gasket used on all engines (except as noted in "Engine Detonation Note" above). Different compression ratios secured by use of different pistons as noted under "Pistons" following.

Cylinder Head & Gasket Installation—*See "Cylinder Head & Manifold" in Buick Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Buick Special Data.*

PISTONS

Pistons—Aluminum alloy, dome head, cam ground, full skirt with transverse slots in oil ring groove, Anodized finish.

►*PISTON REPLACEMENT NOTE:* Different pistons used as follows:

Model	Std. Size Piston No.
Series 40 (Synchro-mesh)	Buick No. 1392564
Series 40 (Dynaflow)	Buick No. 1392566
Series 50, 60, 70 (Dynaflow)	Buick No. 1392565

►*ORIGINAL CYLINDER BORE CAUTION:* Engines with ¼" long dash following engine number have .010" Oversize Cylinder Bore & Pistons. Standard cylinder bore size: (All Models) 3.9985-4.0015".

Removal—Pistons and rods removed from above.

►*CAUTION*—Mark pistons, rods, and bearing caps with cylinder number before removal to insure correct reinstallation. Use Rod Bolt Guides (short guide J-5239-1 on lower bolt, long guide J-5239-2 on upper bolt) to retain bearing shell and assist in pushing assemblies out.

Fitting New Pistons: Clearance .0014-.0020". If micrometer used on pistons, measure at top and bottom of skirt 90° from pin hole (top diameter very slightly less than bottom in service). Use .003" x ½" x 12" feeler gauge to fit pistons with cylinder block in normal position. Insert feeler on lower side of bore 90° from piston pin hole. Pull to withdraw feeler should be 7-13 lbs. at 70°F. (piston and bore clean and dry).

Replacement Pistons: Standard ("High Limit" or maximum diameter production size) and .005", .010", .020", .030" Oversize. *NOTE*—Pistons furnished only with fitted pins.

Installing Pist ns: Assemble pistons on rods with valve depressions in head on same side as clamp bolt in rod. Install pistons with valve depressions toward camshaft. *See Rod Installation.*

PISTON PINS

Diamet r - .940". L ngth - 3.400".
Clearance in Piston-.003-.005", or easy push fit at 70° F.
Piston Pin Removal & Installation: *See "Piston Pins" in Buick Special Data. CAUTION - Pistons may b damaged if special procedure and tools not used.*
Replacement Pins: Std. size only. Fitted pins furnished with all new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearanc
Compr	.078"	010- 020"	002- 004"
Oil	.186"	015- 035"	0035 0095"

►*OIL RING NOTE.* Ring is three-piece (two rails and spacer) with expander. New rings are cemented assembly for ease in handling (will separate in service).

Replacement Rings: Production type rings furnished singly and in sets Standard & .010", .020", .030" Oversize. Special Service Ring sets furnished Standard (use up to .019" O.S.), & .020", .030" Oversize.

Installing Rings: Compression ring groove or bevel (on inner edge) upward. Oil ring expander gap ends should be at either end of piston pin (in unslotted portion of groove) and side rail gaps must be on valve depression side of piston (upward when installed in cylinder).

CONNECTING RODS

Length—6" **Weight**—22.16 ozs.
Crankpin Journal Diameter—2.249-2.250"
Out-of-round limit . 0015".
Bearings—Durex 100A, steel backed, full precision type. Both halves interchangeable. No shims.
Clearance—.0002-.0023" (service limit .003").
Sideplay - .005-.012".

Replacement Bearings: Standard & .001", .002", .020", .021" Undersize. Size is stamped on back of bearing at or near tang.

Installing Rods: *See Installing Pistons above.* Rib on edge of cap and conical boss on web of rod must be toward rear of engine on all rods in RIGHT bank or toward front of engine in LEFT bank.

CRANKSHAFT

►*CRANKSHAFT & FLYWHEEL UNBALANCE OR VIBRATION (After replacement of parts - Synchro-mesh & Dynaflow Cars): See "Engine Balancing" in Buick Special Data.*

Journal Diameter—2.498-2-499". Five bearings.
Out-of-round limit .0015".
Bearings—Durex 100A, steel backed, full precision type. Both halves interchangeable. No shims.

BEARING NOTE—Bearing upper halves can be rotated out and in by using tool KMC-734 in oil hole.

Clearance - .0005-.0025".

Replacement Bearings: Standard & .001", .002" Undersize. *NOTE*—First four bearings identical and interchangeable. Rear bearing longer and flanged.

End Thrust: Taken by rear (#5) flanged bearing.
Endplay—.004-.008".

Crankshaft R ar Main B aring Oil S al: *S "Crankshaft & Main B arings" in Buick Sp cial Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Crankshaft Fr nt Oil Seal· *See "Engine Front Cover" in Buick Special Data*

FLYWHEEL REPLACEMENT *See "Flywheel" in Buick Special Data*

CAMSHAFT

►*CAMSHAFT THRUST PLATE & TIMING GEAR PRODUCTION CHANGE (APPROXIMATELY 5000 1956 CARS):* The camshaft thrust plate and spacer ring have been eliminated and the timing gear has been changed. If difficulty is encountered on these cars, install a standard type timing gear, spacer plate and thrust ring. The standard timing gear is identified by a cam shaped hub while the supplementary gear has a round hub.

►*CAMSHAFT IDENTIFICATION NOTE & NON-INTERCHANGE CAUTION:* Camshafts are identified as follows: **Series 40 (Synchro-mesh Trans.)** - No grooves in land just forward of No. 3 camshaft bearing journal. **All Other Series** - Two grooves in land just forward of No. 3 camshaft bearing journal.

Journal Diameters—(1) 1 685-1 686 , (2) 1 655-1.656", (3) 1 625-1.626", (4) 1 595-1 596" (5) 1.565-1.566 '.

Bearings—Steel-backed, babbitt lined bushings.

Clearance—.0005- 0035' (service limit .0015-.004').

End Thrust Spacer ring installed on shaft between front bearing journal and thrust plate bolted to crankcase behind camshaft sprocket **Endplay**—.004-.008".

Timing Chain: Link Belt **Width** .688", **Pitch** .500" **Length** 26 or 52 links.

Camshaft Setting: Mesh chain on sprockets with two copper-plated washers (12 links apart) in line with O' marks on sprockets with marks toward left side of engine. Turn camshaft so that keyway is straight downward, turn crankshaft so that #1 and #4 pistons are on top dead center, install sprockets and chain as an assembly.

Engine Front Cover Removal· *See "Engine Front Cover" in Buick Special Data*

Engine Front Cover Oil Seal (Crankshaft Front Seal)· *See "Engine Front Cover" in Buick Special Data.*

VALVES

►*OIL FLOW REDUCTION TO VALVE MECHANISM NOTE:* Where the valve mechanism is receiving an excessive amount of oil and it is desirable to reduce the flow, a new plug having a .077" orifice can be installed in cylinder head. *See "Valve System" in Buick Special Data".*

►*VALVE ROCKER ARM PRODUCTION CHANGE:* A heavier type rocker arm with a relocated oil hole is now being used in production. The oil hole in the later type rocker arm is located in center of bearing casting and not in boss on rocker arm. The later rocker arm is completely interchangeable with early type.

Tappet Clearance· None in service (hydraulic).

Valve	Head Diameter	Stem Diameter	Length
Intake	1 750	3720'	4 704"
Exhaust	1 375'	3715'	4 704"

Valv	S at Angl	Litt	St m Cl aranc
Intake	45°	.378"	.002-.003"
Exhaust	45°	.378"	.003-.004"

Valv Seat Width—1/16" (3/64-5/64")

►*VALVE GRINDING CAUTION*· If height of valve stem end raised .075" by valve grinding, height must be reduced by grinding end of stem or replacing valve to insure correct operation of hydraulic lifter.

Valve Springs· Double springs used on all valves. Install springs with closed-coil end toward cylinder head.

Valve Spring Specifications

	Inner Spring		Outer Spring	
Valve	Lbs.Press.	Lgth.	Lbs.Press.	Lgth.
Closed	24-29	1.53"	43-48	1.5"
Open	58-64	1.15"	91-97	1.12"

Valve Guides: Drive old guides out from combustion chamber side using Driver J-269. Install new guides from top of head using Valve Guide Aligner J-5240-2 over guide hole and installer J-5240-1 to drive guide down until installer shoulder contacts top of aligner which will position guide correctly in head. Finish ream guides with Valve Guide Reamer J-129-3.

Hydraulic Valve Lifters: Barrel type.

Diameter—.8425". **Clearance in Block**—.0015-.003".

Lifter Overhaul & Testing—*See "Valve System" in Buick Special Data*

►*VALVE GRINDING CAUTION See Valves (above)*

Rocker Arm Assembly· *See "Valve System" in Buick Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Synchro-mesh Models

Intake Valve - Opens 25° BTDC. Close 77° ALDC.
Exhaust Valve - Opens 75° BLDC. Close 42° ATDC.

Dynaflow Models

Intake Valve - Opens 30° BTDC. Close 82° ALDC.
Exhaust Valve - Opens 78° BLDC. Close 44° ATDC.

Valve Timing Check—Timing chain cover must be removed to check chain and sprocket marks. *See Camshaft Setting under CAMSHAFT above.*

OILING SYSTEM

Crankcase Capacity: 6 qts. (refill), 8 qts. (dry engine). NOTE— 1 qt. additional for dry filter.

Normal Oil Pressure· 35 lbs. at 35 MPH.

Pressure Regulator Valve In oil pump body. Not adjustable.

Oil Pressure Indicator - AC No. 1508362. Not electric.

Oil Pump· Helical gear (early cars), spur gear (later cars), in crankcase at rear of engine

Pump Overhaul—*See "Oiling System" in Buick Special Data*

Oil Filter· Full-flow. On pad at right rear of engine. NOTE—Ball check valve in filter base by-passes oil directly to engine when pressure differential between inlet and outlet ports reaches 4½-5½ lbs.

Replacement Filter Elem nt—AC No. PF-122.

Crankcas Ventilation: Filter element in oil filler cap (air intake) and in rear end of valve lifter cover (air outlet) to which ventilator pipe is connected.

COOLING

►*FAN "OUT-OF-BALANCE" OR DRIVEN PULLEY CRACKING CORRECTION:* This condition may be caused by the counterbore in fan spacer being too shallow. Check to determine if the fan spacer is clamping fan driven pulley against water pump hub. If fan spacer does not clamp, deepen the counterbore to 3/8" using a 5/8" reamer, to provide clearance for water pump shaft.

Water Capacity: (Synchro-mesh Cars) 16 5 qts (without heater), 18 qts. (with heater), **(Dynaflow Cars)** 18 5 qts (without heater), 20 qts (with heater)

Pressure Valve: AC No 850549 (7 lb—Without Air Conditioning), No 850559 (13 lb—With Air Conditioning) Radiator Filler Cap

►*PRESSURE VALVE NOTE:* A 13 lb. pressure valve *(same as used on air-condition d cars) may b us d on cars without air conditioning, wh n operating in t mperatures above 110°.*

Thermostat: Pellet type in water manifold above pump. (Std.) Buick No. 1391226 opens at 157-162°F. (High Temp.) Buick No. 1391225 opens at 177-182°F.

Water Pump: Packless, sealed ball bearing type. *See "Buick V8" in Water Pump Section.*

Pump Removal—Remove fan blade assembly, spacer, and pulley from pump shaft hub, then remove pump cover assembly and gasket from timing chain cover.

Temperature Gauge: AC No. 1513110 (Cars without air conditioning). No. 1513392 (Cars with air conditioning). *See "Temperature Gauges" in Misc llaneous S ction.*

CLUTCH

►*CLUTCH EQUALIZER ASSEMBLY & ENGINE BRACKET INTERFERENCE CORRECTION:* Grind 1/8" from end of equalizer shaft nearest engine and grind off ¼" from both ends of the reinforcing ridge on equalizer engine bracket. Check to see that the long side of the clutch over-center spring extension is upward (this may be installed upside down).

Own. Single plate (conventional spring type).

►*CLUTCH NOTE:* Service replacement parts are not furnished for this clutch.
See "Buick Single Plate" in Clutch S ct i n.
Clutch Disc No. - Buick No. 1391632.

Pedal Adjustment—Free travel ¾-1". Adjust by loosening locknut and turning adjusting nut on release rod at clutch fork.

Removal—Remove rear axle and transmission (See below), take off clutch underpan, disconnect linkage at yoke, remove clutch release bearing support by taking out spring washer in housing, pull out yoke (with release bearing) from fulcrum, mark clutch and flywheel, remove cover mounting screws.

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh.
See "Buick Synchro-m sh in Transmissi n S cti n.
Transmissi n Contr l: *S "Transmissi n C ntr ls" in Transmission S ction.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Disconnect rear axle assembly and move it back out of way. Disconnect speedometer cable, shift rod and selector rod. Disconnect rubber thrust pad from transmission support and remove shims. Remove bolts attaching transmission mounting pad to support. Place a jack under engine and raise engine and transmission just enough to relieve load on transmission support. *(CAUTION - Note the location and number of shims).* Remove support from frame. Remove two top transmission to flywheel housing bolts and install Guide Pins J-851 to support transmission. Remove lower bolts and remove transmission, sliding it straight back. *CAUTION - If guide pins are not used and weight of transmission is allowed to rest on main drive gear in clutch driven hub, the drive plate will be damaged.*

DYNAFLOW DRIVE

"Variable Pitch" Dynaflow Drive. Torque Converter and hydraulically operated planetary transmission. A two position (high & low) stator is used in the torque converter to multiply engine output torque when required (controlled by accelerator pedal at the wide open position) *See "Buick Variable Pitch Dynaflow Drive" in Transmission Section*

▷*DYNAFLOW OIL LEAKAGE CORRECTION (Oil flowing from breather pipe):* This condition caused by uncovered oil hole in transmission mainshaft. *See "Buick Dynaflow Drive" in Transmission Section.*

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION. See "Buick Variable Pitch Dynaflow Drive" in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING See "Buick Variable Pitch Dynaflow Drive" in Transmission Section.*

Throttle Linkage Adjustment and Dash Pot Setting on Dynaflow Drive Cars. *See "Tune-up".*

Lubrication—Check fluid level in transmission every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level—Engine must be idling with selector lever at "P" (parking) and transmission at normal operating temperature. Add oil to "Full" mark on dip stick only.

Capacity—10 quarts.(Add 1¾ pints for dry transmission). *Use only Special Buick Oil for Dynaflow Drive or Automatic Transmission Fluid Type A.*

▷*OTHER DYNAFLOW SERVICE DATA See "Buick Variable Pitch Dynaflow Drive" in Transmission Section.*

UNIVERSALS

Saginaw & Spicer. One used (in torque ball at rear of transmission).
See Universals Section for complete data.

REAR AXLE

Own. Semi-floating hypoid gear type of new design, and torque tube drive.

▷*TORQUE TUBE FRONT FLANGE LOOSENING CORRECTION.* This condition is due to uneven flange which does not allow proper seating of bolt head. To correct, file flange rear face, under head of bolt so that a full bearing of the bolt is obtained. Install later type bolts, Part No. 183822 (identified by six radial marks in bolt head) and torque to 50-60 ft. lbs.

▷*UNIVERSAL JOINT ROUGHNESS ON DECELERATION CORRECTION:* This condition may be due to the torque tube ball retainer being oversize or off center on the flange which prevents it seating fully in recess in end of rear bearing retainer. Correct by filing down outer diameter of retainer so retainer is free to float when torque ball assembled. Tighten flange bolts alternately.

▷*REAR AXLE "CLUNKING" NOISE CORRECTION (At speeds below 25 MPH): May be caused by excessive clearance between differential side gears and bore in differential case. See "Buick Hypoid" in Rear Axle Sect.*

▷*SERIES 70 REAR AXLE OIL PUMP NOTE:* Beginning with early May 1956 production, the oil pump formerly used in Series 70 rear axle assemblies has been eliminated. Service replacement parts connected with the oil pump have also been discontinued. When pump is removed for any reason, it should be left out of the assembly. Series 50 & 70 axle shafts and differential carriers are interchangeable.

▷*REAR WHEEL BEARING OIL LEAK CORRECTION: See "Buick Hypoid" in Rear Axle Section.*

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Buick Hypoid" in Rear Axle Section.*

Axle Ratios

Series	Synchro-mesh	Dynaflow
40	3.91-1	2.23-1
50, 60, 70		3.36-1

▷*REAR AXLE RATIO NOTE:* Ratio is stamped on bottom of axle housing as follows: 3/2 (3.23-1), 3/4 (3.36-1), 3/9 (3.91-1).

Backlash - .007-.009".

Axle Shaft Removal: Remove rear wheel and brake drum. Remove nuts attaching wheel bearing retainer plate to brake backing plate leaving bolts in place to support backing plate. Pull out axle assembly using Puller J-6176 with a slide hammer (be careful not to disturb brake backing plate). *See "Buick "Hypoid" in Rear Axle Section for disassembly procedure.*

Rear Axle Assembly Removal: Place stands under rear axle with wheels clear of floor and place a jack under center of axle housing so it supports weight of axle assembly. Disconnect radius rod at axle end. Disconnect lower ends of rear springs and lower ends of rear shock absorbers. Disconnect parking brake cable at rear cable sheave and at bracket on torque tube. Disconnect brake hose from pipe at frame cross-member and remove yoke (cover hose and brake pipe openings). Loosen torque ball retainer bolts so ball is free. Remove two opposite torque tube flange bolts, replacing them with 3" long guide pins, then remove other flange bolts. Roll rear axle assembly out from under car.

Wheel Bearing Adjustment: None required.

Rear Suspension: *See "Buick Rear Suspension" in Suspension & Wheel Alignment Section.*

Torque Ball Adjustment: New design torque ball assembly does not require adjustment.

SHOCK ABSORBERS

Delco. Direct-acting hydraulic (front & rear). Front shock absorbers mounted within front suspension coil springs.

Front Shock Absorbers

Model	Std.	200# Overload
40, 60 (Exc. 49, 69) Early	5522798	5383669
40, 60 (Exc. 49, 69) Late	5531226	5531225
49, 69 (Early)	5383669	
49, 69 (Late)	5531225	
50, 70 (Early)	5383669	5382679
50, 70 (Late)	5531225	5532070

Rear Shock Absorbers

Model	Std.
41, 43, 48, 63, 63D	5531240
46C, 46R, 66C, 66R	5531428
49, 69, 52, 53, 72, 73	5531242
56C, 56R, 76C, 76R	5531427

▷*REAR SHOCK ABSORBER MOUNTING BOLT LOOSENING CORRECTION:* Replace the mounting bolt and nut with Part No. 454961 (bolt), and Part No. 454939 (nut). Torque to 80-90 ft. lbs. The later type bolt is identified by 6 radial marks on head.

FRONT SUSPENSION

Independent. Shock absorbers mounted within the coil springs.
See "Buick" in Suspension & Wheel Alignment Section.

▷*FRONT TIRES RUBBING ON FRAME CORRECTION (Early 1956 cars):* Install a 1/32" plain washer under the bolt head of the rear steering arm bolt on both right and left sides.

▷*ADJUSTMENT CAUTION.* Check spring height and position of Idler arm before changing adjustments.

Kingpin Inclination - 7° at 7/8° camber.

Caster - 0° to Neg. 2° (Neg. 1° desired at both wheels). *NOTE - This caster setting supersedes the former setting of Neg. ½° to Neg. 1½°.*

Camber - Pos. 7/8° to Neg. 5/8° (Pos. 3/8° desired). Camber on both wheels must be within ¾° of each other.

Toe-In - 1/16" to 1/8".

Toe-out on Turns—Outer wheel 20°, inner wheel 22½° ± 3/4°.

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm and nut type.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: "Saginaw (In-Line) Hydraulic". Recirculating ball nut and worm type with the worm and ball nut, power piston and rack, and the power cylinder all on a single center line.
See "Saginaw (In-Line) Power Steering" in Steering Sect.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Bendix Hydraulic (Single Anchor): Conventional two shoe with short molded lining front (Primary) and long molded lining rear (Secondary). Parking "Step-On" lever applies rear wheel service brakes.

See "Bendix Hydraulic (Without Eccentric)" in Brake Section.

►*BRAKE SQUEAK CORRECTION:* Install Anti-Squeak Spring, Part No. 1345469 on all four brake drums. Spring is installed on O.D. of drum and held in place with clips, Part No. 1172311, disregard hole in clip as inboard side of wheel will hold them in place.

►*BRAKE PEDAL TWISTING CORRECTION (MANUAL BRAKES):* On early 1956 Dynaflow models a bending or twisting of the brake pedal plate can be corrected by removing the brake pedal pivot lock nut, bolt and pedal as well as the dash insulator retainer. Drill a 9/32" hole through the cowl using the unused hole in brake pedal bracket as a guide. Install a ¼" x 20" x ¾" bolt, washer and locknut and tighten to cowl panel.

►*DISTORTED AND OUT-OF-ALIGNMENT POWER BRAKE PEDAL CORRECTION:* Loosen pivot bolt locknut on right side of brake pedal bracket and with pedal in fully released position, turn eccentric pivot bolt at left side of bracket until there is just enough clearance between push rod and air valve sleeve to prevent contact at any point in pedal travel. Tighten locknut, making sure that adjustment does not change. If the above procedure does not correct the trouble, it will be necessary to shim between pedal plate and power cylinder, as necessary to correct the alignment.

►*POWER BRAKE PEDAL SLOW RETURN CORRECTION:* Install Power Brake Pedal Return Spring, Part No. 1175435 on eccentric bolt and hook it back of brake pedal.

►*BRAKE MASTER CYLINDER PRODUCTION CHANGE:* A new master cylinder, Part No. 5456000 is being used in production and for service replacement. A new master cylinder repair kit, Part No. 5455765 is available and can be used on the earlier type master cylinder to convert it to the later design. *See "Buick Hydraulic Brake Master Cylinder" in Brake Section.*

►*PARKING BRAKE PEDAL SLIPPAGE CORRECTION:* This condition is caused by incorrect adjustment of parking brake release rod trunnion and can be corrected by adjusting the trunnion so when parking brake is in fully released position, the release rod spring will be compressed approximately ¼" to give it a desired preload of approximately 4 - 6 lbs. *See "Brake Notes" in Buick Special Data.*

Drums—Diameter 12" Rebore limits. .060"

Wheel Cyl. Diameter—Front 1-1/8", Rear 1".

Replacement Lining & Shoes—Linings or shoes with linings come in Standard and .030" oversize, and differ between Regular and Power brakes, as well as between car Series.

Lining Width & Thickness

Model	Front Wheels	Rear Wheels
Series 40, 50, 60	2.25" x .187"	2.25" x .187"
Series 70	2.50" x .250"	2.25" x .187"

Braking Power - 53% Front, 47% Rear.

Clearance - Heavy drag and back off 15-17 notches.

Standard Master Cylinder: "Displacement" type. Located on engine side of cowl panel directly below brake pedal. *See "Buick Master Cylinder" in Brake Section.*

Checking Fluid - Maintain fluid level ½" to 1" below top of filler opening.

Removal - Disconnect brake pipe and tape end of pipe. Disconnect stop light wire, and disconnect push rod from brake pedal and remove brake pedal. Remove screws holding steering column jacket rubber seal retainer to floor pan and push it up on steering column jacket. Pull floor mat away from pedal plate and remove pedal plate and master cylinder together.

Power Brakes: Moraine Suspended type power brake unit (replaces conventional master cylinder). Reservoir is integral with master cylinder.

See "Moraine Power Unit" in Brake Section.

►*HYDROVAC POWER BRAKE NOTE: If this type power brake found on car, see "Hydrovac Power Unit" in Brake Section.*

Checking Fluid Level - Maintain fluid level ½" to 1" below top of filler opening.

Removal of Power Unit - Disconnect brake pipe from master cylinder and tape end of pipe. Disconnect vacuum hoses from power cylinder, and stop light wires from switch. Place drip pan under reservoir and remove reservoir. Disconnect push rod from brake pedal. Remove eccentric bolt and remove pedal. Remove screws holding dash insulator retainer to pedal plate. Remove retainer and push steering column seal up column jacket. Pull floor mat out of way and remove pedal plate and power brake unit from car.

MISC. MECHANICAL

Air Conditioning: Frigidaire-Harrison type with solenoid controlled compressor clutch (compressor operates only with air-conditioning switch turned on). *See "Frigidaire-Harrison Air-Conditioning" in Miscellaneous Sect.*

Windshield Wipers: Cable operated vacuum type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Electric type with reversible motor in each window. *See "GM Electric Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters (Two-Way): Electric type with single reversible type motor for horizontal adjustment. *See "GM Two-Way Seat Regulators" in Miscellaneous Section.*

Power Seat Adjusters (Six-Way): Electric type with single reversible motor. *See "GM Six-Way Seat Regulators" in Miscellaneous Section.*

Power Top Control: Hydro-Lectric with reversible pump motor. *See "Power Top Controls" in Miscellaneous Sect.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	65-70
Intake Manifold	25-30
Exhaust Manifold	25-30
Oil Pan Screws	10-12
Oil Pan Nuts	15-18
Main Bearing Caps	90-100
Vibration Dampener	60-65
Con Rod Caps	40-45
Camshaft Sprocket	15-18
Water Pump Mounting	25-29
Oil Pump Mounting	25-30
Flywheel Housing (Upper)	45-50
Flywheel Housing (Lower)	25-30

ENGINE

ENGINE REMOVAL (WITH TRANSMISSION IN CAR): *(CAUTION—If car is equipped with Air Conditioning, see Air Conditioning Section for precautions to take when removing equipment or disconnecting refrigerant lines).* Proceed as follows:

1—Drain cooling system, crankcase and transmission. Remove hood top panel (see Hood Removal above). Disconnect battery, and wires from generator. Remove upper and lower radiator hoses and remove radiator core.

2—Disconnect power steering pump to valve body hoses at pump and install caps on fittings to prevent oil leakage. Disconnect refrigerant lines (See Air Conditioning Section). Disconnect all heater hoses at water pump and remove right heater hose from thermostatic valve.

3—If car is equipped with power brakes, disconnect vacuum line at intake manifold. Remove carburetor air cleaner, disconnect throttle linkage and fittings and remove carburetor. Disconnect flexible fuel line at fuel pump and remove line from clips. Disconnect ground straps, primary wire at distributor, oil pressure and cooling system temperature switch wires Disconnect wires at porcelain resistor.

4—Disconnect windshield wiper vacuum hoses at manifold line and vacuum pump line. Raise front of car and install stands.

5—Disconnect propeller shaft at rear axle and remove assembly from car by sliding yoke out of transmission extension housing. Remove transmission linkage slush deflector, and disconnect speedometer cable and shift linkage at transmission. Remove starter from car.

6—Disconnect front engine supports at frame. Disconnect exhaust pipes from exhaust manifold. Remove idler arm support screws from frame and lower idler arm and steering connector link. Loosen hand brake cable at relay. Remove stands from front of car and lower car to floor.

7—Install a chain or rope around intake manifold and attach chain hoist above engine. Take up all slack and then remove rear engine support bracket from frame and extension housing. Lift engine, with transmission, out of car.

OIL PAN

OIL PAN REMOVAL: Drain engine oil, and remove oil level indicator. Disconnect battery ground strap and wires from starter solenoid. Remove starter motor assembly. Remove idler arm support screws and lower support from frame side bar. Remove water hose and clip from center of crossmember. Remove oil pan screws and nuts and remove oil pan.

Oil Pan Installation: Install new cork seals in rear main bearing cap and in front cover, being sure ends of gaskets are in recess provided for them. Cement pan gaskets to both sides of pan, being sure holes in gasket line up with holes in pan. Place a small amount of chassis grease on each of the four corners of gasket which hang over front and rear cutouts, which will permit pan to slide over corks and insure a good seal. Place pan in position on bottom surface of cylinder block over the four studs, and install nuts and lockwashers loosely. Install remaining screws and tighten screws and nuts in rotation to 7-10 ft. lbs. torque. Complete installation by reversing removal procedure.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use a Torque Wrench and tighten cylinder head capscrews starting from the center row of bolts and working outward and toward each end.

▷*CYLINDER HEAD TIGHTENING CAUTION—Loosen intake manifold before checking the cylinder head capscrew torque. This will prevent the upper row of screws from being under-torqued due to the bridging effect of the manifold.*

Cylinder Head Gasket. Install with side stamped "Top" UP

Cylinder Head Capscrews. 8 short screws in outside row, 5 medium length screws in center row, 4 long screws at rocker arm shaft.

Tightening Torque. See Tightening (Torque Wrench) Specifications.

ORIGINAL BORE & PISTONS

ORIGINAL PRODUCTION ENGINE BORE & PISTON SIZES: Piston and cylinder size variation indicated by letter ("A" through "M") stamped on top of block at outer edge of cylinder bore. Each letter indicates two sizes ("—" if letter to left of bore, "+" if to right of bore center). These letters used in production for selective fitting of pistons.

PISTONS

FITTING NEW PISTONS: Pistons should be fitted by Micrometer Gauge Method or Feeler Gauge Method as described below. Piston skirt clearance is .0015" at top of skirt, and .000" at bottom (with proper allowance for temperature variation).

Feeler Gauge Method:—Use ½" feeler stock .002", .0025", or .003" thick (see Feeler Gauge Note and table below) on side of piston directly over "T" slot (center feeler on slot) with lower rounded end of feeler extending ½" down on piston skirt past horizontal slot (feeler must not extend further down on piston skirt because skirt is tapered with greater diameter at bottom) Install piston and feeler in cylinder with piston right side up and feeler toward side, measure pull required to withdraw feeler Pull will vary in accordance with thickness of feeler gauge used and with piston temperature. See table below for correct pull for each feeler gauge thickness to obtain proper skirt clearance listed above

Feeler Pull	Piston Clearance (70°F.)		
(In lbs.)	.002" Feeler	.0025" Feeler	.003" Feeler
1	.00225"	.00275"	.00326"
2	.002"	.00252"	.00304"
3	.00175"	.00228"	.0028"
4	.0015"	.00205"	.00258"
5	.00125"	00182"	.00235"
6	001"	.00157"	.00213"
7	.00075"	.00133"	.0019"

PISTON PINS

PISTON PIN FITTING: *(NOTE—Special tool J-3848 is required to fit pins to connecting rods).* See following for Removal and Installation:

Removal—Install pilot of tool J-3848 on puller screw and insert this assembly through piston and pin from side of piston stamped "REAR." Install support (part of tool J-3848) over puller screw with small end of support against front side of piston (side opposite to that stamped "REAR"). Install nut loosely on puller screw and place assembly in arbor press with support positioned over slot in press table to allow screw to extend down. Press piston pin out of piston and rod assembly Remove tool from piston and rod

Installation—Lubricate pin holes and install pilot (part of tool J-3848) through piston and rod, lubricate pin and insert it in piston pin hole on "REAR" side of piston. Install puller screw through pin and pilot from "REAR" side of piston. Insert spacer (part of tool J-3848) between connecting rod and front side of piston until it is seated on the pilot Install support over puller screw with smaller end toward front of piston (opposite to side stamped "REAR") Mount piston and tool assembly in vise with side of piston stamped "REAR" down and flats of puller screw gripped in vise Install nut on threaded end of puller and tighten with torque wrench to start piston pin into connecting rod. *(CAUTION—If* pin can be started into rod with less than 15 ft.lbs. minimum torque, the clearance between piston pin and rod is excessive and either the piston and pin assembly or connecting rod must be replaced). Remove assembly from vise and install in arbor press with large side of support down Install collar (part of tool J-3848) over piston pin and press puller screw down until top of pin is level with top of collar *REMOVE COLLAR and SPACER.* Pin will be projecting slightly from rod, and must be guided into pin boss next to support to assure correct alignment When aligned, press pin in until pilot bottoms in support This properly positions pin in rod

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT REMOVAL (Engine in Car): Jack up all four wheels and install a stand at each wheel. Drain crankcase and cooling system. Remove oil pan (see Oil Pan Removal), oil pump (see Oil Pump Removal), timing chain (see Timing Chain Removal), and flywheel (see Flywheel Removal). Take off steering idler at right frame side bar and lower linkage to floor. Remove spark plugs. Take off rod caps and push rod and piston assemblies up into bores to clear shaft. Remove front and rear main bearing caps, support shaft at front and rear and remove three remaining caps, lower shaft out of engine.

REAR MAIN BEARING OIL SEAL: Wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove).

Oil Seal Installation – With crankshaft out of engine (see Crankshaft Removal). and bearing cap off, install length of new packing in groove in block. Use Tool J-6349 and drive seal into place. With tool in place, cut ends of packing flush at each end. Repeat operation for bearing cap.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*NOTE:* To prevent seal from rotating in groove (because of thrust caused by transmission) after a new seal is installed, place gasket sealer on ends of cap over the seal, then place a piece of .001" polyester tape (Scotch Brand No. 850 or equivalent) over ends of cap and the new seal. Install gasket sealer over the tape and install bearing cap.

ENGINE BALANCING

ENGINE BALANCE CHECK & UNBALANCE CORRECTION: 1) – Connect a tachometer to engine and run engine at progressively higher speeds (with transmission in neutral). Note degree of vibration at various speeds.

2) – If greatest vibration is noted at approximately 2800 RPM, either the torus cover, flywheel, or flex plate may be out of balance. To correct, add a washer under one of the four flex plate-to-flywheel attaching nuts. Recheck for vibration. If the addition of the washer increases vibration, remove washer and place it under one of the other three attaching nuts until the best over-all balance is obtained. In order to perfect the balance, it may be necessary to add additional washers under other flywheel-to-torus cover attaching nuts in the area of the first washer.

3) – If greatest vibration is noticed at 3500 RPM, the flywheel or flex plate may have excessive lateral runout. Check runout as follows: Remove transmission and inspect flywheel for weld spots which may hold flex plate away from the flywheel.

4) – Mount a dial indicator on rear of engine. Rotate flex plate to check each leg for runout on the surface that contacts the flywheel. The total runout at this point should not exceed .010". If the runout is in excess of .010", use the flex plate leg which is the most rearward as a standard. Then bend back the legs that are too far forward until they are within .005" of standard leg. *NOTE* – Be sure to bend the complete leg.

5) – Install transmission. Tighten flex plate-to-wheel nuts alternately to 5 ft. lbs. Then, tighten to 15-20 ft. lbs. Recheck engine for vibration. If vibration continues to exist at 3800 RPM, the flywheel and torus assembly have excessive runout and should be replaced.

NOTE: The flex plate checking procedure should be followed whenever transmission is removed

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove hood lock plate support plate. If car is equipped with air conditioning, remove the condenser (see "Air Conditioning" in Miscellaneous Section). Remove radiator core and remove timing chain and sprockets. Remove valve lifters and slide camshaft slowly forward out of engine. *CAUTION – Do not allow camshaft lobes to score camshaft bushings.*

Camshaft Alignment Check: Check camshaft for proper alignment whenever it is removed from the engine. *See "Camshaft Alignment Check" below.*

Camshaft Bushing Removal & Installation: Use Bearing Remover & Installer Tool J-3063 to pull old bushings out. Install new bushings with same tool and see that oil holes in bushing line up with oil holes in block (check oil leads with piece of wire after tool removed).

Camshaft Installation: Lower camshaft into position between radiator grille and engine and guide it carefully into cylinder block. Be sure distributor is timed correctly when inserting camshaft. Reverse removal procedure.

CAMSHAFT ALIGNMENT CHECK: Put shaft on surface plate and support at front and rear bearing journals on "V" blocks, or on centers. Mount dial indicator on surface plate over centerline of camshaft with pointer touching shaft. Check heel of each cam through 180° rotation with dial set at zero. Replace camshaft if dial reading greater than .0015".

TIMING CHAIN

TIMING CHAIN REMOVAL: Set engine in firing position for No. 6 cylinder. Remove water pump (see Cooling on car page), oil pan (see Oil Pan Removal), crankshaft pulley and engine front cover. Take out the two camshaft sprocket screws and lockwashers. Remove sprocket with chain from camshaft, remove crankshaft sprocket.

Timing Chain Installation: Reverse removal instructions given above. Timing marks on sprocket must be together and aligned with straightedge across shaft centers.

VALVE SYSTEM

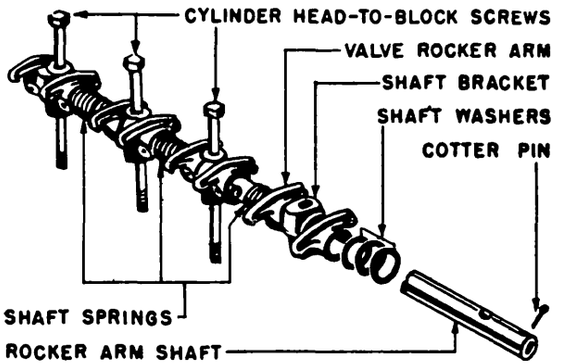
VALVE REMOVAL: With cylinder head removed, take out spark plugs. Install head upside down on Cylinder Head Holding Stand J-3064. Install Holding Strap J-3064-6 over heads of valves. Turn head right side up, compress valve springs with compressor bar and stirrup of Holding Tool, remove valve keepers. Release bar and remove valve spring retainer, also rubber seal from lower groove on valve stem. Turn head over, remove Holding Strap, take out valves. *CAUTION – Note location of each valve, which must be installed in same location.*

Installation: Reverse removal procedure.

VALVE STEM SEALS

VALVE STEM OIL SEALS: Seals are installed in lower groove (nearest valve head) ahead of valve keepers. Check for proper sealing after keepers installed by striking end of valve stems to seat keepers, then using suction cup (similar to type used for grinding valves), compress cup on valve spring retainer. If cup will not stick, seal is broken and a new seal should be installed.

ROCKER ARMS



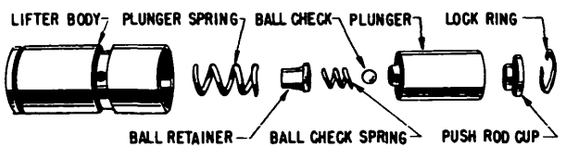
ROCKER ARM ASSEMBLIES: Drain radiator, remove radiator hoses, six radiator-to-air-deflector screws, and radiator anchor nut and spacers at frame bracket (check number of spacers and reinstall same number when radiator replaced). Lift out radiator.

Disassembly & Reassembly: See illustration for correct order of parts. Parts can be removed from shaft by removing cotter pin at end.

Installation: When installing rocker arm assemblies on cylinder head note the following precautions:

Rocker Arm Shafts—Locating notch on front end of shaft must point inward and down.

Rocker Shaft Brackets—Front and rear rocker shaft brackets have screw hole for rocker arm cover screws. These screw holes must be upward and toward outside of engine from rocker shaft center arm.



CADILLAC ROCKER ARM ASSY.

HYDRAULIC LIFTERS

VALVE LIFTERS: Hydraulic, Barr 1 Type. Consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet or body (See illustration). Oil is introduced to this unit from main oil gallery through hole in side of lifter plunger and body.

Removal: Disconnect power brake vacuum line from intake manifold. Remove heater hoses from clips on rocker arm covers and remove covers. Remove intake manifold. Remove valve compartment cover screws. Loosen engine ventilator pipe clampscrew at flywheel housing, remove long ventilator pipe screw at valve compartment and remove cover. Remove rocker arm assemblies *(NOTE* – When only one or two lifters are to be removed, do not remove rocker arm assembly. Compress valve spring, slide rocker arm over and remove the push rod.) Remove push rods, keeping them in order so they may be replaced in the same location. Using Valve Lifter Remover Tool J-3049, remove lifters from engine. Keep lifters in order so they may be replaced in the same location.

HYDRAULIC VALVE LIFTER

Disassembly: Press down on center of valve lifter push rod cup, and with a pointed tool, remove lockwire from groove. Invert lifter and slide out push rod cup, plunger, ball retainer and spring. *NOTE*— If plunger is stuck in body, place lifter push rod end down, in Valve Lifter Plunger Remover Tool J-4160. Holding tool firmly in hand with thumb over lifter body, strike tool sharply on block of wood until plunger falls out of body.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cleaning & Inspection: Wash all parts in a suitable carbon solvent and remove all trace of carbon and varnish. Inspect plunger and lifter body for scoring or other damage that would prevent free movement. Inspect lower end of lifter body for nicks or indentations. If any exist, replace complete lifter assembly. Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement. Plunger should drop of own weight into body bore.

Reassembly: Place ball on its seat in lower end of plunger while holding plunger upside down. Place small spring on ball. Position ball retainer over ball and end of plunger. Move retainer up and down to be sure spring is in working order. Place spring over ball retainer. Lower lifter body over plunger assembly on an angle to seat spring. If necessary probe with a small wire through oil hole to allow assembly to be seated. Turn assembly right side up and fill plunger with clean engine oil. Jiggle ball with a small piece of wire until oil drains out of plunger into body and trapped air is released from body. Refill plunger with oil and place push rod cup on plunger. Position lock wire over cup. Using Valve Lifter Lock Wire Installer J-2730, press lock wire into groove.

Testing (Leak Down Rate)—Remove distributor cap, coil and rocker arm covers as an assembly. Set timing mark "C" on harmonic balancer to the pointer and observe position of distributor rotor. Check each lifter as outlined in following table, using Valve Lifter Leakdown Tool J-3074:

With rotor at No. 1 firing position (pointing toward rear of engine), check:

No. 1 Intake	No. 3 Exhaust	No. 6 Exhaust
No. 1 Exhaust	No. 4 Exhaust	No. 7 Intake
No. 2 Intake	No. 5 Intake	No. 8 Intake
No. 2 Exhaust	No. 6 Intake	No. 8 Exhaust

With rotor at No. 6 firing position (pointing toward front of engine) check:

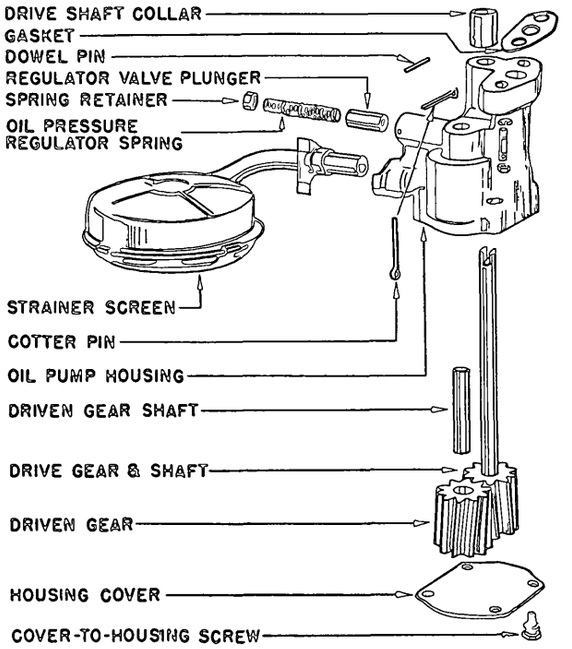
No. 3 Intake	No. 5 Exhaust
No. 4 Intake	No. 7 Exhaust

Insert feeler gauge of tool between valve stem and rocker arm, at the same time compressing the tool "pop-out" spring against valve spring *(NOTE*—Tool should be installed as quickly as possible to avoid any unnecessary leakdown of lifter). Note the interval of time during which the tool is held in place by valve spring pressure. It will be found through this test that bad lifters or lifter will have the shortest leakdown time.

OILING SYSTEM

▷*AIR IN OILING SYSTEM (Causing oil foaming or noisy Hydraulic Lifter operation): See Oil Pump Reassembly below for sealing of pump intake float tube and Oil Pump Installation for correct positioning of oil pan baffle.*

OIL PUMP



▷*OIL PUMP PRODUCTION CHANGE:* A felt washer, Part No. 392454, has been installed in the oil pump intake beginning with Engine No. 001148 to insure correct sealing of pump from air.

OIL PUMP REMOVAL: Take off oil pan (see Oil Pan Removal). Remove oil pan baffle, and two nuts securing pump to rear main bearing cap. Remove pump and float and screen as an assembly.

Disassembly: Remove float and screen assembly. Take out retaining cotter pin and withdraw pressure regulator parts from pump body. Remove pump lower cover for pump gear and shaft removal.

Oil Pump Specifications: Backlash between gears .008-.012". Driveshaft to Body Clearance .0010-.0025" (new), .005" max. (worn). Endplay between cover and gears .001-.004" (new), .006" max. (worn).

Pressure Regulator—Valve Plunger to Body Clearance .0020-.0035" (new), .005" (worn). Spring Free Length 2 25/64". Spring Pressure at 1 13/32"—5 3/4 to 6 1/4 lbs.

OIL PUMP

Reassembly: To correct air in system, remove pump float and inspect float tube and tube bore in pump body for burrs, remove burrs with fine sandpaper. Install an "O" ring seal, Part No. 5665829, on float tube against the shoulder 1 1/16" from end of tube, insert float tube in body and secure with new cotter pin. Check float for free movement. Complete pump assembly by reversing disassembly procedure (above).

Installation: When installing pump, use new gasket between pump and bearing cap. Make certain that clearance between oil pan baffle and sides of pan is at least ¼" on each side. Bend baffle as necessary to secure this clearance. *CAUTION*—Insufficient clearance will prevent oil from returning to pump on hills or during sudden stops and will allow air to enter system.

VACUUM PUMP

VACUUM PUMP (Removal): Drain engine oil and remove oil pan. Remove oil pan baffle and disconnect vacuum line at engine block. Remove six screws holding vacuum pump to oil pump, and remove vacuum pump with the oil pump idler gear. Remove hexagonal drive shaft. *CAUTION*—Oil pump idler gear may fall when pump removed.

Disassembly—Remove two screws holding plate to vacuum pump and remove plate from dowels. Turn pump upside down and shake out rotor assembly. Remove springs and vanes from pump rotor.

Vacuum Pump Clearances—Vane to cover plate .002-.005". Rotor to cover plate .004-.007". Socket to cover plate .0144-.0324". Socket to rotor face .0104-.0254". Rotor to shaft .0010-.0023". Rotor to depression in body cavity .0005-.0034"

Installation—Install vacuum lines to pump and replace hexagonal shaft. Install idler gear in oil pump and install vacuum pump below oil pump with six screws. Connect vacuum line to engine block. Install oil pan baffle, then install oil pan.

Reassembly—Inspect inside of body for scores or wear. Inspect plate for wear and dress down on surface plate. (CAUTION—Make sure that all parts are clean and that no foreign material is in housing). Install vanes and spring in rotor. Compress vanes and install rotor in pump body. Position plate on doweled pump body so that hole in plate lines up with hexagonal hole in rotor. Install screws in cover plate.

COOLING SYSTEM

RADIATOR CORE REMOVAL: Drain cooling system and loosen upper and lower radiator hoses. On air conditioned cars, remove condenser assembly. Remove six screws (also four spacer screws on air conditioned cars) which hold radiator to support. Remove radiator assembly with hoses.

Radiator Core Installation: Reverse removal instructions given above. NOTE—Core must be properly positioned for spacing between core and fan—this space must be ½" to 1".

BRAKE NOTES

▷*BRAKE PEDAL BINDING CORRECTION:* Check clearance between brake pedal to relay rod and opening in toe board. Correct by moving the pedal attaching bracket at support mount, or enlarge hole in toe board. Check metal retainer over felt seal on inside of toe board and centralize hole in retainer as necessary by rotating seal and retainer. Punch or drill new holes as necessary. Check relay-to-brake rod clevis for interference at relay connecting point. Clevis pin should fit easily into clevis hole. Remove stock from relay as necessary to provide free entry of clevis in hole. Check brake pedal for correct horizontal position as viewed from seat. Level pedal by shimming between attaching bracket and steering column support.

►*AIR CONDITIONED CAR SERVICE CAUTION: B for disc nnecting any part f air c nditi ning quipment r lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

ENGINE & SERIAL NUMBER: Stamped on upper right corner on front face of right hand block, on right frame side member just to rear of engine support bracket, and on lubrication plate on front side of left body pillar (Exc. Coupe), on left door lock pillar (Coupe).

Series	First 1956 Nos.
60S	566000001
62	566200001
75	567500001
86	568600001

Identification—First two figures indicate year, third and fourth indicate model (last five figures are numbered consecutively regardless of series).

Engine Unit Number Note: Use for identification. Stamped on top of crankcase to rear of left hand block with prefix indicating model:

Series	Engine Unit Prefix
60S, 62, 75 (Standard)	4X-1 and up.
60S, 62, 75 (Air Conditioned)	4XK-1 and up.
86 (Standard)	5X-1 and up.
86 (Air Conditioned)	5XK-1 and up.
60S, 62 (Dual Carburetors)	7X-1 and up.
60S, 62 (Dual Carbs. & Air Conditioned)	7XK-1 and up.

►*ENGINE NUMBER NOTE:* "L.C." will be added as a suffix to engine unit number on all engines built to low compression specifications.

►*NOTE:* Mark * preceding Engine Unit Number indicates cylinder bore and pistons are .010" oversize.

TUNE-UP

►*1956 DETONATION CORRECTION (Early Cars in Low Octane Areas): See "Ignition Timing" below.*

►*POWER LOSS OR "STUMBLE" AFTER HARD LEFT TURN CORRECTION (CARS WITH CARTER CARBURETOR):* May be caused by fuel leakage from bowl into choke vacuum passage. *See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

►*FLAT SPOT & "SHUDDER" CORRECTION (ELDORADO ENGINE): See "Cadillac (Carter & Rochester Carburetors" in Carburetion Section.*

►*SURGE UNDER FULL THROTTLE OR LEANNESS AT HIGH SPEED CORRECTION (CARTER CARBURETORS): See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

►*PART THROTTLE DETONATION CORRECTION:* Install Vacuum Advance Unit, Delco-Remy Part No. 1116103 on early cars which were equipped with Part No. 1116097.

COMPRESSION PRESSURE: 165 to 185 lbs., (at cranking speed). 212 to 230 lbs., (at 1000 RPM).

VACUUM READING: Not specified. *NOTE*—Beginning with Eng. No. 033849, new Camshaft used which results in decrease in manifold vacuum (normal vacuum at sea level with new camshaft is 13-15" idling).

►*VACUUM CHECKING CAUTION: When checking engine vacuum, shut off engine before removing vacuum hose. The plunger in the vacuum operated throttle check will increase engine speed to approximately 900 RPM if hose is removed with engine running. Set hand brake firmly before checking engine vacuum.*

VALVE TAPPET CLEARANCE: None in service (Hydraulic Lifters).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Valve diverts exhaust gases of left hand cylinder bank through carburetor heating passages in intake manifold to right hand exhaust system during warm-up period.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders—RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs—AC No. 44 (All Engines), 14mm.

COIL: Delco-Remy 1115082. *12 Volt.*

Ignition Current—1.25 amps. idling. 3 amps. stopped.

Resistor—Delco-Remy 1927809. On coil bracket.

►*COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil.*

DISTRIBUTOR: Delco-Remy 1110858 (Except Eldorado), 1110859 (Eldorado Engine). *12 Volt.* New "Window type" with external adjustment. *See "Delco-Remy (Window type) Distributor" in Electrical Section.*

Condenser—Delco-Remy 1932004. **Capacity** .18-.23 mfd.

Contact Point Set—Delco-Remy 1931988.

Breaker Gap—.016" (new & used points).

Cam Angle—26-33°.

Breaker Arm Spring Tension—19-23 ozs.

Rotation—Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	575	0-4	1150
6-8	1275	12-16	2550
9-11	1950	18-22	3900

Vacuum Spark Control: Delco-Remy 1116097 (Early); 1116103 (Later). *See "Part Throttle Detonation Correction" above.*

Vacuum Advance - 1116097

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7
18	36	15.5-17.25

Plunger Travel - 3/8-13/32"

Vacuum Advance - 1116103

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	6.5-8.5
15.5	31	13.5-16

Plunger Travel - 5/16-11/32".

IGNITION TIMING

►*1956 ENGINE DETONATION (Low Octane Areas):* If octane rating of available fuel results in detonation complaints, this condition can be corrected as follows:

1) Ignition Timing—Check timing. Timing can be retarded to 2½° BTDC (midway between "A" and "C" on harmonic balancer), or in extreme cases to TDC ("C" mark on balancer), without noticeable decrease in performance.

2) Distributor Vacuum Advance—If detonation not corrected by timing change, original Vacuum Advance Unit, Delco-Remy No. 1116097, can be replaced with late type unit No. 1116103.

3) Lowering Compression Ratio—On engines before Eng. No. 033849, compression ratio can be lowered by installing shim., Part No. 1466224, under each cylinder head. After installing shim, torque head bolts to 65-70 ft. lbs. and retorque after 500 miles to 75-80 ft. lbs. *NOTE*—Beginning Eng. No. 033849, engines have extra head gasket, shim, or modified cylinder head installed in production and it should not be necessary to lower compression ratio.

4) Low Compression Pistons—For travel in foreign countries where octane rating of fuel is not equivalent to average U.S. fuel, a set of low compression pistons, Part No. 3630680, can be installed.

►*SETTING CAUTION: Settings below are latest recommendations and should be followed exactly to avoid detonation and possible damage to engine. THESE SETTINGS ARE CORRECT FOR FUEL OF 97 OCTANE RATING AND TIMING MUST BE RETARDED IF FUEL OF LOWER OCTANE RATING USED.*

Car Model	Ignition Setting
First Cars (To Eng. No. 033849)	2½° BTDC
Later Cars (Beginning No. 033849)	5° BTDC

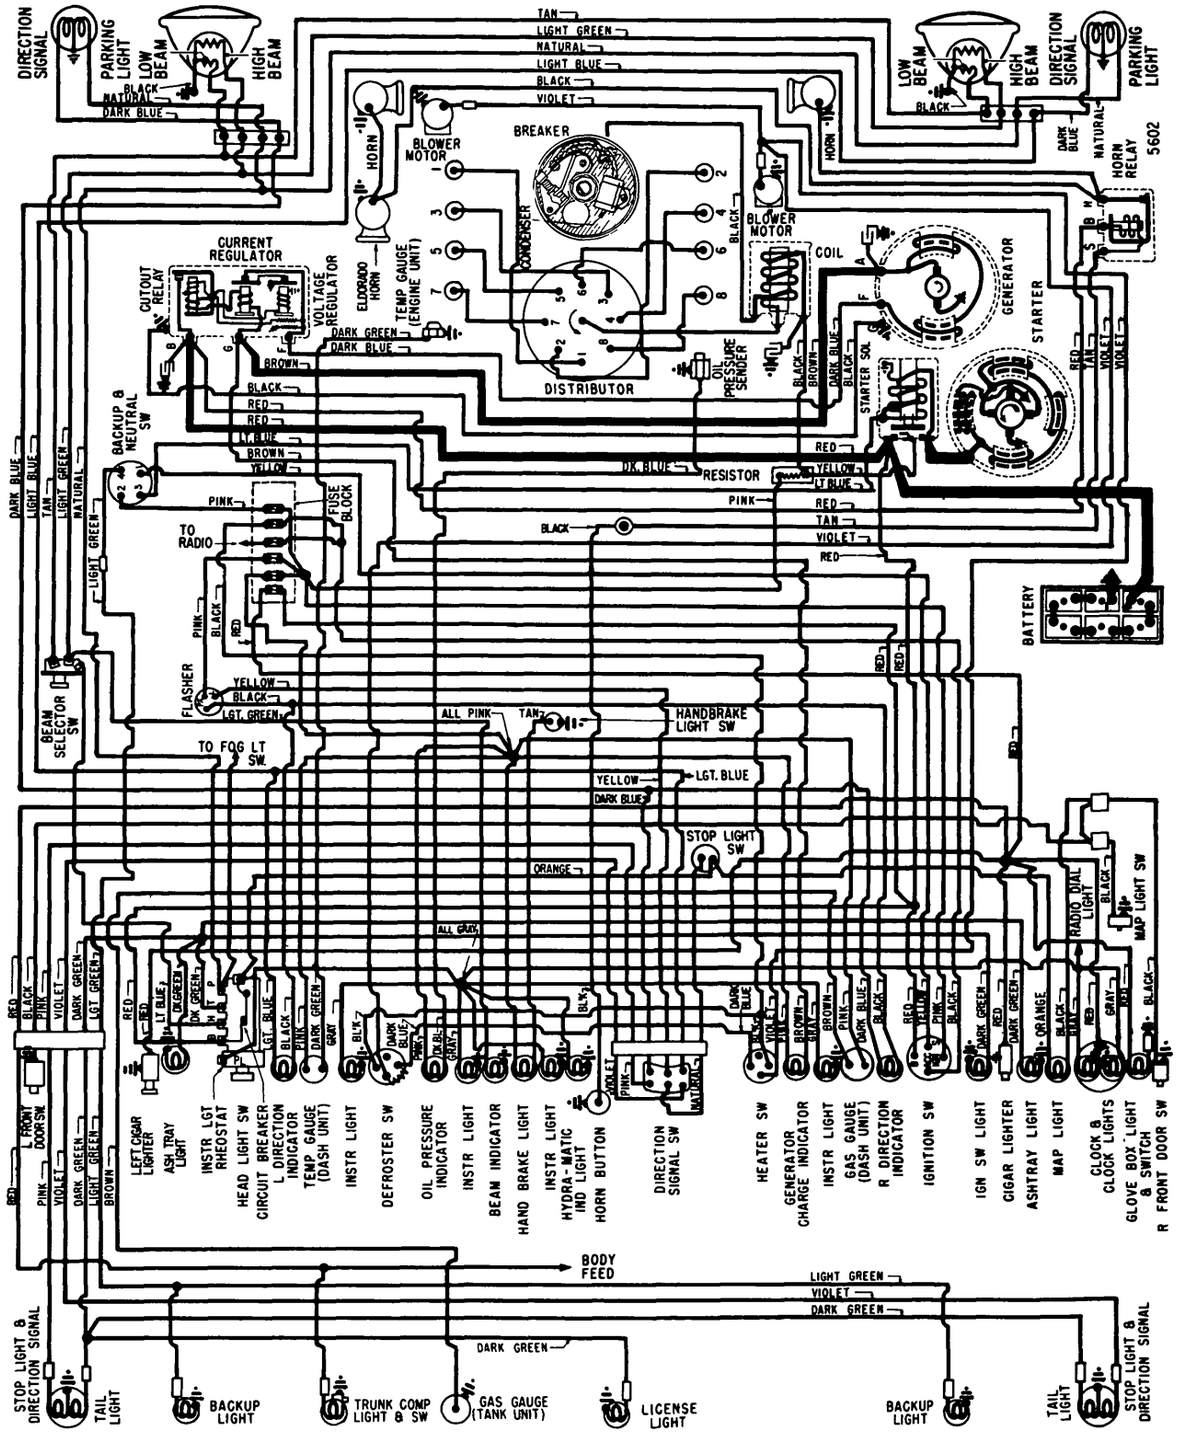
Timing—Disconnect vacuum line to distributor and tape end of line. Idle engine at 400 RPM, set timing midway between "A" and "C" line on balancer (First Cars—2½° BTDC setting), or at "A" line on balancer (Later Cars - 5° BTDC setting).

Timing Mark—Two lines on vibration balancer at front of engine marked "A" (5° BTDC) and "C" (TDC) and pointer on right side of chain case cover.

CARBURETOR

►*CARBURETOR APPLICATION: One 4-Barrel Carter or Rochester 4-Barrel Carburetor used on all models except Eldorado. Two Carter 4-Barrel Carburetors used on Eldorado.*

►*1956 DETONATION CORRECTION: (Early Cars in Low Octane Areas): See "Ignition Timing" below.*



►*CARBURETOR PRODUCTION CHANGES & RECOMMENDED CORRECTIONS: See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

►*FAILURE TO OBTAIN WIDE OPEN THROTTLE POSITION (Due to improper accelerator pedal adjustment):* Adjust accelerator pedal arm-to-trunnion, on the accelerator pedal linkage, up or down to obtain 4¼" clearance from underside of top of pedal to floor pan. With carpet installed, this dimension should be 3¼" to top of carpet.

►*IMPROPER CARBURETOR CHOKE OPERATION CORRECTION:* This condition may be caused by oil leaking from the right rocker arm cover and draining down to the hot air stove on the right exhaust manifold where it is then drawn up into the choke housing. Check for indications of oil in choke assembly and clean if necessary. Replace right rocker arm cover gasket.

►*IDLE SPEED (AIR CONDITIONED CARS): Summer and Winter Idle Speed Adjustment is different as follows:* **Summer Setting (Air Conditioner in Operation)**—With transmission selector lever in either "Dr" range, and

CONTINUED ON NEXT PAGE

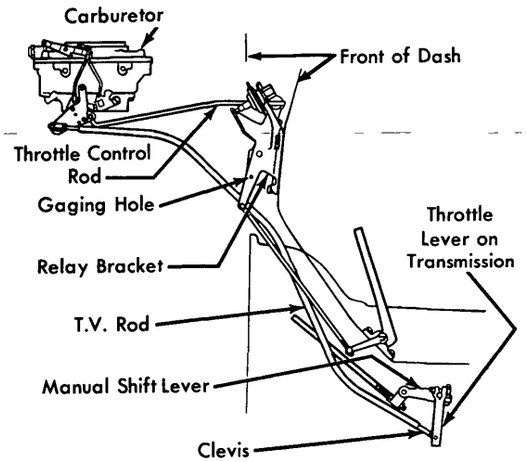
CONTINUED FROM PRECEDING PAGE

with air conditioner "ON" set idle speed at 420 RPM (Cars with Standard Engine). 490-510 RPM (Cars with Eldorado Engine).

Winter Setting (Air Conditioner Not in Operation)– With transmission selector lever in either "Dr" range, and with air conditioner "OFF" set idle speed at 420 RPM (Cars with Standard Engine), 490-510 RPM (Cars with Eldorado Engine).

Idle Speed-Up Control Adjustment (Cars with Air Conditioning): With engine at normal operating temperature and slow idle adjustment completed, turn air conditioner "ON", and place transmission selector lever in "N" position. Adjust engine idle speed to 900 RPM by loosening locknut on diaphragm shaft and turning knurled nut ot obtain specified RPM. Tighten locknut.

►***THROTTLE CHECK ADJUSTMENT CAUTION (CARS BETWEEN ENGINE NOS. 033849 & 053286):*** **S t plunger gap at .185" to prevent return check opening throttle when vacuum is low (the camshaft change at Engine No. 003849 resulted in lower manifold vacuum).** ***See Production Change below for later type Throttl Check Assembly.***



►***THROTTLE CHECK ASSEMBLY PRODUCTION CHANGE:*** **Starting at Engine No. 053286, a new Throttle Check Assembly entered production to prevent return check opening throttle during low vacuum periods. This later assembly is furnished in kit, Part No. 7009892 (identified by black check valve nipple, and tin plated throttle plunger) and can be used for service replacement on cars after Engine No. 033849.**

Throttle Check Adjustment (Standard Method): With engine at normal operating temperature, allow engine to idle and make sure that check plunger is not in contact with throttle relay lever. Open throttle wide momentarily to allow engine manifold vacuum to drop and throttle check plunger to come out. Let throttle snap shut and observe delay caused by throttle check. If engine races, throttle check plunger is too long. If engine stalls, plunger is too short. Adjust plunger screw as necessary for correct operation. *NOTE* – On cars between Engine No. 033849 & 053286, plunger gap must be set at .185". *See "Throttle Check Adjustment Caution" above.*

Throttle Check Adjustment (Alternate Method): With engine running at operating temperature and selector lever in "Park" position, remove hose from throttle return check assembly and place a piece of masking tape over end of hose to prevent vacuum leak. Hold plunger with a wrench and turn hex-head stem to obtain an engine speed of approximately 1100 RPM. Connect vacuum hose, making certain that engine speed returns to 420 RPM in "DR" (single carburetor engines); 500 RPM (dual carburetor engines). With foot brake fully applied, check adjustment by momentarily speeding up engine to full throttle with transmission in "DR" range, then quickly release accelerator. When properly adjusted, the engine will barely keep from stalling when foot is released from accelerator. *CAUTION* – Make sure that excessive overrun of throttle check is not present.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

HYDRA-MATIC THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT: Remove clip from carburetor throttle rod trunnion and remove trunnion from relay bracket lever (at front of dash). Place a ¼" drill shank through gauging hole in relay lever and dash relay bracket. With engine running, set throttle lever in hot idle position (Air Conditioner turned "OFF"). Adjust carburetor throttle rod trunnion to allow free entry into dash relay lever and install trunnion and spring clip. Push end of throttle valve rod (rod from carburetor to transmission throttle lever) toward rear of car to position transmission throttle lever against its stop. Turn front jam nut on throttle valve rod against trunnion until all slack is taken up. **Then tighten nut the number of turns as indicated below** (due to engine throttle adapter plate and transmission changes). Tighten rear jam nut being careful not to put binding force on carburetor plate. *NOTE – Because of differences in carburetion and hydraulic characteristics in the transmission, throttle valve rod adjustments may be varied 1½ turns in either direction to provide correct shift points.*

Throttle Valve Rod Adjustment
Before Engine No. 033849
①(Cars with Single Carburetor)

Trans. No.	②Throttle Plate No.	③ Turns
Up to C-32200 or A-2539	#1	3

②-Plate stamped "1" or "3".
③-Tighten nut on T.V. rod the number of turns indicated.
④-Remove throttle plate #1 and install kit, Part No. 3630753 which includes a #3 throttle plate. Adjust throttle valve 3 turns.

CARTER WCFB
(Standard Engin)

Carter WCFB 2333S, SA (Early), 2543S (Late) Cars without Air Conditioning. Carter WCFB 2334S, SA (Early), 2544S (Late) Cars with Air Conditioning.

►*CARBURETOR REPLACEMENT NOTE: Carter WCFB 2370SA can be used to replace WCFB 2333S, SA, & 2334S, SA. Carter WCFB 2545S can be used to replace WCFB 2543S, & 2544S. On cars with Air Conditioning, Unitized Package 202-44U must also be used.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*NOTE: Carburetors No. 2334S, SA & 2544S have Idle Speed-up Control for use with Air Conditioning.*

►*IDLE SPEED ADJUSTMENT NOTE: Idle Air By-Pass screw on throttle body is used to adjust idle speed. Throttle valves are normally closed at slow idle.*

Idle Speed – 420 RPM in "DR" range. (Cars with Air-Conditioning should have the same idle speed, with Air Conditioner turned on). *NOTE – This idle speed setting supersedes the previous setting of 400 RPM.*

Idle Mixture & Idle Speed Setting – Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

►*IDLE SPEED ADJUSTING STOP SCREW NOTE:* An idle speed stop screw has been added to some Carter carburetors to improve idle characteristics during the break-in period. The idle stop screw is not necessary after the break-in period and should be removed at the 1000 mile point.

►*OTHER DATA: See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

Hydra-Matic Throttle Linkage Adjustment: *See "CARBURETOR" above.*

Fuel Pump Pressure: 5¼ - 6½ lbs. at 4800 RPM.

ROCHESTER 4GC
(Standard Engine)

ROCHESTER 4GC No, 7008750 (Early - Without Air Conditioning); No. 7009750 (Late - Without Air Conditioning); 7008751 (Early - With Air Conditioning); 7009751 (Late - With Air Conditioning).

►*CARBURETOR REPLACEMENT NOTE: Rochester 4GC No. 7009901 can be used to replace 7008750 & 7009750. Rochester 4GC can be used to replace 7008751 & 7009751.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feel Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*NOTE: Carburetors No. 7008751 & 7009751 have Idle Speed-up Control for use with Air Conditioning.*

►*IDLE SPEED ADJUSTMENT NOTE: Idle Air By-pass screw on throttle body is used to adjust idle speed. Throttle valves are normally closed at slow idle.*

►*ROCHESTER CHOKE SETTING CHANGE (To eliminate hard starting after engine stalls while choke is on):* Adjust choke to index mark instead of one point rich mark as previously used.

►*FLAT SPOT CORRECTION (ROCHESTER CARBS.):* Install primary main metering jet No. 7002651. Carburetors with the new jet are identified by a black or red carburetor tag.

Idl Spe d – 420 RPM in "DR" range. (Cars with Air-Conditioning should have the same idle speed, with Air Conditioner turned on). *NOTE – This idl sp ed setting supersedes the previous s tting f 400 RPM.*

Idle Mixture & Idle Speed Setting – Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Cadillac (Cart r & R ch ster) Carburetor" in Carburetion Section.*

►*OTHER DATA: See "Cadillac (Cart r & Rochest r) Carburetor" in Carburetion S cti n.*

Hydra-Matic Throttle Linkag Adjustment: *See "CARBURETOR" above.*

Fuel Pump Pressure: 5¼ - 6½ lbs. at 4800 RPM.

CARTER WCFB (2)
(Eldorado Engine)

Carter WCFB 2371S (Front-With ut Air Conditi ning). 2373S (Front-With Air Conditi ning). 2372S (R ar-All Models).

►*FLAT SPOT CORRECTION (B for Engin N . 044963, Cars without Air Conditioning; 044986, Cars with Air Conditioning): See "Cadillac (Carter & Roch ster Carburetors)" in Carburetion Section.*

►*IMPROVED IDLE STABILITY NOTE: Wind th t rsion closing spring one additional turn ar und th sec ndary throttle shaft.*

►*CARBURETOR REPLACEMENT NOTE: Cart r WCFB 2371S can be used for service r placement of 2372S & 2373S. Unitized Package 202-100U must be used wh n replacing 2373S (Air Conditioned Cars).*

►*CARBURETOR INSTALLATION NOTE: Front & Rear Carburetors operate together as follows:*

►*MANIFOLD FUEL DISTRIBUTION (FRONT CARB.):* Right PRIMARY & Left SECONDARY barrels feed Cyl. 2-3-5-8, Left PRIMARY & Right SECONDARY barrels feed 1-4-6-7.

►*MANIFOLD FUEL DISTRIBUTION (REAR CARB.):* Left PRIMARY & Right SECONDARY barrels feed Cyl. 2-3-5-8, Right PRIMARY & Left SECONDARY barrels feed 1-4-6-7.

►*NOTE: 2373S has Idle Speed-Up Control for us with Air Conditioning.*

►*IDLE SPEED ADJUSTMENT NOTE: Idle Air By-Pass screw on throttle body is used to adjust idle speed. Throttle valves are normally closed at slow idle.*

Idle Speed – 490-510 RPM in "DR" range.

Idle Mixture & Idle Speed Setting – Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Cadillac (Carter & Rochester Carburetors)" in Carburetion S ction.*

Hydra-Matic Throttle Linkag Adjustment: *See "CARBURETOR" above.*

Fuel Pump Pressure: 4¼ - 6½ lbs. at 4800 RPM.

CARB. EQUIPMENT

Fuel Pump: AC (Fuel only). Vacuum pump is part of engine oil pump.

R placement Fuel Pump – AC No. 4269.

Pr ssur – 5¼ - 6½ lbs. at 4800 RPM.

See "Fu l Pumps" in Carburetion Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Gas lin Gaug : AC Electric.
Dash Unit – AC No. 1518488.
Tank Unit – AC No. 1517215.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Delc 3EMR70-W. *12 Volt,* 11 plate, 70 ampere hour capacity (20 hr. rate).
Batt ry Gr und – Negative.
Engin Gr und – Connected between engine and cowl.

STARTER

►*STARTER MOTOR HARNESS CHAFING CORRECTION (B f r Eng. No. 036253): Reroute harness above br ath r pip so it will not rub against corner of engine bl ck.*

D lco-R my 1107642 (Early); 1107657 (Late). *12 Volt.*
Armatur – Delco-Remy 1926626 (1107642); 1932185 (1107657).
Driv –Overrunning clutch (solenoid pinion shift)
Rotation–Counter-clockwise at commutator end.
Brush Spring T nsi n–35 ozs minimum

P rf rmance Data

Torque	RPM	Volts	Amperes
0 ft lbs	3500	10 1	95
10 5 ft lbs	Lock	5 4	470

►*STARTER PINION ADJUSTMENT NOTE:* The later type starter, Delco-Remy No. 1107657 has an extended nose casting that covers all exterior linkage. The starter pinion adjustment is pre-set at the factory and field adjustment is not required.

Starting Switch: Delco-Remy Solenoid Switch No. 1119777 (Starter No. 1107642); No. 1119910 (Starter No. 1107657), mounted on starter and controlled by Ignition & Starter Switch, Delco-Remy No. 1116470. Turn key full RIGHT against spring tension to start.
See "Start r Contr ls" in Electrical Section.

N utral Safety & Back-up Light Switch: Delco-Remy 1998137.
Adjustment – *See "Hydra-Matic Drive" in Transmission Secti n.*

GENERATOR

D lco-R my 1102002 (Std.), 1102011 (Air Conditioned Cars). Armature N . 1923535 (All). *12 Volt.*

►*REPLACEMENT GENERATOR:* Delco-Remy 1102005 (Less Fan & Pulley).
Maximum Charging Rate–See Current Regulator.

Performance Data

	Amperes	Volts	RPM
Cold	30	14	2150

Rotati n–Counter-clockwise at commutator end.
Brush Spring T nsion–28 ozs. each.
Field Current–1.48-1.62 amperes at 12 volts.

Generator Charge Indicator: Red light on instrument panel. *See Diagram.*

Belt Adjustment: Loosen both pivot bolts and adjusting strap screw pull generator out until belt just tight enough to drive generator without slip.

REGULATOR

Delco-Remy 1119001. *12 V lt.*

►*REGULATOR NOTE: Specifications below are for "Normal" setting. See "Delco-Remy 1119000 Series Regulator" in Electrical Section.*

Cutout Relay
Cuts In – 11.8-13.5 volts (hot).
Contact Gap – .020".
Air Gap – .020" (with contacts just closed).

Voltage Regulator
Setting – 13.8-14.8 volts (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting – *See Electrical Section.*

Current Regulator
Setting – 27-33 amperes (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjustment – *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Autronic Eye: *See "Autronic Eye" in Electrical Section.*
Direction Signal: *See "Direction Signals" in Electrical Section.*

Stop Light Switch (Location): Mechanical type located to left of steering column adjacent to pedal retaining bar.

FUSES: Located on fuse panel under instrument panel on cowl insulating board just to left of car centerline except as noted below.
Air Conditioner & Heater – 25 amps.
Antenna – 14 amps.
Back-up Lights – 9 amps.
Cigar Lighters, Clock, Dome or Bow Light, Glove Box, & Trunk Light – 25 amps. Body Feed fuse on panel protects these circuits.
Instruments – 9 amps.
Radio – 7½ amps.
Turn Signals – 6 amps.
Spotlight – 9 amps. On steering column support.

CIRCUIT BREAKERS: (Lighting) – 20 amps. Located in headlamp switch. Protects the following circuits: Headlights, Fog Lights, Ash Tray Lights, Instrument Lights, Map Light, Parking Lights, & Stop Lights.
Hydro-Lectric System (When Used) – 15 amps., in feed circuit.
Power Seats & Windows – 40 amps. Located on left inner cowl panel.
Electric Trunk Lock – 5 amps. Located on left inner cowl panel.

HORNS: (Exc. Eldorado)–Delco-Remy 1999765 (Low Note), 1999766 (High Note). *12 Volt.*
Eldorado–Delco-Remy 1999585 (Trumpet type), *12 Volt.*

Horn Relay: Delco-Remy 1116908. *12 Volt.*
Contacts Close–5.0-9.5 volts.
Contact Gap–.027". **Air Gap–**.014".

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipm nt or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*"BOOMING" NOISE ON AIR CONDITIONED CARS CORRECTION (Appar nt at 25 MPH r at ff-idl speeds):* Noise can be eliminated or reduced by installing an oil filter-to-hydraulic pump support brace, Part No. 1463022.

►*ENGINE BALANCE CHECK & UNBALANCE CORRECTION: See "Engine Balancing" in Cadillac Special Data.*

Bore	Stroke	Displacement	Rated HP
4"	3 5/8"	365 cu. ins.	51.2

Engine	Compr. Ratio	Developed HP
Standard	9.75-1	285 at 4600 RPM
Eldorado	9.75-1	305 at 4700 RPM

►*OVERSIZE CYLINDER BORE CAUTION: Engines with mark * preceding Engine Unit No. (on left rear of crankcase) have a .010" oversize cylinder bore and pistons.*

ENGINE REMOVAL: *See "Engine" in Cadillac Special Data.*

OIL PAN REMOVAL: *See "Oil Pan" in Cadillac Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Cadillac Special Data.*

►***CYLINDER HEAD PRODUCTION CHANGE** (At Engine No. 033849):* A new cylinder head, Part No. 3630695 (Right hand); No. 3630696 (Left hand) with improved combustion chamber design are used on all models after above engine number.

TIGHTENING TORQUES: *See "Tightening Specifications" in Cadillac Special Data.*

PISTONS

►*ORIGINAL CYLINDER BORE CAUTION:* Engines with mark * preceding Engine Unit No. (on left rear of crankcase) have .010" oversize pistons and cylinder bore. Standard cylinder bore size: 3.8125-3.8145".
Original Bore & Pistons–*See "Original Bore & Pistons" in Cadillac Special Data.*
Pistons – Aluminum alloy, T-slot, cam ground, "stannate" coated.
Weight – 22.72 ozs. (less pin).
Removal–Piston and rod assemblies removed from above. Install connecting rod Guide Studs J-3224, on connecting rod bolts to guide rod out through bore without nicking or scratching. *CAUTION–Do not nick lower edge of bore when pushing rod up.*
Fitting New Pistons: Use micrometer or feeler gauge. *See "Pistons" in Cadillac Special Data.*
Replacement Pistons: Standard "High Limit" or maximum production size, and .010", .020", .030" oversize. Pistons furnished only with fitted pins.
Installing Pistons: Install in cylinder with piston pin boss marked "Rear" toward rear of engine. *See "Connecting Rods" (below) for installation of pistons on rods.*

PISTON PINS

Pin is pressed in connecting rod.
Diameter–1.000". **L ngth–**3 3/32".
Pin Fit in Piston–.00005"-.0001" clearance at 70°F. Not fitted in field (replace piston & pin assembly).
Pin Fit in Rod–(NOTE–Special tools required). *See "Piston Pins" in Cadillac Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

PISTON RINGS

Top compression ring is chrome plated rolled steel and the other two rings are cast iron An expander is not used behind the oil ring in production.

Ring	Width	End Gap ①	Side Clearance
Compr. (#1 & 2)	5/64"	.013-.023"	.0017-.0035"
Oil (#3)	3/16"	.013-.023"	.0008-.0026"

①- With Standard 4.0000" cylinder.

Replacement Rings: Standard, 010", .020", .030" oversize.

►*REPLACEMENT RING NOTE–If re-ring set is to be installed in new or low mileage bores, it is not necessary to install oil ring expander.*

Installing Rings: Chamfered face of both compression rings must be installed toward top of piston.

CONNECTING RODS

Length–6 5/8" (center-to-center).
Weight–23.49 ozs.
Crankpin Journal Diameter–2.2488-2.2493".
Out-of-Round Limits–.00025".
Bearings–Moraine-Durex, bearing shell is steel backed aluminum. Bearing halves interchangeable. No shims.
Clearance – .0005-.0020" (Service limit .0045").
Sideplay– 008-.014" (total both rods).

Replacement Bearings: Furnished in standard size only.

Installing Rods (In Pistons): On pistons Nos. 2-4-6-8, install rod so mark 'REAR' on piston pin boss is to **left** side of rod (with stamped number on rod facing operator). On pistons Nos. 1-3-5-7, install rod so mark 'REAR' on piston pin boss to to **right** side of rod (with stamped number on rod facing operator). **After piston and rod assembly installed in engine, re-check to see that the numbered side of connecting rod on No. 1, 3, 5, 7 rods are on LEFT side of engine and No. 2, 4, 6, 8 are on RIGHT side of engine and that rods are on the proper crank pins.**

CRANKSHAFT

Journal Diameters – 2 5/8".
Out-of-Round Limits – .0025".
Clearance – .0008-.0025" (service limits .005" max.).
End Thrust– Taken by flanged rear main bearing.
End Play – .001-.005" (service limit .010" max.).
Bearings – Rear main bearing is a steel backed babbit, shell type insert. Other bearings are aluminum inserts.

►*REAR MAIN BEARING INSERT PRODUCTION CHANGE (To reduce leaks):* The later type inserts, Part No. 3630741 do not have a chamfer across full width of bearing ends.

Replacement Bearings: Furnished in standard size only.

Crankshaft Removal: *See "Crankshaft & Main Bearings" in Cadillac Special Data.*

Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Cadillac Special Data.*

CAMSHAFT

►*CAMSHAFT PRODUCTION CHANGE:* A new camshaft was used in production beginning Engine No. 033849. Later camshaft has slight increase in valve overlap, which results in a decrease in intake manifold vacuum.

►*CAUTION:* Handle shaft with care to avoid damage or mis-alignment. Check whenever removed.
Removal, Alignment & Installation–*See "Camshaft & Bearings" in Cadillac Special Data.*
Bearings–Steel backed babbitt bushings.
Clearance–.001-.0022' (service limit .004" max.).
Bearing Out-of-Round Limit–.002" max.

Timing Chain: Link-Belt side guide type. Width 11/16", Pitch .500", Length 23" or 46 links.
Installation & Removal–*See "Timing Chain" in Cadillac Special Data.*

Camshaft Setting: Both sprockets marked '0'. Mesh chain with sprockets turned so that marks adjacent and in line with straightedge across shaft.

►*CAUTION.* Install chain as a unit with camshaft sprocket (sprocket press fit on shaft with locating dowel and two retaining capscrews).

VALVES

Tappet Clearance: None in service (hydraulic).

Valves	Head Diam.	Stem Diam.	Length
Intake	1 750"	3415- 3425"	①4 628-4 648"
Exhaust	1 562"	3415-.3420"	4 21/32"

Valve	Seat Angle	Lift	Stem Clearance
Intake	②44°	411"	③ 0005- 0025"
Exhaust	②44°	411"	③ 001- 0025"

①–"Rich" Valves "Eaton" Valves 4 628-4 653"

②–New valves (Valves in service can be refaced to 45° if seat width recommendation not exceeded).

③–New valves and guides Worn limit .005" max.

►*VALVE SEATING CAUTION:* Do not lap or grind so that seat width is more than 1/64" (1° difference between valve and seat angle designed to provide "hairline" contact.

►**Valve Seat Recommendations:** 3/64-1/16" (moderate speed or city driving), 1/16-3/32" (high speed driving). Cut seat so that distance from outer edge to edge of flange on valve head not more than 1/32".
Valve Stem Oil Seal–Rubber oil seal installed in lower groove on valve stem (below valve keeper).

Oil Seal Installation: *See "Valve System" in Cadillac Special Data.*

Valve Removal & Installation: *See "Valve System" in Cadillac Special Data.*

Valve Guides: Pressed in cylinder head with counterbored end down toward valve head. Use Remover Tool J-3062 to drive old guides out toward top of head, Installer Tool J-3066 to drive new guides in (tool plate serves as stop for driver).

Valve Springs: (Free Length) 1.980".

Valve Spring Specifications

	Pressure	Length
Valve Closed	62-68 lbs	1 696"
Valve Open	152-162 lbs	1 285"

►*SPRING INSTALLATION CAUTION: Lower end of valve spring must be seated in recess in cylinder head*

Valve Lifters: Hydraulic.
See "Valve System" in Cadillac Special Data.
Valve Lifter Removal–*See "Valve System" in Cadillac Special Data.*

Rocker Arms: Rocker arm end shaft assemblies are mounted on each cylinder head *NOTE*–No adjustment screws provided on rocker arms.

Rocker Arm Installation–*See "Valve System" in Cadillac Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

(Before Eng. N . 033849).
Intake Valves – Open 22° BTDC. Close 67° ALDC.
Exhaust Valves – Open 63° BLDC. Close 27° ATDC.

(After Eng. N . 033849).
Intake Valves – Open 25° BTDC. Close 78° ALDC.
Exhaust Valves – Open 70° BLDC. Close 28° ATDC.

Valve Timing Check – Not practical to check in field. Manufacturer recommends removing timing chain cover and checking timing gears.

OILING SYSTEM

Crankcase Capacity: 5 qts. One quart additional for dry filter.

Normal Oil Pressure: 30-35 lbs. min. at 30 MPH. 15 lbs at idle speed
Pressure Regulator Valve–On oil pump Not adjustable.
Oil Pressure Indicator – Light on instrument panel controlled by pressure switch, Cadillac No. 1508434 mounted on engine.

Oil Pump: Helical gear. In crankcase at rear of engine.

Oil Pump Removal & Overhaul: *See "Oiling System" in Cadillac Special Data.*

Vacuum Pump: Part of Oil Pump assy. *See "Vacuum Pump" in Cadillac Special Data.*

Oil Filter: Partial flow. Replace element every 6000 miles or more frequently in dusty areas.
Replacement Filter Element–AC No. 1P-115

Crankcase Ventilation: Air intake in oil filler cap (oil wetted type) with outlet connection at rear of valve compartment cover, and outlet pipe extending down below engine at right corner.

COOLING

►*THERMOSTAT INSTALLATION CAUTION: Install with spring strap parallel to car center line otherwise right engine bank will operate at higher temperature*

►*ELDORADO ENGINE COOLING LOSS CORRECTION:* **Improper positioning of right hand ignition wire bracket may permit bracket to rub against heater hose. Loosen bracket nut on carburetor and swing bracket as close to firewall as possible. Tighten nut.**

►*ALUMINUM RADIATOR CORE CAUTION & IDENTIFICATION NOTE:* **Aluminum radiator cores have been used in partial production. The letters "ALC" following the serial number on the plate attached to radiator upper tank identify these radiators. When cleaning these radiators, only clear water should be used, Caustic cleaning solutions will corrode and damage the radiator.**

Water Capacity: (Exc. Series 75) 19¼ qts., with heater; 17¼ qts., without heater. (Series 75) 21¾ qts., with heater; 17¼ qts., without heater.

Pressure Valve: AC No. 850800. Radiator filler cap. Opens at 12-15 lbs.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Th rm stat Dole type In water outlet at top of pump body

Standard S tting—Starts to open at 163° to 168°F

High T mp.—Starts to open at 177° to 182°F

Water Pump· Packless, sealed ball bearing type

See "Cadillac" in Water Pump Section.

Pump R moval—Remove upper and lower radiator hoses after draining cooling system Remove generator drive belt and take out capscrew mounting pump and water manifold assembly on front of engine, lift out pump and fan NOTE—Water manifold and thermostat housing are part of pump casting

Radiator Rem val & Installation· *See "Cooling System" in Cadillac Special Data*

Temperature Gaug s· AC Electric

Dash Unit - AC No. 1513158.

Engin Unit – AC No. 1513130.

See "T mp rature Gaug s" in Miscellaneous Section.

HYDRA-MATIC DRIVE

"J taway". A new four speed hydraulically controlled automatic transmission having two fluid couplings.

►*HYDRA-MATIC "SQUEAK" CORRECTION:* This squeak may occur in first and reverse gears, and in "Dr3" under full throttle. *S "Dual-Coupling Hydra-Matic" in Transmissi n S cti n.*

►*1-2 OR 2-3 LATE SHIFT CORRECTION:* May be caused by improper throttle valve rod adjustment, dirt in control valve assembly, or interchanged valve springs. *See "Dual-Coupling Hydra-Matic" in Transmission Section.*

►*ROUGH SHIFT CORRECTION:* May be caused by bent throttle valve rod striking the accelerator pedal arm which would prevent the throttle valve rod from returning to its stop for proper adjustment. Check rod for straightness and adjust for correct shift pattern.

►*ERRATIC SHIFT CORRECTION: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

►*FILLER PIPE LEAK CORRECTION:* A new service package, Part No. 8616956 is available to correct oil leakage originating at point where filler pipe fits into sleeve in transmission case.

►*TRANSMISSION OIL FOAMING CORRECTION:* This condition may be caused by leakage in oil cooler. *See "Dual-Coupling Hydra-Matic" in Transmission Section.*

►*SLIPPING 2-3 SHIFT CORRECTION (EXC. ELDORADO ENGINE):* If this condition cannot be corrected by throttle valve rod adjustment, and is not caused by sticking valves, install an inner accumulator spring, Part No. 8617469. *See "Dual-Coupling Hydra-Matic" in Transmissi n Secti n.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual-Coupling Hydra-Matic" in Transmissi n S cti n.*

►*TESTING & TROUBLE SHOOTING: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

Lubricati n – Check fluid level every 2000 miles along with regular car lubrication. Drain and refill every 25,000 miles. Use only Cadillac Hydra-Matic Fluid.

Capacity – 12 qts. (approximately). *NOTE – Th correct lev l is d t rmin d by the "Full" mark n gaug , with transmission hot.*

Ch cking Fluid L v l – With selector lever in "N" or "P" position, run engine at speed of 20 MPH for about 1½ minutes (to be sure fluid coupling is full). With engine idling, add fluid to bring level to within ¼" of the "F" mark on dipstick *(NOTE* – Fluid level should be ¼" below "F" mark when cold, and at the "F" mark when hot). *CAUTION – Do not fill above "F" mark on dipstick as this will cause foaming when oil is hot.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type Two used (three on commercial cars with center bearing)

See Universals Section for complete data

►*DRIVE LINE "THUMP" CORRECTION (Cars between Engine No. 017541 and 046805. Or cars prior to engine No. 017541 which have the late type replacement transmission):* Install the late type front universal joint yoke, Part No. 5670522, which must be lubricated with one ounce of special lubricant, Part No. 1098652. Th e later type yoke must be lubricated every 25,000 miles by removing the yoke and applying lubricant to the splines.

►*TRANSMISSION REPLACEMENT CAUTION:* If a transmission is replaced on cars with a late type yoke, the extension housing and output shaft of the transmission must be of the late design. Check the output shaft and measure depth of bore in extension housing to make sure it is machined to clear the longer yoke. If the transmission has the early extension housing, use the early type yoke, Part No. 1456508, or special service yoke, Part No. 1465331.

►*REAR UNIVERSAL YOKE CAUTION Do not disturb nut on end of pinion shaft retaining rear universal joint yoke unless yoke or oil seal should be replaced. Pinion bearing preload must be adjusted whenever this nut disturbed*

REAR AXLE

Own Make. Hypoid gear, semi-floating with Hotchkiss Drive

See "Cadillac Hypoid" in Rear Axle Section.

►*OVERHAUL CAUTION*· Manufacturer recommends that Carrier Assembly be serviced by replacement Do not disassemble this unit or attempt service work other than oil seal and universal joint replacement

Axle Identification—Axles marked by number stamped bottom of differential case below center of pinion shaft (First Cars) or on oil return hole boss at front end of differential case (beginning Engine No 94850) Ratios and marks are as follows

Series	Ratio	Mark
60S, 62 (Std.)	3.07-1	"3"
60S, 62 (Optl.) ①	3.36-1	"6"
75	3.36-1	"6"
86	3.77-1	"7"

①—Standard on cars with Dual 4-Bbl. Carburetors.

►**Pinion Bearing Pre-Load Caution**· Must be adjusted each time pinion shaft nut loosened *See "Cadillac Hypoid" in Rear Axl Section.*

Backlash– 003- 010' Screw adjustment

Axle Shaft Rem val: Remove wheel and take out screws holding brake drum on axle shaft flange and remove drum Remove nuts and lockwashers from bolts holding bearing retainer and backing plate on axle housing, use Puller J-942-1 and Slide Hammer J-2619 to remove axle shaft

►*CAUTION* Use care not to damage axle shaft oil seal when sliding axle shaft out and do not disturb position of backing plate on housing

Commercial Cars—Remove wheel, remove nut and washer on end of shaft Use Puller (Snap-On No S4567 or similar five jaw type) to remove wheel hub and brake drum Disconnect brake line Take out retaining screws and remove dust shield (bearing retainer) and backing plate Use Puller J-838 to pull axle shaft and bearing assembly out, using care not to damage oil seal in housing

Differential Carrier Removal· Disconnect rear universal joint and remove lubricant from rear axle housing Remove axle shafts (see above) Remove nuts and washers holding carrier to axle housing and remove entire assembly with gasket *See "Overhaul Caution" above.*

Wheel Bearings Sealed ball-bearing type

CAUTION—Check bearings for loss of lubricant when shaft removed If bearings spin freely indicating loss of lubricant, replace bearings

Pinion Bearing Preload Adjustment Pinion should be adjusted whenever nut on end of pinion shaft disturbed (for universal joint yoke or oil seal replacement)

See "Cadillac Hypoid" in Rear Axle Section.

SHOCK ABSORBERS

Delco. Direct acting permanently sealed, airplane type located within coil springs (front), "Sea-Leg" type installation (rear), as follows

Series	① Front	① R ar
60S, 62	5352611	5352612
75, 86	5352613	5513719

①- Cadillac part numbers.

FRONT SUSPENSION

Independent type with direct acting shock absorbers within coil springs

Kingpin Inclination—5°51' with 0° camber

Caster—0° to Neg 1° Adjustment must be equal within ½° or less on both sides of car

Camber—Neg 3/8° to Pos 3/8° with ¼-½° more positive camber on left side

Toe-In – 5/32-7/32" (standing). Loosen clamp bolts, turn adjusters at outer end of each tie rod equally.

Toe-Out n Turns – With outer wheel turned 20°, inner wheel should be 22°40'.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STEERING

Power Steering: Saginaw (In-Line) Hydraulic. Hydraulically operated in-line power steering gear which combines the recirculating ball type gear with a concentric hydraulic booster.

See "Saginaw (In-Line) Power Steering" in Steering Sect.

►*POWER STEERING GEAR PUMP "SQUEAL" CORRECTION (Pump pressures reduced): See "Saginaw (In-Line) Power Steering" in Steering Section.*

►*POWER STEERING "CLUNKING" NOISE CORRECTION (Can be heard on hard turns and when steering wheel turned with car standing and engine running): See "Saginaw (In-Line) Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Sect.*

Steering Wheel & Horn Button Removal: *See "Saginaw (In-Line) Power Steering" in Steering Section.*

Steering Gear Removal: *See "Saginaw (In-Line) Power Steering" in Steering Sect.*

BRAKES

Bendix (Hydraulic) Single Anchor. Conventional two-shoe. Parking lever applies rear wheel service brakes. Bendix or Moraine Power Brakes are standard equipment.

►*BRAKE PEDAL BINDING CORRECTION: See "Brake Notes" in Cadillac Special Data.*

Drums—Diameter 12" (all Series). Regrinding limits .060".

See "Bendix Hydraulic Single Anchor (Without Eccentric)" in Brake Section.

	Brake Lining Length	Width	Thickness
Primary	11.52" ①	2½"	¼"
Secondary	12.98"	2½"	¼"

①—(60S & 62). 12.98" (75 & 86 Series).

►*1956 BRAKE LINING PRODUCTION CHANGE:* To reduce possibility of brake squeal, brake lining on all cars beginning Engine No. 000519 has a .004 - .008" crown. *NOTE* - This crowned lining furnished for service replacement on all 1953-56 cars.

Braking Power—(Exc. 86 Series) 55.8% (front), 44.2% (rear). (86 Series) 52.8% (front), 47.2% (rear).

Clearance—.010" (top), .015" (bottom). Adjusting screw backed off 14 notches from point where wheel can just be turned by hand.

Power Brakes: Bendix or Moraine Power Brake units integral with master cylinder and fluid reservoir located on left front frame member.

Master Cylinder – Integral with power brake unit.

Checking Fluid Level – Maintain fluid level to within ¾" of top of filler cap boss.

Removal of Power Unit – Disconnect relay to unit rod at clevis and disconnect relay rod from push rod. Disconnect both vacuum hoses from power brake unit, and disconnect hydraulic line at outlet fitting. Remove four screws and lockwashers and nuts from cylinder mounting bracket and remove power brake assembly.

MISC. MECHANICAL

Windshield Wipers: Cable operated—Vacuum type.

See "Windshield Wipers" in Miscellaneous Section.

Windshield Washer: Connected with windshield wiper so that when windshield washer is operated, wiper motor automatically operates to clean windshield.

Power Window Regulators: Electric, with reversible motor in each window.

See "Electric Window Regulators" in Miscellaneous Section for data.

Power Top Control: Hydro-Lectric with "sealed" system which does not require periodic draining and refilling.

See "Top Controls" in Miscellaneous Section.

Power Seat Adjusters (Two-Way): Electric type with single reversible type motor for horizontal adjustment.

See "GM Two-Way Seat Regulators" in Miscellaneous Section.

Power Seat Adjusters (Six-Way): Electric type with single adjustable motor.

See "GM Six-Way Seat Regulators" in Miscellaneous Section.

►*SIX-WAY POWER SEAT "CHUCKING" CORRECTION: See "GM Six-Way Seat Regulators" in Miscellaneous Section.*

Trunk Lid Lock: Reversible electric motor operating a jack screw and limit switches which control opening and closing of the trunk lid.

See "GM Electric Trunk Lid Lock" in Miscellaneous Section.

Air Conditioning: Frigidaire with magnetic compressor clutch (compressor operates only with switch "on").

See "Frigidaire (GM) Air Conditioning" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

	6 Cyl. Ft. Lbs.	V8 Ft. Lbs.
Cylinder Head	90-95	60-70
Intake Manifold	① 15-20	25-35
Exhaust Manifold	①15-20	25-35
Oil Pan	② 12 1/2-15	②12-15
Main Bearing Caps	100-110	60-70
Flywheel	50-65	55-65
Con Rod Caps	35-45	30-35
Rocker Arm Support Bracket	25-30	
Rocker Arm Cover		2 1/2
Engine Front Cover	6-7 1/2	6-8
Clutch Housing	45-55	25-35

①—Tighten two end clamp bolts to 25-30 ft. lbs.
②—Corner bolts Tighten other flange bolts to 6-7½ lbs. (6 Cyl.), 6-9 lbs. (V8).

ENGINE

6 CYL. PASS. CARS

ENGINE REMOVAL: Drain cooling system, crankcase, and transmission and proceed as follows

1) Scribe alignment marks on hood around hood hinges. Disconnect right hand headlamp, parking lamp, and horn wires and remove wires from radiator core support brace. Remove both horns. Remove radiator hoses and heater hoses on models so equipped. On Powerglide models, remove and plug oil cooler lines.

2) Remove radiator core support to fender bolts, core support to fender side baffle bolts and core support to front cross member bolts. Remove radiator core and core support. Remove battery, battery support and battery cables.

3) Disconnect starter and generator wires, engine to body ground strap, oil pressure indicator wire at switch on block and coil primary lead at coil Remove windshield wiper motor. Remove temperature indicator element from cylinder head. Remove air cleaner.

4) Disconnect gasoline feed pipe from fuel pump and disconnect vacuum lines at intake manifold. Remove exhaust pipe to manifold bolts. Disconnect carburetor control rod from dash panel bell crank. Remove transmission control rods. Remove clutch control bellcrank and control rods on conventional transmission models. On overdrive models, disconnect overdrive wires and cables. On Powerglide models, remove oil filler tube and plug opening

5) Disconnect speedometer cable at transmission. Split universal joint. Remove propeller shaft. Remove rocker arm cover and install lifting hooks from Kit J-4536 in cylinder head bolt holes. Raise engine slightly and remove all four engine mounts. Remove the engine and transmission from chassis as a unit.

V8 PASS. CARS

ENGINE REMOVAL: Drain cooling system, crankcase, and transmission and proceed as follows·

1) Scribe alignment marks on hood around hood hinges and remove hood from hinges. Remove radiator hoses and heater hoses. Remove radiator core support to core bolts and shims. On Powerglide models, remove and plug oil cooler lines Remove radiator core.

2) Remove battery, battery support and battery cables. Disconnect starter and generator wires, engine to body ground strap, oil pressure indicator wire at switch on block and coil primary lead at coil

3) Remove windshield wiper motor. Remove temperature indicator element from cylinder head. Remove air cleaner, fan blade and pulley. Disconnect gasoline feed pipe from carburetor and vacuum lines from intake manifold. Remove distributor and coil. Disconnect carburetor control rod from dash panel bell crank.

4) Disconnect exhaust cross over pipe from exhaust pipe and muffler assembly. Remove transmission control rods Remove clutch bell crank and control rods on conventional transmission models. On Overdrive models, disconnect overdrive wires and cables. On Powerglide models, remove oil filler tube, plug opening and disconnect oil cooler lines Disconnect speedometer cable at transmission.

5) Split rear universal joint and remove propeller shaft Remove choke heat tube and rocker arm cover and install two eye bolts and spacers from Kit J-4536-A in cylinder head bolt holes. Raise engine slightly and remove all four engine mounts Remove engine and transmission from chassis as a unit, tilting engine to clear radiator core support

6 CYL. TRUCKS

ENGINE REMOVAL (6 CYL. TRUCKS): Drain cooling system, crankcase, and transmission, then proceed as follows.

1) Disconnect hood springs and hinges, remove hood. Remove radiator support bracket-to-fender bolts, support-to-frame crossmember bolts, then remove radiator and support.

2) Remove battery cable and ammeter wire from starter switch terminal. On vehicles with push-button starter, remove battery cable and ammeter wire from large terminal on solenoid and starter switch wire from small terminal (tape end of battery cable to prevent shorting).

3) Disconnect coil lead from distributor terminal and pull coil high tension wire from center of distributor cap. Remove two coil mounting screws and lay coil with wires attached on dash. Disconnect engine ground strap from frame, gasoline line from fuel pump, generator and field wires from generator.

4) Remove air cleaner and disconnect choke and throttle control cables from carburetor (when used). Remove temperature indicator element from cylinder head and disconnect oil pressure line at cylinder block.

5) Disconnect windshield wiper and Hydrovac vacuum lines (if so equipped). Remove exhaust pipe flange-to-manifold bolts. Remove starter pedal, then remove accelerator pedal from accelerator rod (if so equipped).

6) One ½ and ¾ Ton with conventional transmission, remove control rods from bellcrank on left side of clutch housing. On automatic transmission models, disconnect transmission control and throttle linkage rods from transmission. On 1 Ton models, remove coolant line clips from dash and frame panels. On other models, remove floor mat and transmission floor pan cover.

7) On 1 Ton models, remove cotter key and pin attaching parking brake pull rod assembly to parking lever. On 1½ and 2 Ton models, disconnect parking brake lever return spring from brake operating lever and remove cotter key and pin attaching inner and outer levers to parking brake operating lever.

8) On 1, 1½, and 2 Ton models, remove transmission cover with parking and gearshift lever. Place piece of cardboard on top of transmission to prevent dirt falling in during removal.

9) Disconnect speedometer cable from transmission and clutch link-to-pedal arm (if so equipped). Remove propeller shaft.

10) Remove rocker arm cover, rocker arm attaching bolts, rocker arm, shaft assembly and pushrods.

11) With Lift Kit J-4536-A, raise engine slightly, remove all four engine mounts and raise engine and transmission from chassis as a unit. Remove crankcase ventilator pipe, then remove starting motor, generator and fan belt.

V8 TRUCKS

ENGINE REMOVAL (V8 TRUCKS): Same as V8 Pass. Cars except as follows· Remove windshield wiper motor. Disconnect Hydra-Matic oil cooler and plug the openings. Remove propeller shaft.

ENGINE MOUNTINGS

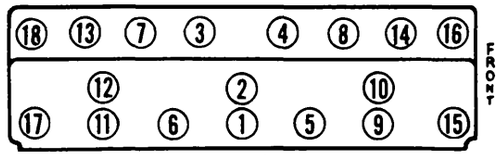
PASS. CARS & TRUCKS

ENGINE MOUNTING REPLACEMENT: (Front Mounts)— Remove top and bottom stud nuts and remove washer and cushion between each nut and the cross member or engine bracket Raise front of engine (On V8 models, remove the distributor cap before raising engine). *CAUTION—Raise engine only far enough for clearance.* Replace necessary cushions

Rear Mounts: Support engine weight to relieve rear mounts Remove mount attaching bolts from frame outrigger and flywheel housing (or Powerglide Transmission) and remove support. Install new support and bolts and tighten securely with engine weight resting on mounts.

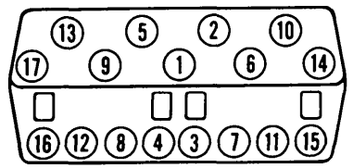
CYLINDER HEAD & MANIFOLD

ALL ENGINES



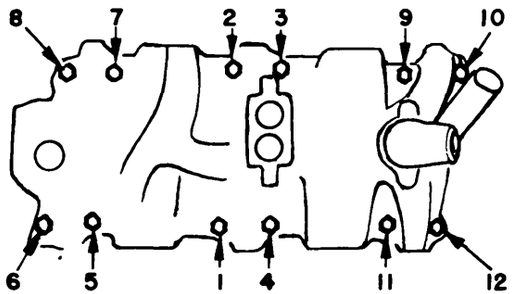
CYLINDER HEAD INSTALLATION (6 CYL. ENGINES): Use torque indicating wrench to tighten cylinder head capscrews in correct sequence as shown in diagram

CYLINDER HEAD INSTALLATION (V8 ENGINES): Coat steel cylinder head gaskets with a good head gasket paste and install gaskets in position on cylinder block. Install heads over dowel pins in the block. Oil threads of all long cylinder head bolts and coat threads of all short bolts with Permatex No. 3 (short head bolts protrude into water passages) Use a torque indicating wrench and tighten bolts a little at a time to 60-70 ft. lbs , in the sequence shown in diagram.



INTAKE MANIFOLD INSTALLATION (V8 ENGINES): Install manifold end gaskets on cylinder block. Coat ends of intake manifold side gaskets around water passages with a good sealing compound and install heads Tighten bolts a little at a time to 25-35 ft. lbs torque.

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

CHEVROLET 6 CYL. CYLINDER HEAD

CHEVROLET V8 CYLINDER HEAD

CHEVROLET V8 INTAKE MANIFOLD

PISTON PINS

V8 ENGINES

PISTON PINS (V8 ENGINE): Removal–Install pilot of Tool J-5538 on puller screw and install puller screw, with pilot, through piston and pin. Install tool support over threaded end of puller screw with small end of support against piston. Install nut loosely on puller screw and place assembly in arbor press so that pin can be pressed out through support.

Installation: Lubricate pin holes and position connecting rod in its respective piston so that flange or heavy side of rod at bearing end will be toward **front** of piston (cast depression in head of piston and "F" marks on piston struts) on #1-#3-#5-#7 pistons and rod flange to **rear** of piston on #2-#4-#6-#8 pistons. Install piston pin on puller screw and pilot on screw. Install puller screw through piston and rod, indexing pilot through piston and rod. Install support over threaded end of puller screw with small diameter toward piston. Install nut on puller screw and tighten with a torque wrench to start piston pin into connecting rod *(CAUTION–If pin can be started into connecting rod with less than 15 ft. lbs. torque, clearance is excessive).*

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

6 CYL. & V8 MAIN BEARING REPLACEMENT (With Engin in Car): Upper bearing halves can be "rolled" out for replacement. Proceed as follows:

1) Remove spark plugs and remove engine oil pan. Remove bearing cap and bearing shell.

2) Install main bearing shell removing and installing tool (or use a cotter pin bent as required). Rotate crankshaft in direction of usual rotation and roll upper bearing shell out of engine.

3) Oil new bearing shell and insert plain (un-notched) end of shell between crankshaft and block on the indented or notched side. Rotate bearing into place. Install new bearing shell in bearing cap.

REAR MAIN BEARING OIL SEAL (6 CYLINDER ENGINE): Remove rear main bearing cap and remove old seal from groove. Insert new packing in bearing cap and roll firmly into place with a rounded tool (roll from both ends toward center). Use a round block of wood, same diameter as crankshaft flange, to hold packing in place. Cut off both ends of packing evenly and flush with bearing cap face. Install upper half of seal in crankcase in same manner, with engine out of car.

REAR MAIN BEARING OIL SEAL (V8 ENGINE): Remove rear main bearing cap and remove old seal from groove. Insert new seal in groove with fingers, and then with Tool J-5788 (Oil Seal Installer), and a hammer, pound seal firmly into groove. Cut the small portion of the seal that protrudes from groove flush with surface of bearing cap. Replace upper half of seal in crankcase in same manner, with engine out of car.

VIBRATION DAMPENER

ALL ENGINES

VIBRATION DAMPENER (6 CYL. ENGINE): Removal–Remove radiator. On Powerglide models, remove oil cooler lines and plug outlets, Remove fan belt and install Puller J-1287-B and pull dampener assembly from crankshaft.

Installation: Remove puller and install two 3/8"-16 x 1" (16 thread) capscrews in dampener to support wheel portion during installation. Position dampener on crankshaft with key and keyway on alignment and drive dampener on shaft until it bottoms against crankshaft gear. Use a heavy hammer and bar through the grille, taking care that a straight installation is made. Remove the two capscrews previously installed. Install radiator.

VIBRATION DAMPENER (V8 ENGINE): Removal–Remove radiator. On Powerglide models, remove oil cooler lines and plug outlets. Remove fan belt, fan, and pulley, and install Puller J-1287-B and pull dampener assembly from crankshaft.

Installation: Install two 3/8"-16 x 1½" capscrews to hold the hub and flywheel portion of dampener together.

during assembly. Coat cover seal contact on dampener with engine oil and position dampener on crankshaft. Use Transmission Front Bearing Installer J-5590 and drive dampener on shaft until hub bottoms on timing sprocket. Remove the two screws installed previously and install pulley, fan, and fan belt. Install radiator.

ENGINE FRONT COVER

ALL ENGINES

FRONT OIL SEAL INSTALLATION: Pry old seal out of front cover. Install new seal so that open end of seal is toward inside of cover and drive it into position with Oil Seal Driver J-996. *CAUTION–Support cover at sealing area while installing seal.*

CAMSHAFT & BEARINGS

6 CYL. ENGINES

CAMSHAFT REMOVAL & INSTALLATION: Remove rocker arm and pushrod covers. Remove rocker shaft assembly, pushrods and valve lifters. Remove timing gear cover attaching screws and two bolts that are installed from back through front main bearing cap, remove cover and gasket. Pull crankshaft gear with Puller T-126-R. Remove two camshaft thrust plate screws by working through holes in camshaft gear. Remove camshaft and gear assembly by pulling it through front of block *(CAUTION* - Support shaft carefully to avoid damage to camshaft bearings). To install camshaft, reverse removal procedures.

6 CYL. CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Install No. 1 and No. 2 bearings first, then rear two bearings. *(CAUTION* –Align oil holes in bearings with oil holes in block before pulling into place), Install plug flush to 1/32" deep from clutch housing face of case.

Reaming: Special reamer with four cutters on one bar recommended by car manufacturer (for proper alignment). Insert reamer through #1, #2, & #3 bearings. Start reamer cutter in all four bearings at the same time (wash metal cuttings away with a liberal supply of kerosene while reaming), turn reamer slowly until cutters pass through bearings. Remove reamer by rotating in same direction as when reaming bearings and withdraw from engine. Bearing cuttings must be blown out with compressed air. Install camshaft and check bearing clearances with narrow feeler gauge. Clearance should be .002-.004". Install expansion plug to rear of rear bearing.

V8 ENGINES

CAMSHAFT REMOVAL & INSTALLATION: Remove rocker arm covers and intake manifold. Back off rocker arm nuts until arms may be pivoted away from pushrods. Remove pushrods and valve lifters *(NOTE* - Place or mark lifters and rods so that they may be reinstalled in their original positions). Remove fuel pump. Remove two adapter mounting bolts and lockwashers and remove fuel pump adapter and gasket from block. Remove pushrod. Remove grille assembly. Drain radiator, disconnect hoses. With Powerglide, disconnect oil cooler radiator lines from core. Remove radiator core-to-core support bolts and remove radiator core. Note spacer shims removed, if any. Remove fan belt, fan and pulley. Remove harmonic balancer with Puller J-1287-B. Remove oil pan and heater hose from water pump if so equipped. Remove water pump, then remove front end cover and gaskets. Crank engine until "O" marks on camshaft and crankshaft sprockets are in alignment. Remove three camshaft sprocket-to-camshaft bolts. Remove camshaft sprocket and timing chain together *(NOTE* - Sprocket is a light press fit on camshaft for approximately 1/8". If sprocket does not come off easily, a light blow with a plastic-faced hammer on lower edge should dislodge the sprocket). Install two 5/16"-18 x 4" bolts in two of camshaft bolt holes. Remove

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

camshaft from engine. *(CAUTION* - Camshaft journals are of same diameter and care must be exercised to avoid damage to bearings). To install camshaft, reverse removal procedures.

V8 CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Remove bearing nearest center of block first, then No. 2 and No. 4 bearings, and finally front and rear bearings (with this sequence minimum number of turns are required to locate Remover & Replacer for removal of next bearing). When installing, install No. 1 or front bearing first. This bearing will act as guide for tool and center the No. 2 and No. 3 bearings being pulled into place. *(CAUTION*–Use care when installing rear bearing due to smaller size of oil pressure holes in rear bearing. When installing end plug, install flush to 1/32" deep to maintain level surface on rear of cylinder block).

TIMING GEARS

6 CYL. ENGINES

REPLACEMENT TIMING GEARS: Fibre type camshaft gear and steel crankshaft gear used on passenger cars Aluminum camshaft gear and steel crankshaft gear used on trucks.

TIMING GEAR INSTALLATION Gears are press fit on crankshaft and camshaft and must be removed and installed as follows

Crankshaft Gear–To remove gear, attach Puller T126-R by threading puller screws in tapped holes in gear, pull gear off When installing gear, make certain that two woodruff keys installed in crankshaft keyways, drive gear on shaft until it seats against shoulder on shaft

Camshaft Gear–To remove gear, install Gear Remover J-971 on shaft in back of gear (remover consists of support sleeve), place camshaft assembly in arbor press *(CAUTION*–Thrust plate must be positioned so that it will not be damaged by woodruff key in shaft as shaft pressed out), press shaft out of gear To install gear, place shaft in arbor press (support shaft securely directly back of front bearing journal), install gear spacer ring and thrust plate over end of shaft, and install woodruff key in shaft keyway. Install camshaft gear and press it on shaft until it bottoms against the gear spacer ring. End clearance of thrust plate should be .001" to .005". Install camshaft assembly in engine block, being careful not to damage bearings or cams. With crankshaft installed turn camshaft and crankshaft so that valve timing marks on gear teeth will line up, then push camshaft into position. Install camshaft thrust plate-to-block screws and tighten securely. Camshaft and crankshaft gear runout should not exceed .004" for camshaft and .003" for crankshaft. Backlash between timing gear teeth should not be less than .004" nor more than .006". *CAUTION*–Press on hub only when installing camshaft gear.

TIMING CHAIN

V8 ENGINE

TIMING CHAIN Removal–Remove vibration dampener, timing chain cover, and oil slinger Rotate engine until timing marks on sprockets are in alignment and in alignment and adjacent Remove three camshaft sprocket screws and remove camshaft sprocket and chain together

Installation Install chain on camshaft sprocket Hold sprocket vertical with chain hanging below, and line up 'O' timing marks on both sprockets so they are adjacent and in line with a straight edge across shaft centers Align dowel in camshaft with dowel hole in sprocket and install sprocket on camshaft Draw camshaft sprocket onto shaft using the three mounting bolts Tighten to 15-20 ft lbs *CAUTION–Do not attempt to drive sprocket onto shaft as welch plug at rear of engine can be dislodged.*

VALVE SYSTEM

ALL ENGINES

ENGINE NORMALIZING PROCEDURE (For Valve Tappet Clearance Adjustment) Clearance changes while engine is warming up. Adjust only after engine has been 'normalized' as follows Run engine at 600 RPM and check oil temperature with thermometer at overflow pipe on valve rocker arm shaft connector until no change noted in oil temperature for a period of five minutes (oil temperature will become stabilized at some point between 150° and 225°F) This normalizing period will be from 5 to 30 minutes depending on engine temperature when started.

VALVE TAPPET ADJUSTMENT

6 CYL. & V8 ENGS. WITH HYDRAULIC LIFTERS

NOTE–Required when cylinder head has been removed or when rocker arm or valve assemblies have been replaced.

6 Cylinder Engines: The hydraulic lifters must be at the lowest point of travel when adjusted (piston in firing position) Remove distributor cap and turn engine until rotor is in firing position (points just breaking) for cylinder being set Starting with #1 cylinder, turn valve adjusting screw down until rocker arm just contacts valve This can be determined by checking push rod side play at adjusting screw end while turning the adjusting screw At the point where no side play can be felt, continue turning the adjusting screw down 1-1/2 turns and tighten lock nut securely Adjust each cylinder following the same sequence as the firing order (1-5-3-6-2-4)

V8 Engines· With No. 1 Cyl. at TDC firing position adjust Exhaust valves 1-3-4-8, Intake valves 1-2-5-7 by backing off the adjusting nut on rocker arm until there is play in valve push rod, then tighten adjusting nut to just remove all push rod-to-rocker arm clearance, **then tighten adjusting nut an additional 3/4 turn** to place hydraulic lifter in center of its travel Crank engine one revolution so that #6 cylinder is in firing position, and then proceeding as above, adjust Exhaust valves 2-5-6-7, and Intake valves 3-4-6-8

VALVE STEM OIL SEALS

6 CYL. ENGINES

VALVE STEM OIL SEAL INSTALLATION: Seal consists of synthetic rubber ring installed in second groove of valve stem directly under valve locks on all valves. When assembling valves, install seal as follows Install valve spring and spring retainer on valve stem, compress spring until lower groove on valve stem is exposed, install seal in this groove *(CAUTION* - Seal must seat flat in groove and not be twisted). Install valve locks in upper groove in valve stem, relieve spring tension, check to see that seal is properly retained in spring retainer and that locks are engaged.

V8 ENGINES

VALVE STEM OIL SEAL INSTALLATION: TWO seals used as follows: 1) Cup shaped shedder or shield installed over upper end of valve spring (retained by spring retainer), and 2) Synthetic rubber ring installed in second groove of valve stem directly under valve locks. These seals used on all valves. Install as follows·

Oil Shedder – Install shedder on top of valve spring with cupped end down over spring before installing spring retainer. *NOTE - This type shedder supersed s previous type shield with smaller diameter cup within spring.*

Oil Stem Seal – Install in same manner as seal on 6 Cyl. Engines (above).

VALVE GUIDES

6 CYL. ENGINES

VALVE GUIDE INSTALLATION (6 CYL. ENGINES): Install guides to proper position in head with the following special tools (see table below for correct height of guide above machined surface of cylinder head). Use Valve Guide Driver J-5599 to install exhaust valve guides and Driver J-5598 to install intake valve guides. After guides installed, ream to .343".

Valve Guide Installation Height
6 Cyl. Engine

Engine	Intake	Exhaust
235" & 261"	1"	15/16"

►*NOTE* Above specifications are different than those given for earlier models

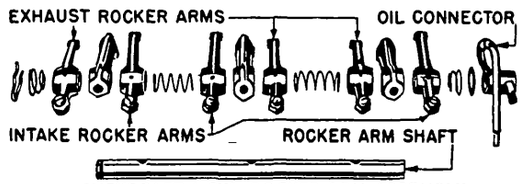
ROCKER ARMS

6 CYL. ENGINES

ROCKER ARMS (6 CYL. ENGINES): Diamond bored and "granodized" (no bushings) and fit directly on rocker arm shafts. Different rocker arms used as follows

Rocker Arm Identification
6 Cyl. Engines

Type	Cylinder	Part N .
L H. Intake	2-4-6	3837029
R.H. Intake	1-3-5	3837030
L.H. Exhaust	1-3-5	3837031
R.H. Exhaust	2-4-6	3837032



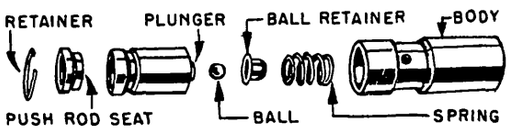
Installation Assemble rocker arms as indicated in illustration with open end of shaft toward center, and baffle in rear shaft open end in vertical position

V8 ENGINES

ROCKER ARM STUD REPLACEMENT (V8 ENGINES) Oversize rocker arm studs are available in 003" & 013" oversizes for service replacement. Remove old stud by placing Spacer J-5802 over stud, installing

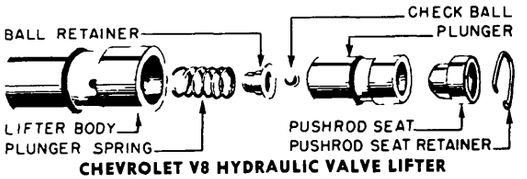
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



CHEVROLET 6 CYL. ROCKER ARM ASSEMBLY
(REAR ASSY. SHOWN—FRONT ASSY. SIMILAR)

nut and flat washer and removing stud by turning nut. Ream hole for oversize stud with Reamer J-5715 (.003"), J-6036 (.013"). Coat press-fit area of stud with hypoid lubricant and install stud to correct height of 1-41/64".



►*STUD INSTALLER TOOL J-5801 REWORK (For Installing Stud to 1¾" Height):* Grind 3/32" off bottom of tool. With reworked tool drive stud in to 1¾" height, then press studs in further to 1-41/64" height.

HYDRAULIC LIFTERS
6 CYL. & V8 ENGINES

HYDRAULIC VALVE LIFTERS: Barrel type, consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet or body (see illustration). Oil is introduced to this unit through oil gallery in block.

CHEVROLET 6 CYL. HYDRAULIC VALVE LIFTER

CHEVROLET V8 HYDRAULIC VALVE LIFTER

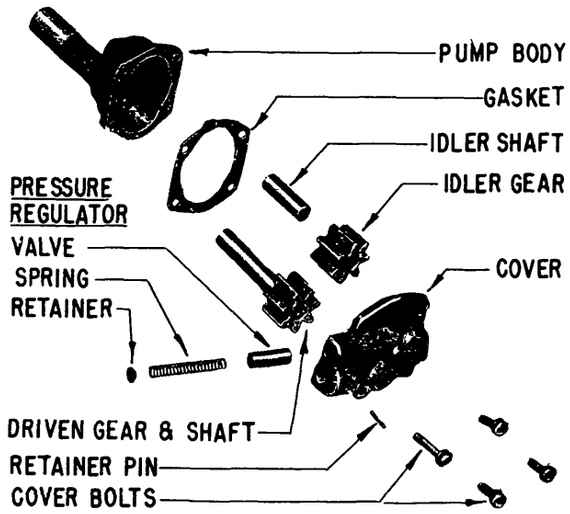
Removal: On 6 cylinder engines, remove rocker arm assemblies, push rods and push rod cover. On V8 engines, remove intake manifold and back off the rocker arm nuts until rocker arm can be swung away from push rods Remove push rods

Disassembly: Hold plunger down with a push rod and using a small screw driver or pointed awl, remove plunger retainer. Remove push rod seat, plunger, ball check valve, ball retainer and spring. Clean all parts in solvent and inspect each part carefully for nicks and burrs, or wear. Replace complete assembly if any parts are damaged.

R assembly (6 Cyl. Engin s): Invert plunger and set check valve ball into hole in plunger and place check valve ball retainer over ball and on plunger. Place check valve retainer spring over retainer and then assemble lifter body over the complete assembly, being careful to line up the feed holes in plunger and lifter body. Turn assembly over and fill with S.A.E. 10 engine oil, then insert end of Tool J-4274 through ball seat hole in bottom of plunger and press down solid, at which point holes in lifter body and plunger will be aligned. Insert pin (part of Tool J-4274) through both holes to hold plunger down against spring tension, then remove tool from top of lifter. Fill assembly with S.A.E. 10 engine oil, install push rod seat and spring retainer. Press down on push rod seat and remove pin.

Reassembly (V8 Engines): Invert plunger and set ball into hole in plunger, and place check valve ball retainer over ball and on plunger. Place check valve retainer spring over retainer. Assemble valve lifter body over the complete assembly. Turn assembly over and install push rod seat. Compress plunger with push rod and install retainer. Compress plunger to open oil holes and fill plunger with S.A.E. 10 engine oil Work plunger up and down to refill.

Installation: Reverse removal procedure.



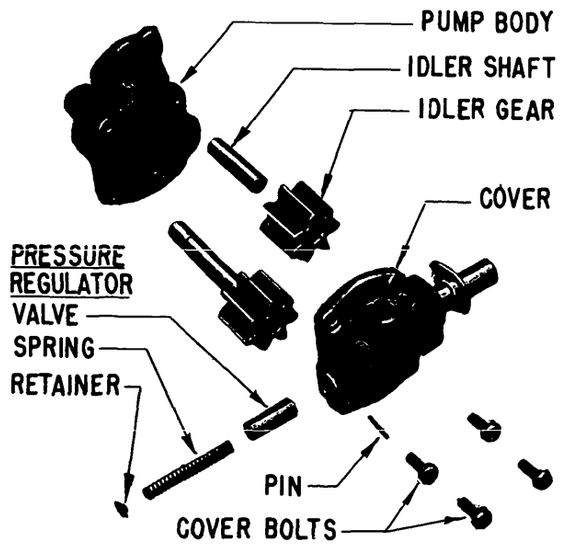
OILING SYSTEM
6 CYL. ENGINES

OIL LEAD TO VALVE ROCKER ARMS (6 CYL. ENGINES): Rocker arm shaft oil line pipe extends forward to push rod compartment from a fitting in tappet ledge just above rear camshaft bearing, to center of engine then upward to a fitting between the hollow rocker arm shafts. To replace this pipe, cut a new pipe to proper length, install new nipples at each end and install pipe to cylinder block fitting, then bend pipe to contour so that clearance is provided for the push rods and push rod cover and so that end of pipe extends straight up for cylinder head lubrication.

OIL PUMP
6 CYL. ENGINES

6 CYL. OIL PUMP (Removal & Disassembly): Drain oil, remove oil pan and disconnect oil pump-to-block oil line. Remove oil pump retaining sleeve lock screw and remove oil pump and oil pump-to-block oil line. Remove pressure oil line from pump and remove pump cover attaching screws, cover, gasket, idler gear and drive gear and shaft. Remove regulator valve pin and valve parts. Remove intake pipe and fixed screen as an assembly. Wash all parts in solvent and inspect pump body for cracks or excessive wear. Check shaft for looseness in housing and gear and cover for wear.
connector nuts securely. Replace intake pipe and screen.

Ass mbly: Install drive gear and shaft in body. Install idler gear with smooth side toward cover. Install cover and new gasket. Tighten screws securely and check to see that shaft turns free Install pump oil line to pump, leaving it loose.



CHEVROLET 6 CYL. OIL PUMP

Installation: Install pump in block and align oil lines and install retaining sleeve lock screw and tighten securely *(CAUTION*—Make sure tapered end of lock screw draws down into hole in oil pump body). Tighten oil pump-to-block oil line and pump-to-screen oil line connector nuts securely. Replace intake pipe and screen.

V8 ENGINE

V8 OIL PUMP (Removal): Drain oil, remove oil pan, and remove pump-to-rear main bearing cap bolt and remove pump, extension shaft and collar. Remove pump cover attaching screws, cover idler gear and drive gear and

CONTINUED ON NEXT PAGE

CHEVROLET V8 OIL PUMP

CONTINUED FROM PRECEDING PAGE

shaft. Remove intake pipe and fixed screen as an assembly. Wash all parts in solvent and inspect pump body for cracks or excessive wear. Check shaft for looseness in housing and gear and cover for wear.

Ass mbly: Place drive gear and shaft in pump body and install idler gear so that smooth side of gear will be toward cover. Install cover and attaching screws. Tighten screws to 6-9 ft. lbs. and check to see that shaft turns freely. Install intake pipe and fixed screen. Assemble collar end of extension shaft assembly over pump drive shaft, aligning tang of extension shaft with slot in end of pump drive shaft. Install retaining clip with flat end of clip in groove of pump drive shaft.

Installation; Assemble pump and extension shaft to rear main bearing cap, aligning slot at top end of extension shaft with drive tang on lower end of distributor drive shaft. Install pump to rear main bearing cap bolt and tighten to 45-50 ft. lbs. Install oil pan.

COOLING SYSTEM

ALL PASS. CARS

RADIATOR REMOVAL (Passenger Cars): Drain radiator and remove radiator hoses. On models equipped with Powerglide transmission, remove oil cooler lines from radiator and plug lines and radiator fittings. Remove radiator core to radiator support bolts and lift radiator core straight up to remove. *NOTE*—When removing radiator note the shims at support bolts and install at the same location when radiator is installed.

►*POWERGLIDE OIL COOLER CAUTION:* If foreign matter of any kind is allowed to enter cooler, the core should be cleaned with an air stream and flushed thoroughly with automatic transmission oil. Serious damage will be done to transmission if dirt or foreign matter remains in cooler.

BRAKE NOTES

SLOW POWER BRAKE PEDAL RETURN CORRECTION: When this condition is encountered, check the following points and correct as necessary.

Push Rod Lever Assembly—Power brake unit pushrod has been installed on the outboard side of lever assembly at pedal linkage. Correct by assembling on inboard side. Lubricate all linkage pivot points.

Power Brake Rubber Boot—Bellows or rubber boot may be gathered at front side of dash panel causing a bind on pushrod. Correct by pulling bellows through smaller hole in dash panel and mounting plate at same time power unit is being assembled to mounting plate.

Power Unit Valve Sleeve—Remove power unit from dash. Remove rubber boot from end plate of unit and squirt rubber lubricant (Ru-Glyde) between valve sleeve into which pushrod is assembled and the sleeve bore in valve assembly to lubricate "O" ring seal on valve sleeve.

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extrem car wh n disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model Designation

Series	Serial Prefix	Model
1500①	A	ONE-FIFTY
2100	B	TWO-TEN
2400	C	BEL-AIR
1508	D	SEDAN DELIVERY

①–Except Sedan Delivery.

SERIAL NUMBER: Stamped on plate on left front door hinge pillar post.

Starting Serial Number–001001 (at each plant).

►*SERIAL NUMBER NOTE: Serial Number (examp B56F001025) includes following identification date in sequence.*

Series①	Year	Assy. Plant②	Serial No.
B	56	F	001025

①–See Model Designation above.

②–See Assembly Plant Designation below.

Assembly Plant Designation

A–Atlanta	**J**–Janesville	**O**–Oakland
B–Baltimore	**K**–Kansas City	**S**–St. Louis
F–Flint	**L**–Los Angeles	**T**–Tarrytown
	N–Norwood	

ENGINE NUMBER: Stamped on right side of engine block to rear of distributor.

Starting Engine Number–0001001 (at each plant). Suffix letters and numerals indicate plant at which engine built ("F" for Flint, and "T" for Tonawanda), Model Year, and Model Type. See following for Model Type Designation.

Model Type Designation

Engine	Suffix
Regular "235"	Z
Regular "235" (with H.D. Clutch)	ZC
Powerglide "235"	Y

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. at cranking speed. A variation of 20 lbs. between cylinders indicates need for cylinder reconditioning.

VACUUM READING: At 500 RPM – 14.4" (With selector lever in Drive Range – Powerglide Cars), 16.7" (With transmission in Neutral). At 450 RPM – 14.5" (With selector lever in Drive Range - Powerglide Cars), 16.3 (With transmission in neutral).

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic type. Check for free operation when tuning engine. Should require ½ turn from unhooked to hooked position. *Distorted springs should be replaced.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .035".

Plugs – AC No. 44-5. 14 mm. Torque to 20-25 ft. lbs.

►*SPARK PLUG INSTALLATION CAUTION:* Spark plug flash-over or misfire on 1956 engines may be caused if 1955 plugs are used. Insulators on 1956 plugs have four annular ribs that help prevent flash-over. Spark plug boot has larger inside diameter.

COIL: Delco-Remy 1115087. *12 Volt.*

Ignition Current – 1.8 amps. idling, 4 amps. stopped.

Resistor – Delco-Remy 1931614. 1.40-1.62 ohms. On firewall.

►*COIL RESISTOR NOTE:* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position).

DISTRIBUTOR: Delco-Remy 1112403. *12 Volt.*

Condenser–Delco-Remy 1928111. **Capacity**–.18-.23 mfd.

Contact Point Set–Delco-Remy 1924571.

Breaker Gap–.016-.021 (New points), .0125-.0175". (Used points).

Cam Angle–28-35° with .016" gap.

►*BREAKER GAP CAUTION: Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set points.*

Breaker Arm Spring Tension–19-23 ozs.

Rotation – Clockwise viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		375	0-4		750
4-6		700	8-12		1400
9-11		1350	18-22		2700
12-14		1750	24-28		3500

Octane Selector: Adjustment on distributor provides 10° spark advance or retard from center 'O' position.

Vacuum Spark Control: Delco-Remy 1116089.

Vacuum Advance

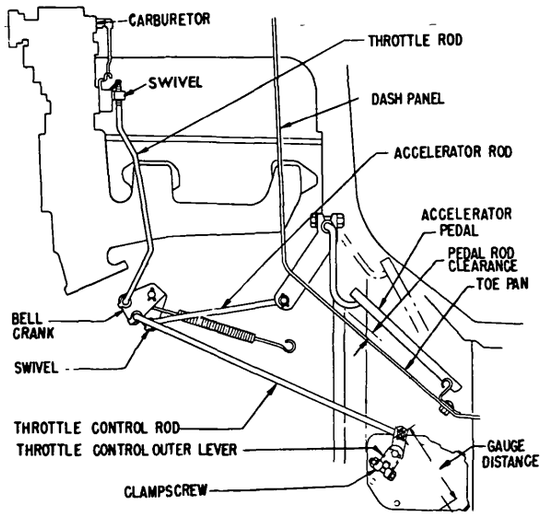
Distr. Degrees	Eng. Degrees	Vacuum ("of HG)
Start	0	4-6
7.5	15	7.5-10

Plunger Travel – 3/16-3/32".

IGNITION TIMING

Setting – TDC at idle speed. *NOTE - The Manufacturer recommends setting timing to 5° BTDC with engine operating at 1000 RPM and distributor vacuum disconnected.*

Timing Mark–Steel ball insert in flywheel lined up with pointer in inspection hole in right front face of housing with Octane Selector set on 'O'. Then adjust Selector as follows:



Octane Selector Setting–Set for slight ping when accelerating with wide open throttle.

CARBURETOR

►*FAST IDLE CONTROL CAUTION (AIR CONDITIONED CARS):* Fast idle control is set to provide 900 RPM engine speed when Fast Idle Control Knob on dash is pulled out. **Make sure knob is pushed in when making normal fast idle adjustments** and that fast idle control linkage does not interfere with normal operation of the carburetor linkage when fast idle is not in operation.

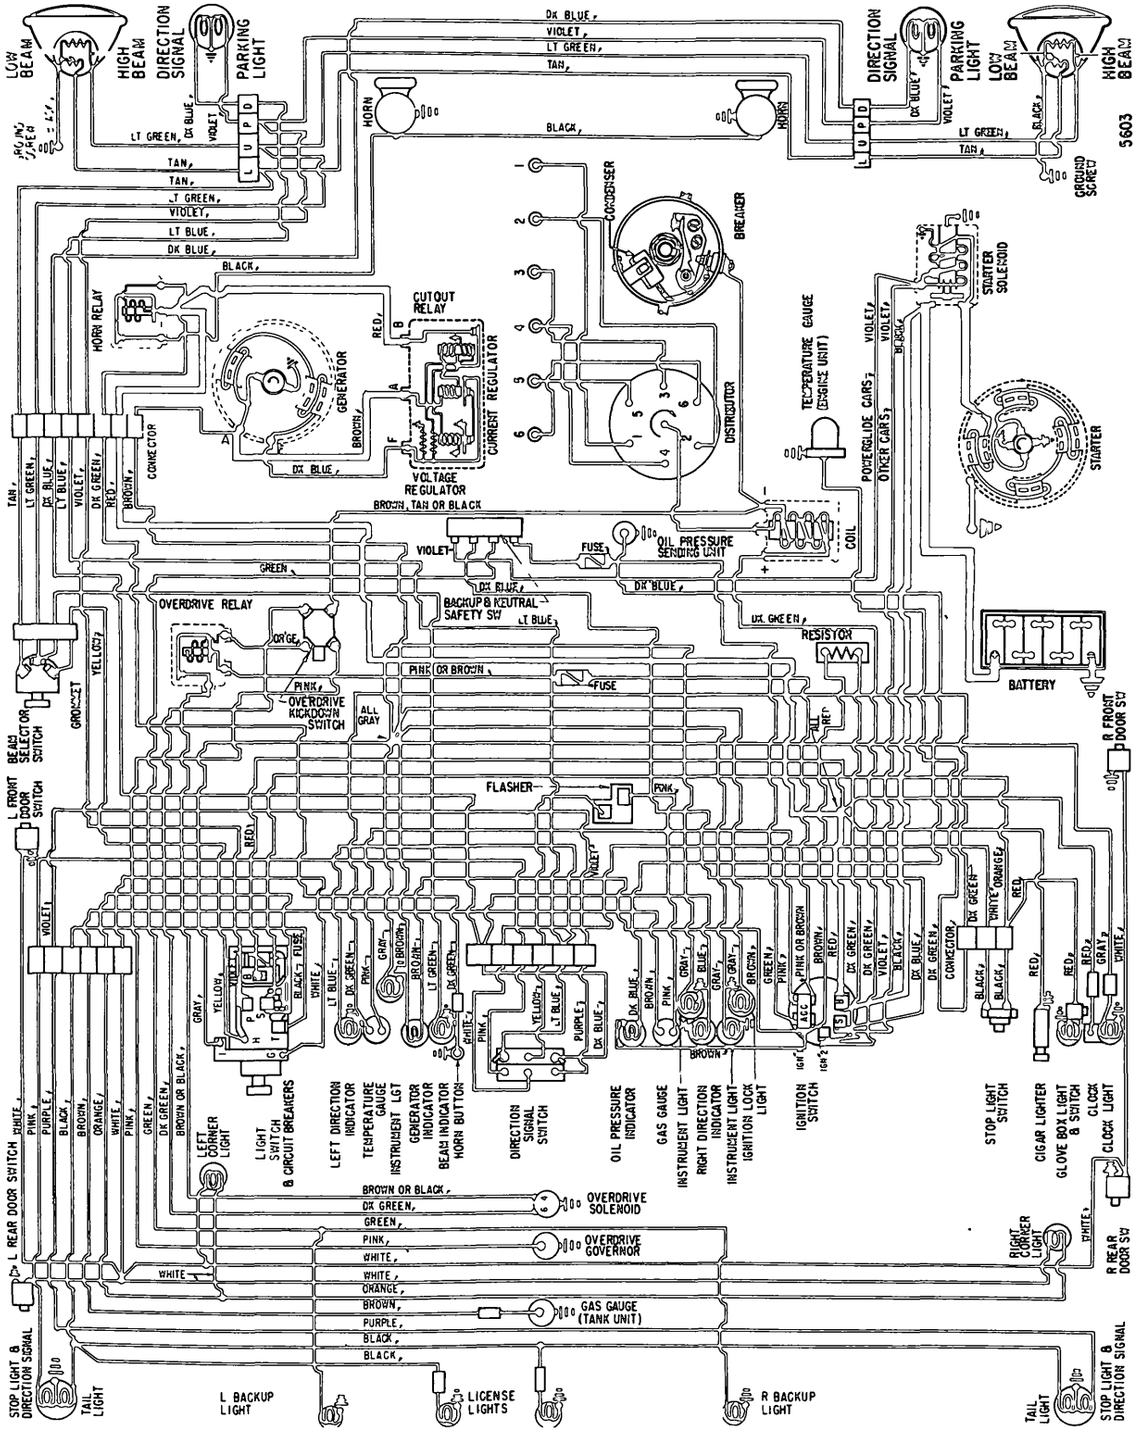
THROTTLE LINKAGE ADJUSTMENT (All Mod ls): *POWERGLIDE NOTE - Adjust transmission throttle control linkag BEFORE adjusting carburetor throttl linkage (see below).*

Carburet r Throttle Linkage (All M d ls): With accelerator pedal depressed, clearance between lowest point on accelerator link and toe pan (floor mat removed) should be exactly 1". With throttle actuating lever in wide open position, adjust upper throttle rod swivel for free entry into lever.

POWERGLIDE THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE CARS): Engine must be at normal operating temperature and transmission warm (choke valve wide open and fast idle inoperative with throttle stopscrew against low step of fast idle cam) when adjustments made.

1) Adjust engine idle speed to 425 RPM with selector lever in "D" range (set hand brake firmly to hold car while making adjustments).



2) Disconnect control rod from throttle lever on transmission cover. Remove lower bolt at rear of transmission side cover. Rotate throttle valve control outer lever assembly counter-clockwise to the open throttle position.

3) Hold lever in this position and with throttle valve outer lever gauge J-5806 set at 7.09" measure distance from left side cover lower rear bolt and hole in throttle lever. If pins of gauge will enter holes, adjustment is correct. If necessary to adjust, loosen lever to clamp attaching bolt and adjust lever on throttle shaft as necessary. Reconnect control rod.

4) Disconnect bellcrank-to-transmission throttle lever rod at throttle valve lever. Disconnect accelerator-to-bellcrank rod at bellcrank.

5) Force bellcrank-to-transmission throttle lever rod forward against stop in transmission (open throttle position) and adjust bellcrank-to-carburetor throttle rod for free entry of swivel pin in throttle valve lever, with carburetor throttle valve in wide open position.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6) With carburetor throttle valve held in wide open position and accelerator fully depressed, adjust accelerator-to-bellcrank rod for free entry of swivel pin into hole in bellcrank.

THROTTLE RETURN CHECK ADJUSTMENT (POWERGLIDE CARS): With engine idle speed set at 425 RPM, shut off engine, close choke valve and position throttle stop screw on highest step of fast idle cam. Using a 9/32" wrench on flat section of return check shaft, hold from turning, and turn the adjusting screw until it just contacts the throttle lever contact arm.

ROCHESTER BC

Model	Rochester No.
Std. Transmission	7009255
Powerglide	7009254

Idle Setting–1-2½ turns open.
Idle Speed (Synchro-mesh)–475 RPM.
Idle Speed (Powerglide)–425 RPM with Powerglide Selector lever in "D" (Drive) range.
Float Level–1 9/32" (Gauge M-250). With air-horn inverted and gasket in place, position Gauge M-250 over the floats with the tang inserted in the discharge nozzle. Bend float arms as necessary so that top of each float just touches the gauge and the float is centered between the gauge legs.
Float Drop–Bend float tang as necessary to obtain a distance of 1¾" from the gasket surface to the bottom of the float, with the air-horn upright and the float hanging free.
Choke Adjustment: Centered on index.
Fast Idle: With idle adjusting screw on next to highest step of fast idle, Gauge BT-99 (.076") should just slide between lower edge of choke valve and carburetor bore. To adjust, bend connector rod.
▷ *OTHER DATA: See "Rochester BC" Carburetors in Carburetion Section.*
Fuel Pump Pressure: 3½-4½ lbs.

CARB. EQUIPMENT

Fuel Pump: AC Diaphragm type.
Replacement Fuel Pump–AC No. 4149 (Fuel only), No. 4138 (Fuel & Vacuum).
Pressure–3½-4½ lbs.
See "Fuel Pumps" in Carburetion Equipment Section.
Gasoline Gauge: AC Electric.
Dash Unit – AC No. 1518473.
Tank Unit – AC No. 1518158.
"See "Fuel Gauges" in Carburetion Section.

BATTERY

Delco 2SMR53W. 12 Volt. 9 plate, 53 ampere hour capacity (20 hr. rate).
Battery Ground – Negative.
Engine Ground – Engine to cowl at rear head bolt.

STARTER

Delco-Remy 1107644. 12 Volt. Armature – 1926626.
Drive – Overrunning clutch (solenoid pinion shift).
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 35 ozs. minimum.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Perf rmanc Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	5.8	435

Starting Switch: Delco-Remy Solenoid Switch 1119789 mounted on starter and controlled by Ignition & Starter Switch 1116512.

See "Delco-Remy Starter Solenoid (Without Relay)" in Electrical Section.

Neutral Safety & Back-Up Light Switch: Delco-Remy 1998106 (Powerglide cars only).

Adjustment–*See "Chevrolet Powerglide" in Trans.Sect.*

GENERATOR

Delco-Remy. *12 Volt.* Application as follows:

Generator	Armature
1100326 (Std.)	1928952
1102041 (Pow. St.)	1929640
1102042 (Air Cond.)	1923535
1105947 (Taxi)	
1106981 (Taxi & City Pol.)	1929360

Maximum Charging Rate – *See Voltage Regulator.*

Performance Data

Generator	Amperes	Volts	RPM
1100326	25	14.0	2780
1102041, 42	30	14.0	2150
1105947	32	14.0	1850
1106981	40	13.0	1500

R tation – Counter-clockwise at commutator end.

Brush Spring Tension – 28 ozs.

Field Current – (1100326) 1.5-1.62 amps., (1102041, 42) 1.48-1.62 amps., (1105947) 1.54-1.67 amps., (1106981) 1.37-1.50 amps. All at 12.0 Volts.

B lt Adjustment: 5/16" belt deflection with light thumb pressure midway between generator and pump pulleys.

REGULATOR

Delco-Remy. *12 Volt.* Used with generators as follows:

Delco-Remy Regulator No.	Generator No.
1119000	1100326, 1102041
1119001	1102042, 1105947
1119004	1106981

NOTE – Regulator is "1119000 Series". Specifications b low are "Normal" settings.

Cutout Relay

Cuts in – 11.5-13.0 volts (1119004) 11.8 - 13.5 volts (Others). Hot.

Contact Gap – .020".

Air Gap – .020" (with contacts just closed).

Voltage Regulator

Setting – 13.6-14.3 volts (1119004), 13.8 - 14.8 volts (Others). Hot.

Air Gap – .063" (1119004), .075" (Others) with armature pressed down to point where contacts just touch.

Ch cking & Adjusting – *S "D lco-Remy 1119000 S r- i s" R gulator in El ctrical S ction.*

Curr nt R gulat r

S tting (1119000) – 23-27 amperes (hot).

S tting (1119001) – 27-33 amperes (hot).

S tting (1119004) – 37-42 amperes (hot).

Air Gap – .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting – *See "Delco-Remy 1119000 Series" Regulator in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Direction Signal: *See Electrical Section.*

Autronic Eye: *See Electrical Section.*

Lighting Switch Removal: Disconnect all wires from switch (make sure that all wires are tagged for identification). Depress switch shaft retainer on top side of switch assembly (rear of instrument panel) and pull shaft and knob out. Remove switch retaining nut and switch assembly.

Stop Light Switch Location: Mechanical type mounted under instrument panel adjacent to brake pedal lever.

Adjustment–Adjust position of switch so that stop light goes on when brake pedal is depressed 5/8" from fully released position.

FUSES: All accessory fuses except as indicated below are contained on the accessory fuse and junction block located on upper inside of dash panel to left of steering column.

Overdrive–14 amps. Located in Lucite cartridge in overdrive relay feed line on engine side of dash to left of steering column.

Radio–In feed line adjacent to radio.

Back-up Light–On accessory fuse block.

► *LIGHTING SWITCH FUSE NOTE:* A 3 ampere fuse has been added to light switch to protect instrument panel rheostat from burning out.

LIGHTING CIRCUIT BREAKERS: Two 13-amp. circuit breakers located on main light switch, protect all lighting circuits.

HORNS: Delco-Remy 1999759 (Low Note), **1999760** (High Note). *12 Volt.*

Horn Relay: Delco-Remy 1116781 or 1116913.

Contacts Close – 5.0-9.5 volts.

Contact Gap – .027".

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

►*NOTE: The following repair data applies to all Pass. Car & Truck Engines.*

Bore	Stroke	Displacement	Rated HP
3 9/16"	3 15/16"	235.5 cu. ins.	30.4

Compression Ratio	Developed HP
8.0-1	140 at 4200 RPM

Compression & Vacuum Reading – *See TUNE-UP.*

ENGINE REMOVAL: *See Chevrolet Special Data.*

OIL PAN REMOVAL: Remove bolts attaching steering idler arm bracket to frame side rail and drop for clearance. Remove pan retaining bolts and remove pan.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ch vrolet Special Data.*

ENGINE MOUNTINGS: *See Chevrolet Special Data.*

TIGHTENING TORQUES: *See Chevrolet Special Data.*

PISTONS

Aluminum alloy, cam ground, tin plated, with pin offset 5/64".

Weight–1.18 lbs. (235" Engine), 1.36 lbs. (261" Engine).

Removal–Pistons and rods removed from above.

Clearance – .005-.0011" measured 1.29" from top of piston, .033-.041" at top land, Selective fit.

Replacement P i s t o n s: Furnished Std. & .001", .020" .030", .040" oversize. *STANDARD SIZE PISTON NOTE* –Std. pistons furnished in four sizes with size stamp and size rang e as follows: **S4**(3.5625" -3.5630"), **S5** (3.5630"-3.5635"), **S6**(3.5635"-3.5640"), **S7**(3.5640"-3.5645").

Fitting New Pistons: Use .0015" x ½" feeler (part of Tool J-5513). With piston and cylinder clean and dry. insert feeler and inverted piston into cylinder to a point where center of piston pin hole is flush with top surface of block (feeler 90° from pin hole). Pull required to withdraw feeler must be 7-18 lbs.

Installing Pistons: Install piston with notch in piston mark "Front" toward front of engine.

PISTON PINS

Locked in rod. No bushing used in piston.

Diameter – .8660-.8665". **L ngth** – 3.168-3.198".

Pin Fit in Piston – Thumb push fit (at room temp.). To check fit, with piston and pin at 60° F., apply light oil film to pin, insert pin vertically in one piston boss (one end of pin in either piston boss). Pin should hold own weight, but should install easily with thumb pressure.

Replacement Pins: Furnished Std. & .0015", .003", .005", oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.(1&2)..	.0930-.0935"	.010-.020"	.001-.003"
Oil (3)	.181-.188"	.015-.055" ①	.000-.008" ②

① – On rails. ② – 3-piece, chrome rails (2) and spacer.

► *RING INSTALLATION CAUTION: Install compression rings with side marked "TOP" upward.*

Replacement Rings: Furnished Std. & .005", .010", .020", .030", .040" oversize.

CONNECTING RODS

Length–6 13/16". **Weight**–31.76 ozs. (Exc. 261" Engine).

Crankpin Journal Diameter–2.311"-2.312", all engines.

Lower Bearing–Replaceable precision type.

Clearance–.0007-.0028". Not adjustable, replace bearings.

Sideplay–.005-.012" at lower end.

Replacement Bearings: Std. .001", .002", .010", .020" undersize.

Installing Rods: Numbers on rods and caps must be together and installed in same numbered cylinders with numbers and pin clamp bolt toward camshaft side.

CRANKSHAFT

►*CAUTION: No. 1 (front) and No. 2 (front intermediate) bearings similar in appearance but must not be int r-changed. No. 2 bearing marked by "T" in oil groov .*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Journal Diameters—(1) 2.6835"—2.6845", (2) 2 7145"-2 7155", (3) 2 7455"—2.7465", (4) 2 7765"—2.7775" *NOTE*—Journal taper or out-of-round limits .001". Run-out Limits for Nos. 2 & 3 journals is .002".

Cl aranc —.0005" minimum,. 003" maximum (new bearings), Service limits .0005" min. .0045" maximum. See Adjustment below.

NOTE—Precision type bearings can be replaced singly

Bearings—Steel backed thin wall babbitt. *Boring or reaming not required*

B aring Adjustment: Solid shims. Remove shims until light drag secured when shaft turned by hand, then replace .002" shim on one side for clearance (if unequal number of shims used, place extra shim on same side of all bearings).

Replacement Bearings: Furnished Std. .002", .010", .020", .030" undersize.

Bearing Installation: Not necessary to remove crankshaft or engine from car. *See "Crankshaft & Main Bearings" in Chevrol t Special Data.*

Bearing Cap Installati n—No. 2 & No. 3 bearing caps marked for identification. Install No 2 cap with mark "FRONT" toward front of engine, No. 3 cap with mark "REAR" toward rear of engine

Crankshaft R ar Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chevrolet Special Data*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chevrolet Special Data*

End Thrust: Taken by No. 3 (rear intermediate) bearing. To check endplay, force crankshaft to rear, check clearance at rear of No. 3 bearing. Adjust by replacing bearing. **Endplay**—.0035"-.0095".

Vibration Dampener: *See "Vibration Dampener" in Chevrolet Special Data.*

CAMSHAFT

J urnal Diameters—(1) 2.1537-2.1547", (2) 2.0912-2.0922", (3) 2.0287-2.0297", (4) 1.9662-1.9672".

►*NOTE:* Journal out-of-round limits .001". Run-out limits .002".

Bearing Type—Steel backed babbitt lined bushing (staked in place). *NOTE*—Bearings must be line reamed

Se "Camshaft & Bearings" in Chevrolet Special Data

Clearanc —.0015-.0035".

End Thrust: Taken by thrust plate behind camshaft gear (gear position on shaft controls endplay).

Endplay Adjustment—*See "Timing Gears" in Chevrolet Special Data.*

Endplay—Free fit to .003" maximum.

Timing Gears: Fibre (Pass. Cars. Exc. Corvette), Aluminum (Corvette and Trucks). Steel crankshaft gear.

R placement Timing Gears & Installation: *See "Timing Gears" in Chevrolet Special Data.*

Timing G ar Backlash — .003-.005".

Camshaft S tting: Gears punch marked. Punch marks on both gears must line up directly opposite each other.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chevrolet Special Data*

VALVES

Tappet Clearanc : (Passenger Cars) — None in Service (hydraulic).

(Trucks) — (235") .006" Intake, .016" Exhaust. (261") .006" Intake, .020" Exhaust, HOT. **See** *Valve System" in Chevrolet Special Data.*

Valve	Head Diam.	Stem Diam.	Length
Intake	1 7/8"	.3410-.3417"	6.376-6.396"
Exhaust	1 1/2"	.3410-.3417"	4.913-4.933"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	30° ℄	.4004"	.0010-.0027"
Exhaust	45° ℄	.4004"	.0010-.0027"

℄ — Seat angle in block 1° additional.

►*VALVE GRINDING CAUTION:* Replacement valves are furnished with face angles of 30° and 45°. When seats are ground to new recommendations of 30° and 45°, valves must be ground to recommended angle of 29° (Intake) and 44° (Exhaust) whether valves are being re-used or new valves are being installed.

Valve Seat Width — 3/64"-1/16" (Intake), 1/16-3/32" (Exhaust).

Valve Stem Oil Seal Installation: *See "Valve System" in Chevrolet Special Data.*

Valve Guides: Precision type. Pressed in head.

Valve Guide Installation—*See "Valve System" in Chevrolet Special Data.*

Valve Springs: Install springs with closed coil end down.

Spring Specifications

	Pressure	Length
Valve Closed	74-82 lbs.	1.858"
Valve Open	196-208 lbs.	1.462"

Free Length — 2.281"

►*VALVE SPRING HEIGHT CAUTION:* Check installed height of valve springs. If distance from spring seat in head to top of valve spring exceeds 1 55/64", install shim approximately 1/16" thick. At no time should spring be shimmed to give installed height of less than 1 51/64".

Valve Lifters (Pass. Cars) — Hydraulic type. *See "Valve System" in Chevrolet Special Data.*

Hydraulic Lifter Overhaul & Testing — *See "Valve System" in Chevrolet Special Data.*

Valve Lifters (Trucks): Mechanical type.

Rocker Arm Assembly: *See "Valve System" in Chevrolet Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

235" Engine

Intake Valves — Open 10°30' BTDC, Close 53°30'ALDC.

Exhaust Valves — Open 49° BLDC, Close 15° ATDC.

Valve Timing Check — *(CAUTION* - It will be necessary to replace the hydraulic valve lifter and pushrod operating No. 1 exhaust valve, with a conventional lifter and pushrod). Remove all tappet clearance from No. 1 exhaust valve Turn engine over until this valve just starts to close and until triangular flywheel mark lines up with pointer on right face of flywheel housing. Mount dial indicator on rocker arm shaft with stem of indicator contacting No 1 exhaust valve adjusting screw and set the dial indicator to .058". Turn crankshaft until indicator hand just stops moving. Timing is correct if indicator reading is ZERO plus or minus .004". Reset tappet to correct running clearance.

OILING SYSTEM

Crankcase Capacity: 5½ qts (dry), 5 qts (refill)

Normal Oil Pressure: 35 lbs. (approx.).

Pressure Regulator Valve—In oil pump body. Not adjustable

Oil Pressure Indicator—Light located at right side of instrument cluster, controlled by a pressure operated switch, Delco-Remy 1998149, located in main oil gallery on left side of engine. Switch closes at 4-6 lbs.

Oil Pump: Gear type. Located in crankcase, driven by distributor gear.

Oil Pump Overhaul—*See "Oiling System" in Chevrolet Special Data.*

Oil Filter Element: AC P-115

Rocker Arm Oil Lead & Overflow Pipe: *See "Oiling System" in Chevrolet Special Data.*

Crankcase Ventilation (Standard): Air intake through valve rocker arm cover, outlet through pipe on right side of engine.

Servicing — On all models with air cleaner mounted on valve rocker arm cover, wash filter element with solvent and re-oil at 2000 mile intervals or more often if required by operating conditions.

Crankcase Ventilation (Optional): Positive Type. Vacuum operated ventilator consisting of a vacuum pipe from oil filler pipe to ventilator valve in fitting on intake manifold. Valve is spring loaded, variable opening type giving constant crankcase ventilation at all speeds. **Valve must close at idling to give proper air-fuel mixture.**

Servicing — Every 10,000 miles (or oftener if required) clean vacuum pipe, valve, and filler pipe thoroughly. Filler cap gasket must seal tightly.

►*VACUUM VALVE CAUTION:* If improper action of spring is suspected due to spring being distorted, or etched from corrosive action, the valve assembly should be replaced.

COOLING

►*RADIATOR REMOVAL CAUTION (POWERGLIDE CARS): Transmission oil cooler is part of radiator lower tank, and must be TIGHTLY SEALED after removal or during repairs to avoid entrance of foreign material.*

Water Capacity: 16 qts (17 qts with heater).

Pressure Valve: AC No. 850795. Radiator filler cap. 7 lb. type. **Replacement Valve** - AC No. RC-1.

Thermostat: Harrison. In cylinder head water outlet.

Standard — No. 3133595 (stamped 151) 151°. Can be used for alcohol anti-freeze.

Optional—No. 3123994 (stamped 160), 160°, No. 3133597 (stamped 170) 170°.

Temperature Gauge: AC Electric.

Dash Unit — AC No. 1513134.

Engine Unit — AC No. 1513130.

See "Temperature Gauges" in Miscellaneous Section.

Wat r Pump: Double outlet, packless type with sealed ball-bearing shaft.

See "Chevrolet" in Water Pump Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Radiator Removal & Installation: *See "Radiator" in Chevrolet Special Data.*

CLUTCH

Own (Exc. Powerglide Cars)—Diaphragm spring type.

See "Chevrolet (Own)" in Clutch Section.

Clutch Disc—Chevrolet No 3836103 (Molded) 3836121 (Woven), 3836119(Hvy. Duty)

P dal Adjustment: Pedal free travel ¾-1' Loosen check nut at connecting link at clutch fork Turn adjusting nut to remove all lash at fork, **then back off two turns.** Tighten check nut.

Removal: Remove transmission (see Transmission Removal below). Remove throwout bearing from fork. Remove clutch fork tension spring from fork, disconnect clutch fork pushrod. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824, to support clutch assembly during removal. Loosen clutch attaching bolts one turn at a time until diaphragm spring is released. Remove Pilot Tool, then remove clutch assembly from car. *CAUTION*- When installing clutch, align "X" mark on clutch cover with "X" mark on flywheel.

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh.

See "Chevrolet 3-Speed" in Transmission Section.

Transmission Control: *See "Transmission Controls" in Transmission Section.*

Removal: Drain Transmission and disconnect speedometer cable and shift rods. Disconnect propeller shaft at rear universal and slide shaft toward rear to disengage from transmission. Remove two top transmission to clutch housing screws and install Guide Pins J-1126. Remove the two lower screws and slide transmission back until clutch spines are disengaged. Remove transmission from below car.

OVERDRIVE

Warner Model AS1-R10H. Solenoid operated type with governor control and throttle operated kickdown. Lockout Switch not used.

See "Chevrolet Overdrive" in Transmission Section.

Ov rdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

R moval: Same as for Synchro-mesh transmission (above) after disconnecting control cable and wiring

POWERGLIDE TRANSMISSION

Torque converter and hydraulically operated planetary gear unit with manual controls.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTIONS See "Chevrolet Powerglide" in Trans. Section.*

►*TESTING & TROUBLE SHOOTING: See "Chevrolet Powerglide" in Transmission Section.*

Lubricati n· Check fluid level in transmission every 1000 miles. Oil should be added only when level gets down to "Add One Quart" mark on dipstick. Change oil, remove and clean oil suction screen every 25,000 miles. Use only AUTOMATIC TRANSMISSION FLUID "Type A" bearing an "AQ-ATF" marking on container.

Capacity—5 qts. (refill), 11 qts. (after overhaul).

►*POWERGLIDE DRAINING CAUTION—There is no drain plug on converter. Drain transmission case only, add 4½ qts. of fluid initially, recheck after idling engine.*

Checking Fluid Level—Engine must be idling with the parking brake set, transmission warm, and the control lever in "N" range when taking dipstick readings. Dipstick is located under hood on right side just opposite starter

►*OTHER DATA: See "Chevrolet Powerglide" in Transmission Section.*

UNIVERSALS

Own. Yoke & Spider (Trunnion) type.

►*CAUTION:* Rear bearing companion flange nut controls rear axle pinion bearing preload. Preload must be adjusted whenever companion flange nut loosened. *See "Chevrolet Pass. Car (Hotchkiss Drive) in Rear Axle Section.*

REAR AXLE

Own. Semi-floating, hypoid gear type, with Hotchkiss Drive. Pinion bearing adjustment is different than on previous models.

See "Chevrolet Pass. Car (Hotchkiss Drive)" in Rear Axle Section.

►*PINION BEARING PRELOAD CAUTION.* Rear universal joint companion flange controls rear axle pinion bearing preload. Bearing preload must be adjusted whenever companion flange nut is loosened

Car Model	Axle Ratio	Serial Prefix
Std Transmission	3 70-1	AA or BA
Overdrive	4 11-1	AC or BC
Powerglide	3.55-1	AB or BB

Backlash — .006-.009" (.008" preferred).

Removal: Raise car and support with jack stands under frame side rails. Remove rear wheels and remove two trunnion bearing "U" bolts from rear universal yoke and separate the joint (tape bearings to trunnion). Disconnect hand brake cable and equalizer and remove cables from clamps at frame. Disconnect hydraulic brake lines at rear axle housing. Disconnect shocks. Support axle assembly on hydraulic jack and remove spring "U" bolts, nuts and anchor plate, and lower axle to floor

Axle Shaft Removal: Raise car and place jack stands under axle housing Remove tire, wheel and brake drum assembly. Remove four nuts and lockwashers from bearing retainer bolts (on inside of axle flange). Attach axle Puller J-5748,with slide hammer, to flange and remove axle shaft and bearing assembly. Be careful not to disturb backing plate. *NOTE*—If bearing retainer and parking brake strut interfere, raise strut slightly with screw driver to obtain clearance.

SHOCK ABSORBERS

D lc . Direct acting non-adjustable. Serviced by replacement.

FRONT SUSPENSION

Independent type with direct acting shock absorbers within front coil springs and new spherical type joints connecting control arms and steering knuckles.

See "Chevrolet (Spherical Joint)" in Front Suspension Section.

Kingpin Inclination — 3½-4½°.

Caster — Pos. ½-1½°.

Camber — 0° to Pos. 1°.

►*CASTER & CAMBER ADJUSTMENT NOTE: Adjusted by shims located between upper control arm inner support shaft and support bracket.*

Toe-In — 1/16-1/8" (per wheel), 1/8-1/4" (total both wheels).

Toe-Out on Turns — With inside wheel at 20°, outside wheel should be 18° 10".

STEERING

Manual: Saginaw Ball Bearing W rm & Nut. Recirculating ball worm and nut.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Own (Linkag Typ). *S e "Chevrolet Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Butt n R moval: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Chevrolet-Bendix. Duo-servo, single anchor hydraulic, without anchor pin adjustment Hand lever applies rear wheel service brakes

See "Chevrolet-Bendix Hydraulic" in Brake Section

►*REPLACEMENT BRAKE SHOE GRINDING CAUTION:* To compensate for lack of brake anchor adjustment, brake shoes are ground to a 057- 087" smaller diameter than the drum diameter Grinding shoes to the true drum diameter on bench grinders will cause heel and toe contact, resulting in erratic brake action *NOTE—If spindle mounted type grinder is used, the shoes should be ground to the true drum diameter*

Drums—Diameter 11"

Wheel Cylinder Diameter—Front 1 1/8", Rear 1".

	Brake Lining Width	Thickness
Front Whl	2"	.187- 194"
Rear Whl	1 3/4"	.187- 194"

Length Per Shoe—9.3125" (Primary), 11.6875" (Secondary).

Braking Power—55.9% (front wheels), 44 1% (rear wheels`.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cl aranc –Single adjusting screw located at bottom of backing plate. Back off adjusting screw 7 notches from slight drag position. Brakes must be free of any drag after adjustment.

Standard Mast r Cylind r: Located on engine side of firewall in line with brake pedal

Ch cking Fluid–Reservoir is integral with master cylinder. Maintain level in cylinder to lower edge of filler hole

R m val–Disconnect hydraulic line from end of cylinder and remove bolted brass fitting Remove four retaining nuts and lock washers holding master cylinder to firewall and remove cylinder.

Installati n–Reverse removal procedure making sure that push rod clevis is straddling the brake pedal Refill master cylinder and bleed all brake lines. Adjust push-rod-to-main cylinder clearance as follows· Make sure brake pedal returns to fully released position with no binding, and that pedal retracting spring has not lost its tension, then adjust brake pedal clevis to give a barely perceptible .end play between main cylinder piston and brake pushrod (1/16-3/16" pedal movement should be felt).

Power Brakes: Bendix Vacuum Type Power Unit replaces conventional master cylinder.
See "Bendix Power Unit" in Brake Section.

►*SLOW POWER BRAKE PEDAL RETURN CORRECTION: See "Brake Notes" in Chevrolet Special Data*

MISC. MECHANICAL

Windshield Wipers: Cable operated type (Std.). Electric type (Optional)
See "Windshield Wipers" in Miscellaneous Section.

Window Regulators: Electric type with reversible motor operating each door window assembly.
See "Power Window Regulators" in Miscellaneous Section.

Power Top Control: Hydro-Lectric. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjuster: Reversible electric motor controls horizontal front seat movement. *See "Power Seat Adjusters" in Miscellaneous Section.*

Air Conditioning: *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model Designation

Series	Serial Prefix	Model
1500	VA	ONE-FIFTY
2100	VB	TWO-TEN
2400	VC	BEL-AIR
2934	VE	CORVETTE
1508	VD	SEDAN DELIVERY

SERIAL NUMBER: Stamped on plate on left front door hinge pillar post.

Starting Serial Number–001001 (at each plant) for all models except Corvette.

►*SERIAL NUMBER NOTE: Serial Number (example VB56F001025) includes following identification information in sequence.*

Series ①	Year	Assy. Plant ②	Serial No.
VB	56	F	001025

①–See Model Designation above.

②–See Assembly Plant Designation below.

Assembly Plant Designation

A-Atlanta	J–Janesville	O–Oakland
B–Baltimore	K–Kansas City	S–St. Louis
F–Flint	L–Los Angeles	T–Tarrytown
	N–Norwood	

ENGINE NUMBER: Stamped on pad at front right hand side of cylinder block behind water pump.

Starting Engine Number–001001 (at each plant). Suffix letters and numerals indicate plant at which engine built ("F" for Flint, "T" for Tonawanda), Model Year (56) and Model Type Designation (see below).

Model Type Designation

Engine	Suffix
V8 with 3-Speed Trans.	G
V8 with Overdrive	GC
V8 with Air Cond. & Overdrive	GQ
V8 with Powerpack & Overdrive	GE
V8 with Air Cond. & 3-Spd. Trans.	GF
V8 with Hvy. Duty Clutch	GJ
V8 with Air Cond. & H.D. Clutch	GK
V8 with Power Pack	GL
V8 with Air Cond. & Power Pack	GM
V8 with Power Pack, O.D. & Air Cond.	GN
V8 with Powerglide	F
V8 with Powerglide & Power Pack	FB
V8 with Powerglide & Air Cond.	FC
V8 with Powerglide, Air Cond , Pow.Pack	FD
V8 (Corvette) with 3-Spd. Trans.	GR
V8 (Corvette) with Powerglide	FG

TUNE-UP

COMPRESSION PRESSURE: 150 lbs. (162 & 170 HP Engs.), 160 lbs. (Others), at cranking speed. A variation of 20 lbs. between cylinders indicates need for cylinder reconditioning.

VACUUM READING: Steady 17-21" at idling speed.

VALVE TAPPET CLEARANCE: (Corvette) – .008" Intake, .018" Exhaust, with engine HOT and idling. (Others) – None in service - hydraulic.

MANIFOLD HEAT CONTROL: V8 (Std.) – Single exhaust with crossover pipe. Heat control valve with counterweight and thermostatic coil spring located between right manifold and exhaust pipe. Hook coil spring under stop stud. Install counterweight with square projection up and upper end of spring stop resting on top of stop stud.

V8 (Corvette Std., Others Optl.) – Dual exhaust system. Coil spring and counterweight same as other V8 (Std.) engines.

►*DUAL EXHAUST NOTE:* With valve closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders – RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7

SPARK PLUG GAP: .035".

Spark Plugs – AC No. 44-5 (Std. V8), AC No. C-43 (Corvette). 14 mm. Torque to 20-25 ft. lbs.

►*SPARK PLUG INSTALLATION CAUTION:* Spark plug flash-over on 1956 engines may be caused if 1955 plugs are used. Insulators on 1956 plugs have four annular ribs that help prevent flash-over, and larger inside diameter on spark plug boot. If 1955 plugs installed, flash-over or misfire will be prevalent due to loose fit of boot.

COIL: Delco-Remy 1115087 (Std.), 1115091 (Corvette). *12 Volt.*

Ignition Current – 1.8 amps. idling, 4 amps. stopped.

Resistor – Delco-Remy 1931614. 1.40-1.62 ohms. On firewall.

►*COIL RESISTOR NOTE:* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position).

DISTRIBUTOR: Delco-Remy. *12 Volt.* Single breaker, or double breaker types with 8 lobe cam. Used as follows:

Application	Delco-Remy Distr. No.
V8 (Std.), 2-Bbl.Carb.(Early)	1110866, 1110869
V8 (Std.), 2-Bbl.Carb.(Later)	1110847
V8 (Std.), 4-Bbl.Carb.(Early)	1110866, 1110869
V8 (Std.), 4-Bbl.Carb.(Later)	1110878
V8 (Corvette), 4-Bbl.Carb.(Early)	1110872
V8 (Corvette), 4-Bbl.Carb.(Later)	1110879
V8 & Corvette, TWO 4-Bbl.Carb.(Early)	1110872
V8 & Corvette, TWO 4-Bbl.Carbs.(Later)	1110879

Condenser – Delco-Remy 1869704. **Capacity** .18- 23 mfd.

Contact Point Set - Delco-Remy 1924499 (Distributor 1110847, 66, 69, 78), Delco-Remy 1918148 (Distributor 1110872 & 79 - Two used).

Breaker Gap - .019" (New Points - Distr. 1110847, 66, 69, 78), .015" (New Points - Distr. 1110872, 79), .016" (Used Points).

Cam Angle–26-33° with .016" gap (Distributor 1110847, 66, 69, 78), 34° plus or minus 1° for both sets of points operating together (Distributor 1110872, 79).

►*CAM ANGLE NOTE (Double Breaker Distributors):* Adjust each set of points separately for cam angle of 29° plus or minus 1° (block other set of points open with insulator at least .025" thick). Cam angle for both sets operating together should then be 34° plus or minus 1° with breaker gap of .014-.018".

►*BREAKER GAP CAUTION: Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set points.*

Breaker Arm Spring Tension – 19-23 ozs.

Rotation – Clockwise viewed from above.

Automatic Advance – 1110847

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	400	0-4	800
8-10	1150	16-20	2300
15-17	1800	30-34	3600

Automatic Advance – 1110866, 69, 72

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	350	0-4	700
7.5-9.5	750	15-19	1500
10-12	1200	20-24	2400
13-15	1750	26-30	3500

Automatic Advance - 1110878, 79

Degrees Distr.	RPM	Degrees Eng.	RPM
.5-2.5	400	1-5	800
6-8	750	12-16	1500
9.5-11.5	1300	19-23	2600
13-15	1850	26-30	3700

Vacuum Spark Control: Delco-R my 1116100 (Distributor 1110847 & 66), **1116104** (Distributor 1110869 & 78). *NOTE* - No vacuum control used on Distributor 1110872 & 79.

Plunger Travel – 15/64-1/2" (1116100), 15/64-17/64" (1116104).

Vacuum Advance – 1116100

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7
11.75	23.5	12-20.5

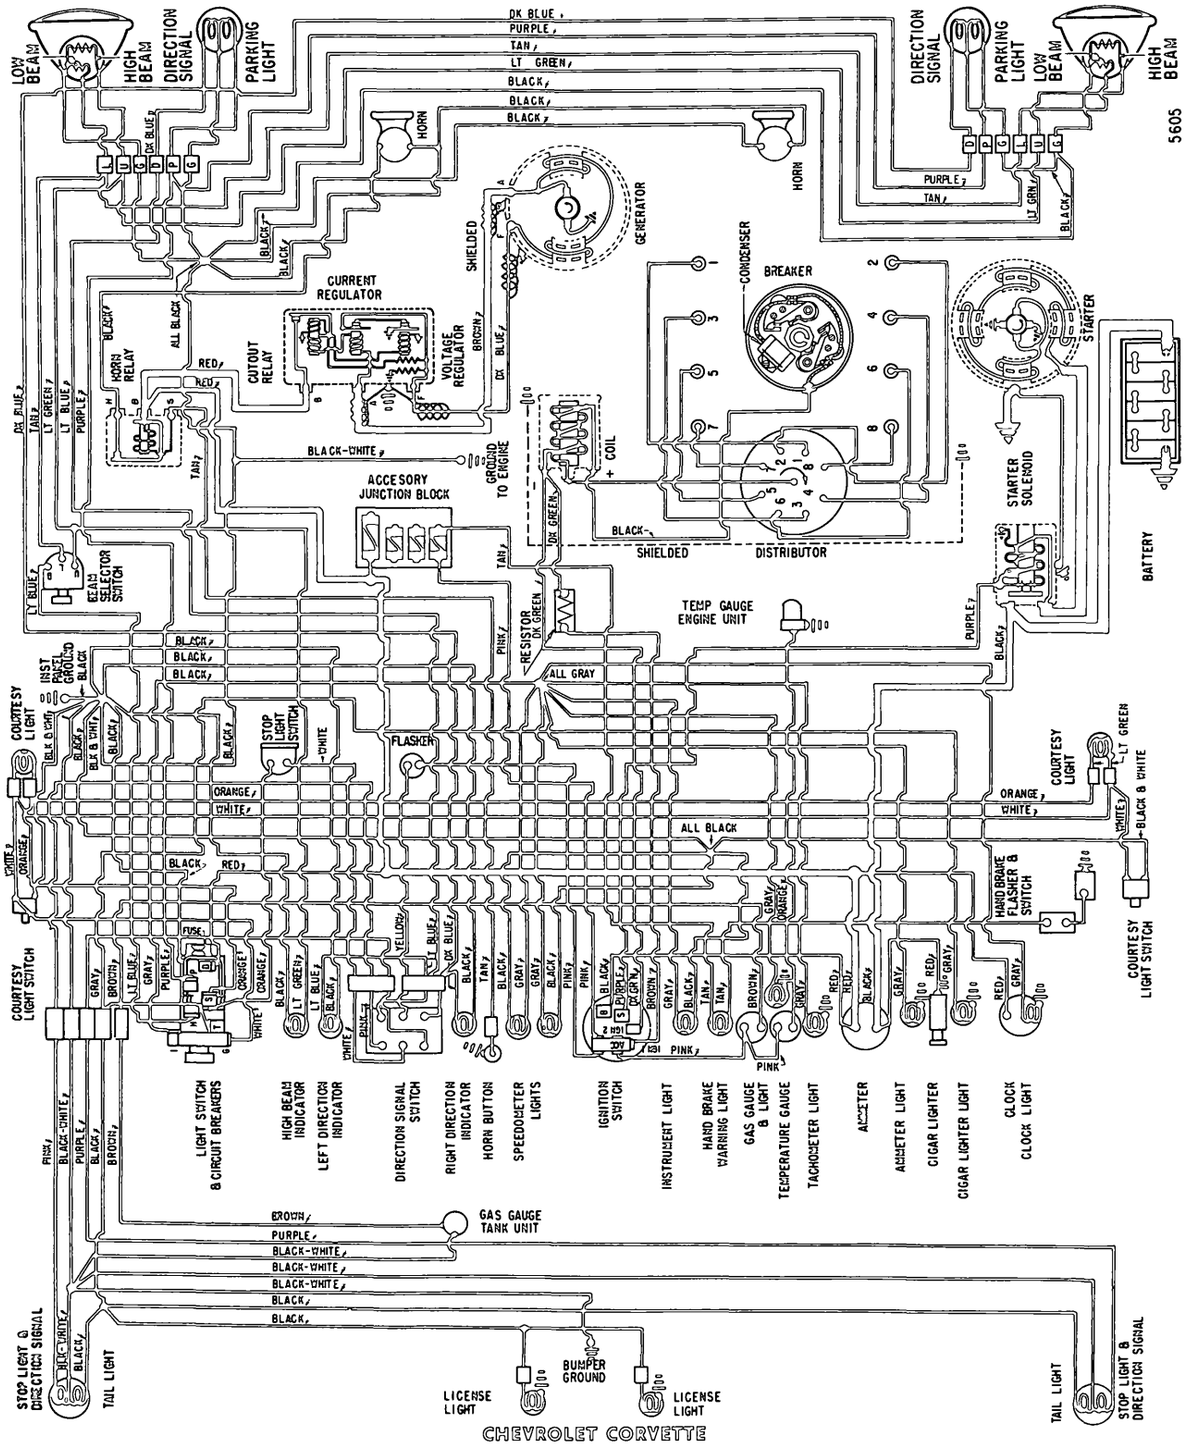
Vacuum Advance – 1116104

Distr. Degress	Eng. Degrees	Vacuum (" of HG)
Start	0	7-9
11.75	23.5	14-15.5

IGNITION TIMING

Setting – Set timing to setting indicated below. *Manufacturer recommends setting timing at 1000 RPM and with distributor vacuum disconnected.*

Distributor No.	Setting (At Idl)	Setting (at 1000 RPM, Vac. Discon.)
1110847	4° BTDC	8° BTDC
1110866	4° BTDC	12° BTDC
1110869	4° BTDC	12° BTDC
1110872 (1 Carb.)	4° BTDC	12° BTDC
1110872(2 Carbs.)	① 8° BTDC	② 16° BTDC
1110878	4° BTDC	10° BTDC
1110879(1 Carb.)	4° BTDC	10° BTDC
1110879 (2 Carbs.)	③ 8° BTDC	② 14° BTDC



① – Do not exceed 10°.
② – Do not exceed 18°.
③ – Do not exceed 12°.

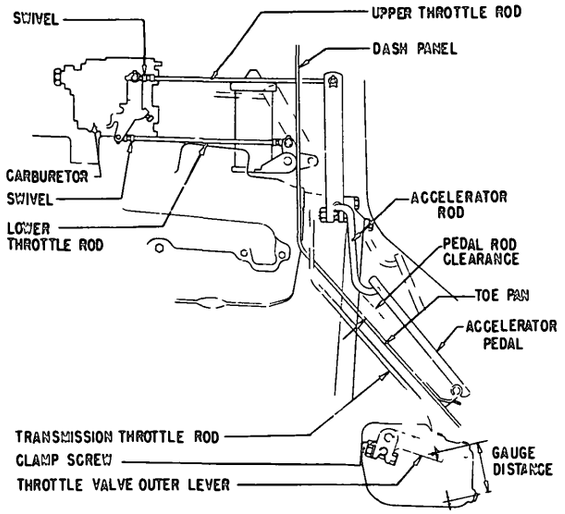
Timing Mark – Mark on vibration damper and an indicator on left side of valve chain cover. Indicator is marked with five lines on each side of "O" mark. Each line represents 2°.

CARBURETOR

►*CARBURETOR APPLICATION NOTE: Rochester 2GC Dual Carburetor is Std. on all models (Exc. Corvette).*

CONTINUED ON NEXT PAGE

CHEVROLET CORVETTE



CONTINUED FROM PRECEDING PAGE

Rochester 4GC and Carter WCFB 4-Barrel Carburetors used on a mixed basis on models (Exc. Corvette) with Power Package. A single or TWO Carter WCFB 4-Barrel Carburetors used on Corvette.

▷ *FAST IDLE CONTROL CAUTION (AIR CONDITIONED CARS):* Fast idle control is set to provide 900 RPM engine speed when Fast Idle Control Knob on dash is pulled out. Make sure knob is pushed in when making normal fast idle adjustments and that fast idle control linkage does not interfere with normal operations of the carburetor linkage when fast idle is not in operation.

THROTTLE LINKAGE ADJUSTMENT (All Models): *POWERGLIDE NOTE – Adjust transmission throttle linkage BEFORE adjusting carburetor throttle linkage (see below).*

Carburetor Throttle Linkage (All Models): With accelerator pedal depressed so that clearance between lowest point on accelerator link and toe pan (floor mat removed) is exactly ¾" (2-Bbl. Carbs.), 1" (4-Bbl. Carb. - except Corvette), 3/8" (Corvette - single and double carbs.); adjust upper throttle rod swivel so that it enters carburetor throttle lever freely (rear carburetor on Corvette double carburetor installation), connect rod.

POWERGLIDE THROTTLE LINKAGE

Transmission Throttle Control Linkage Adjustment (Powerglide Cars): With selector lever in "D" (Drive) range and with hand brake applied, adjust engine idle to correct speed (engine and transmission at normal operating temperature). Turn engine off and check choke valve to make sure it is fully open and that throttle stop screw is against low step of fast idle cam. Disconnect transmission throttle rod at transmission. Remove extreme lower rear bolt in side cover on transmission. Rotate transmission throttle valve outer lever assembly counter-clockwise to the open

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

throttle position (against stop). Hold in this position and with throttle valve positioning gauge J-5906 set to 2 7/8", measure the distance between the bolt hole inside cover and hole in throttle lever. If pin or gauge enters hole, adjustment of lever is correct. If necessary to adjust, loosen lever to clamp attaching screw and adjust outer lever to obtain correct adjustment. Install bolt in side cover and attach throttle rod to transmission lever. Force transmission throttle control rod forward against stop in transmission (open throttle) and adjust lower rod on carburetor throttle lever for free entry of swivel pin into carburetor throttle lever, with carburetor throttle valve in wide open position. Adjust upper throttle rod as outlined in Carburetor Throttle Linkage above

ROCHESTER 2GC

Model	Rochester No.
Std. Transmission	7008387
Powerglide	7008388

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting—After idle speed set to correct specifications (see Idle Speed below), turn both idle mixture screws for smooth idle with highest vacuum reading and RPM.

Idle Speed—450-500 RPM (Synchro mesh), 400-450 RPM (Powerglide—with Selector Lever in "D" range).

Float Level—1¼" (Gauge BT-129). With air-horn inverted and gasket in place, position the float level gauge over the float so it rests against the pump side of power piston shaft, with the outer gauge leg in line with the center of the float. Bend float arm to adjust.

Float Drop—Bend float tang as required to obtain a distance of 1 29/32" from the gasket surface to bottom of the float, with air-horn upright and float hanging free. Use scale or scribed mark on float and pump gauge.

Automatic Choke Setting: Centered at index.

►*OTHER DATA: See "Rochester 2GC Carburetor" in Carburetion Section.*

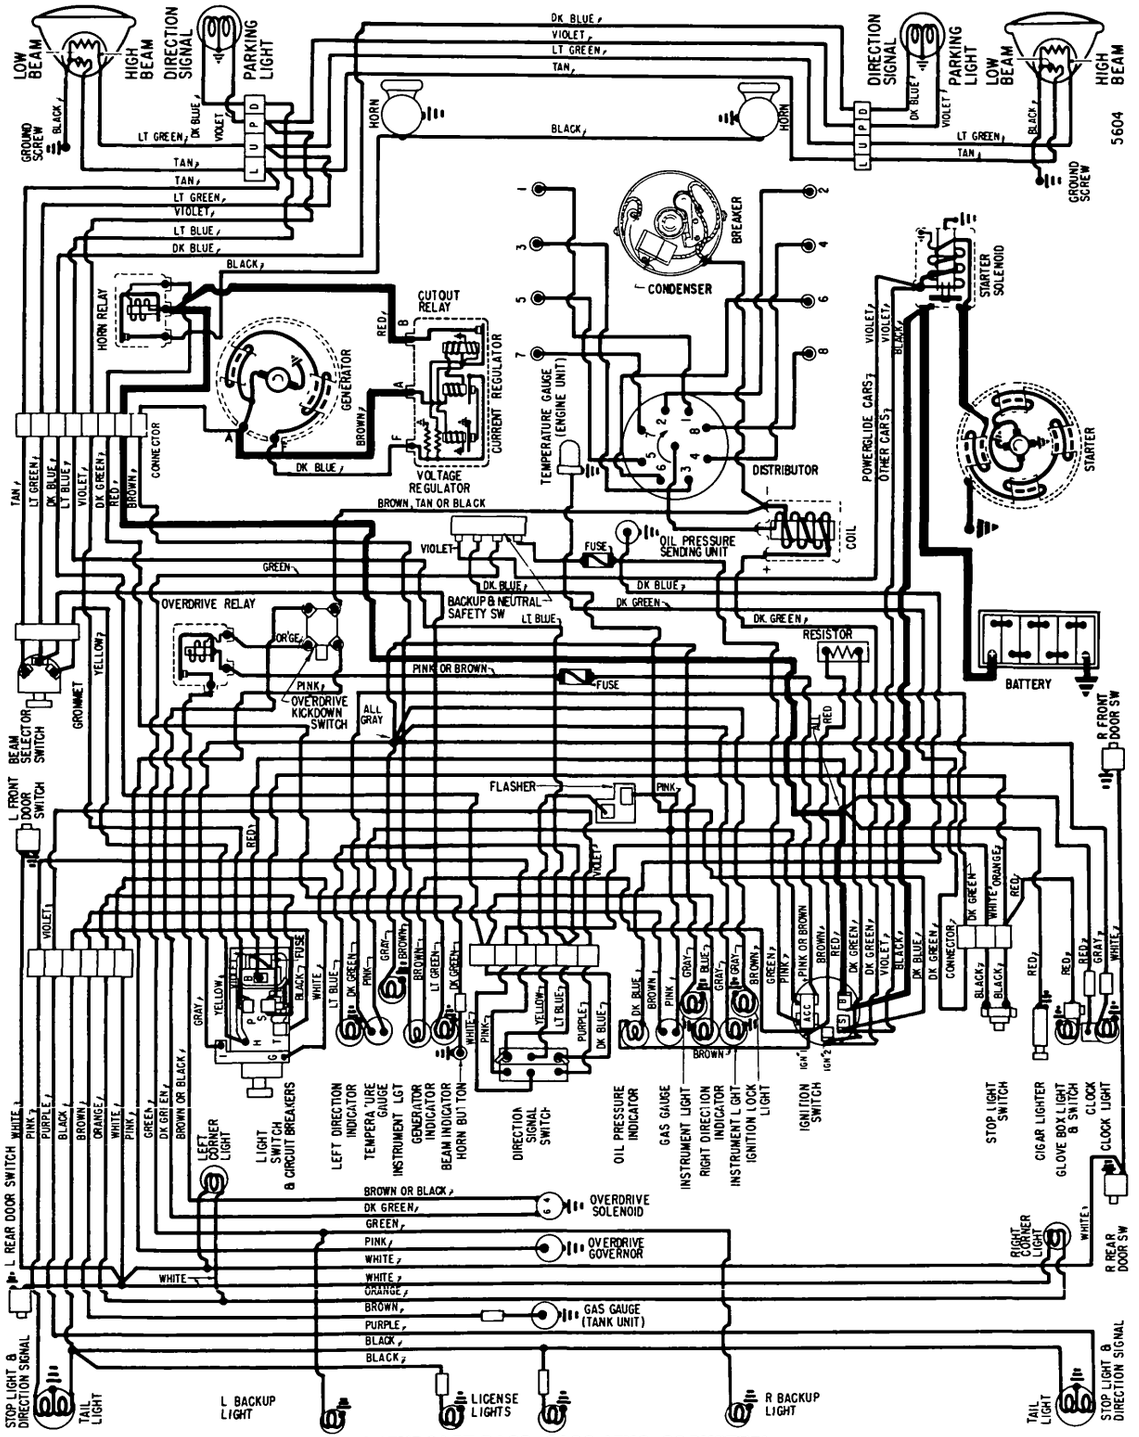
Fuel Pump Pressure: 4-5¼ lbs.

ROCHESTER 4GC 4-BARREL
No. 7008737

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting—Adjust idle mixture screws for highest steady vacuum.

Idle Speed—450-500 RPM (Std. & O.D.), 400-425 RPM (Powerglide - with Selector Lever in "D" range).



►*OTHER DATA: See "Rochester 4GC" Carburetor in Carburetion Section.*

Fuel Pump Pressure: 4-5¼ lbs.

CARTER WCFB 4-BARREL
No. 2366S, SA (Std. V8 Power Pkg. & Corvette with Single Carb.)

►*CHOKE SETTING PRODUCTION CHANGE & STALLING CORRECTION: Adjust automatic choke to 1 point rich, superseding previous setting of "center d" setting.*

CONTINUED ON NEXT PAGE

CHEVROLET PASS. CARS (EXC. CORVETTE)

CONTINUED FROM PRECEDING PAGE

►*MANIFOLD FUEL DISTRIBUTION· Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*
Idle Setting–¼-1¼ turns open Adjust both screws alike Turn screws out for richer mixture
Idl Sp d–(Exc. C rv tte) 450-500 RPM (S.M. & O.D.) 400-450 RPM (Powerglide – With Selector Lever in "D" range).
Idl Sp d–(C rv tt) 600 RPM. *NOTE* - On Powerglide Cars with Selector Lever in "D" Range and brake set.

BATTERY

D lc 2SMR53W (Std. V8), 25M53W (Corvette). *12 Volt,* 9 plate, 53 ampere hour capacity (20 hr. rate).
Batt ry Gr und – Negative.
Engin Gr und – Engine to cowl at rear head bolt.

STARTER

D lc -R my. *12 Volt.* Application as follows

Car M d l	Starter No.
V8, Std. Trans.	1107645
V8, Powerglide	1107649
Corvette	1107627

Armatur (All) – Delco-Remy No. 1926626.
Driv – Overrunning clutch (solenoid pinion shift).
R tati n – Counter-clockwise at commutator end.
Brush Spring Tensi n – 35 ozs. minimum.

P rf rmanc Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75 max.
10.5 ft. lbs. min.	Lock	5.8	435 max.

Starting Switch: Delco-Remy Solenoid Switch 1119767 (Corvette), 1119789 (Others) mounted on starter and controlled by Ignition & Starter Switch 1116512. Turn key full RIGHT against spring tension to start. *See "Delco-Remy Starter Solenoid (Without Relay)" in Electrical Section.*
Neutral Safety & Back-up Light Switch: Delco-Remy No.1998112 (Corvette), 1998106 (Others).
Adjustment'– *See "Chevrolet Powerglide" in Transmission Section.*

GENERATOR

Delco-Remy. *12 Volt.* Application as follows

Application	Generator	Armature
V8 Std.	1100321	1928952
V8 Pwr. Strg.	1102041	1929640
V8 Air Cond.	1102042	1923535
V8 Spec. (Cab)	1105947	
V8 Spec. (Cab & Pol.)	1106981	1929360
Corvette	1102043	1929640

Performance Data

Generator	Amperes ①	Volts	RPM
1100321	25	14.0	2780
1102041, 42, 43	30	14.0	2150
1105947	32	14.0	1850
1106981	40	13.0	1500

① – Not maximum output. See Regulator data.

Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 28 ozs.
Field Current – (1100321) 1.5-1.62 amps., (1102041, 42, 43) 1.48-1.62 amps., (1105947) 1.54-1.67 amps., (1106981) 1.37-1.50 amps., all at 12.0 volts.
Belt Adjustment: 13/16" belt deflection midway between fan and generator pulleys with light pressure applied.

REGULATOR

Delco-Remy. *12 Volt.* Application as follows:

Regulator No.	Generator
1119000	1100321
1119001	1102041, 42, 43, 1105947
1119004	1106981

NOTE – Regulators are "1119000 Series Regulators". Specifications below are for "Normal" Settings.

Cutout Relay

Cuts In – 11.8-13.5 volts Hot (1119000, 1), 11.5-13.0 volts Hot (1119004).
Contact Gap – .020".
Air Gap – .020" (with contacts just closed).

Voltage Regulator

Setting'– 1119000, 1) 13.8-14.8 volts Hot, (1119004) 13.6-14.3 volts Hot.
Air Gap – .075" (1119000, 1), .063" (1119004) with armature pressed down to point where contacts just touch.
Ch cking & Adjusting – *See "D lco-R my 1119000 Series R gulator" in El ctrical Section.*

Curr nt R gulat r

Setting – (1119000) 23-27 amperes Hot, (1119001) 27-33 amperes Hot, (1119004) 37-42 amperes Hot.
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting – *See "Delco-Remy 1119000 Series Regulator" in Electrical Section.*

Autronic Eye: *See Electrical Section.*
Direction Signals: *See Electrical Section*
Lighting Switch Removal: Disconnect all wires from switch (make sure that all wires are tagged for identification). Depress switch shaft retainer on top side of switch assembly (rear of instrument panel) and pull shaft and knob out. Remove switch retaining nut and switch assembly.
Stop Light Switch Location: Mechanical type mounted under instrument panel adjacent to brake pedal lever.
Adjustment–Adjust position of switch so that stop light goes out when brake pedal depressed 5/8" from fully released position.

FUSES: All accessory fuses except as indicated below are contained on the accessory fuse and junction block located on upper inside of dash panel to left of steering column.
Overdrive–14 amps Located in Lucite cartridge in overdrive relay feed wire on engine side of dash panel to left of steering column
Radio–In feed wire adjacent to radio.
Back-up Light –On accessory fuse block.
►*LIGHTING SWITCH FUSE NOTE:* A 3 ampere fuse has been added to light switch to protect instrument panel rheostat from burning out.
LIGHTING CIRCUIT BREAKERS: Two 13-amp. circuit breakers located on main light switch, protect all lighting circuits.
HORNS: Delco-Remy 1999759 (Low Note), **1999760** (High Note). *12 Volt.*
Horn Relay: Delco-Remy No. 1116913, or 1116781.
Contacts Close – 5.0-9.5 volts.
Contact Gap – .027".

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Us extreme care when disconnecting any part of air conditioning equipment or lines for access to engin . See "Air Conditioning Service Cautions" in Misc. S ct.*
►*PASSENGER CAR ENGINE NOTE: Hydraulic valv lifters are used on the Standard V8 Engine and solid Type lifters are used on the Corvette engine.*
ENGINE SPECIFICATIONS: V8, Valve-in-Head.

Bore	Stroke	Displacement	Rated HP
3¾"	3"	265 cu. ins.	45

Engine	Compr. Ratio	Developed HP
V8 Std.	8.0-1	162 at 4400 RPM
V8 Powerglide	8.0-1	170 at 4400 RPM
V8 Power Package	9.25-1	205 at 4600 RPM
V8 Corvette	9.25-1	225 at 5200 RPM

Compr ssion & Vacuum R ading – *See TUNE-UP.*

ENGINE REMOVAL: *Se "Engine" in Ch vrolet Sp cial Data*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OIL PAN REMOVAL: Disconnect steering idler arm bracket from frame side rail and drop for clearance.

ENGINE MOUNTINGS: *See "Engine Mountings" in Chevrolet Special Data.*

CYLINDER HEAD & MANIFOLDS: *See Chevrolet Special Data.*

TIGHTENING TORQUES: *See Chevrolet Special Data.*

PISTONS

Cast aluminum, slipper skirt, with piston pin offset 5/64".

Weight—18.77 ozs.

Removal—Pistons and rods removed from above.

Replacement Pistons: Furnished Std. Size & .020", .030", .040" oversize.

►*STANDARD SIZE PISTON NOTE:* Standard pistons furnished in four sizes with size code stamped on piston. The sizes and codes are: **S4** (3.7500-3.7505"), **S5** (3.7505-3.7510"), **S6** (3.7510-3.7515"), **S7** (3.7515-3.7520").

Fitting New Pistons: Use .0015" x ½" feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder to a point where center of piston pin hole is flush with top surface of block (feeler 90° from pin hole). Pull required to withdraw feeler must be 7-18 lbs.

Installing Pistons: Install pistons with cast depression in head and "F" mark cast in side of piston toward front of block. *See Rod Installation.*

PISTON PINS

Piston pin is pressed into connecting rod and retainers are not used.

Diameters—.9270-.9273". **Length**—3.1200".

Pin Fit in Piston—.00015-.00025". Pins should be capable of supporting own weight in either pin boss at 60°F.

Pin Fit in Connecting Rod—*NOTE—Special tools required for removal & installation. See "Piston Pins" in Chevrolet Special Data.*

Replacement Pins: Furnished only in assembly with piston. Oversizes not available.

PISTON RINGS

Upper compression ring is chrome plated and oil control ring is 3-piece type (2 chrome plated rails and spacer).

Ring	Width	End Gap	Side Clearance
Compr. No. 1	.077-.078"	.008-.016"	.001-.003"
Compr. No. 2	.077-.078"	.009-.018"	.001-.003"
Oil	.181-.188"	.015-.055" ①	.000-.008"

① — On rails.

►*RING INSTALLATION CAUTION:* Install compression rings with side marked "TOP" upward.

Replacement Rings: Furnished Std. & .020", .030", .040" Oversize.

CONNECTING RODS

Length (Center to Center) — 5.7000". **Weight** — 19.02 ozs.

Crankpin Journal Diameter—1.999-2.000".

Lower Bearing—Replaceable precision type.

Clearance—.001-.003" (new), .001-.004" (used).

Side play—.008-.014" (both rods).

Replacement Bearings: Furnished Standard size, .001", .002", .010", .020" Undersize.

Installing Rods: Install rod in piston so that flange or heavy side of rod at bearing end will be toward front of piston (cast depression in head of piston and "F" mark on piston strut) on Nos. 1, 3, 5, and 7 pistons, and rod flange to rear of piston on Nos. 2, 4, 6, and 8 pistons. Install rod and piston assembly in cylinder with cast depression in piston head and "F" mark on strut toward front of cylinder block.

CRANKSHAFT

Journal Diameter—2.2978-2.2988".

►*NOTE: Journal runout at intermediate bearing is .002" maximum.*

Clearance—.001-.003" (new bearings), .001-.004" (used bearings).

End Thrust—Taken at No. 5 (rear) main bearing.

Endplay—.002-.006". Check at front end of rear main bearing.

Replacement Bearings: Furnished Standard size, .001", .002", .010", .020" Undersize.

Bearing Installation: Not necessary to remove crankshaft or engine from car. *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chevrolet Special Data.*

Vibration Dampener: *See "Vibration Dampener" in Chevrolet Special Data.*

CAMSHAFT

►*CAUTION: Camshafts differ on engines as follows:*

Model	Chevrolet No.
Corvette (All)	3711354
Others (Synchro-mesh)	① 3704212
Others (Powerglide)	② 3728779

① — Cast 3703906. ② — Cast 3728284.

Journal Diameters—1.8682-1.8692" (all journals).

Clearance—.0015-.0035".

Bearings—Steel backed babbitt lined bushing.

Replacement Bearings: "Precision" type (do not require reaming). Use Tool Set J-6098 to remove and install bearings.

Camshaft Setting: Both sprockets marked '0'. Install chain with sprocket marks adjacent and in line with straight edge across shaft centers.

►*CAUTION: When installing sprocket on camshaft, line up dowel holes in sprocket and shaft. DO NOT DRIVE SPROCKET ON SHAFT, use three mounting bolts and DRAW sprocket into place.*

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Chevrolet Special Data.*

Timing Chain: Link Belt. **Width** — .875". **Pitch** — .500. **Length** — 46 links.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chevrolet Special Data.*

VALVES

Tappet Clearance: (Corvette) — .008" Intake, .018" Exhaust, with engine hot and idling. (Others) — None in service - hydraulic.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.720"	.3415-.3422"	4.902-4.922"
Exhaust	1½"	.3410-.3417"	4.913-4.933"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45° ③	①	.001-.0027"
Exhaust	45° ③	②	.0015-.0032"

① — .3336" (Std. V8 S.M.), .3732" (Std. V8 Powerglide) .40432" (Corvette).

② — .3336" (Std. V8 S.M.), .3732" (Std. V8 Powerglide), .41355" (Corvette).

③ — Seat angle in head is 46°.

►*VALVE GRINDING CAUTION:* Replacement valves furnished with face angle of 45°. When seats are ground to new recommendation of 45°, valves must be ground to recommended angle of 44° (Intake & Exhaust), whether valves being re-used or new valves installed.

Valve Seat Width—3/64"-1/16" (Intake), 1/16"-3/32" (Exhaust).

Valve Stem Oil Seal Installation: *See "Valve System" in Chevrolet Special Data.*

►*VALVE SEAL PRODUCTION CHANGE:* New "shedders" installed over upper end of valve springs used on later cars and should be installed on all engines. These shedders replace previous type shield within valve springs. *See "Valve System" in Chevrolet Special Data.*

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance is excessive. Valves are furnished with .003", .015", .030" oversize stems. Use Reamer Set J-5830.

Valve Springs: Install springs with closed coil end of spring toward cylinder head. On intake valve springs a baffle is used inside spring.

Spring Specifications (Std. V8)

	Pressure	Length
Valve Closed	76-84 lbs.	1.696"
Valve Open	155-165 lbs.	1.366"

Spring Specifications (Corvette)

	Pressure	Length
Valve Closed	65-72 lbs.	1.696"
Valve Open	151-161 lbs.	1.306"

►*VALVE SPRING INSTALLED HEIGHT CAUTION:* Check installed height of valve spring after grinding valves by measuring the distance from spring seat in cylinder head to top of valve spring. If this dimension exceeds 1 45/64", install valve spring seat shim furnished 1/32" & 1/16" thick. Installed height of spring must be 1 11/16 - 1 45/64".

Valve Lifters (Std. V8): Hydraulic type. *See "Valve System" in Chevrolet Special Data.*

Valve Lifters (Corvette): Plain barrel type. Remove in same manner as for hydraulic valve lifters. *See "Valve System" in Chevrolet Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Rocker Arm Stud Replacement — *See "Valve System" in Chevrolet Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Conventional Std. V8 Valve Timing

Intake Valves — Open 18° BTDC, Close 54° ALDC.

Exhaust Valves — Open 52° BLDC, Close 20° ATDC.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Powerglide Std. V8 Valve Timing

Intake Valves – Open 26°30' BTDC, Close 63°30' ALDC.
Exhaust Valves – Open 66°30' BLDC, Close 23°30' ATDC

Corvette Valve Timing

Intake Valves – Open 21°30' BTDC, Close 62°30' ALDC.
Exhaust Valves – Open 62°30' BLDC, Close 23°30' ATDC.

OILING SYSTEM

Crankcase Capacity: 4 qts. (refill), 5 qts. (dry).
Normal Oil Pressure: 30 lbs. at 1170-1200 RPM.
Pressure Regulator Valve – In oil pump. Not adjustable.
Oil Pressure Indicator (Std. V8) – Light on right side of instrument cluster, controlled by pressure switch, Delco-Remy No. 1998149, located on left side of engine. Switch operates at 4-6 lbs.
Oil Pressure Indicator (Corvette) – AC No. 1508063. Not electric.
Oil Filter: Full flow type. Replace element at 6000 mile intervals. Use new seal, tighten center bolt to 20-25 ft. lbs.
Replacement Filter Element – AC No. PF-131.
Oil Pump: Gear type Located in crankcase, driven by distributor gear
Oil Pump Overhaul–*See "Oiling System" in Chevrolet Special Data.*
Crankcase Ventilation–Air intake through valve rocker arm cover, outlet through pipe on right side of engine

COOLING

►*RADIATOR REMOVAL CAUTION (POWERGLIDE CARS) Transmission oil cooler is part of radiator lower tank, and must be TIGHTLY SEALED after removal or during repairs to avoid entrance of foreign material.*

Water Capacity: 16 qts. (17 qts. with heater).
Pressure Valve: AC Type RC-1, Chevrolet No. 850795. 7 lb. type radiator filler cap.
Thermostat: Harrison. In water outlet on intake manifold.
(Std.) No. 3133595 (stamped 151), 151°.
(Optl.) No. 3123994 (stamped 160), 160°, or No. 3133597 (stamped 170), 170°.
Temperature Gauge (Std. V8): AC. Electric type.
Dash Unit – AC No. 1513134.
Engine Unit – AC No. 1513130.
See "Temperature Gauges" in Miscellaneous Section.
Temperature Gauge (Corvette): AC No. 1513198. Not electric.
Water Pump: Packless type with ball bearing shaft.
See "Chevrolet" in Water Pump Section.
Radiator Removal & Installation: *See "Cooling System" in Chevrolet Special Data.*

CLUTCH

Own (Diaphragm Spring Type) or Borg & Beck. Single plate.
See "Chevrolet (Own)" or "Borg & Beck" Clutches in Clutch Section.

Borg & Beck	Model	Assy. No.	Disc No.
V8 Std. (Pow. Pkg.)	10A9	361404	382527
V8 O.D. (Pow. Pkg.)	10A9	361404	382526
Corvette	10.5A9	361402	382528

Own (Diaphragm Spring Typ)	Cover No.	Disc No.
Synchro-mesh (10")	3836723	3836708
H.D. & O.D. (11")	3836719	3836906

►*STD. V8 OVERDRIVE DRIVEN PLATE REPLACEMENT NOTE (BORG & BECK CLUTCH):* New Clutch Driven Plate Assy., Part No. 3741089, has been released to replace Clutch Driven Plate Assembly, Part No. 3729780, to eliminate drive line rattle. New assembly has six inner damper springs instead of the four on old assembly.

Pedal Adjustment: Pedal Free Travel ¾-1". Loosen check nut at connecting link at clutch fork. Turn adjusting nut to remove all lash at fork, **then back off two turns.** Tighten check nut.

Removal (Borg & Beck): Remove transmission (see Transmission Removal below). Remove clutch housing pan. Pull out clutch release bearing and sleeve. Mark flywheel, cover, and one pressure plate lug with punch to insure proper reassembly. Loosen holding screws a turn or two at a time to avoid bending rim of cover, until cover is free. Remove clutch assembly and clutch disc assembly from clutch housing. When removing driven disc be sure to mark flywheel side.

Removal (Diaphragm Spring Type): Remove transmission (see Transmission Removal below). Remove clutch throwout bearing from fork, then clutch fork tension spring from fork. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824 to support clutch assembly. Loosen clutch attaching bolts one turn at a time until diaphragm spring is released. Remove tool, then clutch assembly from vehicle. *NOTE* - When installing clutch, align "X" marks on cover and flywheel.

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh
See "Chevrolet 3-Speed" in Transmission Section.
Transmission Control: *See "Transmission Controls" in in Transmission Section*
Removal: Drain transmission and disconnect speedometer cable and shift rods Disconnect propeller shaft at rear universal and slide shaft toward rear to disengage from transmission Remove two top transmission to clutch housing screws and install Guide Pins J-1126 Remove the two lower screws and slide transmission back until clutch splines disengage Remove transmission from below car

OVERDRIVE

Warner Model AS1-R10H. Solenoid operated type with with governor control and throttle operated kickdown Lockout Switch not used
See "Chevrolet Overdrive" in Transmission Section.
Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*
Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring

POWERGLIDE TRANSMISSION

Powerglide Transmission–Torque converter and hydraulically operated planetary gear unit with manual controls

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Chevrolet Powerglide" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING See "Chevrolet Powerglide" in Transmission Section.*

Lubrication–Check fluid level in transmission every 1000 miles Oil should be added only when level gets down to "Add One Quart" mark on dipstick Change oil, remove and clean oil suction screen every 25,000 miles Use only AUTOMATIC TRANSMISSION FLUID "Type A" bearing an "AQ-ATF" marking on container
Capacity–5 qts (refill), 11 qts (after overhaul)

►*POWERGLIDE DRAINING CAUTION There is no drain plug on converter Drain transmission case only, add 4½ qts. of fluid initially, recheck after idling engine.*

►*CHECKING FLUID LEVEL & FILLING TRANSMISSION NOTE* A filler plug has been added to transmission side cover for use in checking fluid level and adding fluid to transmission This change made necessary because filler tube and dipstick is not accessible from under hood on air conditioned cars

Checking Fluid Level–Engine must be idling with parking brake set, transmission warm, and the selector lever in "N" position when taking dipstick readings (on cars without air conditioning), or checking level at filler plug on side of transmission (cars with air conditioning) Maintain fluid level to "F" mark on dipstick (cars without air conditioning), or to bottom of filler plug hole on side of transmission (cars with air conditioning)

►*OTHER DATA See "Chevrolet Powerglide" in Transmission Section*

UNIVERSALS

Own. Yoke & Spider (Trunnion) type

►*CAUTION* Rear bearing companion flange nut controls rear axle pinion bearing preload Preload must be adjusted whenever companion flange nut loosened *See "Chevrolet Pass Car (Hotchkiss Drive)" in Rear Axle Section.*

REAR AXLE

Own. Semi-floating, hypoid gear type, with Hotchkiss Drive Pinion bearing adjustment is different than on previous models
See "Chevrolet Pass. Car (Hotchkiss Drive)" in Rear Axle Section.

►*PINION BEARING PRELOAD CAUTION* Rear universal joint companion flange controls rear axle pinion bearing preload Bearing preload must be adjusted whenever companion flange nut is loosened

Axle Ratios	Standard	Optional
Std. V8 (Synchro-mesh)	3.70-1	
Std. V8 (Overdrive)	4.11-1	
Std. V8 (Powerglide)	4.55-1	
Corvette (Synchro-mesh)	3.55-1	3.27-1
Corvette (Powerglide)	3.55-1	3.27-1

Backlash – .006-.009" (.008" preferred).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Raise car and support with jack stands under frame side rails Remove rear wheels and remove two trunnion bearing "U" bolts from rear universal yoke and separate the joint (tape bearings to trunnion). Disconnect hand brake cable and equalizer and remove cable from clamps at frame Disconnect hydraulic brake lines at rear axle housing Disconnect shocks. Support axle assembly on hydraulic jack and remove spring "U" bolts, nuts and anchor plate, and lower axle to floor

Axl Shaft Removal: Raise car and place jack stands under axle housing. Remove tire, wheel and brake drum assembly Remove four nuts and lockwashers from bearing retainer bolts (on inside of axle flange) Attach Axle Puller J-5748, with slide hammer, to flange and remove axle shaft and bearing assembly. Be careful not to disturb backing plate *NOTE*–If bearing retainer and parking brake strut interfere, raise strut slightly with screwdriver to obtain clearance

SHOCK ABSORBERS

Delco. Direct acting non-adjustable Serviced by replacement

FRONT SUSPENSION

Independent with direct acting shock absorbers within front coil springs. Different types used as follows:
Corvette – "Threaded Bushing" type pivot points on upper and lower control arms.
Others – "Spherical Joint" type pivot points between control arms and steering knuckle support.
See "Chevrolet" in Suspension & Wheel Alignment Sect.
Kingpin Inclination – 3½ - 4½° crosswise.
Caster – (Corvette) 0° to Pos. 1°, (Others) Pos. ½-1½°.
Camber – 0° to Pos. 1°.
Toe-In – (Corvette) 0-1/8". (Others) 1/16"-1/8" per wheel or 1/8-1/4" total.
Toe-Out on Turns – With outside wheel at 20°, inside wheel should be 23° (Corvette), 22-26° (Others).

STEERING

Manual: Different type steering systems used as follows: **Corvette - Saginaw Worm & Roller.** Push-pull adjustment.
Others – Saginaw Ball & Baring Worm & Nut. Recirculating ball type.
See Saginaw "Worm & Roller" or "Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Saginaw Linkage type. *See "Saginaw (Linkage Type)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Chevrolet-Bendix. Duo-servo, single anchor hydraulic, without anchor pin adjustment. Hand lever applies rear wheel service brakes
See "Chevrolet-Bendix Hydraulic" in Brake Section.

►*REPLACEMENT BRAKE SHOE GRINDING CAUTION* To compensate for lack of brake anchor adjustment, brake shoes are ground to a 057- 087" smaller diameter than the drum diameter Grinding to the true diameter on a bench grinder will cause heel and toe contact, resulting in faulty brake action. *NOTE–If spindle mounted type grinder is used, the shoes should be ground to the true drum diameter*

►*SLOW BRAKE PEDAL RETURN CORRECTION: See "Brake Notes" in Chevrolet Special Data.*

Drums–Diameter 11"
Wheel Cylinder Diameter–Front 1 1/8", Rear 1".

Lining	Width	Thickness
Front Whl.	2"	.187- 194"
Rear Whl	1¾"	187-.194"

Length Per Shoe–9.3125" (Primary), 11.6875" (Secondary).
Braking Power–55 9% (Front Wheels), 44.1% (Rear Wheels).
Clearance–Single adjusting screw located at bottom of backing plate. Back off adjusting screw 7 notches from slight drag position. Brakes must be free of any drag after adjustment.

Standard Master Cylind r: Located on engine side of firewall in line with brake pedal
Checking Fluid–Reservoir is integral with master cylin'er. Maintain level in cylinder to lower edge of filler hole.
Removal–Disconnect hydraulic line from end of cylinder and remove bolted brass fitting. Remove four retaining nuts and lock washers holding master cylinder to firewall and remove cylinder.

Installation–Reverse removal procedure making sure that push rod clevis is straddling the brake pedal. Refill master cylinder and bleed all brake lines. Adjust push rod-to-main cylinder clearance as follows. Make sure brake pedal returns to fully released position with no binding, and that pedal retracting spring has not lost its tension, then adjust brake pedal clevis to give a barely perceptible end play between main cylinder piston and brake pushrod (1/16-3/16" pedal movement should be felt).

Power Brakes· Bendix Vacuum Type Power Unit replaces conventional master cylinder
See "Bendix Power Unit" in Brake Section.

MISC. MECHANICAL

Windshield Wipers: Cable operated type (Std). Electric type (Optional)
See "Windshield Wipers" in Miscellaneous Section

Power Window Regulators: Electric type with reversible motor operating each door window assembly.
See "Power Window Regulators" in Miscellaneous Section.

Power Top Controls: Hydro-Lectric. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjuster: Reversible electric motor controls horizontal front seat movement. *See "Power Seat Adjusters" in Miscellaneous Section.*

Air Conditioning: See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.

MODEL IDENTIFICATION

Series	Model Designation Serial Prefix	Wheelbase	Type
3100	3A	114"	Half Ton
3200	3B	123¼"	Half Ton
3400	3C	104	①¾ Ton
3500	3D	125"	①¾ Ton
3600	3E	123½"	¾ Ton
3700	3F	137"	①¾ Ton

① — "A" stamped following suffix when this engine is used in 3600 Series, "B" when used in 3800 Series, "C" when used in 4000 Series.
② — With Hydra-Matic Transmission.
③ — Updraft Carburetor.
④ — Updraft Carburetor & Hydra-Matic Transmission.
⑤ — Heavy Duty Clutch. "A" stamped following suffix when this engine used in 3600 Series, "B" if used in 3800 Series, "C" if used in 3100 & 3200 Series.
⑥ — "A" stamped following suffix if used in 4000 Series.
⑦ — Optional, Heavy Duty.
⑧ — Optional, Heavy Duty. Allison Transmission.

TUNE-UP

COMPRESSION PRESSURE: (6 Cyl.) 130 lbs.,**(V8)** 140 lbs. at cranking speed. Variation of 20 lbs. between cylinders indicates need for cylinder head reconditioning.

VACUUM READING: 6 Cyl. Engine—17-21" at idling speed
V8 Engine—Adjust to highest steady vacuum reading

VALVE TAPPET CLEARANCE: *NOTE—Conventional type lifters used on 6 Cyl. engines. Hydraulic valve lifters used on V8 Engines.*
6 Cyl. Engines—(3000 Series)—Intake 006" Exhaust 016" **(Other Series)**—Intake .006" Exhaust 020"
V8 Engines (With Hydraulic Lifters)—No adjustment required unless cylinder head removed or valve lifters replaced.

MANIFOLD HEAT CONTROL: 6 Cyl. — Thermostatic type. Check for free operation when tuning engine. Should require 1/2 turn from unhooked to hooked position. *Distorted springs should be replaced.*
V8 — Heat control valve with counterweight and thermostatic coil spring located between right manifold and exhaust pipe. Hook coil spring under stop stud. Install counterweight with square projection up and upper end of spring stop resting on top of stop stud.

IGNITION

FIRING ORDER: 6 Cyl. — 1-5-3-6-2-4
V8 — 1-8-4-3-6-5-7-2.
Cylinders (V8) — RIGHT BANK 2-4-6-8. LEFT 1-3-5-7.

SPARK PLUG GAP: .035"
Spark Plug — AC No. 44 or 45-Com. (½, ¾, 1, 1½ Ton), AC No. C43 (2 Ton V8). 14 mm. Torque to 20-25 ft.lbs.
►*SPARK PLUG INSTALLATION CAUTION:* Spark plugs flash-over on 1956 engines may be caused if 1955 plugs are used. Insulators on 1956 plugs have four annular ribs that help prevent flash-over, and larger inside diameter on spark plug boot. If 1955 plugs installed, flash-over or misfire will be prevalent due to loose fit of boot.

COIL: Delco-Remy 1115087. *12 Volt.*
Ignition Current — 1.8 amps. idling, 4 amps. stopped.
Resistor — Delco-Remy 1931614. 1.40-1.62 ohms. On firewall.

►*COIL RESISTOR NOTE (6 Cyl Trucks Exc. Forward Control).* Resistor connected to ignition switch by two leads. Second lead is connected through starter switch and provides a direct connection to coil when starter switch operated

►*COIL RESISTOR NOTE (6 Cyl Forward Control & All V8 Models).* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position)

DISTRIBUTOR: Delco-Remy. *12 Volt.* Application as follows:

Engine	Distributor No.	Condenser	Contact Set
235" Engine	1112403	1928111	1924571
261" Engine	1112407	1928111	1924571
V8 Engine	1110847	1924499	1924499

Condenser Capacity — .18-.23 mfd. (all models).
Breaker Gap—.019" (new points), 016" (used points)
Cam Angle— 028-035" (Dist Nos 1112403 & 1112407) 026-033" (Dist No 1110847) All at 016" gap

►*BREAKER GAP CAUTION Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set points.*
Breaker Arm Spring Tension—19-23 ozs
Rotation—Clockwise viewed from above

Automatic Advance—1110847

Degrees	Distr.	RPM	Degrees	Eng.	RPM

Start	0	4-6
7.5	15	7.5-10

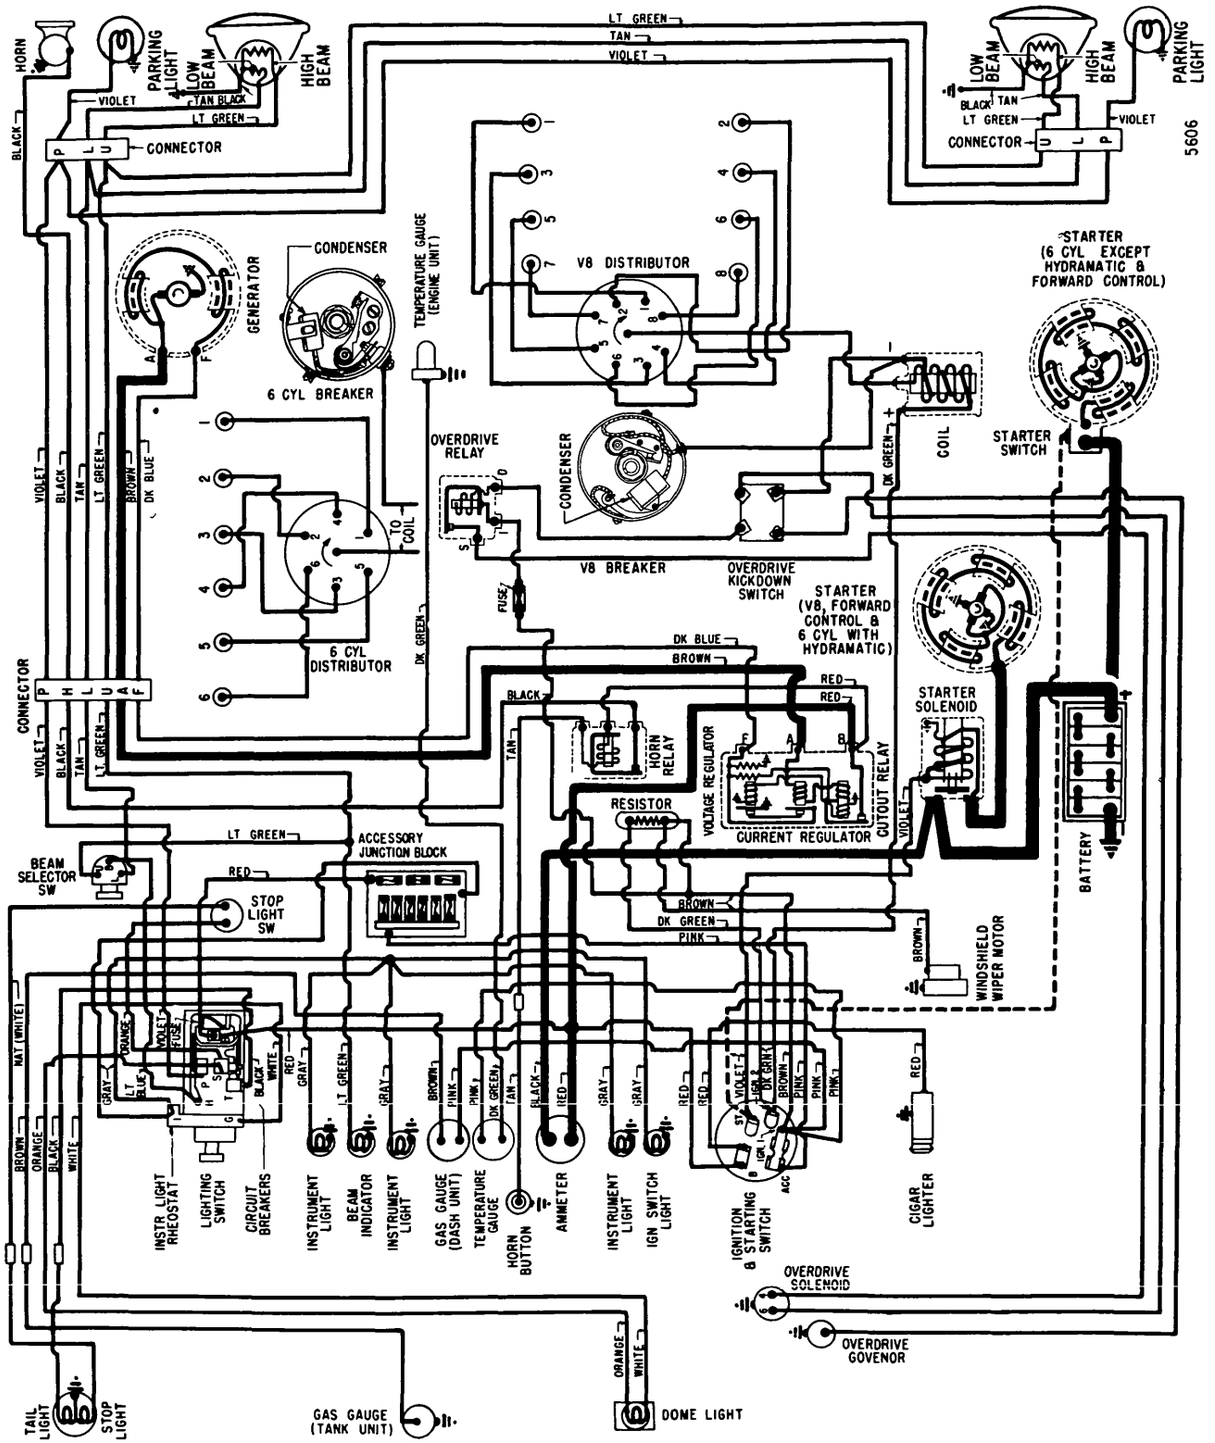
IGNITION TIMING

Setting – Set timing to setting indicated below. *Manufacturer recommends setting timing at 1000 RPM and with distributor vacuum disconnected.*

Model	Setting (At Idle)	Setting (At 1000 RPM, Vac. Discon.)
6 Cyl. (235" & 261")	TDC	5° BTDC
V8 Engine	4° BTDC	8° BTDC

Timing Mark – 6 Cyl. - Steel ball insert in flywheel lined up with pointer in inspection hole in right front face of housing with Octane Selector set on "O". Adjust Octane Selector as follows: Set for slight ping when accelerating with wide open throttle.

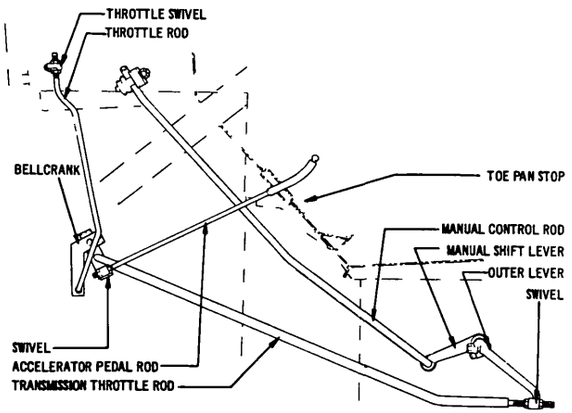
V8 – Mark on vibration damper and an indicator on left side of valve chain cover. Indicator is marked with five lines on each side of "O" mark. Each line represents 2°.



CARBURETOR

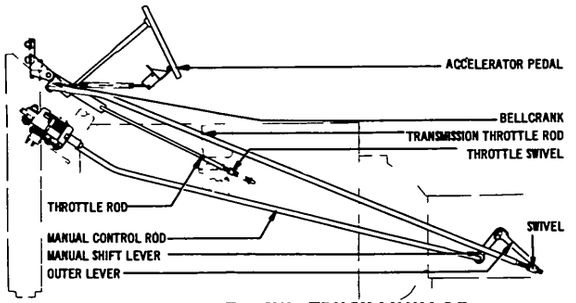
►*CARBURETOR APPLICATION: Rochester "B" & "BC" Carburetors are standard on all 6 Cyl. Models (Except Forward Control). Rochester "2G" Carburetor is standard on all V8 Models. Carter Updraft Carburetor is standard on Forward Control Models.*

THROTTLE LINKAGE ADJUSTMENT: *NOTE–On Automatic Transmission Cars, adjust transmission throttle control linkage BEFORE adjusting carburetor throttle linkage.*



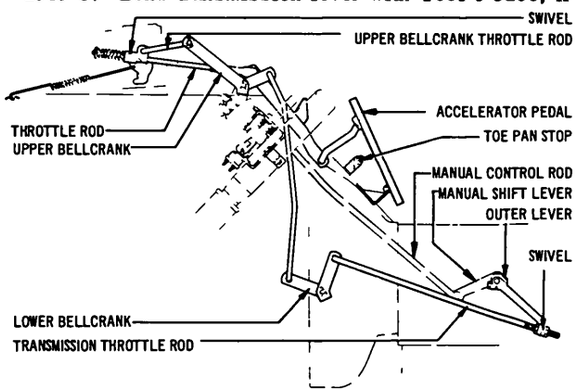
Carburetor Throttle Linkage: With accelerator depressed fully and throttle valve wide open, adjust threaded swivel at throttle lever for free entry into throttle lever. Then lengthen control rod by turning swivel **tw full turns.** Connect rod to throttle lever.

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

Thr ttl Linkage Adjustm nt: (6 Cyl. Hydra-Matic Drive Trucks, exc pt F rward Control) – With engine at normal operating temperature and idle speed set at 425 RPM, remove lower end of carburetor throttle lever-to-bell crank rod from lever on bell crank. Install Lever Positioning Gauge J-5609 in hole in lever and gauge hole in pan rail of engine block (hole is located toward rear of bell crank position), and leave gauge in this position. Remove swivel from bell crank-to-transmission outer lever at transmission and move transmission outer lever back against stop. Check distance from hole in outer lever to back of transmission with Gauge J-2545-C. Bend lever as necessary for free entry of gauge in lever hole using Tool J-5260 *(CAUTION–Do not apply force to stops at either end of lever travel).* Hold outer lever back against stop and adjust swivel position on bell crank-to-transmission rod so it just enters hole in transmission lever. Remove Positioning Gauge from bell crank and reinstall throttle rod. Recheck engine idle speed with idle screw against stop on carburetor, and adjust carburetor throttle-to-bell crank rod so swivel at upper end freely enters hole in throttle lever. At this point, **sh rt n** bell crank-to-transmission outer lever by turning swivel lock nuts **two full turns.** Remove bell crank-to-carburetor throttle rod upper swivel from lever and pull rod upward until linkage is stopped by forward stop in transmission. Hold in this position and adjust accelerator-to-bell crank rod swivel until accelerator pedal is against floor stop, then shorten rod **one full turn.** Replace upper end of throttle-to-bell crank rod in throttle lever.



CHEVROLET 6 CYL. TRUCK LINKAGE (EXCEPT FORWARD CONTROL)

Thr ttl Linkage Adjustment: (6 Cyl. Hydra-Matic Forward C ntrol) – With engine at normal operating temperature and idle speed set at 425 RPM, remove accelerator pedal-to-bellcrank rod and install Carburetor Control Lever Adjusting Gauge J-5629 with slotted end resting on inside shoulder of hex head brass fitting on intake manifold and pin end in rod hole in lever on bell crank. Leave gauge in this position. Remove swivel from bell crank-to-transmission outer lever rod at transmission and move lever back against stop. Check distance from hole in outer lever to back of transmission with Gauge J-2545-C. Bend lever as necessary for free entry of gauge in lever hole using tool J-5260 *(CAUTION-Do not apply force to stops at either end of lever travel).* Hold outer lever back against stop and adjust swivel position on bell crank-to-transmission rod so it just enters hole in transmission lever, then **shorten** bell crank-to-transmission outer lever rod **two full turns.** Recheck engine idle speed with idle screw against stop on carburetor. Adjust carburetor throttle-to-bell crank rod so swivel at lower end freely enters hole in throttle lever. Remove Positioning Gauge from bell crank lever Remove carburetor throttle-to-bell crank rod from throttle lever and pull bell crank-to-transmission outer lever rod up toward floorboard until linkage is stopped by forward stop in transmission. Hold rod in this position and install accelerator pedal-to-bell crank rod in bell crank lever, and adjust swivel so accelerator pedal is against toe board stop. Install carburetor throttle-to-bell crank rod, then **shorten** accelerator pedal-to-bell crank rod **one full turn.**

CHEVROLET 6 CYL. TRUCK LINKAGE (FORWARD CONTROL)

Throttle Linkage Adjustment: (V8 Hydra-Matic Drive Trucks) – Back out throttle valve adjusting screw so throttle valve is in the tightly closed position and swivel on end of throttle rod is against lug on upper bellcrank throttle rod. Remove swivel from transmission throttle lever and move lever back against its internal stop. Check distance from hole in lever to rear face of transmission case with Throttle Lever Checking Gauge J-2545-C. Bend transmission lever with Tool J-5260, if necessary, to allow entry of gauge into hole *(CAUTION-Do not apply force against stop at ither nd of lever travel).* Adjust length of transmission throttle rod so swivel just enters hole in transmission throttle lever. Adjust engine idle speed to 425 RPM with selector lever in "N" position. This adjustment will move transmission throttle lever off its internal stop. Depress accelerator pedal to obtain 5/8" distance between toe pan stop and bottom of pedal, then adjust length of throttle rod to give full open throttle. Depress pedal until transmission throttle lever is tight against forward stop on transmission and turn screw on toe pan stop up against accelerator pedal. Release pedal and turn screw upward **two full turns** and secure screw with jam nut (transmission throttle lever will be moved slightly off forward stop on transmission).

CHEVROLET V8 TRUCK LINKAGE

ROCHESTER "B" & "BC"

Downdraft types with manual choke (Rochester Model "B"), and automatic choke (Rochester Model "BC")

Models	Rochester Nos.
235" Engine ①	②7004468
235" Engine ③	④7009255
261" Engine	②7005140

①–Except Forward Control & Automatic Transmission models
②–With Manual Choke.
③–With Automatic Transmission (Except Forward Control models)
④–With Automatic Choke.

Idle Setting (Exc. 7009255) – 1-2½ turns open (turn screw out for richer mixture).
Idle Setting (7009255) – 2½ turns open (turn screw out for richer mixture).
Idle Speed – 400-450 RPM (Exc. Auto. Trans. models), 425 RPM (Auto. Trans. models with Selector Lever in "N" position).
Float Level – 1 9/32" from bottom of each float to cover gasket (do not remove gasket). Use Gauge M-250. With assembly inverted, place gauge with projection inserted in discharge nozzle. Carefully bend float lip vertically so that each float just touches top portion of gauge. Bend float arms to bring them into alignment and to center them in gauge. Tilt assembly 90° on each side and check to see that floats do not touch gauge.
Float Drop–Turn cover right side up so float drops down Distance from gasket on cover to bottom of each float should be 1¾" on all models Adjust by bending tang at rear of each float assembly
►*CAUTION· Both floats must be set alike and must not be twisted out of alignment*
Accelerating Pump–No seasonal adjustment
Choke Adjustment: Centered on index
Fast Idle (7009255)· With fast idle screw on next to highest step of fast idle cam, Gauge BT-99 (076") should just slide between lower edge of choke valve and carburetor bore To adjust, bend connector rod
Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *Se "Carburetor" above.*
►*OTHER DATA· See "Rochester B & BC" Carburetors in Carburetion Section.*
Fu l Pump Pressure: 3½-4½ lbs.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ROCHESTER "2G"

Dual downdraft type with manual choke.

Model	Rochester No.
Synchro-mesh Trans.	7008389
Overdrive Trans.	7008383

►*V8 TRUCK ENGINE CARBURETOR-TO-MANIFOLD GASKET PRODUCTION CHANGE (To Eliminate Hard Hot Starting):* New intake manifold-to-carburetor gasket, Part No. 3733281, with better insulation characteristics, is now being used in production and should be used on all 2-barrel carburetor V8 Truck installations when replacement required. Former gasket, Part No. 3704952, will continue to be used on passenger cars.

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrel feeds Cyl 2-3-5-8, LEFT barrel 1-4-6-7*

Idle Setting—After idle speed set to correct specifications (see Idle Speed below), turn both idle mixture screws for smooth idle with highest vacuum reading and engine RPM

Float Level—1¼" from air horn gasket to top of float with assembly inverted Use Gauge BT-129 so it rests against power piston shaft with outer leg in line with center of float Adjust by bending float arm between pivot and float with Tool BT-69

Fast Idle: No adjustment of fast idle speed is provided It is necessary, however, to have correct relationship between fast idle cam position and choke valve position Check & adjust as follows. Place end of idle adjusting screw on next to highest step of fast idle cam Using Gauge J-5921, small end of gauge must slide easily between upper edge of choke valve and bore of carburetor, with gauge held vertically If necessary, bend choke rod until correct clearance is obtained

Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *See "Carburetor" above.*

►*OTHER DATA: See "Rochester 2G' Carburetors in Carburetion Section.*

Fuel Pump Pressure: 4-5¼ lbs.

CARTER

Carter (BB) 871SB (Forward Control Models). Single barrel updraft type with manual choke control

Idle Setting—½-1½ turns open (turn screw out for richer mixture)

Idle Speed—450-500 RPM (Synchro-mesh), 400-450 RPM (Hydra-Matic)

Float Level—Top of float (not seam) 0" to 1/32"below top of bowl with needle valve seated Use Gauge J-818-13A on top edge of bowl (gasket removed). Press float lever lip firmly against needle

Accelerating Pump—Inner holes (in plunger shaft and throttle lever) Summer Outer hole Winter

Thr ttl Linkag Adjustm nt (Hydra-Matic Driv Cars): *S "Carbur tor" abov .*

►*OTHER DATA: See "Cart r (BB)" Carburetors in Carbur ti n S ction.*

Fu l Pump Pr ssur : 3½-4½ lbs.

CARB. EQUIPMENT

Fuel Pump: AC Diaphragm type.

Model	AC Pump No.
6 Cyl., Std. (Fuel only)	4149
6 Cyl., Optl. (Fuel & Vacuum)	4138, 707
V8, Std. (Fuel only)	4150
V8, Optl. (Fuel & Vacuum)	4141, 708

Pump Pressure—(6 Cyl.) 3½-4½ lbs. (V8) 4-5¼ lbs.

Gasoline Gauge: AC Electric.

Dash Unit—AC No. 1518461.

Tank Unit	Truck Model
AC No. 1518258	Half Ton
AC No. 1518236	¾ Ton
AC No. 1518498	1½ & 2 Ton
AC No. 1518234	School Bus

See "Fuel Gauges" in Carburetion Section.

BATTERY

Delco 2SMR53 (Exc. School Bus). *12 Volt,* 9 plate, 53 ampere hour capacity (20 hr. rate).

Delco 3SM70 (School Bus). *12 Volt,* 11 plate, 70 ampere hour capacity (20 hr. rate).

Battery Ground—Negative.

Engine Ground—(6 Cyl.) Engine to frame, (V8) Engine to dash.

STARTER

Model	Delco-Remy No.
6 Cyl. (Exc Fwd Cont & Hydra-Matic)	①1107634
6 Cyl (With Hydra-Matic)	②1107633
6 Cyl (Fwd. Cont W/O Hydra-Matic)	②1107626

V8 (Hydra-Matic)	②1107643

①—Manual Pinion Shift ②—Solenoid Pinion Shift.

Armature—Delco-Remy 1926626 (all models)

Drive (6 Cyl. Synchro-mesh Trans., Exc. Fwd. Cont.)—Overrunning clutch with pedal operated manual pinion shift

Drive (6 Cyl. Fwd. Cont. & Hydra-Matic Models. All V8 Models)—Overrunning clutch with solenoid pinion shift

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—35 ozs minimum

Performance Data			
Torque	RPM	Volts	Amperes
0 ft lbs	6900	10 3	75
10 5 ft. lbs.	Lock	5 8	435

Starting Switch: (Solenoid Pinion Shift Models)—Delco-Remy Solenoid Switch No 1119767 mounted on starter and controlled by Ignition & Starter Switch 1116522 Turn key full RIGHT against spring tension to start

Starter Switch: (Manual Pinion Shift Models)-Starter switch mounted on starter and controlled by pedal operated lever

Hydra-Matic N utral Saf ty Switch: Delco-Remy No 1998111 (Exc Forward Control) Delco-Remy 1998110 (Forward Control)

Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

GENERATOR

D lco-R my. *12 Volt.* Generators used as follows:

Model	G n rat r N .	Armatur N .
All (Std.)	1100326	1928952
Optl., Pow. St., 30 amps.	1102041	1929640
Optl., Pow. St., 40 amps.	1106982	1932349
Optl., 30 amps.	1105947	
Optl., 40 amps.	1106981	1929360

Maximum Charging Rate—Controlled by regulator and governed by battery condition.

Performanc Data - C ld			
Generator	Amperes ①	V lts	RPM
1100326	25	14.0	2780
1102041	30	14.0	2150
1105947	32	14.0	1850
1106981, 2	40	13.0	1500

① — Not maximum output. See Current Regulator.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—28 ozs.

Field Current—1.5-1.62 amps. (1100326), 1.48-1.62 amps. (1102041), 1.54-1.67 amps. (1105947), 1.37-1.50 amps. (1106981, 2). All at 12.0 volts.

Belt Adjustment: 5/16" (6 Cyl.), 13/16"(V8) deflection midway between water pump and generator pulleys with light load applied to belt.

REGULATOR

Delco-Remy. *12 Volt.* Regulators used with generators as follows:

Regulator No.	G n rat r N .
1119000	1100326, 1102041
1119001	1105947
1119004	1106981, 2

►*NOTE: Regulator is "1119000 S ri s R gulator". Sp cifications below are for "Normal" s ttings.*

Cutout R lay

Cuts In—(1119000, 1119001) 11.8 - 13.5 volts HOT. (1119004) 11.5-13.0 volts HOT.

Contact Gap—.020".

Air Gap—.020" (with contacts just closed).

Voltage R gulat r

S tting—(1119000, 1119001) 13.8-14.8 volts HOT. (1119004) 13.6-14.3 volts HOT.

Air Gap—.063" (1119004), .075" (Others), with armature pressed down to point where contacts just touch.

Checking & Adjusting—*Se "D lco-R my 1119000 S ri s Regulator" in Electrical S ction.*

Current R gulat r

Setting (1119000)—23-27 amperes HOT.

Setting (1119001)—27-33 amperes HOT.

Setting (1119004)—37-42 amperes HOT.

Air Gap—.075" with armature pressed down to point where contacts just touch.

Checking & Adjusting—*Se "D lco-R my 1119000 Series Regulator" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *Se El ctrical S cti n.*

Direction Signals: *See Electrical Section.*

Lighting Switch R moval: Disconnect all wires from switch (make sure that all wires are tagged for identification) Depress switch shaft retainer on top side of switch assembly (rear of instrument panel) Remove switch retaining nut and switch assembly

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*LIGHTING SWITCH FUSE NOTE:* A 3 ampere fuse has been added to lighting switch assembly to prevent instrument panel rheostat from burning out.

Stop Light Switch L cati n: Mechanical type mounted on underside of toeboard and operated by brake pedal

CIRCUIT BREAKERS: Two 13 amperes circuit breakers located in main lighting switch One protects headlamps and parking lamps and the other circuit breaker protects all other light circuits

HORNS: Delco-Remy 1999760 (High), 1999759 (Low)

H rn R lay: Delco-Remy 1116913. *12 Volt.*
Contacts Close – 5.0-9.5 volts.
C ntact Gap – .027".

ENGINE

►*ENGINE APPLICATION NOTE· Three variations of 235" Thriftmaster engine, the 261" Jobmaster engine, and two V8 engines (the 265" Taskmaster & Trademaster) are used in 1956 production. See "Truck Model Identification" for engine application.*

Engin	Series
Thriftmaster 6 Cyl.	① 3000, 4000
Thriftmaster Special 6 Cyl.	② 3400, 3500, 3700
Thriftmaster Hvy. Duty 6 Cyl.	③ 6000

235" Thriftmaster	8.0-1	30.4	140 at 4200
261" Jobmaster	7.8-1	33.7	148 at 4000
265" V8 Trademaster	7.5-1	45.0	155 at 4200
265" V8 Taskmaster	7.5-1	45.0	155 at 4200

Compr ssi n & Vacuum Reading – *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data*

OIL PAN REMOVAL: (V8 Engines)–Disconnect steering idler arm bracket from right frame side rail and drop for clearance

ENGINE MOUNTINGS: *See "Engine Mountings" in Chevrolet Special Data*

CYLINDER HEAD & MANIFOLDS: *See "Cylinder Head & Manifold" in Chevrolet Special Data*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chevrolet Special Data*

►*OTHER ENGINE DATA· S e 1956 Passeng r Car pages and note the following.*

ALL 6 CYL. & V8 ENGINES: Valves – High alloy steel exhaust valves replace those formerly used.
Oil Control Ring–Three-piece oil control rings replace four-piece type used previously. New ring consists of two chrome plated rails and spacer.

6 CYL. ENGINES· Upper Main Bearing Insert–"Roll-out" type upper main bearings used. Inserts are retained by a tang which bears against cap and fits into matching groove in cylinder block. Bearings can be rolled out by removing bearing cap and inserting special plug in crankshaft oil hole.
Valve Guide Installation – On both 235" & 261" engines, exhaust valve guides are installed in head so they will extend 15/16" above the head, and intake valve guides are installed to extend 1" above the head. Use Tool J-5599 to install exhaust guides, Tool J-5598 to install intake guides.

►*THRIFTMASTER 235" HEAVY DUTY ENGINE NOTE·* Upper compression rings are chrome plated and rotators are standard equipment on exhaust valves.

V8 ENGINES: Rings – Top compression rings are chrome plated.
Valve Rotators – Standard on all exhaust valves.
Valve Spring Dampers & Oil Shields – Used on all intake and exhaust valves.

►*TASKMASTER V8 PISTON NOTE:* Two small notches are ground into crown of each piston to provide additional piston-to-valve clearance (minimizing possibility of valve-piston collision during engine over-speeding conditions).

►*VALVE SPRING HEIGHT CAUTION (V8 ENGINES):* Check installed height of valve springs. Distance from top of shim, or spring seat, to top of valve spring shield should not be in excess of 1 45/64". If so, install a 1/16" or 1/32" shim to obtain an installed spring height of 1 5/8" for exhaust, 1 11/16" for intake.

VALVE TIMING: As indicated below

235" Thriftmaster & 261" Jobmaster

Intake Valves–Open 11°30' BTDC, Close 52°30' ALDC.
Exhaust Valves – Open 51° BLDC, Close 13° ATDC.

265" Trademaster & Taskmaster

Intake Valves – Open 18° BTDC, Close 54° ALDC.
Exhaust Valves – Open 52° BLDC, Close 14° ATDC.

Valve Timing Check (235" & 261" Engines): Remove all tappet clearance from No 1 exhaust valve Turn engine over until this valve opens and just starts to close and until triangular mark on flywheel lines up with pointer in flywheel housing opening Mount dial indicator on rocker arm shaft support with stem contacting No 1 exhaust valve adjusting screw set dial indicator to .063". Turn crankshaft until indicator hand just stops moving. Timing is correct if indicator reading is ZERO plus or minus .004". Reset No. 1 exhaust valve to correct running clearance.

OILING SYSTEM

Crankcase Capacity (6 Cyl)–5 qts (refill) 5½ qts (dry) **(V8)**–4 qts (refill), 5 qts (dry)

Normal Oil Pressure: (6 Cyl –45 lbs **(V8)**–35 lbs

Pr ssur R gulator Valv s–In oil pump body Not adjustable

Oil Pressur Indicator–AC No 1508246 Not electric

Oil Pump: Gear type. Located in crankcase, driven by distributor gear.

►*OIL PUMP INTAKE NOTE·* Oil pump intake is fixed screen type and replaces "floating" type previously used. Intake and screen are removed as an assembly.

Oil Pump Overhaul–*See "Oiling System" in Chevrolet Special Data*

Crankcase Ventilation (Standard): Air intake through valve rocker arm cover, outlet through pipe on right side of engine
Servicing–On all models with air cleaner mounted on valve rocker arm cover, wash filter element with solvent and re-oil at 2000 mile intervals or more often if required by operating conditions

Crankcase Ventilation (Optional): Positive Type Vacuum operated ventilator consisting of a vacuum pipe from oil filler pipe to ventilator valve in fitting on intake manifold Valve is spring loaded variable opening type giving constant crankcase ventilation at all speeds **Valve must close at idling to give proper air-fuel mixture**
Servicing–Every 10 000 miles (or oftener if required) clean vacuum pipe, valve and filler pipe thoroughly Filler cap gasket must seal tightly

►*VACUUM VALVE CAUTION* If improper action of spring is suspected due to spring being distorted or etched from corrosive action the valve assembly should be replaced

►*TASKMASTER V8 CRANKCASE VENTILATION NOTE* Positive type crankcase ventilation is Standard.

COOLING

Water Capacity· As follows

Model	235"	265"	261"
½, ¾, 1 Ton	17 qts.	17½ qts.	
½, ¾, 1 Ton H.D.	17½ qts.	18 qts.	
1½ Ton Special	17½ qts.	18 qts.	
1½ Ton Special H.D.	18 qts.	18½ qts.	
5000 Ser., 4 or 5 speed		18 qts.	
5000 Series, H.D.		18½ qts.	
5000 Series, Powermatic		21 qts.	
6000 Series, 4 or 5 Speed	17½ qts.	18 qts.	17 qts
6000 Series, H.D.	18 qts.	18½ qts.	
6000 Series, Powermatic		21½ qts.	21 qts.

NOTE – Add one quart for models with heater.

Pressure Valve: AC No. 850795. Radiator filler cap. 7 lb. type. **Replacement Valve** – AC No. RC-1.

Thermostat: Harrison. In cylinder head water outlet (6 Cyl.). In water outlet in intake manifold (V8).
Standard – No. 3133595 (stamped 151), 151°. Can be used for alcohol anti-freeze.
Optional – No. 3123994 (stamped 160), 160°. No. 3133597 (stamped 170), 170°.

Temperature Gauge· AC No. 1513138. Not electric.

Water Pump· Packless type with sealed ball bearing shaft. *See "Chevrolet" in Water Pump Section.*

CLUTCH

6 CYL. ENGINES

Own. Diaphragm spring, single plate, dry disc type. *See "Chevrolet (Own)" in Clutch Section.*

Mod l	Cover	Woven Disc	Molded Disc
Standard (10")	3836716	3826119	3836097
Heavy Duty (11")	3836720	3826011	

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Pedal Adjustment: Pedal free travel ¾-1". To adjust, loosen checknut and turn adjusting nut on connecting link at clutch throwout fork. *NOTE*–Use finger pressure only when checking clutch free travel.

Removal: Remove transmission (see Transmission Removal). Remove throwout bearing, remove fork by prying fork off ball, remove fork mounting (use ¾" wrench). Install Clutch Pilot Tool K-411 (to support clutch), loosen all six cover bolts evenly, remove assembly from below. *CAUTION*–Do not allow pressure plate to hang on retracting springs (support by hand). When installing clutch align "X" mark on cover with "X" mark on flywheel.

CLUTCH

V8 ENGINES

Borg & Beck. Single plate, dry disc type.

Series	Model	Assy. No.	Disc No.
3000 & 4000	10.5A9	361402	352528
5000 & 6000 Ⓒ	11A9	361403	382286

Ⓒ–Heavy Duty on 3000 & 4000 Series.

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: Adjust clutch pedal until free travel is 1". Make sure that pedal pad contacts toeboard when pedal pressed down.

Removal: Remove transmission (see Transmission Removal). Before removing clutch assembly, punch mark flywheel, clutch cover and one pressure plate lug so these parts may be assembled in their same relative positions. Loosen hold-down screws evenly and remove cover. *NOTE*–Mark flywheel side of driven plate for correct reassembly.

TRANSMISSION

3-SPEED LIGHT DUTY

Own. Three speed, all helical gear type. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).

See "Chevrolet 3-Speed (Light Duty)" in Transmission Section.

Transmission Control: Steering column mounted gearshift lever. *See "Transmission Controls" in Transmission Section.*

Removal (½ & ¾ Ton): Drain transmission. Disconnect speedometer cable at transmission and shift control rods from transmission levers. Remove propeller shaft. Remove the two top transmission to clutch housing capscrews and insert two transmission guide pins, Tool J-1126, in these holes. Remove the two lower transmission to clutch housing capscrews. Slide transmission straight back on guide pins until clutch gear is free of splines in the clutch disc.

3-SPEED (HEAVY DUTY)

Own. Three speed, constant mesh (second & high), sliding gear (low & reverse).

See "Chevrolet 3-Speed (Heavy Duty)" in Transmission Section.

Transmission Control: Steering column mounted gearshift lever.

See "Transmission Control" in Transmission Section.

Removal: Same as for "3-Speed (Light Duty)" above.

4-SPEED

Own. Four-speed, constant mesh, synchro-mesh, helical gear (2nd, 3rd, & 4th), sliding spur gear (low & reverse). Floor mounted gearshift.

See "Chevrolet 4-Speed" in Transmission Section.

Transmission Control: (All Models exc. Forward Control) –Floor mounted gearshift lever.

Removal (½ & ¾-Ton): See "3-Speed (Light Duty)" above.

Removal (Other Trucks): Remove screws fastening steering jacket grommet and slide grommet up out of way. Remove accelerator pedal and floor mat. Remove sheet metal screws attaching transmission cover to body floor and remove cover. On Forward Control models remove both front and rear floor pans. Remove speedometer cable from transmission rear bearing retainer. On 1-Ton, remove cotter key and pin attaching parking brake pull rod to parking lever. On 1½ & 2-Ton, disconnect parking brake lever return spring from parking brake operating lever and remove cotter key and pin attaching inner and outer levers to parking brake operating lever. Remove parking brake lever lock, flat washer and spring and remove parking brake lever. Drain lubricant from transmission. On 1-Ton, break universal joint at transmission joint flange and tape trunnions and bearings together. On 1½ & 2-Ton, disconnect intermediate universal joint by removing two trunnion bearing "U" clamps, split joint and lower front end of rear propeller shaft to floor. Remove the four universal joint flange nuts. Remove nuts attaching propeller shaft bearing support bracket to frame cross member and remove front propeller shaft and bearing assembly. On all models, remove the two capscrews attaching transmission to clutch housing and insert two Guide Pins J-1126 in these holes. Remove flywheel underpan and remove two lower transmission to clutch housing capscrews. Slide transmission straight back on guide pins until transmission free of splines in clutch disc. Remove transmission.

OVERDRIVE

Warner R10. Used with Chevrolet Truck 3-Speed (Light Duty) Transmission.

See "Chevrolet Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cables have been disconnected.

HYDRA-MATIC DRIVE

Dual Range. Four speed type with fluid coupling.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication–Check fluid level in transmission every day. Drain & refill every 25,000 miles. Use only "Automatic Transmission Fluid" Type A.

Checking Fluid Level–With selector lever in "N" position, parking brake set, and transmission at normal operating temperature, remove access hole cover plate in floor pan, and **check fluid level with engine at idling speed.** Add sufficient fluid to bring level in transmission to "F" mark on dipstick.

Capacity–8½ qts. (refill), 9 qts. (after overhaul). *NOTE*–1 qt. additional with oil cooler.

►*OTHER HYDRA-MATIC SERVICE DATA–See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

REAR AXLE

SEMI-FLOATING (HALF-TON)

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE*–Same design as passenger car axle.

See "Chevrolet Hypoid Semi-Floating" in Rear Axle Section.

Ratio–(Synchro-mesh & Hydra-Matic) 3.90-1 (39:10). **(Overdrive)** 4.11-1 (37:9).

►*AXLE SHAFT NOTE: Shafts unequal length (right shaft longer) and may be identified by mark stamped on shaft, or by length as follows:*

Axle	Part No.	Length
Left	3694769①	29 5/8"
Right	3694770①	30 5/8"

①–Part No. stamped on axle for identification.

Backlash–.005-.008".

Removal of Rear Axle Assembly: Disconnect and remove parking brake pull back spring. Remove cotter pins and clevis pins from each parking brake cable clevis, and remove clevis. Remove springs and retaining clips from cables at frame brackets. Disconnect universal joint trunnion bearing "U" bolts and split rear universal joint. Disconnect shocks from anchor plates. Disconnect hydraulic brake line to connector at rear frame bracket. Remove spring "U" bolts, nuts and anchor plates. Raise rear of truck and roll assembly out toward rear. *CAUTION–Be careful when pulling parking brake cables through openings in frame.*

Axle Shaft Removal: *See "Chevrolet Hypoid Semi-Floating" in Rear Axle Section.*

Axle Shaft Endplay–Free fit to .014" maximum.

FULL-FLOATING (¾, 1, 1½ & 2-TON) (EXC. LCF MODELS)

Own. Full-floating hypoid gear (straddle mounted pinion) with Hotchkiss drive.

►*AXLE ASSEMBLY NOTE; ¾ & 1-Ton axle assemblies are different design than used on 1½ & 2-Ton with standard rear axle assemblies.*

See "Chevrolet Truck Hypoid Full-Floating" in Rear Axle Section

►*AXLE RATIO IDENTIFICATION NOTE: Axle ratios are identified by prefix letters in rear axle numbers stamped on top of carrier housing between reinforcing ribs. See Axle Ratios following:*

Axle Ratio Identification

Ratio	Prefix Letters
5.14-1 (36:7)	CA, CB, CE, CF
4.57-1 (32.7)	CC, CD
6.17-1 (37:6)	CG, CH, CJ
7.2-1 (36:5)	CM

Backlash–.005-.008". Screw adjustment.

Removal of Axle Assembly: Remove differential cover and axle shafts (see below). Disconnect rear universal

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

by removing two "U" bolts from rear yoke (wire trunnions to retain bearings) Slide shaft forward and lower to floor Remove differential carrier mounting bolts

Axle Shaft Rem val (¾ & 1-Ton): Remove eight capscrews and lockwashers in axle shaft flange, install two ½"x13" screws in special threaded holes in flange (between regular mounting screw holes), turn these screws up evenly to loosen the shaft, withdraw shaft from housing, remove and discard gasket *Use new gasket when installing shaft.*

►*CAUTION* Thoroughly clean all lubricant from axle shaft flange and end of wheel hub before installing axle shaft *Grease at this point will cause loosening of axle shaft flange capscrews.*

Axl Shaft Removal (1½ & 2-Ton): Shaft flange is splined in wheel hub (tight fit) and requires special puller for removal. Remove five capscrews and lockwashers in hub cap, remove hub cap and gasket. Assemble special adapter J-1436-8 on Rear Axle Shaft Bearing & Oil Seal Remover. J-1436 (remove jaws), thread adapter into hole in axle shaft flange, pull axle shaft. *NOTE*—When reinstalling axle shaft, tap flange splines into engagement with wheel hub splines (if necessary, rotate wheel slightly to align splines on shaft with both wheel hub and differential side gear splines), use new hub gasket.

►**Axl Shaft N te:** Shafts unequal length (rightshaft longer than left). Install in correct position.

Wh l B aring Adjustment: Remove wheels and axle shafts (see above) Bend back lip of lock in locknut notch, remove locknut and adjusting nut lock. Tighten adjusting nut tight, using special wrench J-2222 (¾ & 1-Ton), J-870 (1½ Ton), J-5670 (2-Ton) while turning hub by hand, then back off nut 45°, check for free turning, install adjusting nut lock with lock tangs aligned with slots in adjusting nut Bend tang down into notch in adjusting nut, install locknut and tighten securely Bend tang of lock down into notch of locknut

HEAVY DUTY FULL-FLOATING (2-TON & LCF MODELS)

Own. Full floating, hypoid gear, roller pinion bearings (straddle mounted pinion), with Hotchkiss drive.
See "Ch vrolet Truck Heavy Duty Hypoid Full Floating" in Rear Axle Section.

Rati s—Same as for "Standard Full-Floating" above.

Backlash— 005- 008".

Rem val Of R ar Axl Assembly: Same as for "Standard Full-Floating" above

Axle Shaft R moval: Same as for 1½ & 2-Ton "Standard Full-Floating" above.

►**Axl Shaft Not :** Shafts unequal length (right shaft longer than left). Install in correct position.

Wh el Bearing Adjustm nt: Same as for "Standard Full-Floating" above

PLANETARY 2-SPEED

Own. Full-floating, two-speed planetary reduction type. with hypoid primary pinion and ring gear.
See "Ch vrolet Truck Planetary 2-Speed" in Rear Axl Section.

►*NOTE: Two gear ratios available as follows:*

Power Rati —6.40-1 (high), 8.72-1 (low). 32:5 Primary gears

Speed Ratio—5.83-1 (high), 7.95-1 (low). 35:6 Primary gears.

Two-Speed Shift Control: Vacuum power type with control on gearshift lever.

Carrier Assembly Removal: *See "Chevrolet Truck Planetary 2-Speed" in Rear Axle Section.*

Axle Shaft Removal & Wheel Bearing Adjustment: Same as for "Standard Full-Floating" above.

SHOCK ABSORBERS

Delco. Direct Acting (Airplane Type) shock absorbers as follows:

Front Shocks

Model	Delco No.
½, ¾, 1 Ton	820R
2 Ton School Bus	682Z

Rear Shocks

Model	Delco No.
½ Ton (114")	800W
½ Ton (123¼")	800Z
¾ Ton	800Z
1 Ton	684U
1½ Ton	660U
2 Ton School Bus (Exc. H.D.)	660U
2 Ton School Bus (H.D.)	660W

FRONT SUSPENSION

Conventional "I" Beam section, with Reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination – 6-8°

Caster (At designed load) – See Table below.

Camber – 1°.

Toe-In – See Table below.

Model	Caster	Toe-In
3100, 3200	1½°	1/8-7/32"
34, 35, 37, 40, 5000	2°	1/4-7/32"
3600	1½°	1/4-7/32"
3800, 6000	2¼°	1/4-7/32"

STEERING

Manual: Saginaw Ball Bearing Worm & Nut (recirculating ball).
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Bendix Linkage Type – *See "Chevrolet Truck (Bendix)" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

►*NOTE: Two different type brakes used on trucks as indicated below.*

Chevrolet-Bendix (Except Rear Wheels of 1½ & 2-Ton Models—Duo-servo, single anchor, hydraulic (without eccentric adjustment).
See "Chevrolet-B ndix Hydraulic" in Brake Section.

►*HALF-TON TRUCK BRAKE SHOE GRINDING CAUTION:* If bench type grinder used, grind shoes to .057" to .087" smaller diameter than drum size. If spindle type grinder used, grind shoe to drum diameter.

Ch vrol t-Twinpl x (R ar Wheels 1½ & 2-T n M d ls)—Two-cylinder, four-anchor type hydraulic Shoes are self-centering and self-energizing
See "Chevrolet Twinplex" in Brake Section.

Wheel Cylinders— Size stamped on housing under adjusting lock spring.

Drums—Cast iron with steel web.

Drum Diameter

Model	Front	Rear
½-Ton	11"	11"
¾-Ton	12"	12"
1-Ton	12"	14"
1½ & 2-Ton	14"	15"

Lining—Molded type. Riveted on 1½ & 2-Ton Models and bonded on all others.

Thickness & Width

Model	Thickness	Width
½-Ton (Front Whl)	202-.222"	2"
½-Ton (Rear Whl.)	.202-.222"	1¾"
¾-Ton (Front & Rear)	264-.284"	2"
1-Ton (Front Whl)	264-.284"	2"
1-Ton (Rear Whl.)	.267-.287"	2½"
1½ & 2-Ton (Front Whl.)	.267-.287"	2½"
1½ & 2-Ton (Rear Whl)	.392- 412"	4"

Clearance—Adjust for clearance as follows.

All Models (Except 1½ & 2-Ton Rear Brakes)—Remove adjusting hole cover and turn brake adjusting screw until light drag is felt, then back off adjusting screw 7 notches (Half-Ton Models), or just enough to eliminate brake drag (Other Models), but not more than 7 notches.

Rear Wheels (1½ & 2-Ton Models)—Remove adjusting hole covers from flange plate and turn rear adjusting screw until slight drag is felt, then back off 3 notches. Repeat on front adjusting screw (2 adjustments on each wheel)

Parking Brakes: Hand lever applies rear wheel service brakes on Half-Ton & ¾-Ton Models, and an independent brake on propeller shaft on all other models.

Adjustment (½ & ¾-Ton Models)—*See "Chevrolet-Bendix Hydraulic" in Brake Section.*

Adjustment (1, 1½, 2-Ton Models & ¾-Ton with 4-Spe d Transmission)—*See "Chevrolet Twinplex" in Brake Section.*

Master Cylinder: Located under floorboard on left hand side of truck

Checking Fluid—Maintain fluid level to lower edge of filler hole.

Removal—Remove from below. *CAUTION*—On 1½ & 2 Ton Low Cab Forward, spacer between cylinder and body bracket will fall out when mounting bolts removed.

Installation—Reverse removal procedure. On LCF Models make sure the spacers are reinstalled

Power Brakes: *See "Hydrovac Power Unit" in Brake Sect.*

Removal—Remove vacuum line, brake fluid line to wheel and master cylinders, and air cleaner hose from vacuum unit. Remove nuts and bolt securing unit to its bracket on right side rail of frame.

MISC. MECHANICAL

Windshi ld Wip rs: Linkage type. Vacuum motor (Std. Equip.). Electric motor (Optl. Equip.).
See "Windshield Wipers" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

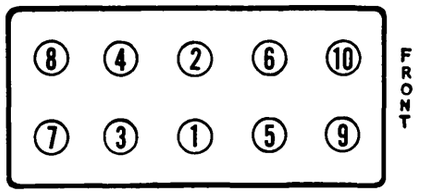
ALL ENGINES	Ft. Lbs.
Cylinder Head	85
Intake Manifold	30
Exhaust Manifold	25
Oil Pan	15
Main Bearing Caps	①85
Flywheel	60
Vibration Dampener	135
Crankshaft Pulley	135
Con Rod Caps	45
Camshaft Sprocket	35
Camshaft Sprocket Hub Thrust Plate	15
Rocker Arm Support Bracket (Single Shaft)	30
Rocker Arm Support Bracket (Double Shaft)	85
Rocker Arm Cover	25
Engine Front Cover	15
Fuel Pump Mounting	30
Water Manifold	30
Water Pump Mounting	30
Oil Pump Mounting	35
Oil Filter	25
Clutch Housing	50

①—Use of lockwashers discontinued during 1956 model year Be sure to use lockwashers on reassembly of bearing caps which had lockwashers to prevent bottoming of screws

ENGINE

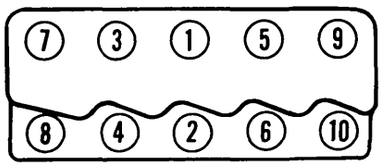
ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery. Remove fan shroud, radiator, and hood. *(NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. *(NOTE* - Place a roll-away jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support. Lower car to convenient working height, then remove engine front support mounting bolts. With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender.

CYLINDER HEAD & MANIFOLD



ALL ENGINES

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.



Tightening Torque—See Tightening (Torque Wrench) Specifications above

V8 ENGINES – SINGLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Single Rocker Shaft): Before cylinder head removed, remove

V8 ENGINES (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES (SINGLE ROCKER ARM SHAFT)

rocker shaft assembly Slide out push rods and place them in sequence in a suitable rack in order that each push rod can be reinstalled in its original position When installing cylinder head, use new gaskets Make sure all holes are punched out Be certain cylinder head enters both dowel guide pins in cylinder block Tighten cylinder head bolts in sequence shown in diagram Slide push rods in position Lower rocker shaft assembly down on two locating studs Install all washers, nuts and bolts *CAUTION*—Extreme caution must be exercised when tightening rocker shaft bolts and nuts so that hydraulic tappets have time to bleed down to their operating length If tappets are forced down too rapidly, damage to push rods, tappet bodies or rocker arms will result

V8 ENGINES – DOUBLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Double Rocker Shaft): Use new gaskets when installing head. Insert cylinder head bolts into rocker arm support brackets. Insert pushrods through holes in head (short rods in upper holes - intake, long rods in lower holes - exhaust). Place rocker arm assemblies in position on heads, then position pushrods. Starting at top center, tighten all cylinder head bolts to correct torque (see Tightening Specifications above). Install exhaust manifolds, crankcase breather tube, and intake manifold. *NOTE* - When installing intake manifold, insert short bolts in holes on extreme ends of manifold.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap Tap seal down in position with Tool C-3511 until tool is seated in bore Hold tool down and cut off protruding ends flush with cap Install bearing insert and both cap seals The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine

ENGINE FRONT COVER

V8 ENGINES – SINGLE ROCKER SHAFT

ENGINE FRONT COVER (Single Rocker Shaft Engines): Proceed as follows

Removal: Drain and remove radiator Disengage fan belt and remove generator Install Tool C-3033 over pulley and force pulley off end of crankshaft Support engine with suitable chain hoist fastened to intake manifold Remove motor support "U" bolts and nuts Remove fan blades and hub, then remove bolts that hold water pump housing to cylinder block and heads Lift water pump housing, water pump, front motor support and insulator up and away from front of engine Discard gaskets Loosen bolts that hold oil pan to cylinder block Drop pan slightly to clear chain case cover Disconnect inlet and outlet fuel lines at fuel pump Remove bolts that hold pump to chain case cover Slide pump out and away from engine Discard gasket Remove bolts and washers from cover Disengage cover from locating dowels, remove from engine Discard gasket.

Installation: Be sure mating surfaces of cover and cylinder block are clean and free of burrs Install new gasket and position cover locating dowels Coat screws with suitable sealer and tighten to 15 ft lbs *NOTE*—Coat four center screws with sealer suitable for water. Coat other screws (upper and lower) with sealer suitable for oil

V8 ENGINES – DOUBLE ROCKER SHAFT

ENGINE FRONT COVER (Double Rocker Shaft Engines): Proceed as follows

Removal: Remove water pump Remove vibration dampener retainer bolt and washer Remove two of the vibration dampener pulley bolts and install puller Tool C-3033 Remove crankshaft pulley and vibration dampener as an assembly Remove felt dust seal and vibration dampener hub key from crankshaft slot Remove left cylinder bank exhaust pipe Disconnect fuel lines at fuel pump, remove fuel pump Remove oil level indicator Remove starter using Tool C-455 Drain engine oil and remove oil pan Remove chain case cover bolts and lockwashers Drive chain case cover off two dowel pins using a soft hammer

Installation: Be sure mating surfaces of cylinder block and cover are clean Apply moderate coat of sealing compound to block and cover faces, install new gasket Make sure crankcase oil slinger is in proper position (flange end pointing toward seal) Position cover on two dowel pins and gently tap cover in place Install cover bolts and lockwashers and tighten to 30 ft lbs Install other items be reversing removal procedure

FRONT OIL SEAL: Remove crankshaft pulley and water pump housing. Loosen oil pan bolts sufficiently until pan clears chain case cover. Install Tool C-3506 and remove seal. Discard seal and retainer. Position new seal and retainer assembly in housing and press into place using Tool C-3506. Seal must be tight against seat surface. *CAUTION* - Always have thin shoulder away from front of cover with stamped case cover, thick shoulder away from front of cover with cast iron cover.

CAMSHAFT & BEARINGS

V8 ENGINES – SINGLE ROCKER SHAFT

CAMSHAFT REMOVAL: Drain radiator, remove radiator and crankshaft pulley Support engine with chain hoist attached to intake manifold Remove engine support U-bolts Remove fan, water pump, and water pump housing assembly Loosen oil pan

CONTINUED ON NEXT PAGE

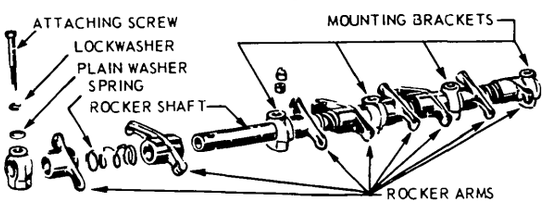
CONTINUED FROM PRECEDING PAGE

bolts sufficiently in order that oil pan clears chain case cover, camshaft gear hub nut, fuel pump eccentric and dowel Then remove camshaft gear and timing chain Support engine at front of oil pan Then remove intake manifold, distributor, distributor drive gear, tappet chamber cover, rocker cover, rocker shaft assemblies and push rods Use Tool C-3158 to pull out hydraulic tappets If varnish build-up is excessive, use puller part of Tool C-3158 and work tappet out of bore Remove four camshaft thrust bolts, then remove camshaft

V8 ENGINES – DOUBLE ROCKER SHAFT

CAMSHAFT REMOVAL: With intake manifold, tappet cover, pushrods, tappets and timing gears removed, remove distributor. Lift out distributor drive gear and stub shaft. Remove camshaft thrust plate attaching bolts and oil trough. Withdraw camshaft and spacer, being careful not to damage cam bearings with cam lobes.

VALVE SYSTEM



V8 ENGINES – DOUBLE ROCKER SHAFT

EXHAUST VALVE SEAT INSERT REPLACEMENT. Furnished 010" O S Use special Tool C-3140 (Double Rocker Shaft Engines) to remove inserts After inserts have been removed from engine, smooth any roughness of seat with a blunt drift Valve seat inserts should be from 002- 004 larger than counterbore to insure correct fit If inserts are found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert Place inserts in dry ice for approximately 10 minutes Clean counterbore thoroughly and install a chilled insert with valve side up and drive it into place with Installing Tool C-767

ROCKER ARMS

V8 ENGINES – SINGLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Single Rocker Arm Shaft). Hold rocker arm shaft and end bracket in a horizontal position with oil grooves facing down Slide an intake rocker arm over shaft and down against bracket, with diagonal slant of arm close to bracket Then slide a spacer spring over shaft

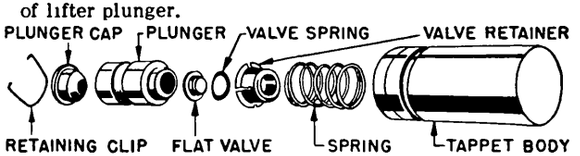
ROCKER ARM ASSEMBLY (SINGLE ROCKER ARM SHAFT)

and down against intake rocker arm Next, slide an exhaust rocker arm over shaft and down against spacer spring, followed by a shaft bracket Continue to slide first an intake rocker arm, then a spacer spring followed by an exhaust rocker arm and bracket, over shaft until last bracket has been installed Slide push rods into push rod holes Be sure that rocker arms are in a horizontal position, then lower rocker shaft assembly down on two locating studs on head Install flatwashers and nuts

V8 ENGINES – DOUBLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Double Rocker Arm Shaft):

Removal: Remove rocker arm covers Place cotter pins in holes of first and last rocker arm brackets to last rocker arm brackets (if not already there) to prevent springs on rocker from pushing assembly apart when cylinder bolts removed Completely loosen ten bolts on each bank that attach rocker arm support brackets to cylinder head and block Grasp support bracket at each end of head pull rocker assemblies and bolts directly away from heads, then remove push rods and place in respective slots in holder C-3068 *CAUTION—Use care when removing rocker assemblies in order not to jerk cylinder heads off locating dowels which would allow them to drop and become damaged.*



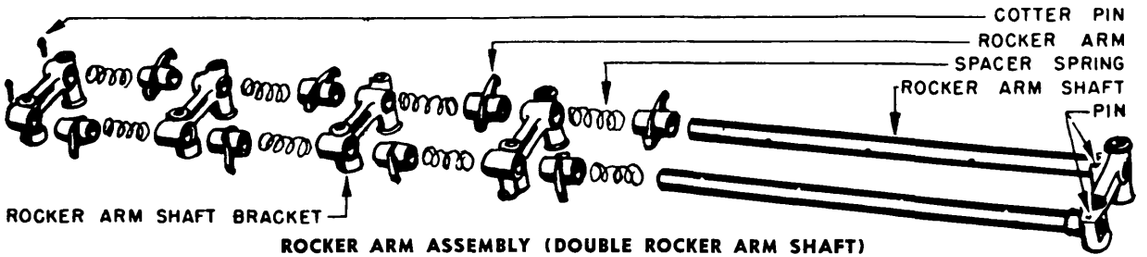
Installation Insert cylinder head bolts in brackets, with **short** bolts in intake side Insert push rods through push rod holes in heads (short rods in upper intake holes, long rods in lower exhaust holes) Place rocker arm assemblies in position on heads, lining up all push rods to their respective rocker arms Starting at top center tighten all cylinder head bolts to torque indicated in Tightening Specifications above *When tappets are full, extreme care must be taken when tightening head bolts so that tappets have time to bleed down to their operating length.* Bulged tappet bodies and permanent noisy operation will result if tappets are forced down too rapidly

HYDRAULIC VALVE LIFTER

ALL ENGINES

HYDRAULIC VALVE LIFTERS (One-Piece Integral Type)

Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.



V8 ONE-PIECE VALVE LIFTER

Removal (Single Rocker Arm Shaft Engine): Remove rocker covers, then remove bolts, nuts and flatwashers holding shaft to heads. Lift rocker shaft and arms straight up and away from heads. Drain cooling system to point below level of intake manifold. Remove carburetor air cleaner, disconnect fuel and vacuum lines, overdrive kick-down switch wires and accelerator linkage at carburetor. Disconnect coil wires and disconnect heat indicator wire at intake manifold. Disconnect heater hose and automatic integral choke heat tube at carburetor. Remove intake manifold bolts, then lift intake manifold, coil and carburetor straight up and away from engine. Discard gaskets (*CAUTION* - Cover intake ports in cylinder head to avoid entry of dirt). Remove crankcase ventilator pipe and gasket. Remove tappet chamber cover bolts. Lift cover up and away from engine. Discard gaskets. Insert hooked portion of Tool C-3158 into hole in tappet body (this portion of tool can be used to remove tappets without a varnish build-up at lower part of tappet body). Lift tappet out of bore. If lifter sticks in bore, slide puller portion of Tool C-3158 through cylinder head (pushrod) openings and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and slowly pull tappet out of bore with sharp twisting motion. As tappet clears bore, withdraw puller pin and puller tool, then lift tappet out of chamber.

Removal (Double Rocker Arm Shaft Engine): Drain cooling system to a point below level of intake manifold. Install valve spring compression Tool C-3024 over rocker arm so heel of tool rests on valve stem side. Make certain valve is seated and tappet body is resting on low point of camshaft lobe (see below). Using handle of tool for leverage, compress valve springs sufficiently to raise rocker arm above pushrod. While holding rocker arm in this position, slide rocker arm to one side along tube (*CAUTION* - To avoid damage to valves, be sure piston head is well below top of travel before compressing valve springs). Remove carburetor air cleaner, disconnect coil wires and wire from heat indicator sending unit. Disconnect heater hose and carburetor heat tube at integral choke. Remove intake manifold, coil and carburetor as an assembly. Remove tappet chamber cover and gasket. Insert hooked portion of Tool C-3216 into hole in tappet body (this portion of tool can be used to remove tappets without varnish build-up). Lift tappet out of bore. If tappet sticks, slide puller portion of tool C-3316 through cylinder head (pushrod) holes and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and pull tappet out of bore with twisting motion.

Disassembly: *(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.)* Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting Check to see that valve exerts a slight pressure on valve spring to insure valve seating Clean lifter assembly in clean solvent and remove all traces of varnish and carbon Blow parts dry with air DO NOT USE A CLOTH

CONTINUED ON NEXT PAGE

ROCKER ARM ASSEMBLY (DOUBLE ROCKER ARM SHAFT)

CONTINUED FROM PRECEDING PAGE

AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene (*CAUTION*—Container and kerosene must be absolutely clean) Allow lifter to fill with kerosene, then remove and replace the plunger cap. Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body. Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter. When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing This will prevent possible scoring of lifter plunger when engine is first started

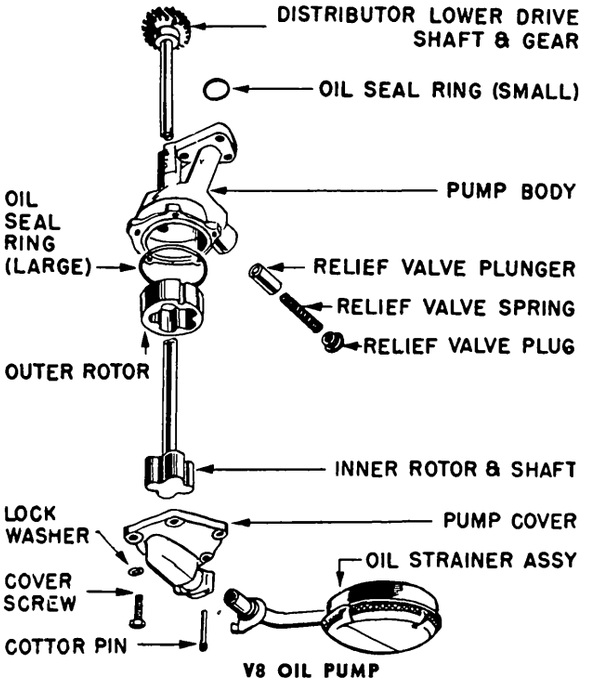
Reassembly: Reverse disassembly procedure as noted above

LOW POINT OF CAMSHAFT LOBE. Remove distributor cap, noting position of rotor for Nos 1 and 6 cylinders Set timing mark "DC" located on crankshaft pulley to pointer With rotor at No 1 firing position, the following lifters will be on the low side of the cam lobe No 2 intake and exhaust, No 4 exhaust, No 7 intake, No 8 intake and exhaust (*NOTE*—To remove No 1 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed) With rotor at No 6 position, following lifters will be on low side of cam lobe No 3 intake and exhaust, No 4 intake, No 5 intake and exhaust, No 7 exhaust (*NOTE*—To remove No 6 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed)

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP. Removal—Drain engine oil, remove oil pan Remove oil pump mounting bolts and lower pump straight down



Disassembly & Inspection: Remove cotter pin holding oil strainer to oil pump suction pipe, then remove pipe Remove cover bolts and cover Discard oil seal ring Remove pump rotor shaft and lift out pump outer rotor Remove oil pressure relief valve plug and lift out spring and plunger Wash all parts in a suitable solvent and inspect for damage or excessive wear Check all pump parts as follows

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers If diameter less than 2 244' or thickness less than 998 , replace both inner and outer rotors

Inner Rotor—Measure thickness of inner rotor with micro-calipers If thickness measures less than 998 , replace both inner and outer rotors

Rotor Depth—Slide rotors in pump body Place a straightedge across pump body Use a feeler gauge and measure clearance between top of rotors and straightedge If clearance in excess of 004", replace pump body

Outer Rotor to Pump Body Clearance—To check rotors for excessive wear, measure clearance between lobes of inner and outer rotors If clearance

V8 OIL PUMP

in excess of 010 , replace both inner and outer rotors

Reassembly: Use new oil seal ring between cover and body Tighten cover bolts to 10-15 ft lbs Prime pump and then install new oil seal ring in pump mounting face

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

IGNITION NOTES

ALL ENGINES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation: Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut tool will wedge bushing tight in its bore and will burnish bore to correct size *DO NOT REAM THE BUSHING*

DISTRIBUTOR BASIC TIMING Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows Rotate crankshaft until No 1 cylinder is at TDC (or firing position) When cylinder is in this position the pointer on chain case cover should be over "DC" on vibration dampener Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear Coat shaft of drive gear with engine oil Install it so that after the gear spirals into place it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase)

PROPELLER SHAFT

PROPELLER SHAFT CENTER BEARING. To remove assembly remove nuts and lockwashers from differential and transmission companion flanges to free propeller shafts at front and rear Take out four center bearing housing-to-frame crossmember mounting bolts remove propeller shaft and center bearing as an assembly

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Place transmission shifting lever in neutral and be sure the hand brake is released Disconnect front end of propeller shaft and remove adjusting screw cover plate Loosen brake cable guide clamping screw and back off cable adjusting nut Turn brake shoe adjusting nut to decrease shoe-to-drum clearance until a slight drag is felt on drum. Back off adjusting nut one full notch (using spanner wrench C-3014) to give approx 010" clearance (NOTE—be sure the two raised shoulders on the adjusting nut are seated in the grooves on adjusting sleeve) The cable length adjusting nut should be positioned against cable housing so there is at least 005" (but not more than 010") clearance between operating lever and brake shoe cable To lock the adjustment, tighten cable housing clamp securely and then tighten cable adjusting nut against housing Test hand brake lever for travel. When properly adjusted, 4 to 6 clicks of ratchet should be obtained to hold car Install adjusting screw cover plate and connect propeller shaft

HAND BRAKE ADJUSTMENT (External Type): The hand brake adjustments can be made from beneath car as follows Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for 015- 020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw Loosen guide bolt locknut and adjust guide bolt adjusting nut for 015- 020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut Turn large adjusting bolt nut (on lower end of bolt below springs) for 015- 020" band to drum clearance for upper half of band Groove in upper end of this nut must contact ridge on band operating lever spacer above nut
NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed 005" (if clearance excessive band may be distorted when brake applied) To correct, compress saddle in vise or place on block and tap lightly with a hammer.

►*1956 AIR CONDITIONED CAR SERVICE CAUTION: Use xtreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning "Misc llan us Cauti ns" in Miscellaneous Section.*

MODEL IDENTIFICATION

S ri s	Model Identification
Windsor	C-71
New Yorker	C-72
Chrysler 300B	C-72-300
Imperial	C-73
Crown Imperial	C-70

SERIAL NUMBER: Stamped on metal plate attached to left front door hinge post.

Starting S rial Nos.	Detroit	Los Angeles
Windsor V8	W 56 1001	W 56 L 1001
New Yorker V8	N 56 1001	N 56 L 1001
Imperial & Crown Imp.	C 56 1001	
Chrysler 300B	**3N 56 1001**	

ENGINE NUMBER: Stamped on boss on top of cylinder block just back of water pump.

Starting Engin N s. W E 56 1001 (Windsor), N E 56 1001 (New Yorker), C E 56 1001 (Imperial & Crown Imp.). **3 N E 56 1001 (Chrysler 300B).**

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*

"A"—All Cylinders .020" oversize.

"B"—All Crankshaft Journals .010" undersize.

"AB"—Both above conditions exist.

"MALTESE CROSS" (3/8" high)—ONE OR MORE crankshaft Journals .001" undersize. *See "Connecting Rods" and "Crankshaft" below.*

"DIAMOND" (3/8" high)—ALL valve lifters .008" oversize.

TUNE-UP

COMPRESSION PRESSURE: 140-170 lbs. (C-71), 150-180 lbs. (Others), at 150 RPM with plugs removed. Variation limit 15 lbs.

VACUUM READING: 18-21" idling.

VALVE TAPPET CLEARANCE: (C-70, C-71, C-72, C-73) No adjustment required in service (hydraulic lifters).

(C72-300) Intake .015", Exhaust .024", HOT. Intake .015", Exhaust .028", COLD.

MANIFOLD HEAT CONTROL: *NOTE* - Before installing valve on engine, lubricate valve shaft with graphi grease.

(C71 Standard): Single exhaust on right cylinder block with thermostatically controlled valve. Install heat control valve with counterweight toward front of engine and small anti-rattle spring retaining pin toward rear and adjacent to cylinder block.

(C70, C71 with P w r Pack, C72, C73, C-72-300): Dual exhaust system used. Heat control valve is in right exhaust pipe.

Coil Spring Installation - Position valve shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end of tongue of spring in upper left hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end tongue of spring around and hook under pin (left pin when facing coil end of valve).

Counterweight Installation - Place counterweight over shaft (shield upward) and insert lock in shaft slot. Center counterweight on shaft and turn weight on shaft until seated. Install stop, and tighten nut securely with tool T-109-173.

►*DUAL EXHAUST NOTE:* When valve is closed most exhaust gases are discharged through the left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders—RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs-Auto-Lite AR-52 (C71), AGR-42 (C70, C72, C73), AGR-41 (C-72-300), AGR-31 (C-72-300 with 10 to 1 optional head). 14 mm. Tighten plugs to 30-32 ft.lbs.

COIL: Auto-Lite CAD-4002, CAD 4003, CAH-4001. *12 Volt.*

Ignition Current—2.5 Amps. idling, 3.1 stopped.

Resistor—Auto-Lite PU-4002. Connected in circuit between "IGN" terminal of Horn Relay and (+) terminal of coil. *Resistor must be in circuit when testing coil output.*

DISTRIBUTOR: Auto-Lite. *12 Volt.* As follows:

Model	Auto-Lite No.
C71 (Std.) Early	① IBJ-4303A
C71 (Std.) Later	① IBJ-4303C
C71 (Power Pack - To Eng. WE-56-13366)	② IBK-4301A
C71 (Power Pack - After Eng. WE-56-13366)	① IBJ-4303C
C70, C72, C73	② IBK-4301A
C72-300	② IBK-4301C

①- Single breaker distributor.
②-Double breaker distributor.

Condenser - Auto-Lite IBB-2015R. **Capacity** .25-.28 mfd.
Contact Point Set - Auto-Lite IGW-3028MS (IBJ Distr.), IGW-3028KS (IBK Distr.).
Breaker Gap - .017" ± .002".
Cam Angle (IBJ) - 31° ± 3°. Do not set contact gap outside limits to obtain specified cam dwell.
Cam Angle (IBK) - 38° ± 3° with both sets of contacts. Do not set contact gaps outside limits to obtain specified cam dwell.

Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

IGNITION TIMING

Model	Std. Setting
C71 (Std.)	2° BTDC
C71 (Powerpack-To Eng. WE56-13366) ①	10° BTDC
C71 (Powerpack-After Eng. WE56-13366) ②	4° BTDC
C70, C72, C73	4° BTDC
C72-300	8° BTDC

①—With Distributor No. IBK-4301-A.
②- With distributor No. IBJ-4303C.

►*TIMING CAUTION (C72-300):* Disconnect distributor vacuum line, set ignition at 8° BTDC and reset engine idle back to 650 RPM.

CONTINUED ON NEXT PAGE

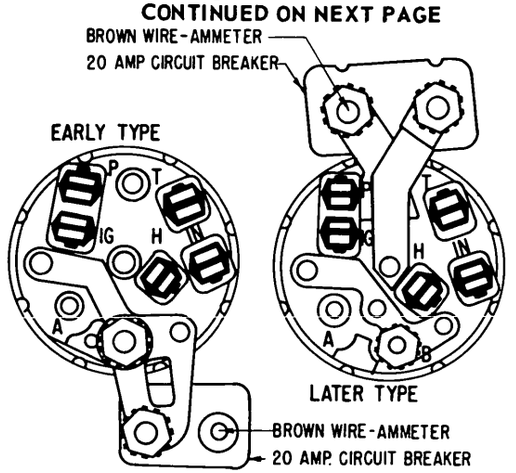
CONTINUED FROM PRECEDING PAGE

Timing Mark - On vibration damper with pointer on left side of front cover.

CARBURETOR

Car Model	Carter Carburetor No.
C70, C72, C73	WCFB 2314S, SA
C71 (Std. Trans,)	BBD 2312S
C71 (PowerFlite)	BBD 2313S
C71 (Power Package)	WCFB 2367S, SA
C72-300	WCFB 2444S (Front), 2445S (Rear)

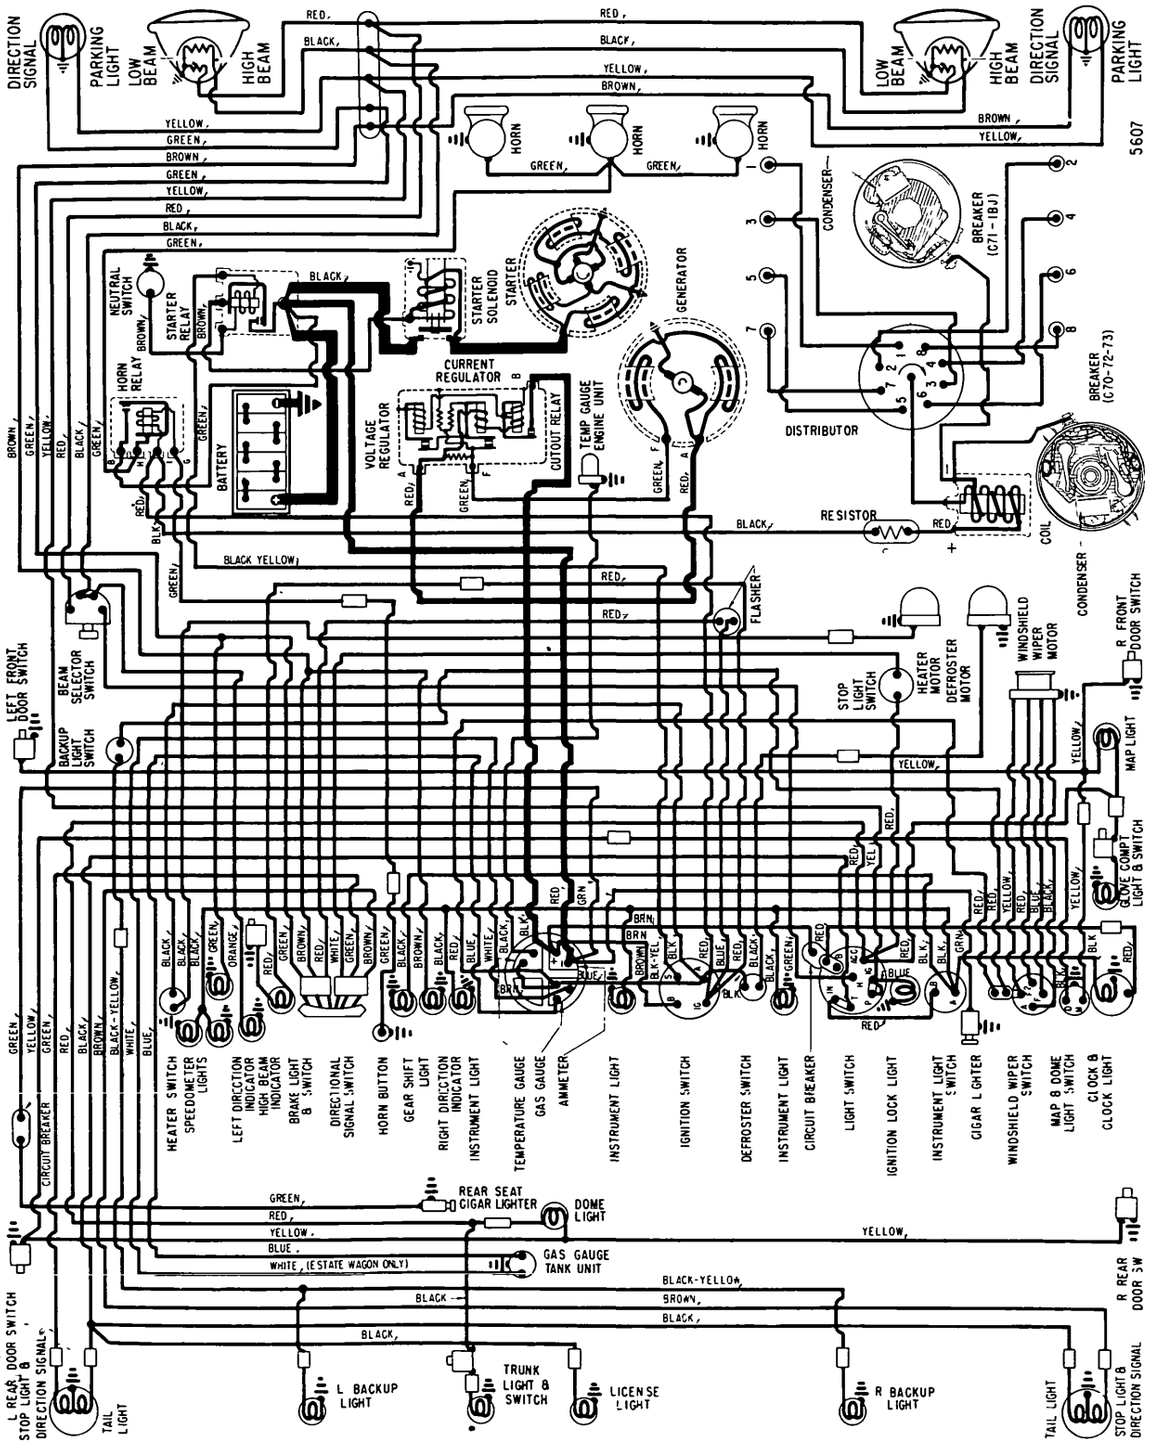
►*CARBURETOR PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: Later "SA" Carburetors have different specifications. See Carter WCFB 4-Barrel" Carburetors in Carburetion Section.*



►*IDLE SPEED (AIR CONDITIONED CARS): Summer and winter Idle Speed Adjustments are different and must be made as follows:*

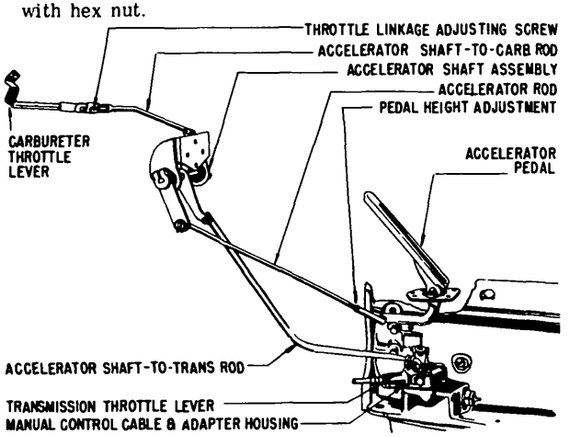
Winter Setting (Air Conditioner not in Operation)– Back off round adjusting nut on diaphragm shaft away from pawl to prevent interference with idle adjustment. Start engine, attach tachometer and with transmission control in neutral ("N") position and engine at operating temperature adjust engine idle to 475-500 RPM.

Summer Setting (Air Conditioner in Operation)–Adjust engine idle as for winter operation, then adjust fast idle device as follows:



Idle Speed-Up Control Adjustment (Cars with Air Conditioning)–Turn blower control switch to first position, temperature control switch to second position. Adjust round adjusting nut on fast idle diaphragm shaft to increase engine RPM to from 700 to 800 RPM.

CONTINUED ON NEXT PAGE



P-YELLOW WIRE TO PARKING LIGHTS
T- BLACK WIRE TO TAIL LIGHTS
IG-BLUE WIRE TO IGNITION LOCK LIGHT
H- GREEN WIRE TO FOOT DIMMER SWITCH
IN-RED WIRE TO INSTRUMENT LIGHT SWITCH
A-RED WIRES TO GLOVE COMPT, TURN SIGNAL & GEARSHIFT LGTS

FIRST & LATER TYPE LIGHT SWITCH

CONTINUED FROM PRECEDING PAGE

With hand brake on, move transmission control lever to drive ("Dr") range then back to neutral ("N") position. Readjust fast idle if necessary. Lock round nut with hex nut.

POWERFLITE & TORQUEFLITE THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT: Check and remove any binding condition in throttle linkage, bring engine up to operating temperature, remove air cleaner to make sure choke is fully opened (off fast idle cam), connect tachometer, adjust idling adjusting screw to give 650 RPM (C72-300B), 475-500 RPM (Others), with transmission in neutral. Loosen throttle linkage screw located on accelerator shaft to carburetor rod, move rear portion of accelerator to carburetor rod rearward until it is stopped by the idle stop on the transmission throttle cam. With rods in line and rear portion of rod lightly pre-loaded, lock throttle linkage adjusting screw to 15 ft. lb. torque.

CARTER B8D 2312S, 2313S
C71 (Exc. Power Package)

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

Idl Setting–¼-1¼ turns open. Turn screws out equally for richer mixture.

Idle Speed - 500 RPM. *For "Idle Speed Setting" and "Idl Speed-Up Contr l Adjustment" on Air Conditioned Cars, s CARBURETOR above.*

Float Lev l - 1/4" (Gauge T109-282) between top of each float and top surface of body casting. *NOTE* - This supersedes previous 7/32" setting.

Acc l rating Pump–Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm.

Fast Idl Cam Setting: .020" (Gauge T109-29) between lip of fast idle cam and boss on casting, with choke valve closed and lip on inner choke shaft lever contacting .lug on outer lever. Adjust by bending lip on inner choke shaft lever. On late carburetors, align index mark on cam with adjusting screw.

Fast Idle Throttle Cl arance: .015" (Gauge T109-44) between lower edge of valve and bore of carburetor with adjusting screw on high step of cam.

Aut matic Chok Setting: (2312S) Centered - set at index. (2313S) Set 1 point rich.

Slow Closing Throttle (Dashpot) Adjustment: 1/16" between shaft and operating lever with throttle valves closed and plunger shaft bottomed. Adjust by loosen-lock nut and turning dashpot unit in or out.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter BBD" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 6-7 lbs.

CARTER WCFB 4-BARREL

No. 2314S, SA (C70, C72, C73)
No. 2367S, SA (C71 Power Package)

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Setting - (2314S, SA) 1-2 turns open, (2367S, SA) 3/4-1 3/4 turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed - 500 RPM in neutral.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter WCFB 4-Barrel" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 6-7 lbs.

CARTER WCFB 4-BARREL

No. 2444S (Front), 2445S (Rear)
(C72-300)

Idle Setting - 1/4-1 1/4 turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed–650 RPM. Selector lever in neutral.

Idle Adjustment–Connect tachometer to engine and set hand brake. Place selector lever in neutral, warm up engine to operating temperature with choke fully released and carburetor on slow idle, adjust both idle screws until a smooth engine idle is obtained at 600-650 RPM. **To synchronize both carburetors,** remove throttle control rod and throttle connector rod. Install connector rod studs and return springs. Starting with closed throttle valves, open each an equal amount, open all four mixture screws **one turn.** Start engine and adjust speed of 600-650 RPM. Install connector rod, adjusting length so there is slight end play and no binding with both carburetors at idle. Attach throttle control rod, making sure it is adjusted so that the carburetor position is not disturbed.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter WCFB 4-Barrel" Carburetor in Carburetion Section.*

Fuel Pump Pressure: 6 - 7 lbs.

CARB. EQUIPMENT

Fuel Pump: Carter M961S (Early), M2413S (Later). Mechanical type.

Pressure - 6-7 lbs.

See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: Auto-Lite Electric Type.

Dash Unit - 14046A (Exc. Sub. & Est. Wgn.), 13705A (Sub. & Est. Wgn.)

Tank Unit - 13970A (Exc. Sub. & Est. Wgn.) 13872A (Sub. & Est. Wgn.)

See "Fu l Gaug s" in Carbur tion Secti n.

BATTERY

(C71) Auto-Lit 11-HS-60 r Willard HO-11-60. *12 Volt.* 11 plate, 60 ampere hour capacity.

(Others) Auto-Lite 12H-70. *12 volt,* 13 plate, 70 ampere hour capacity.

Grounded Terminal - Negative.

►*CAUTION:* This is reversed from previous models.

Engine Ground - Left front of engine

STARTER

Auto-Lite MDF-6001. *12 Volt.* **Armature** - MDF-2006.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 42-53 ozs. (new brushes).

Performance Data - MDF

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60 max.
6.5 ft.lbs.min.	Lock	4.0	240 max.

Starting Switch: Auto-Lite SAD-4001. Solenoid pinion shift and starting switch used with neutral safety switch (on transmission - Auto.Trans. cars) and SEPARATE relay, Auto-Lite RAJ-4001, mounted on fender splash shield. *See "Starter Controls" in Electrical Section.*

Neutral Safety Switch Adjustment: *See "PowerFlit " or "Torque-Flite" Transmission in Transmission Section.*

GENERATOR

Car Model	Auto-Lite Generator	Armatur
C70 (Pow. St.)	GGA-6002B	
C70 (Pow. St. & A.C.)	GGA-6002B, C	
Others (Std.)	GJC-7002A, B	GJC-2030 F
Others (Pow. St.)	GJC-7003A, C	GJC-2090 F
Others (Air Cond.)	GJC-7006A, B	
Others (Air Con d.)	GHM-6004C	
Others (P.S. & A.C.)	GJC-7003A, C	GJC-2090F
Others (P.S. & A.C.)	GHM-6003B	

►*SPECIAL GENERATOR NOTE:* GGA, GHM, and GJC type generators used. Performance specifications below apply equally to all generators, within any one of the three groups specified.

Performance Date - GGA - 12 Volt

Amperes	Volts	RPM 70 F.
4.0	14.6	950 max.
40.0 ℄	14.6	1600 max.
40.0 ℄	15.0	1600 max.

Performance Data - GHM - 12 Volt

Amperes	Volts	RPM C ld
5.0	14.0	875 max.
25.0 ℄	14.0	1325 max.
30.0 ℄	15.0	1350 max.

Performance Data - GJC - 12 Volt

Amperes	Volts	RPMC ld
20.0 ℄	15.0	1750 max.
30.0 ℄	15.0	2050-2250

℄ - Do not operate at high output without ventilating fan for any length of time. To do so may result in burned armatures and fields.

Fi ld Curr nt - (GGA, GHM) 1.1-1.3 amperes at 10.0 volts, (GJC) 1.2-1.3 amperes at 10.0 volts. Readings at 70° F.

Mot ring Curr nt - (GGA) 2.3-2.6 amperes. 3.1-3.5

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

amperes with felt oil seal in drive end head. (GHM) 3.0-3.5 amperes. (GJC) 3.4-3.9 amperes, all at 10.0 volts (70° F).

Rotation - Counter-clockwise at commutator end.

Belt Adjustment: Adjust generator so belt deflection midway between pulleys is ¼" with 9-12 lbs. pressure.

REGULATOR

Auto-Lite. *12 Volt.* Used with generators as follows:

Auto-Lite Regulator No.	Generator Type
VAT-6201A	GGA
VRX-6003B	GHM
VRX-6201A	GJC

Cutout Relay

Cuts In - 13.0-13.7 volts (VRX), 13.0-13.75 volts (VAT).

Cuts Out - 8.2-9.3 volts (approx. 3-5 amps. discharge)

Contact Gap - .015".

Air Gap - .031-.034".

Voltage Regulator

Setting - 14.5 volts at 80° F. while charging at 10.0 amperes or with .25 ohm resistor in series between regulator and battery.

Air Gap - .048-.052" with contacts just opening.

Checking & Adjusting - *See Electrical Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A - Operating Amperes	Test B
VRX	36 Max.	30 (28-32)
VAT	46 Max.	40 (38-42)

Test A - After 15 minutes operation charging at 10 amps.

Test B - After additional 15 minutes operation on current regulator (with load applied to hold voltage at 13.7-13.9 volts (VAT), 13.6-13.8 volts (VRX).

Air Gap - .048-.052" with contacts just opening.

Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Direction Signal: *See Electrical Section.*

Headlight & Panel Light Switch Removal: Remove knob on headlight switch after removing recessed head screw, then remove panel light switch control (indexed on its shaft by lugs in tab plate and slots in shaft). Remove hex nut from threaded sleeve, then remove switch (switches) from instrument panel.

Stop Light Switch Location: On forward end of master cylinder.

►*IGNITION-STARTER SWITCH CAUTION:* When installing accessories, use accessory terminal **only** on ignition-starter switch and **not** the ammeter terminal post.

CIRCUIT BREAKERS: Lighting - Three circuit breakers on back of lighting switch. Protect circuits as follows:

15 Ampere (Early), 20 Ampere (Later) - Protects Head and Beam Indicator Lights.

6 Ampere - Protects Parking, Tail, License Plate, Instrument, Ignition and Clock Lights.

6 Amper - Protects Stop, Map, Dome, Glove Compartment, Courtesy and Trunk Compartment Lights.

Windshield Wiper & Back-Up Lights: 5 Ampere. Mounted on rear of windshield wiper switch.

Window Lifts: 20 Ampere. Mounted behind left front kick panel.

Four Way Seat: 15 Ampere. Mounted behind left front kick panel.

HORNS: Auto-Lite, Jubilee, or Sparton. Dual horns with relay. *12 Volt.*

Auto-Lite - (High Pitch) HAD-4717, (Low Pitch) HAD-4029.

Horn Relay: Auto-Lite RAH-4002. *12 Volt.*

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*ENGINE NOTE: Two types of engines used. Spitfire (single rocker shaft engine) used on C71 Windsor models. Fire Power (double rocker shaft engine) used on other models.*

ENGINE SPECIFICATIONS: 90° V8 (All Models).

Model	Bore	Stroke	Displacement
C71	3.81"	3.63"	331 cu. ins.
Others	3.94"	3.63"	354 cu. ins.

Model	Compr. Ratio	Rated HP	Dev. HP & RPM
C71	8.5	46.5	225 at 4400
C71 (Pwr.Pkg.)	8.5	46.5	250 at 4600
C72-300	9.0	49.7	340 at 5200
C72-300 (Optl.Hd.)	10.0	49.7	355 at 5200
C70, C72, C73	9.0	49.7	280 at 4600

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Remove the oil lever indicator, crankcase plug and drain lubricating oil. Disconnect steering linkage at idler arm support bracket, and allow linkage to settle away from bottom of oil pan. Remove bolts that hold oil pan to cylinder block, slide pan out and down away from engine.

►*C71 NOTE:* On C71 (with single exhaust), disconnect crossover and "Y" pipe at exhaust manifolds and at clamp to exhaust extension so that crossover and "Y" pipe can be moved out of way. Make sure remainder of exhaust system is sufficiently supported.

ENGINE REMOVAL: *See "Engine" in Chrysler Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Chrysler Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chrysler Special Data.*

PISTONS

Two types used as follows:

C-71. Aluminum Alloy, thermally controlled by steel band, horizontal slot, elliptically turned, tin plated.

C-70, C-72, C-72-300B, C-73. Aluminum Alloy, slipper type, thermally controlled by steel strut, elliptically turned, tin plated.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bore is .020" oversize.*

Weight - **(C71)** 21 ozs., **(Others)** 22.8 ozs.

Removal - Pistons and rods removed from above.

Clearance - **(C71)** .00075-.00125" at top of skirt, **(Others)** .00075-.00125" measured 1.5" from bottom of skirt.

Fitting New Pistons: Insert piston in bore, upside down, with .002" x 1/2" feeler stock between thrust face of piston and cylinder wall. Pull required to withdraw feeler stock should be 8-12 lbs. at room temperature of 70° F.

Replacement Pistons: Standard, .005", .020", .030", .040", .060" oversize. Fitted pins included with new pistons.

Installing Pistons: Assemble pistons to connecting rod on right hand cylinder bank (2-4-6-8) with indent on top of piston on side opposite to large chamfer at insert end of connecting rod. On left bank (1-3-5-7) assemble with indent on same side as large chamfer at insert end of connecting rod. *See Rod Installation.*

PISTON PINS

Floating type with lock ring at each end. *NOTE* - Pin offset in piston toward right side of engine.

►*PISTON PIN CAUTION:* 1956 pins have thicker wall section and must not be interchanged with 1955 type (will affect engine balance).

Diameter - .9841-.9843". **Length** - 3.140-3.150".

Clearance in Piston—.0000-.0005" or thumb press fit at 70° F.

Clearance in Rod—.0001-.0004". Selective fit.

Replacement Pins: Standard, .003", .008" oversize.

NOTE—Fitted pins are furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0775-.0780"	.010-.020"	.002-.0035"
Compr. (#2)	.0775-.0780"	.010-.020"	.002-.0035"
Oil (#3)	.1860-.1865"	.101-.020"	.001-.0025"

C-C-71 Side Clearance #1 .0015-.0030", #2 .0010-.0025, #3 .0010-.003".

C-72-300 RING NOTE - Top compression ring is chrome.

Replacement Rings: Furnished in sets Standard, .010", .020", .030", .040", .060" oversize.

Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length—6 5/8". **Weight** 25.2 ozs.

Crankpin Journal Diameter—2.249-2.250". Out-of-round and taper limits .001".

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals machined UNDERSIZE). See "Crankshaft" below.*

Bearings (Lower) - Steel-backed babbitt (except C72-300 which are Tri-Metal).

C72-300 NOTE - Crankshaft special hardened type.

Clearance—.0005-.0015".

Endplay—.006-.014" (total for both rods).

Replacement Bearings: Standard, .001", .002", .003", .010", .012" undersize.

Installing Rods: (*NOTE*—Connecting rod bores are chamfered more on one side than other. This larger chamfer must be installed toward crankshaft fillet). When installing lower bearing shell, make certain that "V" groove in shell is in line with "V" groove in cap. This allows lubrication of cylinder wall. Bearing shells should always be installed so that small formed tang fits into machined grooves of rod. Oil ring expander gap should be toward outside of "V" of engine.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil ring gap should be toward inside of "V" of engine
See Piston Installation above

►*CAUTION:* Rods are **interchangeable.** However, when rods are assembled to piston, the assemblies of one engine bank are **not interchangeable** with the other bank.

CRANKSHAFT

Journal Diameter—2.4995-2.5005". Five bearings. Out-of-round limit .001".

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*

.010" UNDERSIZE (Main & Connecting Rod Journals)—Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—A "Maltese Cross" (3/8" high) stamped on the machined surface following the engine number indicates that ONE OR MORE crankshaft main and connecting rod journals are machined .001" UNDERSIZE. The position of undersize journals are stamped on the machined surface of the center (No. 3) counterweight in following manner: "R" indicates connecting rod journal, "M" indicates main bearing journal. The number following letter indicates main or connecting rod journal number (counting from front of engine)

Bearings - Steel-backed babbitt (except C72-300 which are Tri-Metal)

Clearance - 0005-0015" (except C72-300 Rear Main Bearing - .0015-.0025").

Replacement Bearings: Std., .001", 002", 003", .010", .012" undersize. Upper and lower halves of bearings Nos. 1, 2, and 4 are alike and interchangeable, Upper No. 3 is interchangeable with Lower No. 3, Upper & Lower No. 5 are **not interchangeable.**

End Thrust: Taken by center (#3) main bearing.

Endplay: .002-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chrysler Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chrysler Special Data.*

CAMSHAFT

Journal Diameters—(Nos. 1, 2, 3, 4) 1.998-1.999. (No.5) 1.4355-1.4365".

Bearings—Removable, steel-backed, babbitt lined bushings

Clearance — 001-.003".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay—.002-.006".

Timing Chain: Width 1 1/8". **Pitch** .375". **Length** 68 links.

Camshaft Setting: Timing Check: Marks on gears should be adjacent and in line with straightedge across shaft centers **Chain Installation:** Install chain and gears as an assembly Mesh crankshaft gear in chain with keyway out toward chain, mesh camshaft gear in chain with keyway toward crankshaft gear and mark on gear in line with **23rd chain pin** clockwise from pin at mark on crankshaft gear Install assembly on engine, turning camshaft and crankshaft to line up keys with gear keyways, install fuel pump eccentric (must engage camshaft key), tighten camshaft cupwasher and bolt to 35 ft lbs Check timing as above

Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Special Data*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Chrysler Special Data*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chrysler Special Data*

VALVES

Tappet Clearance: (C72-300) 015" Intake, 024" Exhaust, HOT 015" Intake, 028" Exhaust, COLD

(Others) None in service (hydraulic)

Valves	Head Diam.	Stem Diam.	Length
C71 Intake	1 13/16"	372-373"	4 25/32"
C71 Exhaust	1 1/2"	371-372"	4 3/4"
Others Int	1 15/16"	372-373"	5 1/32"
Others Exh	1 3/4"	371-372"	4 63/64"

Valves	Seat Angle	Lift	Stem Clearance
C73-300 Int	45°	444"	001-003"
C72-300 Exh	45°	435"	002-004"
Others Int	45°	381"	001-003"
Others Exh	45°	357"	002-004"

Valve Seat Width - 1/16-3/32" (Int), 3/64-1/16" (Exh)

►*C71 OVERSIZE VALVE STEM NOTE:* Valves with oversize stems are available in 005", .015", 030" oversize *See Valve Guides below*

►*C72-300 EXHAUST VALVE SEAT INSERT CAUTION: See "Valve System" in Chrysler Special Data*

Intake Valve Stem Oil Seal - Seal installed on intake valve stem after valve is inserted in head and before installation of springs Seal will seat itself in correct position on guide

►*VALVE GRINDING CAUTION:* Valve and seat grinding should not change position of valve in head more than 1/32" from original position Use Gauge C-3436 (C-71), C-3061 (Others) to check distance stem extends through cylinder head If valve tip exceeds maximum allowable on gauge, grind tip as necessary (do not go below minimum allowable on gauge) Improper valve clearance at high speed will result if condition not corrected

Valve Springs: One used on all except C72-300 which used Inner and Outer springs (same as previous models)

Free Length-2" (Except 300B) 1 7/8" Outer, 1 25/32" Inner (300B)

Valve Spring Specifications (C-70,C-71,C-72,C-73)

Valve	Lbs. Pressure	Length
Open	166	1 31"
Closed	72	1 69"

(C 72-300)

	Inner Spring		Outer Spring	
Valve	Lbs.Press.	Length	Lbs.Press.	Length
Open	66	1 09"	158	1 22"
Closed	28	1 53"	60	1 66"

►*CAUTION: Springs must be square within 1/16" (Use steel square on surface plate—revolve spring against square noting alignment of top coil).*

►*VALVE SPRING HEIGHT CAUTION* If valves or seats are reground, check **installed** height of spring If height is 1 23/32" or greater install a 1/16" spacer (Part No. 1400482) in the head counter-bore to bring height back to a nominal 1 5/8-1 11/16".

►*VALVE SPRING LOAD CAUTION: Hydraulic lifter "pump up" will restrict engine speed and cause valves to burn if valve spring loads are not maintained.*

Valve Guides (C71 Spitfire): Cast integral with cylinder head When valve stem clearance excessive, use reamer tool set to ream guides for next oversize valve as follows: C-3433 (379-380" - 005" O S), C-3430 (389-390" - 015" O S), C-3427 (404-405" - 030" O S)

Valve Guides (Others) - Drive old guides out through top of head using tool C-3150 Install new guides by driving them up through valve port opening To install INTAKE valve guide, place a steel scale across combustion chamber and drive valve guide in until punch mark on tool C-3150 is flush with face of cylinder head To install EXHAUST valve guide, drive it in until it is flush with the machined face of the hole Ream guide to 374-375" with tool C-741

►*CAUTION Oil hole in top of exhaust guide must face up*

NOTE—If Valve Guide Tool C-3150 is not available, drive guides in, measuring from top of valve seat as follows: Intake 31/32", Exhaust 1 3/64"

Hydraulic Valve Lifters: Integral flat-valve type.

►*VALVE LIFTER OVERSIZE CAUTION: .008" OVERSIZE Valve lifters used on some engines.* A "DIAMOND" 3/8" high stamped on engine number pad following engine number indicates that all lifters are 008" oversize

Diameter— 9040-9045" **Clearance in Block**— 0005-0015"

Lifter Overhaul & Testing—*See "Valve System" in Chrysler Special Data.*

►*VALVE GRINDING CAUTION:* See Valves (above).

Rocker Arm Assembly: *See "Valve System" in Chrysler Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing (C71)

Intake Valves - Open 5° BTDC, Close 67° ALDC
Exhaust Valves - Open 39° BLDC, Close 25° ATDC

Valve Timing (C70, C72, C73)

Intake Valves - Open 15° BTDC, Close 57° ALDC
Exhaust Valves - Open 49° BLDC, Close 15° ATDC

Valve Timing (C72-300)

Intake Valves—Open 35° BTDC Close 65° ALDC
Exhaust Valves—Open 65° BLDC Close 25° ATDC

Valve Timing Check (Exc. C-300)—With No 1 intake valve closed Insert a 210" spacer between rocker arm and #1 intake valve stem, install dial indicator over this valve so that pointer contacts valve spring at a right angle Wait until seat stops moving (indicating that plunger bottomed so that lifter is solid) Set dial indicator at "Zero", turn crankshaft until dial indicator shows that valve has lifted 021" Pointer on cover should indicate between 5° BTDC to 7° ATDC if timing correct. Then turn crankshaft **counter-clockwise** until lifter is back down to the valve closed position. Re-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

move spacer from between rocker arm and valve stem *See "Camshaft Setting" under CAMSHAFT above.*

►*CAUTION Do not turn crankshaft further than indicated above, which might bottom spring and damage valve mechanism*

Valve Timing Check (C72-300) - Turn crankshaft until No 1 intake valve is closed and No 1 piston is on TDC Install a dial indicator so that pointer contacts valve spring retainer as nearly at right angle as possible Adjust valve rocker screw to provide zero clearance Set dial indicator to zero and turn crankshaft **clockwise** (normal running direction) until dial indicator shows valve has lifted 081" Timing marks on vibration damper should read 5° BTDC to 7° ATDC If reading not within specified limits, check gear index marks and inspect timing chain for wear After valve timing checked, reset valve lash to specified operating limits *See "Camshaft Setting" under CAMSHAFT above*

OILING SYSTEM

►*AIR-CONDITIONED CAR FILTER CARTRIDGE CHANGE NOTE* Due to interference from fender skirt or air conditioning lines immediately above filter cover, filter assembly must be removed from engine to change filter cartridge

Crankcase Capacity: 5 qts (refill) Add one additional quart when filter changed

Normal Oil Pressure: 40-65 lbs with warm oil operating at 40-50 MPH

►*OIL PRESSURE CAUTION:* Oil pressure will drop to 15-20 lbs when FILTER ELEMENT IS CLOGGED Replace element

Oil Pressure Relief Valve—Mounted in oil pump Adjustable. *NOTE*—When replacing relief valve spring use same color spring

Oil Pressure Gauge—Auto-Lite 13700A Not Electric

Oil Pump· Rotor type In crankcase at rear end Driven by lower distributor drive shaft

Pump Overhaul—*See "Oiling System" in Chrysler Special Data*

Priming Oil Pump (After Installation)—Before installing filter assembly, introduce ½ pint of engine oil into the lower hole of the filter pad with a pressure gun or long nosed oil can

Oil Filter: Full-flow At right rear engine All oil enters lubrication system of engine through filter at full pump pressure Safety valve in filter opens if element is clogged, allowing oil to pass into lubrication system under a reduced pressure of 25-45 lbs

Filter Element—Install new filter element and cover gasket at 5000 mile intervals (or earlier if required) Change oil at same time filter element is changed

►*AIR-CONDITIONED CAR FILTER CARTRIDGE CHANGE NOTE* Due to interference from fender skirt or air conditioning lines immediately above filter cover, filter assembly must be removed from engine to change filter cartridge

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe

COOLING

Water Capacity: (C71) 24 qts , (Others) 25 qts One additional quart on all models with heater

Pressure Valve: Chrysler 1373136 (Opens at 7 lbs) Radiator filler cap 14 lb type used with Air Conditioning

Thermostat: Choke type in cylinder head water outlet Starts to open at 160-165° F

Water Pump· Ball bearing type No lubrication required *See "Chrysler" in Water Pump Section for data*

Pump Removal—Drain cooling system Remove radiator shroud assembly fan belt, pulley and fan Remove radiator outlet hose from thermostat housing Remove wire from temperature gauge sending unit Remove pump housing-to-cylinder block attaching bolts, remove pump housing assembly

Temperature Gauge: Auto-Lite. Electric type

Dash Unit - 14145A

Engine Unit-13550A Mounted in pump housing assembly

CLUTCH

Borg & Beck	Model	Assy. No.	Disc No.
Standard	10A7	361376	382366

See "Borg & Beck" Clutches in Clutch Section

Pedal Adjustment: Turn clutch release fork rod adjusting nut until 3/16" free play at outer end of clutch fork is obtained This adjustment will give necessary 1" free play at pedal

Over-Center Spring Adjustment: With clutch pedal in fully released position, and with over-center spring eyebolt finger tight, hold spring eyebolt, spring and bracket assembly as a single unit and with an adjusting wrench tighten adjusting nut seven full turns

Removal: Disconnect propeller shaft, speedometer cable, parking brake cable, and gearshift control rods Remove transmission (See Synchro-mesh Transmission) Mark clutch cover and flywheel Remove bolts that hold clutch cover to flywheel, loosening each bolt a few turns (in succession) until cover is free Remove clutch disc and pressure plate assembly from clutch housing

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh
See "Chrysler Synchro-mesh" in Transmission Section

Transmission Controls: *See "Transmission Controls" in Transmission Section*

Removal Jack up car at front and place floor jacks under lower control arms Disconnect propeller shaft at front end If transmission is to be disassembled, loosen companion flange nut Disconnect speedometer cable, and hand brake cable at brake band Disconnect gearshift and gearshift selector control rods at transmission Remove capscrews and nuts which attach transmission to clutch housing Remove transmission assembly by pulling it back, down and out of car

NOTE—When installing transmission use pilot studs to avoid springing clutch disc

POWERFLITE TRANSMISSION

Torque converter and hydraulically operated planetary transmission
See "PowerFlite" Transmission in Transmission Section for complete data.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION See "PowerFlite" Transmission in Transmission Section for data.*

►*TESTING & TROUBLE SHOOTING See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).

►*OVERFILLING CAUTION:* High engine speed or high temperature operating conditions may cause transmission oil to expand to point where transmission is, in effect, overfilled, causing governor pressure to drop to point to permit a high speed downshift in transmission *See "Checking Fluid Level" below*

Checking Fluid Level - *NOTE* - Manufacturer recommends checking fluid level with engine cold (normal temperature of 70° F)

Cold Check - If oil level between (L) Low mark and end of dipstick, **1 pint** of Transmission Fluid Type "A" may be added, but no more than 1 pint

After Operation Check - If oil level is above (L) Low mark, do not add oil If oil level is above (F) Full mark, drain to 1/2" below full mark Add oil only WHEN OIL LEVEL IS BELOW THE (L) LOW MARK on dipstick, and transmission has been brought up to operating temperature by actual driving In this case add **1 pint** of oil only

Oil Pan Filler Tube (Location)—At right rear of engine compartment.

►*CAUTION* To prevent dirt from entering transmission, make sure oil level indicator is properly seated in filler tube

Linkage Adjustments: *See "PowerFlit " Transmission in Transmission Section*

►*OTHER "POWERFLITE" SERVICE DATA See "PowerFlite" Transmission in Transmission Section for data.*

TORQUE-FLITE TRANSMISSION

Wide range torque converter and automatically operated planetary gear transmission

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION See "Torque-Flite" Transmission in Transmission Section for data*

►*TESTING & TROUBLE SHOOTING*· *See "Torque-Flite" Transmission in Transmission Section*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A)

Checking Fluid Level - Idle engine in (N) Neutral while checking fluid level (L) Low mark on dipstick is proper level for a cold (Room temperature of 70° F)

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

transmission. After transmission has been brought up to operating temperature, oil level should rise to (F) Full mark on dipstick. If above (F) mark at operating temperature, drain oil to bring level to (F) Full mark or add oil to bring level to (F) Full mark if below.

Oil Filler Tube (Location) - At right rear of engine compartment.

Linkage Adjustments: *See "Torque-Flite" Transmission in Transmission Section.*

►*OTHER "TORQUE-FLITE" SERVICE DATA: See "Torque-Flite" Transmission in Transmission Section*

UNIVERSALS

Detroit Universals. (C71, C72, C72-300) Ball & Trunnion used at front, cross type used at rear. (C70, C73) Cross type used at front, rear, and center bearing joints.

Propeller Shaft Center Bearing: *See "Propeller Shaft" in Chrysler Special Data.*

REAR AXLE

Own. Semi-floating type with hypoid gear and Hotchkiss Drive. Barrel type. *NOTE* - Axle gear thrust screw and pad no longer used.

See "Chrysler Hypoid" in Rear Axle Section.

Axle Ratios	Standard Trans.	Auto. Trans.
C70		3.54 (39-11)
C71 Pass.	3.73 (41-11)	3.54 (39-11)
C71 T & C Wgn.	3.91 (43-11)	3.73 (41-11)
C72 Pass.	3.07 (40-13)	3.36 (37-11)
C72 T & C Wgn.		①3.54 (39-11)
C73		②3.07 (40-13)
C72-300	③	③

① - Optional Ratios 3.07 (40-13), 3.36 (37-11).
② - Optional Ratios 3.36 (37-11), 3.54 (39-11).
③ - 12 optional ratios available ranging from 3.07 (40-13) to 6.17 (37-6).

Backlash - .006-.008"

Carrier Removal: Disconnect rear universal, remove axle shafts,(see below), take out carrier capscrews, lift off carrier assembly.

Axle Shaft Removal: Remove wheel, hub, and drum assembly (use screw type hub puller - Tool C-845), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-757) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller).

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust,.remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels.

Endplay—.003-.008"

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic, non-adjustable. Serviced by replacement.

FRONT SUSPENSION

Independent. Coil springs and direct acting shock absorbers.

See "Chrysler" in Front Suspension Section for complete data.

Kingpin Inclination - (C70) 7°. (Others) 5.5°. At 0° camber.

Caster—Neg. 2° to 0° (Neg. 2° preferred with Manual Steering, 0° with Power Steering. Left side should be 0° to ¾° greater than right side within these limits).

Camber—Neg. 1/8° to Pos. 5/8° (Left side Pos. 1/2°, Right side 0° preferred).

Toe-In - 1/8" preferred.

Toe-Out on Turns-Inner wheel 21½°±1°, outer wheel 20°.

STEERING

Manual: Gemmer. Worm and three-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering: "Coaxial". Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column.
See "Coaxial" Power Steering in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" Steering Section.*

BRAKES

►*BRAKE "SQUEAK" CORRECTION: See Chrysler "Center Plane" Brakes in Brake Section.*

Service: Center Plane (Floating Shoe) hydraulic type. *See Chrysler "Center Plane" Brakes in Brake Section.*

Drums—Centrifuse. Diameter 12".

Wheel Cylinder Diameter—1 1/8" bore. Single acting (front), double acting (rear wheels)

Replacement Linings & Shoes—Linings or shoes with linings furnished in Standard & .030" oversize.

Lining—Molded asbestos (bonded to shoe). Length—12.57 per shoe. Width - 2½". Thickness - 13/64".

Braking Power - 60% front, 40% rear.

Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.

Rear Wheels - Same as front wheels except that on rear wheels forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of reverse wheel rotation.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid—Filler plug at top of master cylinder (on dash panel in engine compartment).

Removal—Disconnect pushrod. Disconnect brake line tube at master cylinder. Disconnect stop light switch leads, remove four stud nuts from studs, remove master cylinder.

Power Brakes: "Bellows or "Piston" Assist type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder). *See Chrysler, DeSoto, Dodge, Plymouth Bellows Type" or "Piston Type" power brakes in Brake Section.*

Removal of Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond extremities of bracket (*NOTE* - If pedal linkage is allowed to extend through hole in dash panel, trigger arm may be damaged). Disconnect vacuum hose at power unit. Remove complete power unit and bracket assembly by removing four nuts and lockwashers. Carefully withdraw unit from dash panel.

Parking Brake: On propeller shaft at rear of transmission. 6" External contracting type used with standard transmission. 7" Internal expanding type used with Automatic Transmission.

Adjustment - *See "Hand Brake Notes" in Chrysler Special Data.*

Lining - Width - 2". Thickness - 5/32". Length - 13.06" (Int. Exp.), 15.38" (Ext. Contr.).

Clearance (Internal Expanding) - Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

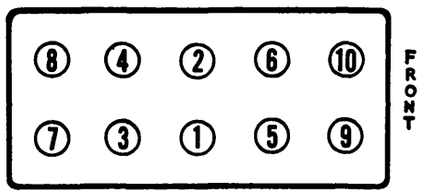
Clearance (External Contracting) - Adjust anchor screw so clearance between band and drum at anchor is .015-.020".

MISC. MECHANICAL

Windshield Wipers: Auto-Lite EPF-4001. Electric type.

See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.

Air Conditioning: Chrysler "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*



Power Window Regulators: Auto-Lite. Electric type. Reversible type motor in each window. Controlled by switch and master control switch. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Auto-Lite. Electric type. *See "Power Seat Adjusters" in Miscellaneous Section.*

Convertible Top Control: Auto-Lite. Electrical-Hydraulic type. *See "Chrysler Top Control" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

V8 ENGINES

ENGINE

ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery. Remove fan shroud, radiator, and hood. *(NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission. Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. *(NOTE* - Place a rollaway jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support. Lower car to convenient working height, then remove engine front support mounting bolts. With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.

Tightening Torque—See Tightening (Torque Wrench) Specifications above.

CYLINDER HEAD INSTALLATION (Double Rocker Shaft): Use new gaskets when installing head. Insert cylinder head bolts into rocker arm support brackets. Insert pushrods through holes in head (short rods in upper holes - intake, long rods in lower holes - exhaust). Place rocker arm assemblies in position on heads, then position pushrods. Starting at top center, tighten all cylinder head bolts to correct torque (see Tightening Specifications above). Install exhaust manifolds, crankcase breather tube, and intake manifold. *NOTE* - When installing intake manifold, insert short bolts in holes on extreme ends of manifold.

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos. With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap. Tap seal down in position with Tool C-3511 until tool is seated in bore. Hold tool down and cut off protruding ends flush with cap. Install bearing insert and both cap seals. The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine.

ENGINE FRONT COVER

ENGINE FRONT COVER (Double Rocker Shaft Engines): Proceed as follows:

Removal: Remove water pump. Remove vibration dampener retainer bolt and washer. Remove two of the vibration dampener pulley bolts and install puller Tool C-3033. Remove crankshaft pulley and vibration dampener as an assembly. Remove felt dust seal and vibration dampener hub key from crankshaft slot. Remove left cylinder bank exhaust pipe. Disconnect fuel lines at fuel pump. Remove fuel pump. Remove oil level indicator. Remove starter using Tool C-455. Drain engine oil and remove oil pan. Remove cover bolts and lockwashers. Drive chain case cover off the two dowel pins, using soft hammer.

Installation: Be sure mating surfaces of cylinder block and cover are clean. Apply moderate coat of sealing compound to block and cover faces, install new gasket. Make sure crankcase oil slinger is in proper position (flange end pointing toward seal). Position cover on two dowel pins and then gently tap cover in place. Install cover bolts and lockwashers and tighten to 30 ft. lbs. Install other items by reversing removal procedure.

FRONT OIL SEAL: Remove crankshaft pulley and water pump housing. Loosen oil pan bolts sufficiently until pan clears chain case cover. Install Tool C-3506 and remove seal. Discard seal and retainer. Position new seal and retainer assembly in housing and press into place using Tool C-3506. Seal must be tight against seat surface. *CAUTION* - Always have thin shoulder away from front of cover with stamped case cover, thick shoulder away from front of cover with cast iron cover.

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: With intake manifold, tappet cover, pushrods, tappets and timing gears removed, remove distributor. Lift out distributor drive gear and stub shaft. Remove camshaft thrust plate attaching bolts and oil trough. Withdraw camshaft and spacer, being careful not to damage cam bearings with cam lobes.

VALVE SYSTEM

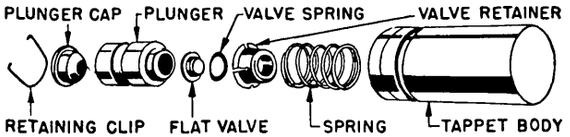
EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished .010" O.S. Use special Tool C-3140 (Double Rocker Shaft Engines) to remove inserts. After inserts have been removed from engine, smooth any roughness of seat with a blunt drift. Valve seat inserts should be from .002-.004" larger than counterbore to insure correct fit. If inserts found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert. Place inserts in dry ice for approximately 10 minutes. Clean counterbore thoroughly and install a chilled insert with valve side up, and drive it into place with Installing Tool C-767.

ROCKER ARMS

ROCKER ARM ASSEMBLY: Removal—Remove rocker arm covers. Place cotter pins in holes of first and last rocker arm brackets (if not already there) to prevent springs on rocker from pushing assembly apart when cylinder bolts removed. Completely loosen ten bolts on each bank that attach rocker arm support brackets to cylinder head and block. Grasp support bracket at each end of head, pull rocker assemblies and bolts directly away from heads, then remove push rods and place in respective slots in holder C-3068. ***CAUTION—Use care when removing rocker assemblies in order not to jerk cylinder heads off locating dowels which would allow them to drop and become damaged.***

Installation: Insert cylinder head bolts in brackets, with **short** bolts in intake side. Insert push rods through push rod holes in heads (short rods in upper intake holes, long rods in lower exhaust holes). Place rocker arm assemblies in position on heads, lining up all push rods to their respective rocker arms. Starting at top center tighten all cylinder head bolts to torque indicated in Tightening Specifications above. ***When tappets are full, extreme care must be taken when tightening head bolts so that tappets have time to bleed down to their operating length.*** Bulged tappet bodies and permanent noisy operation will result if tappets are forced down too rapidly.

HYDRAULIC VALVE LIFTER



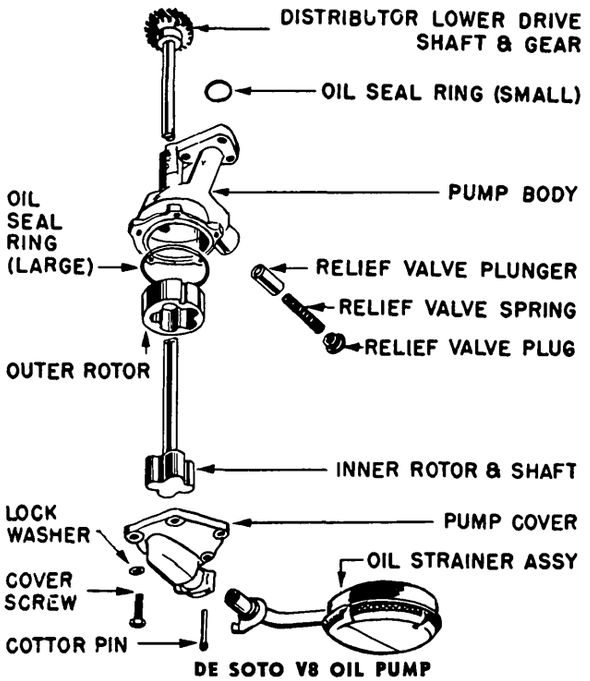
HYDRAULIC VALVE LIFTERS (One-Piece Integral Type): Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.

Removal (Double Rocker Arm Shaft Engine): Drain cooling system to a point below level of intake manifold. Install valve spring compression Tool C-3024 over rocker

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

arm so heel of tool rests on valve stem side. Make certain valve is seated and tappet body is resting on low point of camshaft lobe (see below). Using handle of tool for leverage, compress valve springs sufficiently to raise rocker arm above pushrod. While holding rocker arm in this position, slide rocker arm to one side along tube (*CAUTION* - To avoid damage to valves, be sure piston head is well below top of travel before compressing valve springs). Remove carburetor air cleaner, disconnect coil wires and wire from heat indicator sending unit. Disconnect heater hose and carburetor heat tube at integral choke. Remove intake manifold, coil and carburetor as an assembly. Remove tappet chamber cover and gasket. Insert hooked portion of Tool C-3216 into hole in tappet body (this portion of tool can be used to remove tappets without varnish build-up). Lift tappet out of bore. If tappet sticks, slide puller portion of tool C-3316 through cylinder head (pushrod) holes and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and pull tappet out of bore with twisting motion.



DE SOTO V8 ONE-PIECE VALVE LIFTER

Disassembly: *(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.)* Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting Check to see that valve exerts a slight pressure on valve spring to insure valve seating Clean lifter assembly in clean solvent and remove all traces of varnish and carbon Blow parts dry with air DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene *(CAUTION*—Container and kerosene must be absolutely clean) Allow lifter to fill with kerosene then remove and replace the plunger cap Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing This will prevent possible scoring of lifter plunger when engine is first started

Reassembly: Reverse disassembly procedure as noted above.

LOW POINT OF CAMSHAFT LOBE. Remove distributor cap, noting position of rotor for Nos 1 and 6 cylinders Set timing mark "DC" located on crankshaft pulley to pointer With rotor at No 1 firing position, the following lifters will be on the low side of the cam lobe No 2 intake and exhaust, No 4 exhaust, No 7 intake, No 8 intake and exhaust *(NOTE*—To remove No 1 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed) With rotor at No 6 position, following lifters will be on low side of cam lobe No 3 intake and exhaust, No 4 intake, No 5 intake and exhaust, No 7 exhaust *(NOTE*—To remove No 6 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed)

DE SOTO V8 OIL PUMP

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP. Removal—Drain engine oil, remove oil pan Remove oil pump mounting bolts and lower pump straight down

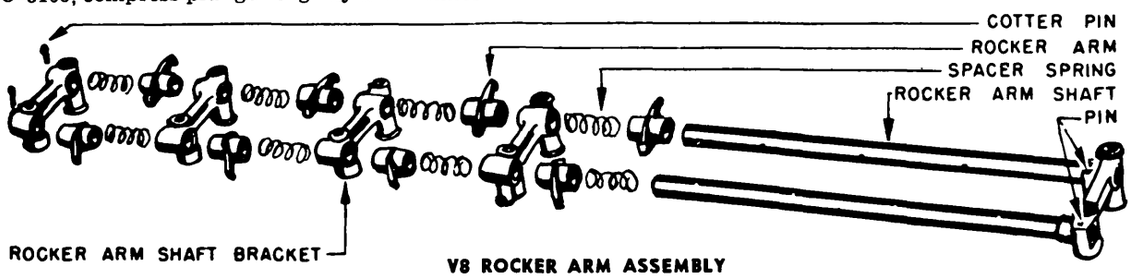
Disassembly & Inspection: Remove cotter pin holding oil strainer to oil pump suction pipe, then remove pipe Remove cover bolts and cover Discard oil seal ring Remove pump rotor shaft and lift out pump outer rotor Remove oil pressure relief valve plug and lift out spring and plunger Wash all parts in a suitable solvent and inspect for damage or excessive wear Check all pump parts as follows

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers If diameter less than 2 244" or thickness less than 998', replace both inner and outer rotors

Inner Rotor—Measure thickness of inner rotor with micro-calipers If thickness measures less than 998", replace both inner and outer rotors

Rotor Depth—Slide rotors in pump body Place a straightedge across pump body Use a feeler gauge and measure clearance between top of rotors and straightedge If clearance in excess of 004", replace pump body

Outer Rotor to Pump Body Clearance—To check rotors for excessive wear, measure clearance between lobes of inner and outer rotors If clearance in excess of 010", replace both inner and outer rotors



Reassembly: Use new oil seal ring between cover and body Tighten cover bolts to 10-15 ft lbs Prime pump and then install new oil seal ring in pump mounting face

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below*

IGNITION NOTES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation: Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut tool will wedge bushing tight in its bore and will burnish bore to correct size *DO NOT REAM THE BUSHING*

V8 ROCKER ARM ASSEMBLY

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows: Rotate crankshaft until No. 1 cylinder is at TDC (or firing position). When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener. Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear. Coat shaft of drive gear with engine oil. Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase).

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Place transmission shifting lever in neutral and be sure the hand brake is released. Disconnect front end of propeller shaft and remove adjusting screw cover plate. Loosen brake cable guide clamping screw and back off cable adjusting nut. Turn brake shoe adjusting nut to decrease shoe-to-drum clearance until a slight drag is felt on drum. Back off adjusting nut one full notch (using spanner wrench C-3014) to give approx. .010" clearance. (NOTE—be sure the two raised shoulders on the adjusting nut are seated in the grooves on adjusting sleeve). The cable length adjusting nut should be positioned against cable housing so there is at least .005" (but not more than .010") clearance between operating lever and brake shoe cable. To lock the adjustment, tighten cable housing clamp securely and then tighten cable adjusting nut against housing. Test hand brake lever for travel. When properly adjusted, 4 to 6 clicks of ratchet should be obtained to hold car. Install adjusting screw cover plate and connect propeller shaft.

HAND BRAKE ADJUSTMENT (External Type): The hand brake adjustments can be made from beneath car as follows: Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for .015-.020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw. Loosen guide bolt locknut and adjust guide bolt adjusting nut for .015-.020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut. Turn large adjusting bolt nut (on lower end of bolt below springs) for .015-.020" band to drum clearance for upper half of band. Groove in upper end of this nut must contact ridge on band operating lever spacer above nut.

NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed .005" (if clearance excessive band may be distorted when brake applied). To correct, compress saddle in vise or place on block and tap lightly with a hammer.

►*DESOTO "ADVENTURER" NOTE:* This model has Special High Compression Engine with TWO 4-Barrel Carburetors and other special equipment as listed below

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model	Model Identification
Firedome	S-23
Fireflite	S-24
Fireflite Adventurer	S-24A

SERIAL NUMBER: Stamped on metal plate attached to left front door body hinge post

Starting Serial Nos.	Detroit	Los Angeles
Firedome S-23	55258001	64028001
Fireflite S-24	50366001	62048001
Fireflite S-24A ©		

© - Assembled at Detroit only.

ENGINE NUMBER: Stamped on machined boss on top of front side of cylinder block just behind water pump

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*

"A"—All cylinders .020" oversize.

"B"—All Main & Connecting Rod Bearings .010" undersize.

"AB"—BOTH above conditions exist.

"MALTESE CROSS" symbol (3/8" high)—ONE OR MORE Crankshaft Journals .001" undersize. *See "Connecting Rods" & "Crankshaft" under ENGINE below.*

"DIAMOND" symbol (3/8" high)—ALL Tappet Bodies are .008" oversize.

TUNE-UP

COMPRESSION PRESSURE: 115-145 lbs. (S-23), 145-175 lbs. (S-24), 160-190 lbs. (S-24A) at cranking speed of 150 RPM (plugs removed, wide open throttle). Maximum variation between cylinders 15 lbs.

VACUUM READING: Steady 18-21" idling.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: *NOTE* - Lubricate valve shaft with graphite grease before installing valve.

(C23, C24 Standard): Single exhaust on right cylinder block with thermostatically controlled valve. Install heat control valve with counterweight toward front of engine, with small anti-rattle spring retaining pin toward rear and adjacent to cylinder block.

(C24A Standard, Optl. Others): Dual exhaust system. Heat control valve is in right exhaust pipe.

Coil Spring Installation - Position valve shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end tongue of spring in upper left hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end tongue of spring around and hook under pin (left pin when facing coil end of valve).

Counterweight Installation - Place counterweight over shaft (shield upward) and insert lock in shaft slot. Center counterweight on shaft and turn weight on shaft until seated. Install stop, and tighten nut securely with Tool T-109-173.

►*DUAL EXHAUST NOTE:* When valve is closed, most exhaust gases are discharged through the left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders—RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs - Auto-Lite AR-51 (S-23), AR-52 (S-24), AR-31 or AS-250 (S-24A). Resistor type 14 mm. Tighten to 30-32 ft. lbs.

COIL: Auto-Lite CAD-4002. *12 Volt.*

Ignition Current - 2.5 amps. idling, 3.1 amps. stopped.

Resistor - Auto-Lite PU-4002. Mounted on left fender splash shield.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. When testing coil, include resistor with coil

DISTRIBUTOR: Auto-Lite IBJ-4302A (S-23), IBJ-4302 (S24 Early), IBJ-4302B (S24 Later), IBK-4303 (Adventurer). *12 Volt. NOTE:* IBK-4303 "double breaker".

Condenser - Auto-Lite IBB-2015R. **Capacity** .25-.28 mfd.

Contact Point Set - Auto-Lite IGW-3028MS (IBJ Distr.), IGW-3028KS (IBK Distr.).

Breaker Gap - 017" ± .002".

Cam Angle—28-34° (IBJ Distr.), 35-41° with both sets of contacts operating together (IBK Distr.).

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Automatic Advance—IBJ-4302

CARBURETOR

►*CARBURETOR APPLICATION: Carter BBD 2-Barrel Carburetors used on Firedome S-23 Models, Carter WCFB Carburetor used on Fireflite S-24 Models. TWO Carter WCFB carburetors used on Adventurer.*

THROTTLE LINKAGE ADJUSTMENT (PowerFlite Cars): Correct any binding conditions. Run engine until normal operating temperature is reached. Remove air cleaner to make certain choke is in the fully open position Connect tachometer leads to coil and ground. Adjust engine idle to 475-500 RPM (transmission in neutral position) Stop engine and loosen throttle linkage adjusting screw (located on accelerator shaft-to-carburetor rod). Move rear portion of accelerator shaft or carburetor rod rearward until it is stopped by idle stop on transmission throttle cam. With rods in line and front portion of rod pre-loaded by its spring,

CONTINUED ON NEXT PAGE

POWERFLITE THROTTLE LINKAGE

CONTINUED FROM PRECEDING PAGE

lock throttle linkage adjusting screw by applying 10-15 ft. lbs. torque. Start engine and recheck idle setting (475-500 RPM), with transmission in neutral and hand brake set. Stop engine and remove tachometer.

Pr ssure Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

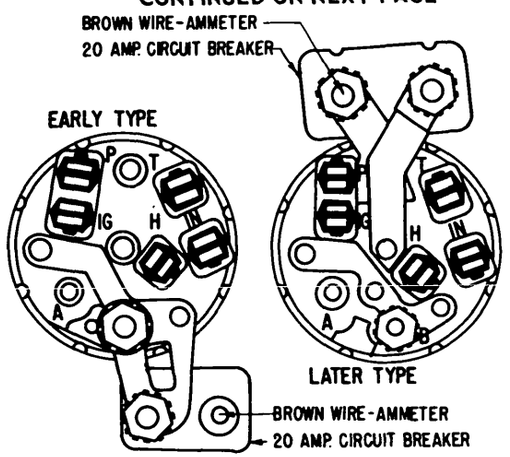
CARTER 2-BARREL BBD

Transmission	Carter No.
Standard	BBD 2308S
Overdrive	BBD 2309S
PowerFlite	BBD 2310S

►***MANIFOLD FUEL DISTRIBUTION:*** *Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting - 1/4-1 1/4 (2250S), 1/2-1 1/2 (Others) turns open. Adjust both screws alike. Turn screws for richer mixture.

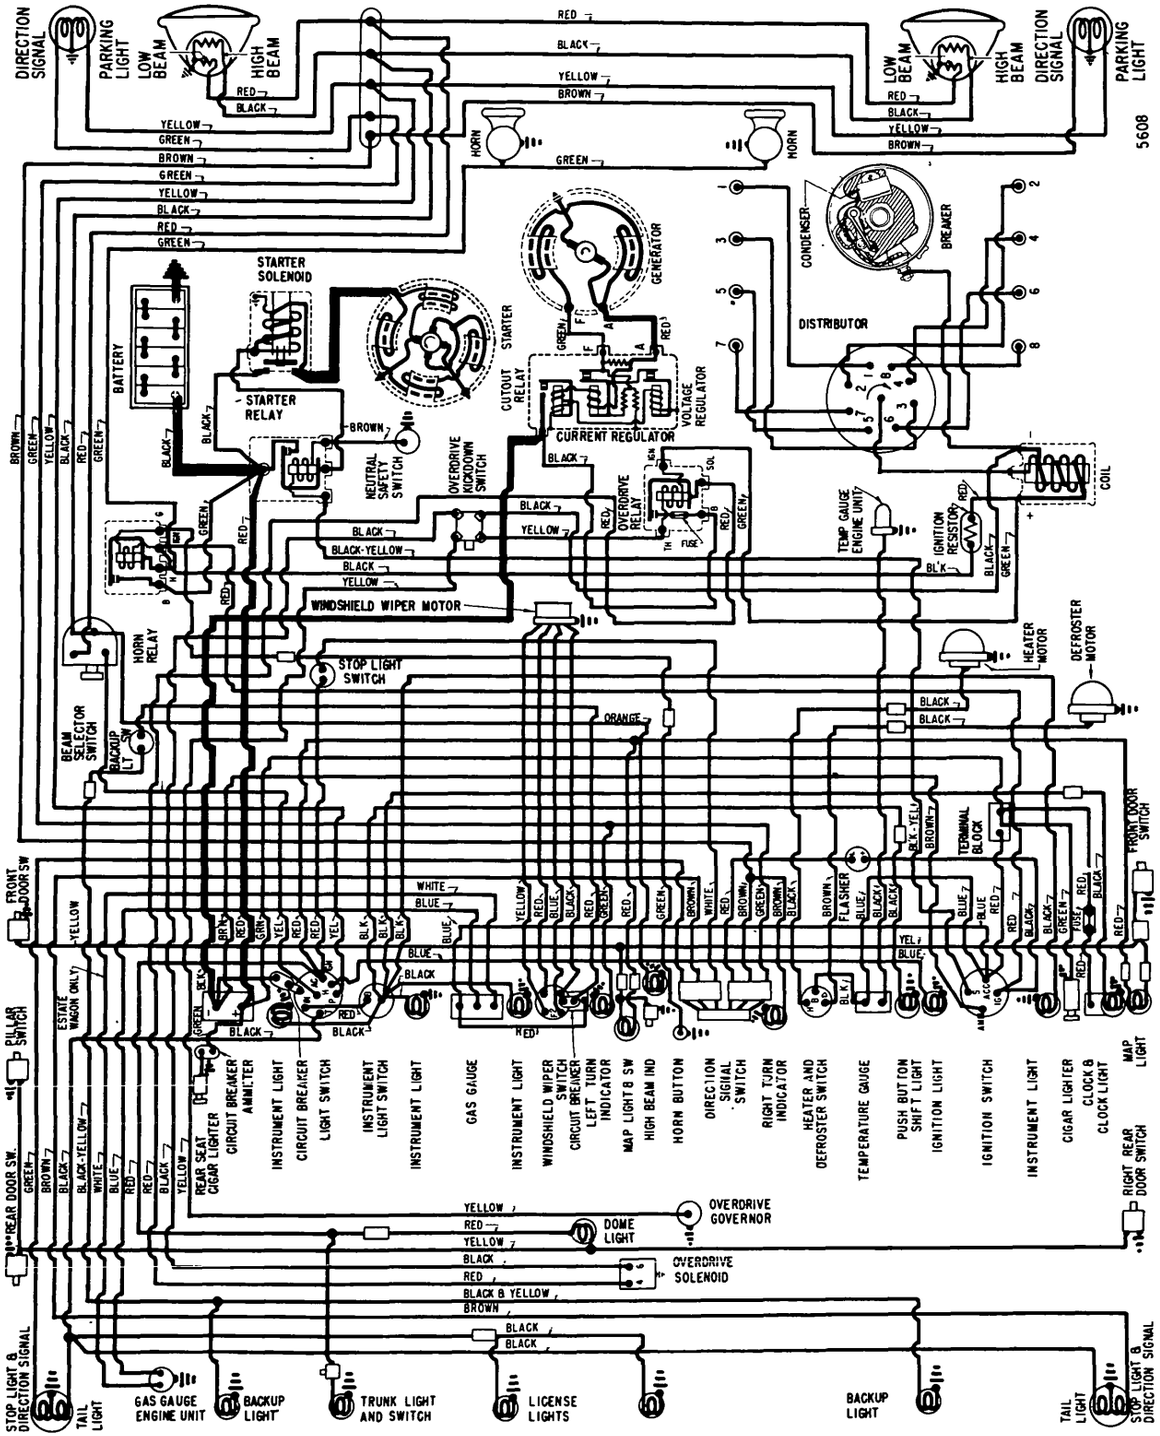
Float Level - 1/4" (Gauge T109-282) from top of each float to top surface of body casting. *NOTE* - This supersedes previous 7/32" setting.



Accelerating Pump - Center hole (medium stroke) of throttle lever, and inner hole of pump arm.

Fast Idle Cam Clearance: .020" (Gauge T109-29) between lip on fast idle cam and boss on casting with choke valve closed and lip on inner choke shaft lever contacting lug on outer lever. Adjust by bending lip on inner choke shaft lever. On late carburetors, align index mark on cam with adjusting screw.

Fast Idle Throttle Clearance: .015" (Gauge T109-44) between lower edge of throttle valve and carburetor bore with adjusting screw on high step of cam.



Automatic Choke Setting: (2308S, 9S) Centered - At Index, (2310S) 1 Point Rich.

FIRST & LATER TYPE LIGHT SWITCH

CONTINUED FROM PRECEDING PAGE

Dashpot Adjustment: Close throttle valves and bottom plunger shaft with 1/16" gauge between shaft and operating lever To adjust, loosen locknut and turn dashpot in or out

Overdrive Kickdown Switch Adjustment: With throttle valves wide open there should be 1/64-3/64" between kickdown lever and switch stem guide To adjust, loosen locknuts and adjust switch

Throttle Linkage Adjustment: *See CARBURETOR above*

►*OTHER DATA: See "Carter BBD" Carburetors in Carburetion Section*

Fuel Pump Pressure: 3½ - 5½ lbs

CARTER 4-BARREL WCFB
S-24 N . 2311S, SA

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*

Idle Setting - 1-2 turns open Set both screws alike Turn screws out for richer mixture

Idle Speed - 450-500 RPM (transmission in neutral)

Throttle Linkage Adjustment: *See CARBURETOR above*

►*OTHER DATA: See "Carter WCFB 4-Barrel" Carburetors in Carburetion Section*

CARTER 4-BARREL WCFB
S-24A Adventurer

►*NOTE Carburetors changed in production as follows*

First Cars	TWO Carter 2317S
Later Cars	Carter 2476S (Frt), 2445S (Rear)

Carburetor Adjustment *Adjust all carburetors exactly as follows for balanced operation*

1) **Connector Rod**—Open both carburetor throttles to wide open position If either front or rear carburetor throttle valves do not open fully adjust length of connector rod Rod must not bind on pivot studs

2) **Idle Speed**—With engine at normal operating temperature, disconnect accelerator shaft rod at rear carburetor set idle speed to 600 RPM (use tachometer) as follows Back off front idle speed screw adjust speed with rear carburetor screw turn front carburetor screw up to point where it contacts stop

3) **Idle Mixture**—Turn rear carburetor idle mixture screws in until lightly seated then back screws out ½ turn Repeat with front carburetor Trim front carburetor idle mixture screws only to obtain smoothest engine idle Connect accelerator shaft rod

►*OTHER DATA: See "Carter WCFB 4-Barrel" Carburetors in Carburetion Section*

CARB. EQUIPMENT

Fuel Pump: Carter M2241S. Vacuum diaphragm type

Pressure - 3½ - 5½ lbs

See "Fuel Pumps" in Carburetion Section

Gas Gauge: Auto-Lite Electric type

Dash Unit - 14032A (Exc Sub & Est Wgn), 14035A (Sub & Est Wgn)

Tank Unit - 13970A (Exc Sub & Est Wgn), 13872A (Sub & Est Wgn)

See "Fuel Gauges" in Carburetion Section

BATTERY

Auto-Lite 11-HS-60 or Willard HO-11-60. *12 Volt*, 11 plates, 60 ampere hour capacity

Ground Terminal - Negative

►*CAUTION: This is reversed from previous models*

Engine Ground - Left front of engine

STARTER

Auto-Lite MDF-6001. *12 Volt* **Armature** - MDF-2006

Drive - Overrunning clutch (solenoid pinion shift)

Rotation - Counter-clockwise at commutator end

Brush Spring Tension - 42-53 ozs (with new brushes)

Performance Data - MDF

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10 0	60 max
6 5 ft lbs min	Lock	4 0	240 max

Starting Switch: Auto-Lite SAD-4001 Solenoid pinion shift and starting switch used with neutral safety switch (on transmission - PowerFlite cars) and SEPARATE relay, Auto-Lite RAJ-4001 mounted on fender splash shield *See "Starter Controls" in Electrical Section*

Neutral Safety Switch Adjustment: *See "PowerFlite" Transmission in Transmission Section*

GENERATOR

Auto-Lite Generator No.	Application
GJC-7002A or GGA-6001K, L	Standard
GJC-7003B or GGA-6002A	Power Steering
GJC-7006B or GGA-6001N	Air Cond
GJC-7003C or GJC-6002C	Pwr Strg & Air Cond

►*SPECIAL GENERATOR NOTE:* GJC & GGA type generators used Performance specifications below apply equally to all generators within either of the groups specified

Performance Data - GGA - 12 Volt

Amperes	Volts	RPM 70° F
4 0	14 6	950 max
40 0①	14 6	1600 max
40 0①	15 0	1600 max

Performance Data - GJC - 12 Volt

Amperes	Volts	RPM Cold
20 0①	15 0	1750 Max
30 0①	15 0	2050-2250

①-Do not operate at high output without ventilating fan for any length of time To do so may result in burned armatures and fields

Brush Spring Tension - (GGA) 34-41 ozs, (GJC) 18-36 ozs with new brushes

Field Current - (GGA) 1 1-1 3 amperes, (GJC) 1 2-1 3 amperes, at 10 0 volts (70° F)

Motoring Current - (GGA) 2 3-2 6 amperes 3 1-3 5 amperes with felt oil seal in drive end head (GJC) 3 4-3 9 amperes, all at 10 0 volts (70° F)

Rotation - Counter-clockwise at commutator end

Belt Adjustment: Adjust deflection so there is 1/4" slack (when pushed with a force of 9-12 lbs from a straight line midway between pulleys)

REGULATOR

Auto-Lite Regulator No.	Generator
VAT-6201A	GGA
VRX-6201A	GJC

Cut out Relay

Cuts In - 13 0-13 7 volts (VRX), 13.0-13.75 volts (VAT).

Cuts Out - 8 2-9 3 volts (approx 3-5 amps discharge)

Contact Gap - 015"

Air Gap - 030-034"

Voltage Regulator

Setting - 14 5 volts at 80° F while charging at 10 0 amperes or with 25 ohm resistor in series between regulator and battery

Air Gap - 048-052" with contacts just opening

Checking & Adjusting - *See Electrical Section*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type Set to following specifications at 70° F*

	Test A - Operating Amperes - Test B
VRX	36 Max 30 (28-32)
VAT	46 Max 40 (38-42)

Test A - After 15 minutes operation charging at 10 amps

Test B - After additional 15 minutes operation on current regulator (with load applied to hold voltage at 13 7 -13 9 volts (VAT) 13 6-13 8 volts (VRX)

Air Gap - 048-052" with contacts just opening

MISC. ELECTRICAL

Checking & Adjusting - *See Electrical Section*

Headlamps: Sealed Beam *See Electrical Section*

Direction Signals: *See Electrical Section*

►*IGNITION-STARTER SWITCH CAUTION: When installing accessories, use accessory terminal* **only** *on ignition-starter switch and* **not** *the ammeter terminal post.*

Lighting & Panel Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft Headlamp knob is held on its shaft by means of a recessed hex screw

Stop Light Switch Location: On forward end of master cylinder

CIRCUIT BREAKERS: Lighting - Three circuit breakers on back of lighting switch Protect circuits as follows:

15 Ampere - Protects Head and Beam Indicator Lights

6 Ampere - Protects Parking Tail, License Plate Instrument, Ignition and Clock Lights

6 Ampere - Protects Stop Map, Dome, Glove Compartment, Courtesy and Trunk Compartment Lights

Windshield Wiper & Back-Up Lights - 5 Ampere Mounted on rear of windshield wiper switch

Window Lifts - 20 Ampere Mounted behind left front kick panel

Four Way Seat - 20 Ampere Mounted behind left front kick panel

HORNS: Auto-Lite, Jubilee, or Sparton. Dual horns with relay

Horn Relay: Auto-Lite RAH-4002 *12 Volt*

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

Model	Compr. Ratio	Developed HP
S23	8.5-1	230 at 4400 RPM
S24	8.5-1	255 at 4400 RPM
S24A	9.25-1	320 at 5200 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in DeSoto Special Data.*

OIL PAN REMOVAL (Single Exhaust): Drain oil and remove oil level indicator. Disconnect crossover and "Y" pipe at exhaust manifolds and at clamp to exhaust extension so that crossover and "Y" pipes can be moved out of way. *(NOTE* - Make sure remainder of exhaust system is sufficiently supported). Disconnect steering linkage at idler arm support bracket, and allow linkage to settle away from bottom of pan. Remove oil pan attaching bolts, remove pan.

OIL PAN REMOVAL (Dual Exhaust): Same as for single exhaust except that crossover and "Y" pipes not used.

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in DeSoto Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in DeSoto Special Data.*

PISTONS

Aluminum alloy, horizontal slot, elliptically turned, tin plated, thermally controlled by steel belt.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" oversize.*

Weight - 19.9 ozs. (stripped).

Removal - Pistons and rods removed from above.

Fitting New Pistons: Clearance: .029-.036" at top land, .0005-.0015" at top of skirt. Pull required to remove .002" x 1/2" feeler inserted between cylinder wall and piston (piston inverted, pin removed) should be 8-12 lbs. at 70°F.

Replacement Pistons: Std., .010", .020", .030", .040", .050", .060" oversize. *NOTE* - .005", .020" O.S. only on S24A.

Installing Pistons: Install pistons with marking on top of piston toward front of engine.

►*PISTON INSTALLATION CAUTION:* Pistons must be assembled to rods on right cylinder bank (2-4-6-8) with indent on piston head opposite to larger chamfer on large end of connecting rod. On left hand cylinder bank (1-3-5-7) assemble rods to pistons with indent on piston head on same side as larger chamfer on large end of connecting rod.

PISTON PINS

Floating type with lock ring at each end.

Diameter—.9216-.9218". **Length**—3-1/16".

NOTE—Piston pin is offset in piston toward right side of engine.

Clearance in Piston—.0000-.0005" or thumb press fit at 70° F.

Clearance in Rod—.0001-.0004". Selective fit.

Replacement Pins: Standard, .003", .008" oversize.

NOTE—Fitted pins are furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0775-.0780"	.010-.020"	.0015-.003"
Compr. (#2)	.0775-.0780"	.010-.020"	.001-.0025"
Oil (#3)	.1860-.1865"	.010-.015"	.001- .003"

Replacement Rings: Furnished in sets Standard, .010", .020", .030", .060" oversize.

Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length (Center to Center) - 6.621-6.625". **Weight**-25.1 ozs.

Crankpin Journal Diameter - 2.249-2.250".

Maximum out-of-round and taper limits—.001".

Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*

Clearance—.0005-.0015" desired. Maximum—.0025".

Endplay—.006-.014".

Bearing Adjustment—None. Replace bearings.

Replacement Bearings: Std., .001", .002", .010", .012" undersize.

Installing Rods: *See "Pistons (Installation)" above.* Larger chamfer of connecting rod bore must be installed toward crankshaft journal fillet. When installing lower bearing shell, make certain that "V" groove in shell is in line with "V" groove in cap. Install shells so that small formed tang fits into machined grooves of rods.

CRANKSHAFT

Journal Diameter - 2.4995-2.5005". 5 bearings.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*

.010" UNDERSIZE (Main & Connecting Rod Journals)—Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—A "Maltese Cross" (3/8" high) stamped on the machined surface following the engine number indicates that ONE OR MORE crankshaft main and connecting rod journals are machined .001" UNDERSIZE. The position of the undersize journals are stamped on the machined surface of the center (#3) counterweight in the following manner: "R" indicates connecting rod journal, "M" indicates main bearing journal. The number following letter indicates main or connecting rod journal number (counting from front of engine).

Bearings—Removable, precision type, steel-backed, babbitt lined. No shims.

Clearance—.0005-.0015".

Replacement Bearings: Std., .001", .002", .003", .010", .012" undersize. Upper and lower halves of bearings Nos. 1, 2, and 4 are alike and interchangeable; Upper No. 3 is interchangeable with Lower No. 3; Upper & Lower No. 5 are **not interchangeable.**

End Thrust: Taken by center (#3) main Bearing.

Endplay—.002-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in DeSoto Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in DeSoto Special Data.*

CAMSHAFT

Journal Diameters - (1) 2.000-2.001", **(2)** 1.984-1.985", **(3)** 1.969-1.970", **(4)** 1.953-1.954", **(5)** 1.4375-1.4385".

Bearings—Removable, steel-backed, babbitt lined bushings.

Clearance—.001-.003"

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay—.002-.006".

Timing Chain: Width—1-1/8". Pitch—.375". Length—68 links.

Camshaft Setting: Timing Check: Marks on gears should be adjacent and in line with straightedge across shaft centers. **Chain Installation:** Install chain and gears as an assembly. Mesh crankshaft gear in chain with keyway out toward chain, mesh camshaft gear in chain with keyway toward crankshaft gear and mark on gear in line with 23rd chain pin clockwise from pin at mark on crankshaft gear. Install assembly on engine, turning camshaft and crankshaft to line up keys with gear key ways, install fuel pump eccentric (must engage camshaft key), tighten camshaft cupwasher and bolt to 35 ft. lbs. Check timing as above.

Camshaft Removal: *See "Camshaft & Bearings" in DeSoto Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in DeSoto Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in DeSoto Special Data.*

VALVES

Tappet Clearance: None in service (hydraulic).

Valves	Head Diameter	Stem Diameter	Length
Intake	1.9325-1.9425"	.372-.373"	4.84"
Exhaust	1.745-1.755"	.371-.372"	4.86"

Valves	Seat Angle	Lift	Stem Clearance
Int., S23, S24	45°	.381"	.001-.003"
Int., S24A	45°	.357"	.001-.003"
Exh., S23, S24	45°	.431"	.002-.004"
Exh., S24A	45°	.413"	.002-.004"

Valve Seat Width - 1/16-3/32" (Int.), 3/64-1/16" (Exh.)

Intake Valve Stem Oil Seal - Seal installed on intake valve stem after valve is inserted in head and before installation of springs. Seal will seat itself in correct position on guide.

►*VALVE GRINDING CAUTION:* If the position of the valve in the head has been changed (due to valve or valve seat grinding) so as to shorten the operating length by 1/32" or more from its factory installed position, the dimension from valve spring seat in the head to valve tip should be checked with gauge C-3061. If the valve tip exceeds the maximum allowable on the gauge, grind the tip as necessary (do not go below the minimum allowable on the gauge). Improper valve clearance at high speed will result if this condition is not corrected.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Springs: **Single springs used on S-23 & S-24. Double springs used on each valve on S-24A. Install with closed coil toward cylinder head.** Free Length - **2" (S-23, S-24), 1 7/8" Outer, 1 25/32" Inner (S-24A).**

Valve Spring Specifications - S-23, S-24

Valve	Lbs. Pressure	Length
Open	166	1.31"
Closed	72	1.69"

Valve Spring Specifications S-24A

Inner Spring			Outer Spring		
Valve	Lbs. Press.	Length	Valve	Lbs. Press.	Length
Open	66	1.09"	Open	158	1.22"
Closed	28	1.53"	Closed	60	1.66"

▷*CAUTION: Spring ends must be square within 1/16". (Use steel square on surface plate—revolve spring against square noting alignment of top coil).*

▷*VALVE SPRING HEIGHT CAUTION:* If valves or seats are reground, check installed height of spring. If height of spring is 1-23/32" or greater, install a 1/16" spacer (Part No. 1400482) in the head counterbore to bring spring height back to normal 1-5/8—1-11/16".

▷*VALVE SPRING LOAD CAUTION: Hydraulic lifter "pump-up" will restrict engine speed and cause valves to burn if spring loads are not maintained.*

Valve Guides: Remove old guides by driving them out through top of head using tool C-3150. Install new guides by driving them up through valve port opening. To install INTAKE valve guide, place a steel scale across combustion chamber and drive valve guide in until punch mark on tool C-3150 is flush with face of cylinder head. To install EXHAUST valve guide, drive it in until it is flush with the machined face of the hole. Ream guide to .374-.375" with tool C-741.

▷*CAUTION: Oil hole in top of exhaust guide must face up. Oil hole must face toward intake guide.*

NOTE—If Valve Guide Tool C-3150 is not available, drive guide in, measuring from top of valve seat as follows: Intake—1". Exhaust—1-3/32".

Hydraulic Valve Lifters: Diameter—.9040-.9045". Clearance—.0005-0015".

▷*VALVE LIFTER OVERSIZE CAUTION: .008" OVERSIZE Valve lifters used on some engines.* A "DIAMOND" 3/8" high stamped on engine number pad following engine number indicates that all lifters are .008" oversize.

Lifter Overhaul & Testing—*See "Valve System" in DeSoto Special Data.*

Rocker Arm Assembly: *See "Valve System" in DeSoto Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Firedome S-23 Valve Timing
Intake Valves - **Open 4° ATDC. Close 76° ALDC.**
Exhaust Valves - **Open 54° BLDC. Close 10° ATDC.**

Firoflite S-24 Valve Timing
Intake Valves - **Open 15° BTDC. Close 57° ALDC.**
Exhaust Valves - **Open 49° BLDC. Close 15° ATDC.**

Firoflite S-24A (Adventurer) Valve Timing
Intake Valves - **Open 35° BTDC. Close 65° ALDC.**
Exhaust Valves - **Open 65° BLDC. Close 25° ATDC.**

Valve Timing Check—Turn crankshaft until #1 intake valve closed. Insert a .210" spacer between rocker arm and #1 intake valve stem, install dial indicator over this valve so that pointer contacts valve spring at a right angle. Wait until seat stops moving (indicating that plunger bottomed so that lifter is solid). Set dial indicator at Zero, turn crankshaft until dial indicator shows that valve has lifted .016". Pointer on chain cover should indicate between 5° BTDC to 7° ATDC if timing correct. Then turn crankshaft counter-clockwise until lifter backed down and valve closed, remove spacer from valve stem.

▷*CAUTION: Do not turn crankshaft further than indicated above, which might bottom spring and damage valve mechanism.*

OILING SYSTEM

Crankcase Capacity: **4 qts. (refill). Add one additional quart if filter changed.**
Normal Oil Pressure: **40-65 lbs. at 2000 RPM.**
Oil Pressure Relief Valve - **Mounted in oil pump. Adjustable.** *NOTE* - **When replacing relief valve spring, use same color spring.**
Oil Pressure Gauge - **Auto-Lite 14033A**
Oil Pump: Rotary type. In crankcase at rear end. Mounted on rear bearing cap.
Overhaul—*See "Oiling System" in DeSoto Special Data.*
Priming Oil Pump (After Overhaul)—Before installing oil pump and strainer to rear main bearing cap, prime pump.
Oil Filter: Shunt type. A portion of oil from oil pump is directed through this filter and the remainder flows directly into engine lubricating system.
Filter Element—Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is replaced.
Crankcase Ventilation: **Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.**

COOLING

Water Capacity: **23 qts. (24 with heater).**
Pressure Valve: **DeSoto 1373136. Radiator filler cap. Opens at 7 lbs. 14 lb. type used with Air Conditioning.**
Thermostat: **By-pass type in cylinder head water outlet. Starts to open at 160-165° F.**
Water Pump: **Centrifugal type.** *See Water Pump Section.*
Pump Removal - **Drain cooling system, remove radiator inlet hose and upper half of fan shroud. Loosen idler pulley and generator adjusting lock bolts, remove drive belts. Remove fan, spacer, and pulley. Remove pump.**
Temperature Gauge: Auto-Lite. Electric type.
Dash Unit - 14034A.
Engine Unit - 13550A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck	Model	Assy. No.	Disc No.
Std. & O.D. (S-23)	10A7	361376	382366
Heavy Duty (S-23)	11A6	361382	381850

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: **Adjust fork rod to secure 3/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.**

Over-Center Spring Adjustment: **With clutch pedal in fully released position, and with over-center spring finger tight, hold spring eyebolt, spring, and bracket assembly as a single unit and tighten adjusting nut seven full turns.**

Removal: Remove transmission (See Synchro-mesh Transmission). Remove clutch housing pan. Pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove cap screws, which hold clutch cover to flywheel, loosening each cap screw a few turns (in succession) until cover is free. Remove clutch assembly and clutch disc assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "DeSoto Synchro-mesh" Transmission in Transmission Section.*
Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

OVERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down. *See "Warner R10" Overdrive in Transmission Section.*
Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*
Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque converter and hydraulically operated planetary transmission.
See "PowerFlite" Transmission in Transmissi n Section.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmissi n Section.*

Lubrication: **Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*OVERFILLING CAUTION:* High engine speed or high temperature operating conditions may cause transmission oil to expand to point where transmission is, in effect, overfilled, causing governor pressure to drop to point to cause a high speed downshift in transmission. *See "Checking Fluid Level" below.*

Checking Fluid Level - *NOTE* - Manufacturer recommends checking fluid level with engine cold (70° F.)

Cold Check - If oil level between (L) Low mark and end of dipstick, **1 pint** of Transmission Fluid Type "A" may be added, but no more than 1 pint.

After Operation Check - If oil level is above (L) Low mark, do not add oil. If oil level is above (F) Full mark, drain to 1/2" below full mark. Add oil ONLY WHEN OIL LEVEL IS BELOW THE (L) LOW MARK on dipstick, and transmission has been brought up to actual operating temperatures by actual driving. In this case add **1 pint** of oil only.

Oil Filler Tube (Location)—At right rear of engine compartment.

►*CAUTION:* To prevent dirt from entering transmission make sure oil level indicator is properly seated in filler tube.

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit. Ball & Trunion type (front), Cross type (rear).

REAR AXLE

Own. (S-23 Exc. Sta. Wgn.) Cage type, (Others) Barrel type. Hypoid gear with Hotchkiss drive.
See "DeSoto Hypoid" in Rear Axle Section.

Rear Axle Ratios

Model	Synchro-mesh	Overdrive	PowerFlite
S23 Sta.Wgn.	4.1,3.91,4.3-1	4.3,4.1-1	
S23 (Others)	3.9,3.73,4.1-1	4.3,4.1-1	
S23 (All)			3.73,3.9,4.1-1
S24 Sta.Wgn			3.54,3.73,3.36-1
S24 (Others)			3.91,4.1,3.73-1
S24A			①

① 5 Optional ratios available ranging from 3.07 (40-13) to 3.91 (43-11).

Backlash - .006-.008".

Carrier Removal: Drain lubricant. Back off brake adjusting cams (See Brakes) before removing hubs and drums. Remove wheel hub and drum assemblies, using wheel puller C-845. Remove axle shafts (see below). Disconnect rear universal joint and drop propeller shaft. Remove carrier assembly from axle housing.

Axle Shaft Removal: Block brake pedal and disconnect brake lines at wheel cylinders. To protect axle bearing outer oil seal, remove rear axle drive shaft keys and install Tool C-745. Remove axle shaft seals, brake supports and bearing shims. Remove rear axle shaft oil seal from brake support with Tool C-839. *(NOTE* - When removing axle bearing shims from ends of axle housing, keep each set of shims separate to assure proper reassembly). Remove axle drive shaft and bearings with Puller C-499.

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay** - .003-.008".

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. Coil springs and direct acting shock absorbers.
See "DeSoto" in Front Suspension Section.

Kingpin Inclination—5-6½°

Caster—Neg. 2° to 0° (Neg. 2° preferred with Manual Steering, 0° preferred with Power Steering). Left side should be between 0° and ¾° more negative than right right side.

Camber—Pos. 1/4°±3/8° (Left side Pos. 1/2°, Right side 0° preferred).

Toe-In - 1/8" ± 1/32" (1/8" preferred).

Toe-Out on Turns —Inner wheel 21½° plus or minus 1° with outer wheel at 20°.

STEERING

Manual Steering Gear: Gemmer. Worm and three-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering: "Coaxial". Components encased in tubular housing which is located at bottom of and concentrically around axis of steering column.
See "Coaxial" Power Steering in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

►*BRAKE "SQUEAK" CORRECTION: See DeSoto "Center Plane" Brakes in Brake Section.*

Service: Center Plane (Floating Shoe) hydraulic type.
See DeSoto "Center Plane" Brakes in Brake Section.

Drums—Centrifuse. Diameter 12".

Wheel Cylinders Diameter—1-1/8" bore. Single acting (front), double acting (rear wheels).

Replacement Linings & Shoes—Linings or shoes with linings are furnished Standard and .030" oversize.

Lining—Molded asbestos (bonded to shoe). Length—12.57" per shoe. Width - 2.5". Thickness - 13/64".

Braking Power - 60% Front, 40% Rear.

Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.

Rear Wheels - Same as front wheels except that on rear wheels forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of reverse wheel rotation.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid—Filler plug at top of master cylinder (on dash panel in engine compartment).

Removal—Disconnect pushrod. Disconnect brake line tube at master cylinder. Disconnect stop light switch leads, remove four stud nuts from studs, remove master cylinder.

Power Brakes: "Bellows" or "Piston" Assist type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder). *See "Chrysler, DeSoto, Dodge, Plymouth Bellows Type" or "Piston Type" Brakes in Brake Section.*

Removal of Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond extremities of bracket *(NOTE* - If pedal linkage is allowed to extend through hole in dash panel, trigger arm may be damaged). Disconnect vacuum hose at power unit. Reomve complete power unit and bracket assembly by removing four nuts and lockwashers.

Parking Brake: On shaft at rear of transmission, 6" external contracting type used with Synchro-mesh Trans. 7" internal expanding type used with PowerFlite.

Adjustment—*See "Hand Brake Notes" in DeSoto Special Data.*

Lining—	Width	Thickness	Length
6" Ext. Type	2"	5/32"	15-3/8"
7" Int. Type	2"	5/32"	13-1/16"

Clearance (Internal Expanding) - Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

Clearance (External Contracting) - Adjust anchor screw so clearance between band and drum at anchor is .015-.020".

MISC. MECHANICAL

Windshield Wipers: Auto-Lit EPF-4001. Electric type. *See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.*

Air Conditioning: DeSoto "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Seat Adjuster: Electric type. *See "Power Seat Adjusters" in Miscellaneous Section.*

Convertible Top Control: Electrical-hydraulic type. *See "Power Top Control" in Miscellaneous Section.*

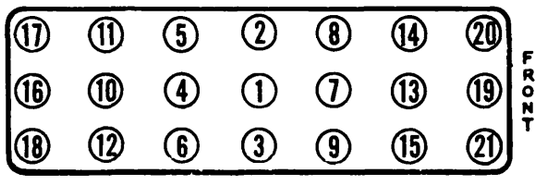
ENGINE

6 CYL. ENGINES

ENGINE ASSEMBLY REMOVAL: Engine, clutch and transmission assembly can be removed from car as an assembly, as follows Remove hood and radiator core Disconnect propeller shaft at transmission Disconnect transmission controls at transmission (wires to overdrive controls) and speedometer cable Disconnect clutch linkage at clutch housing Disconnect fuel pump flexible line at pump, throttle and choke controls at carburetor, heat indicator tube at head Disconnect wires from generator and starter, coil and distributor Disconnect exhaust pipe at manifold Disconnect oil gauge tube at flexible line Remove crankcase breather pipe, and the front and rear engine support bolts Disconnect hand brake linkage Remove carburetor air cleaner Connect hoist to engine and lift assembly out of chassis

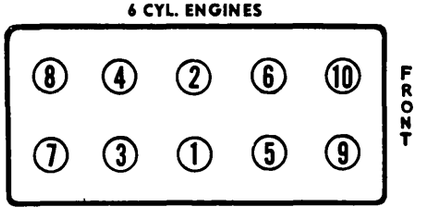
V8 ENGINES

ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery. Remove fan shroud, radiator, and hood. *(NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission. Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. *(NOTE* - Place a roll-away jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support. Lower car to convenient working height, then remove engine front support mounting bolts. With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender.



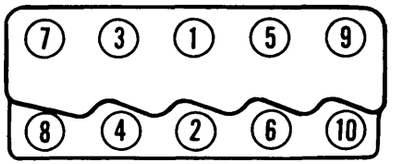
CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.



Tightening Torque—See Tightening (Torque Wrench) Specifications above

6 CYL. ENGINES



CYLINDER HEAD INSTALLATION: When installing cylinder head, use new gasket Coat threads of capscrews with sealer except the three screws that lead into intake manifold ports If sealer used on these capscrews, there is a possibility that it will be drawn into carburetor or valves Use torque indicating wrench to tighten cylinder head bolt nuts and capscrews Tighten in sequence shown in diagram

6 CYL. ENGINES

V8 ENGINES (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES (SINGLE ROCKER ARM SHAFT)

INTAKE & EXHAUST MANIFOLD INSTALLATION: Install the new gasket between intake and exhaust manifold (make sure that heat valve is free and operates freely), and insert the four bolts through exhaust manifold and into intake manifold. Draw bolts down snug but DO NOT TIGHTEN Install thermostatic coil spring and counter-weight. Install manifold-to-engine block gaskets and install assembled manifolds While holding manifold and gaskets evenly against engine block, install long center bolts and draw down snugly. (If bolts show signs of water leakage, coat threads with suitable sealer) Install remaining washer and nuts *(CAUTION*—Be sure to install the four conical, brass washers and nuts on the extreme ends of exhaust manifold). Tighten manifold nuts and bolts, starting from center and working out towards ends, to 15-20 ft lbs torque Tighten the four bolts holding exhaust manifold to intake manifold

V8 ENGINES – SINGLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Single Rocker Shaft): Before cylinder head removed, remove rocker shaft assembly Slide out push rods and place them in sequence in a suitable rack in order that each push rod can be reinstalled in its original position When installing cylinder head, use new gaskets Make sure all holes are punched out Be certain cylinder head enters both dowel guide pins in cylinder block Tighten cylinder head bolts in sequence shown in diagram Slide push rods in position Lower rocker shaft assembly down on two locating studs Install all washers, nuts and bolts *CAUTION*—Extreme caution must be exercised when tightening rocker shaft bolts and nuts so that hydraulic tappets have time to bleed down to their operating length If tappets are forced down too rapidly, damage to push rods, tappet bodies or rocker arms will result

V8 ENGINES – DOUBLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Double Rocker Shaft): Use new gaskets when installing head. Insert cylinder head bolts into rocker arm support brackets. Insert pushrods through holes in head (short rods in upper holes - intake, long rods in lower holes - exhaust). Place rocker arm assemblies in position on heads, then position pushrods. Starting at top center, tighten all cylinder head bolts to correct torque (see Tightening Specifications above). Install exhaust manifolds, crankcase breather tube, and intake manifold. *NOTE* - When installing intake manifold, insert short bolts in holes on extreme ends of manifold.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINES

REAR MAIN BEARING SEAL: Neoprene type seal. When replacing seal, both upper and lower halves should be replaced. Remove oil pan, clutch housing pan, and rear main bearing cap. Remove seal from cap, and then remove upper seal by pushing one corner of seal until opposite end protrudes about ⅜" from block. Pull out with long-nosed pliers. Install new seal in lower half by carefully inserting lower half of seal into bearing cap. Before installing upper seal, coat seal contacting lip with grease. Insert one end of seal into block and push it into place with a rolling motion. Install main bearing cap, making certain that tabs of cap gasket fit in cap seal channel.

V8 ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos. With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap. Tap seal down in position with Tool C-3511 until tool is seated in bore. Hold tool down and cut off protruding ends flush with cap. Install bearing insert and both cap seals. The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine.

ENGINE FRONT COVER

6 CYL. ENGINES

FRONT COVER INSTALLATION: Use new gasket and position cover in place. Install screws but do not tighten. Install pulley and hub on crankshaft far enough so that seal can be evenly positioned on crankshaft. Tighten two screws on right side lightly. Then tighten remainder of screws in like manner. Repeat tightening procedure and torque screws to 15 ft. lbs.

FRONT OIL SEAL: To replace, drive old seal out with suitable drift. When installing seal, make sure seal is driven into place evenly to insure a tight fit. Use a new gasket and position cover in place.

V8 ENGINES – SINGLE ROCKER SHAFT

ENGINE FRONT COVER (Single Rocker Shaft Engines): Proceed as follows:

Removal: Drain and remove radiator. Disengage fan belt and remove generator. Install Tool C-3033 over pulley and force pulley off end of crankshaft. Support engine with suitable chain hoist fastened to intake manifold. Remove motor support "U" bolts and nuts. Remove fan blades and hub, then remove bolts that hold water pump housing to cylinder block and heads. Lift water pump housing, water pump, front motor support and insulator up and away from front of engine. Discard gaskets. Loosen bolts that hold oil pan to cylinder block. Drop pan slightly to clear chain case cover. Disconnect inlet and outlet fuel lines at fuel pump. Remove bolts that hold pump to chain case cover. Slide pump out and away from engine. Discard gasket. Remove bolts and washers from cover. Disengage cover from locating dowels, remove from engine. Discard gasket.

Installation: Be sure mating surfaces of cover and cylinder block are clean and free of burrs. Install new gasket and position cover locating dowels. Coat screws with suitable sealer and tighten to 15 ft. lbs. *NOTE*—Coat four center screws with sealer suitable for water. Coat other screws (upper and lower) with sealer suitable for oil.

V8 ENGINES – DOUBLE ROCKER SHAFT

ENGINE FRONT COVER (Double Rocker Shaft Engines): Proceed as follows:

Removal: Remove water pump. Remove vibration dampener retainer bolt and washer. Remove two of the vibration dampener pulley bolts and install puller Tool C-3033. Remove crankshaft pulley and vibration dampener as an assembly. Remove felt dust seal and vibration dampener hub key from crankshaft slot. Remove left cylinder bank exhaust pipe. Disconnect fuel lines at fuel pump, remove fuel pump. Remove oil level indicator. Remove starter using Tool C-455. Drain engine oil and remove oil pan. Remove chain case cover bolts and lockwashers, **including one inside the pump opening.** Drive chain case cover off the two dowel pins, using soft hammer.

Installation: Be sure mating surfaces of cylinder block and cover are clean. Apply moderate coat of sealing compound to block and cover faces, install new gasket. Make sure crankcase oil slinger is in proper position (flange end pointing toward seal). Position cover on two dowel pins and gently tap cover in place. Install cover bolts and lockwashers and tighten to 30 ft. lbs. Install other items be reversing removal procedure.

ALL ENGINES

FRONT OIL SEAL: Remove old seal by driving it out with Tool C-3050. Place new seal on the chain case cover with the projecting flange facing the inside of the cover. Insert seal gasket and drive new seal in place with Tool C-3051.

CAMSHAFT & BEARINGS

6 CYL. ENGINES

CAMSHAFT REMOVAL: Remove Front End Assembly as a unit. Remove cylinder head, fuel pump, oil pump, valve tappet cover plates, crankshaft pulley, front motor support (with front of engine jacked up), timing chain cover, camshaft sprocket and timing chain. If valves and valve springs are not to be removed, prop valves up by inserting wooden wedges at opposite sides under valve head. Raise tappets and hold in this position (use spring type clothes pins or similar tool to hold tappets up). Withdraw camshaft (rotate shaft to clear any obstructions).

V8 ENGINES – SINGLE ROCKER SHAFT

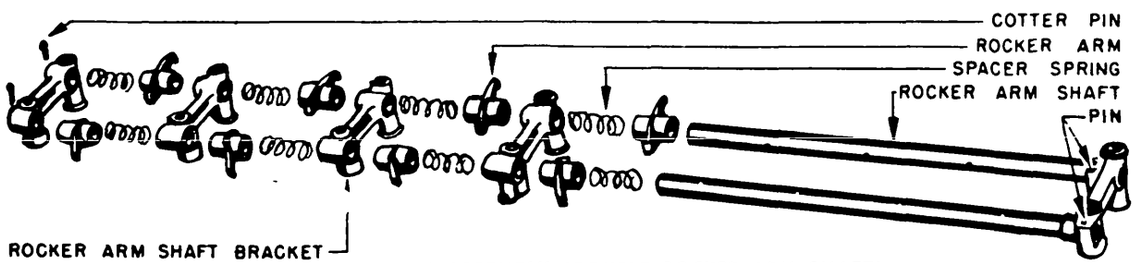
CAMSHAFT REMOVAL: Drain radiator, remove radiator and crankshaft pulley. Support engine with chain hoist attached to intake manifold. Remove engine support U-bolts. Remove fan, water pump, and water pump housing assembly. Loosen oil pan bolts sufficiently in order that oil pan clears chain case cover, camshaft gear hub nut, fuel pump eccentric and dowel. Then remove camshaft gear and timing chain. Support engine at front of oil pan. Then remove intake manifold, distributor, distributor drive gear, tappet chamber cover, rocker cover, rocker shaft assemblies and push rods. Use Tool C-3158 to pull out hydraulic tappets. If varnish build-up is excessive, use puller part of Tool C-3158 and work tappet out of bore. Remove four camshaft thrust bolts, then remove camshaft.

V8 ENGINES – DOUBLE ROCKER SHAFT

CAMSHAFT REMOVAL: With intake manifold, tappet cover, pushrods, tappets and timing gears removed, remove distributor. Lift out distributor drive gear and stub shaft. Remove camshaft thrust plate attaching bolts and oil trough. Withdraw camshaft and spacer, being careful not to damage cam bearings with cam lobes.

VALVE SYSTEM

ALL ENGINES



EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished .010" O.S. Use special Tool C-732 (6 Cyl.), C-3140 (Double Rocker Shaft V8) to remove inserts. After inserts have been removed from engine, smooth any roughness of seat with a blunt drift. Valve seat inserts should be from .002-.004" larger than counterbore to insure correct fit. If inserts are found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert. Place inserts in dry ice for approximately 10 minutes. Clean counterbore thoroughly and install a chilled insert with valve side up, and drive it into place with installing tool C-767.

ROCKER ARMS

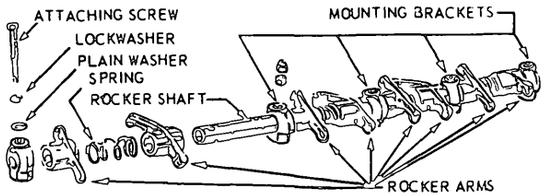
V8 ENGINES – SINGLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Single Rocker Arm Shaft): Hold rocker arm shaft and end bracket in a horizontal position with oil grooves facing down. Slide an intake rocker arm over shaft and down

CONTINUED ON NEXT PAGE

V8 ROCKER ARM ASSEMBLY (DOUBLE ROCKER ARM SHAFT)

CONTINUED FROM PRECEDING PAGE



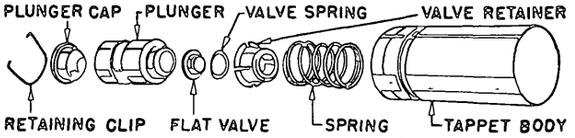
against bracket, with diagonal slant of arm close to bracket. Then slide a spacer spring over shaft and down against intake rocker arm. Next, slide an exhaust rocker arm over shaft and down against spacer spring, followed by a shaft bracket. Continue to slide first an intake rocker arm, then a spacer spring followed by an exhaust rocker arm and bracket, over shaft until last bracket has been installed. Slide push rods into push rod holes. Be sure that rocker arms are in a horizontal position, then lower rocker shaft assembly down on two locating studs on head. Install flatwashers and nuts.

V8 ENGINES – DOUBLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Double Rocker Arm Shaft):

Removal: Remove rocker arm covers. Place cotter pins in holes of first and last rocker arm brackets to prevent springs on rocker from pushing assembly apart when cylinder bolts removed. Completely loosen ten bolts on each bank that attach rocker arm support brackets to cylinder head and block. Grasp support bracket at each end of head, pull rocker assemblies and bolts directly away from heads, then remove push rods and place in respective slots in holder C-3068. *CAUTION—Use care when removing rocker assemblies in order not to jerk cylinder heads off locating dowels which would allow them to drop and become damaged.*

Installation: Insert cylinder head bolts in brackets, with short bolts in intake side. Insert push rods through push rod holes in heads (short rods in upper intake holes, long rods in lower exhaust holes). Place rocker arm assemblies in position on heads, lining up all push rods to their respective rocker arms. Starting at top center tighten all cylinder head bolts to torque indicated in Tightening Specifications above. *When tappets are full, extreme care must be taken when tightening head bolts so that tappets have time to bleed down to their operating length.* Bulged tappet bodies and permanent noisy operation will result if tappets are forced down too rapidly.



V8 ROCKER ARM ASSEMBLY
(SINGLE ROCKER ARM SHAFT)

HYDRAULIC VALVE LIFTER
V8 ENGINES

HYDRAULIC VALVE LIFTERS (One-Piece Integral Type) Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.

Removal (Single Rocker Arm Shaft Engine): Remove rocker covers, then remove bolts, nuts and flatwashers holding shaft to heads. Lift rocker shaft and arms straight up and away from heads. Drain cooling system to point below level of intake manifold. Remove carburetor air cleaner, disconnect fuel and vacuum lines, overdrive kick-down switch wires and accelerator linkage at carburetor. Disconnect coil wires and disconnect heat indicator wire at intake manifold. Disconnect heater hose and automatic integral choke heat tube at carburetor. Remove intake manifold bolts, then lift intake manifold, coil and carburetor straight up and away from engine. Discard gaskets (*CAUTION* - Cover intake ports in cylinder head to avoid entry of dirt). Remove crankcase ventilator pipe and gasket. Remove tappet chamber cover bolts. Lift cover up and away from engine. Discard gaskets. Insert hooked portion of Tool C-3158 into hole in tappet body (this portion of tool can be used to remove tappets without a varnish build-up at lower part of tappet body). Lift tappet out of bore. If lifter sticks in bore, slide puller portion of Tool C-3158 through cylinder head (pushrod) openings and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and slowly pull tappet out of bore with sharp twisting motion. As tappet clears bore, withdraw puller pin and puller tool, then lift tappet out of chamber.

V8 ONE-PIECE VALVE LIFTER

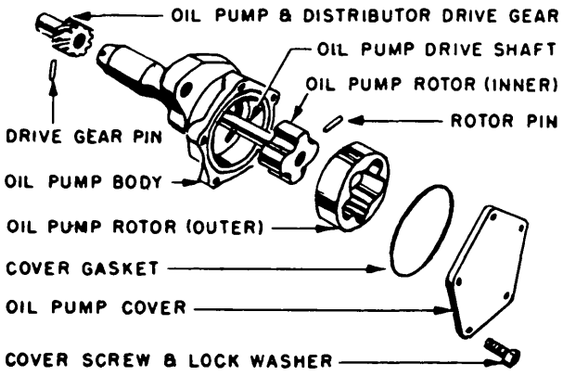
Removal (Double Rocker Arm Shaft Engine): Drain cooling system to a point below level of intake manifold. Install valve spring compression Tool C-3024 over rocker arm so heel of tool rests on valve stem side. Make certain valve is seated and tappet body is resting on low point of camshaft lobe (see below). Using handle of tool for leverage, compress valve springs sufficiently to raise rocker arm above pushrod. While holding rocker arm in this position, slide rocker arm to one side along tube (*CAUTION* - To avoid damage to valves, be sure piston head is well below top of travel before compressing valve springs). Remove carburetor air cleaner, disconnect coil wires and wire from heat indicator sending unit. Disconnect heater hose and carburetor heat tube at integral choke. Remove intake manifold, coil and carburetor as an assembly. Remove tappet chamber cover and gasket. Insert hooked portion of Tool C-3216 into hole in tappet body (this portion of tool can be used to remove tappets without varnish build-up). Lift tappet out of bore. If tappet sticks, slide puller portion of tool C-3316 through cylinder head (pushrod) holes and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and pull tappet out of bore with twisting motion.

Disassembly: *(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.)* Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body. Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting. Check to see that valve exerts a slight pressure on valve spring to insure valve seating. Clean lifter assembly in clean solvent and remove all traces of varnish and carbon. Blow parts dry with air. DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY.

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene. *(CAUTION—Container and kerosene must be absolutely clean).* Allow lifter to fill with kerosene, then remove and replace the plunger cap. Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body. Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again. If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter. When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing. This will prevent possible scoring of lifter plunger when engine is first started.

Reassembly: Reverse disassembly procedure as noted above.

LOW POINT OF CAMSHAFT LOBE: Remove distributor cap, noting position of rotor for Nos. 1 and 6 cylinders. Set timing mark "DC" located on crankshaft pulley to pointer. With rotor at No. 1 firing position, the following lifters will be on the low side of the cam lobe: No. 2 intake and exhaust, No. 4 exhaust, No. 7 intake, No. 8 intake and exhaust *(NOTE—To remove No. 1 intake and exhaust lifter,* rotate crankshaft ¼ turn clockwise from above position after removing lifters listed). With rotor at No. 6 position, following lifters will be on low side of cam lobe: No. 3, intake and exhaust, No. 4 intake, No. 5 intake and exhaust, No. 7 exhaust *(NOTE—To remove No. 6 intake and exhaust lifter,* rotate crankshaft ¼ turn clockwise from above position after removing lifters listed).



OILING SYSTEM
OIL PUMP
6 CYL. ENGINES

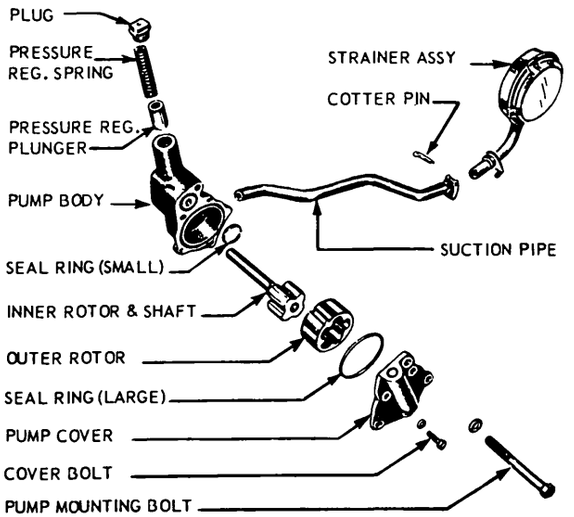
ROTOR TYPE OIL PUMP: Removal—Before removing oil pump, rotate crankshaft and make sure "DC" mark on crankshaft pulley lines up with pointer on timing chain case cover. Do not rotate engine with oil pump removed. Remove the attaching screws and remove pump from engine *NOTE—On some* models it will be necessary to remove the two upper cover capscrews to obtain sufficient clearance to remove oil pump.

Disassembly & Inspection: Remove the oil pump cover and gasket. Hold hand over cover opening and with pump upside down, turn drive shaft until outer rotor slips out. Drive out the straight pin holding pump drive gear to shaft. Press the shaft

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6 CYL. OIL PUMP



out of drive gear and slide shaft and inner rotor assembly out of pump body Wash all parts and dry with air Inspect all parts and replace as necessary, then measure clearance between opposite lobe of inner rotor and outer rotor Clearance should be 010" or less If clearance is greater, replace both rotors Measure thickness and diameter of outer rotor If thickness is 748" or more and diameter is 2 245" or more, rotor is satisfactory Thickness of inner rotor should be 748' or more If either rotor is less than these dimensions, replace BOTH rotors Insert both rotors into pump body and place a straight edge across pump body between bolt holes Clearance between straight-edge and rotor should be 004" maximum If greater, replace pump body Press outer rotor to one side against pump body and measure clearance between rotor and body on opposite side Maximum clearance should be 008 If greater, replace pump body Cover should be smooth and flat If it is scratched or grooved, replace cover Check flatness by placing a straight-edge across inner surface of cover If it is possible to insert a 001" feeler between cover and straight-edge, replace cover

Reassembly: Slide the drive shaft and rotor assembly into pump body Press drive gear on shaft until end play of shaft is from 003" to 010" Press rotor down in body with hand and measure clearance with feeler gauge Install pin and peen over both ends If pin holes do not line up, drill a new pin hole through gear and shaft, using a 5/32" drill Slide outer rotor into place in pump body Install new cover gasket and install cover and tighten screws evenly

V8 ENGINES

ROTOR TYPE OIL PUMP: Removal—Drain engine oil, remove oil pan Remove oil pump mounting bolts and lower pump straight down

Disassembly & Inspection: Remove cotter pin holding oil strainer to oil pump suction pipe, then remove pipe Remove cover bolts and cover. Discard oil seal ring Remove pump rotor shaft and lift out pump outer rotor Remove oil pressure relief valve plug and lift out spring and plunger Wash all parts in a suitable solvent and inspect for damage or excessive wear Check all pump parts as follows.

V8 OIL PUMP

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers If diameter less than 2 244" or thickness less than 998', replace both inner and outer rotors

Inner Rotor—Measure thickness of inner rotor with micro-calipers If thickness measures less than 998", replace both inner and outer rotors

Rotor Depth—Slide rotors in pump body Place a straightedge across pump body Use a feeler gauge and measure clearance between top of rotors and straightedge If clearance in excess of 004", replace pump body

Outer Rotor to Pump Body Clearance—To check rotors for excessive wear, measure clearance between lobes of inner and outer rotors If clearance in excess of 010", replace both inner and outer rotors

Reassembly: Use new oil seal ring between cover and body Tighten cover bolts to 10-15 ft lbs Prime pump and then install new oil seal ring in pump mounting face

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

COOLING SYSTEM

6 CYL. ENGINES

WATER DISTRIBUTION TUBE: Replace whenever engine completely overhauled If tube becomes rusted or corroded, overheating of engine may occur due to failure of water to circulate properly through cylinder block To replace tube, remove radiator core and water pump Pull tube out of block with stiff hooked rod Install tube with slots up and be sure tube is inserted far enough into block so that water pump will seat properly against block

IGNITION NOTES

V8 ENGINES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation: Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size ***DO NOT REAM THE BUSHING.***

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows Rotate crankshaft until No 1 cylinder is at TDC (or firing position) When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear Coat shaft of drive gear with engine oil Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase)

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Place transmission shifting lever in neutral and be sure the hand brake is released. Disconnect front end of propeller shaft and remove adjusting screw cover plate Loosen brake cable guide clamping screw and back off cable adjusting nut. Turn brake shoe adjusting nut to decrease shoe-to-drum clearance until a slight drag is felt on drum. Back off adjusting nut one full notch (using spanner wrench C-3014) to give approx. 010" clearance. (NOTE—be sure the two raised shoulders on the adjusting nut are seated in the grooves on adjusting sleeve). The cable length adjusting nut should be positioned against cable housing so there is at least 005" (but not more than .010") clearance between operating lever and brake shoe cable. To lock the adjustment, tighten cable housing clamp securely and then tighten cable adjusting nut against housing. Test hand brake lever for travel. When properly adjusted, 4 to 6 clicks of ratchet should be obtained to hold car Install adjusting screw cover plate and connect propeller shaft

HAND BRAKE ADJUSTMENT (External Type): The hand brake adjustments can be made from beneath car as follows: Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for 015-.020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw. Loosen guide bolt locknut and adjust guide bolt adjusting nut for .015-.020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut. Turn large adjusting bolt nut (on lower end of bolt below springs) for .015- 020" band to drum clearance for upper half of band. Groove in upper end of this nut must contact ridge on band operating lever spacer above nut

NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed 005" (if clearance excessive band may be distorted when brake applied). To correct, compress saddle in vise or place on block and tap lightly with a hammer.

►*DODGE "500" NOTE:* This model has a special High Compression Engine with different Valve Timing (Adjustable Tappet Clearance), Ignition Setting, Spark Plugs, and Carburetor (Carter 4-Barrel). See Data below.

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model	Model Identification
Coronet 6 Cyl.	D-62-1, 2
Coronet V8	D-63-1
Royal V8	D-63-2
Custom Royal V8	D-63-3
Dodge "500" V8	D-500

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post.

Starting Serial Nos.	Detroit	Los Angeles
D-62-1, 2	32227001	48016501
D-63-1, 2, 3	34972001	42608001

ENGINE NUMBER: (6 Cyl.) Stamped on boss at left front section of cylinder block. **(V8)** Stamped on boss at center of cylinder block directly behind water pump and next to oil filler tube.

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*

"A"—All cylinders .020" oversize.

"B"—All Main & Connecting Rod Bearings .010" undersize.

"AB"—BOTH above conditions exist.

"DIAMOND" symbol (3/8"high)—ALL tappet bodies are .008" oversize.

TUNE-UP

COMPRESSION PRESSURE: (6 Cyl.) 120-150 lbs., **(V8)** 90-155 lbs., at cranking speed of 150 RPM (plugs removed, throttle wide open). Maximum variation between cylinders 15 lbs.

VACUUM READING: (6 Cyl.) 18-20", **(V8)** 18-21", idling.

VALVE TAPPET CLEARANCE: (D63-1, 2, 3). None in service (hydraulic).

D-62-1, 2 – .010" Intake & Exhaust (Hot & Idling).

NOTE – Tappet screws are self-locking. For continuous high speed an additional .002" exhaust clearance is desirable.

D-500 – .012" Intake, .022" Exhaust (Hot & Idling).

MANIFOLD HEAT CONTROL: Application as follows:

(D-62-1, 2): Thermostatic coil spring type with counterweight. Valve should operate freely. When installing coil, place coil spring in position over shaft slot, with outer end (tongue) of spring in the upper left hand position (10 o'clock). Press inner end of coil into slot and seat firmly. Move outer end of spring down (counterclockwise), around and up over stop stud.

(D-63-1, 2, 3 Standard): Single exhaust on right cylinder block with thermostatically controlled valve. Install heat control valve with counterweight toward front of engine, with small anti-rattle spring retaining pin toward rear and adjacent to cylinder block.

(D-500 Std., D-63-2, 3 with Power Package): Dual exhaust. Heat control valve is in right exhaust pipe.

Coil Spring Installation – Position valve shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end tongue of spring in upper left hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end tongue of spring around and hook under pin (left pin when facing coil end of valve).

Counterweight Installation – Place counterweight over shaft (shield upward) and insert lock in shaft slot. Center counterweight on shaft and turn weight on shaft until seated. Install stop, and tighten nut securely with Tool T-109-173.

►*DUAL EXHAUST NOTE:* When valve is closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

6 CYL. ENGINES

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: 035".

Plugs—Auto-Lite Resistor Type AR80 14mm. Torque to 30-32 ft lbs.

COIL: Auto-Lite CAF-4002. *12 Volt.*

Ignition Current—1 8 amps. idling, 2.4 amps. stopped.

Resistor—None used.

DISTRIBUTOR: Auto-Lite IAT-4101B. *12 Volt.*

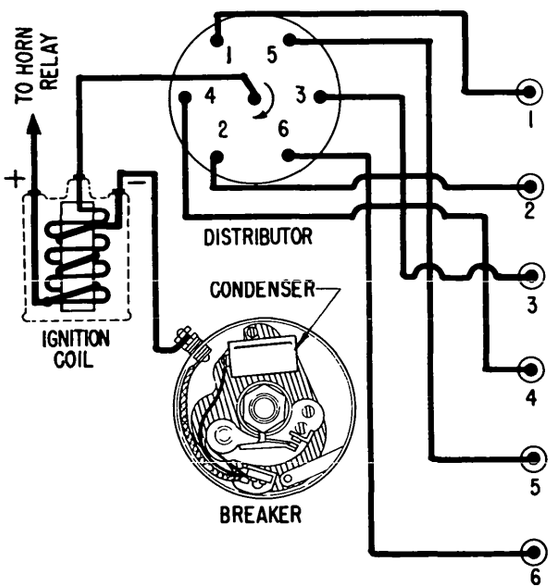
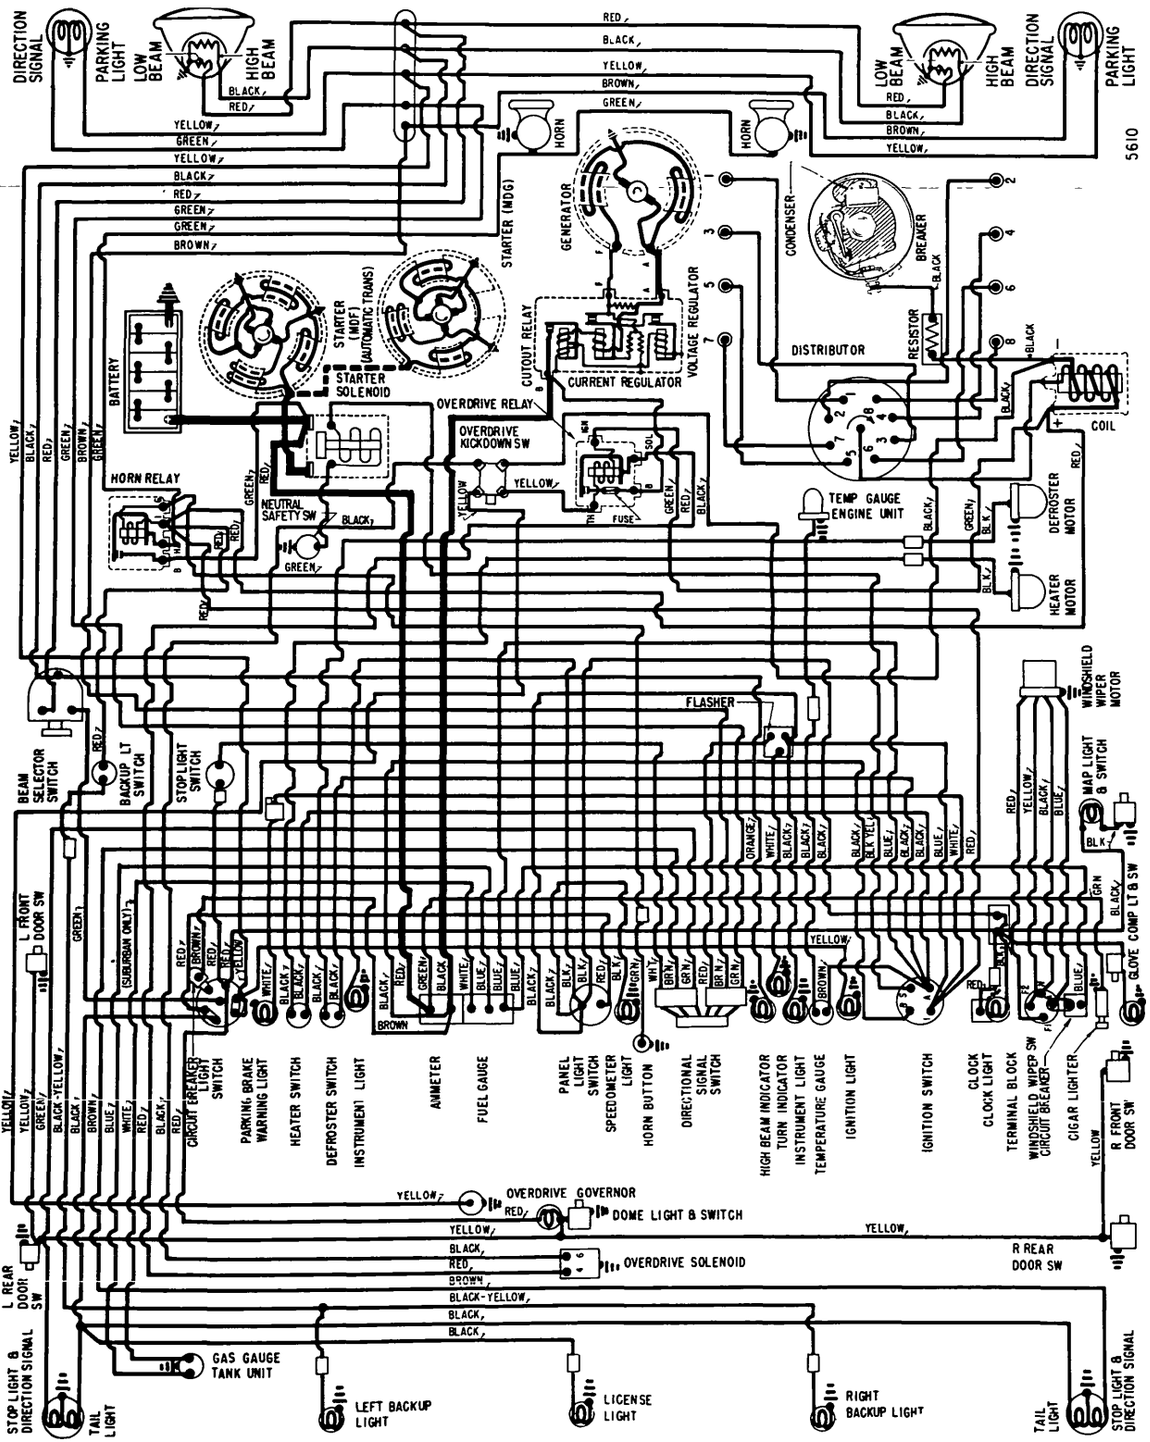
IGNITION TIMING

Model	Std. Setting
D-62-1, 2	2° BTDC
D-63-1	4° BTDC
D-63-2, 3	6° BTDC
D-500	2° BTDC



Timing Mark –(6 Cyl.) 2° BTDC mark on vibration damper under pointer under front cover. **(V8)** On crankshaft pulley (on vibration damper with Power Package), aligned with pointer on chain case cover.

Manual Adjustment – Timing may be advanced or retarded depending on fuel used or altitude. Range of timing should not exceed plus or minus 6° from recommended factory setting.



CARBURETOR

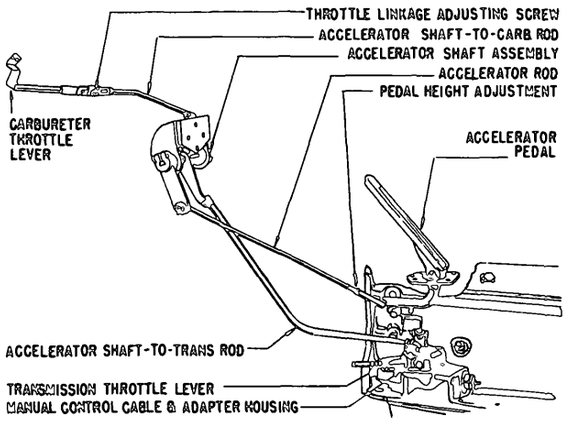
► *CARBURETOR APPLICATION: Stromberg WW 2-barrel Carburetors used as standard equipment on all models.*

CONTINUED ON NEXT PAGE

6 CYL. IGNITION WIRING

CONTINUED FROM PRECEDING PAGE

Carter WCFB 4-barrel Carburetor used on D-63-2, 3 Super Red Ram with Power Package & D-500. D-500 with P wer Package used TWO Carter WCFB Carburetors.



THROTTLE LINKAGE ADJUSTMENT (PowerFlite Cars): Correct any binding corrections. Run engine until normal operation temperature is reached. Remove air cleaner to make sure choke is fully open. Connect tachometer leads to coil and ground. Adjust engine idle speed to 475-500 RPM with transmission in neutral. Stop engine. Loosen throttle linkage adjusting screw (located on throttle control rod from engine to carburetor on 6 Cyl. engines, on accelerator shaft-to-carburetor rod on V8 engines).

6 Cyl. Engines – While holding throttle control rod from engine to carburetor against closed throttle stop, move bellcrank arm just enough to start extending accelerator return spring (Do not extend spring more than 1/8" in opposite direction).

V8 Engines – Move rear portion of accelerator shaft-to-carburetor rod rearward until it is stopped by the idle stop on transmission throttle cam.

All Engines – With control rods in line and pre-loaded lightly, lock throttle linkage adjusting screw by applying 10-15 ft. lbs. torque. Start engine and recheck idle speed (475-500 RPM) with transmission in neutral and hand brake set. Stop engine and remove tachometer.

Pressure Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

POWERFLITE THROTTLE LINKAGE

STROMBERG 2-BARREL WW

Transmission	Stromberg No.
Synchro-mesh (D-62-1, 2)	WW3-124
Overdrive (D-62-1, 2)	WW3-125
PowerFlite (D-62-1, 2)	WW3-126
Synchro-mesh (D-63-1)	WW3-135
Overdrive (D-63-1)	WW3-136
PowerFlite (D-63-1)	WW3-137
Synchro-mesh (D-63-2, 3)	WW3-138
Overdrive (D-63-2,3)	WW3-139
PowerFlite (D-63 2,3)	WW3-140

▷*6 CYL. MANIFOLD FUEL DISTRIBUTION: Each barrel feeds all cylinders.*

▷*V8 MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting – (6 Cyl.) 1 turn open, (V8) ¾ - 1¾ turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed (6 Cyl.) – 475-500 RPM with transmission in Neutral.

Idle Speed (V8) – 450-500 RPM (Std. & O.D.), 475-500 RPM (PowerFlite) with selector button in neutral.

Float Level – 3/16" from top of main body (gasket removed) with gauge (T-25569) at center of float and float lip held firmly against fuel inlet needle, To adjust, bend float lip (Do not force float) with Tool T-24733.

Accelerating Pump – Normal setting, center hole; for less fuel install rod in inner hole; for more fuel install rod in outer hole. Pump travel should be 7/32 to ¼" (V8), 3/16" to 7/32" (6 Cyl.). Adjust by bending pump rod.

Fast Idle: With throttle valves in fully closed position, turn fast idle stop screw in so it just contacts throttle lever, then turn adjusting screw in 4½ turns (V8), 5 1/8 turns (6 Cyl.). With choke valve closed and throttle lever held against fast idle screw, insert a No. 48 drill between tang on contact lever and first step of fast idle cam. Drill should just fit. To adjust, bend tang on cam contact lever (Tool T-26863).

Fast Idle Cam – Open throttle valves sufficiently to clear fast idle cam. With choke valve tightly closed and throttle valves forced closed, tang on cam contact lever should just clear high step of fast idle cam. This clearance should not exceed .020". Adjust by bending fast idle rod (at angle), using Tool T-109-213.

Automatic Choke Setting: Centered (indicator mark on cover coincides with center mark on housing).

Dashpot Adjustment: With idle speed adjusting screw set for normal idle speed, there should be 1/16-3/32" clearance between end of dashpot plunger and ear on throttle lever when plunger is pushed to end of its travel. To adjust, loosen locknut and turn dashpot in bracket to obtain correct clearance.

Kickdown Switch Adjustment: With throttle valves in wide position, there should be 1/64-1/32" clearance between ear on throttle lever and threaded portion on switch housing. To adjust, loosen adjusting nuts and move switch in or out until correct clearance has been obtained.

Throttle Linkage Adjustment: See CARBURETOR above.

▷*OTHER DATA: See "Stromberg WW" Carburetors in Carburation Section.*

Fuel Pump Pressure: 4½ - 6½ lbs.

CARTER 4-BARREL WCFB

D-63-2, 3 (Power Pack) Early	2303S, SA, SB
D-63-2, 3 (Std. & O.D.) Later	2474S
D-63-2, 3 (PowerFlite) Later	2432S
"500" (Standard)	2443S, SA
"500" (Power Pack)	(front) 2476S, (rear) 2445S

▷*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting – ½-1½ turns open (2432S; 2474S; 2303S, SA, SB), ⅜-1¾ turns open (2443S, SA), ½-1¼ turns open (2445S, 2476S). Turn screws out for richer mixture.

Carburetor Adjustment (2476S & 2445S): *Adjust carburetors exactly as f llows for balanced operation:*

1) Connector Rod – Open both carburetor throttles to wide open position. If either front or rear carburetor throttle valves do not open fully, adjust length of connector rod. Rod must not bind on pivot studs.

2) Idle Speed – With engine at normal operating temperature, disconnect accelerator shaft rod at rear carburetor, set idle speed to 500 RPM (use tachometer) as follows: Back off idle speed screw, turn front carburetor screw up to point where it contacts stop.

3) Idle Mixture – Turn rear carburetor idle mixture screws in until lightly seated, then back screws out ½ turn. Repeat with front carburetor. Trim front carburetor idle mixture screws only to obtain smoothest engine idle. Connect accelerator shaft rod.

Idle Speed – 450-500 RPM (Std. & O.D.), 475-500 (PowerFlite) with transmission in neutral.

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷*OTHER DATA: See Carter "WCFB" Carburetors in Carburation Section.*

Fuel Pump Pressure: 4½-6½ lbs.

CARB. EQUIPMENT

Fuel Pump: Auto-Lite FA-4005 (6 Cyl.), FB-4006 (V8 Early), Carter M2414 (V8 Later).

Pressure - 4½ - 6½ lbs.

See "Fuel Pumps" in Carburation Section of Manual.

Gasoline Gauge: Auto-Lite. Electric.

Dash Unit - 14007A (Sub. & Est. Wgn.), 14010A (Others).

Tank Unit - 13905A (Sub. & Est. Wgn.), 13969A (Others).

See "Fuel Gauges" in Carburation Section.

BATTERY

Auto-Lite 11-HS-60 or Willard HO-11-60 (D-63-2, 3 & D-500). 12 Volt, 11 plate, 60 ampere hour capacity.

Auto-Lite 11-HS-50 or Willard HO-11-50 (Others). 12 volt, 9 plate, 50 ampere hour capacity.

Warm Climate Option (Exc. Air Conditioned Cars) – Auto-Lite 11-MS-45 or Willard MO-11-45. 12 volt, 7 plate, 45 ampere hour capacity.

Grounded Terminal – Negative.

▷*CAUTION: This is reversed from previous models.*

Engine Ground – Left front of engine.

STARTER

Auto-Lite. 12 Volt. Application as follows:

Model	Auto-Lite Starter No.
Standard (D-62-1, 2)	MDG-6001
PowerFlite (D-62-1, 2)	MDF-6002
Std. (D-63-1, 2, 3, D-500)	MDG-6002
PowerFlite (D-63-1, 2, 3, D-500)	MDF-6007

Armature (All) – Auto-Lite MDF-2088.

Drive – Bendix "Folo-Thru" No. EBB-20.

Rotation – Counter-clockwise at commutator end.

Brush Spring Tension – 42-53 ozs. (new brushes).

Performance Data - MDF

Torque	RPM	Volts	Amperes
0 ft.lbs.	3200 Min.	10.0	60 Max.
6.5 ft.lbs. Min.	Lock	4.0	240 Max.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data - MDG

Torque	RPM	Volts	Amperes
0 ft.lbs.	4400 Min.	10.0	50 Max.
5 ft.lbs.Min.	Lock	4.0	210 Max.

Starting Switch: Auto-Lite SAE-4001 (Std.), SAE-4002 (PowerFlite). Magnetic type switch controlled by ignition switch. Neutral safety switch mounted on transmission on Automatic Transmission Cars. *See "Starter*

Neutral Safety Switch Adjustment: *See "PowerFlite" in Transmission Section.*

GENERATOR

Auto-Lite *12 Volt.* Application as follows:

Auto-Lite Generator No.	Application
GJC-7002A or GGA-6001K, L	6 Cyl. Std.
GJC-7001A, C or 7002A	V8 Std.
GJC-7003B or GGA-6002A	Pow. St.
GJC-7006B or GGA-6001N	Air Cond.
GJC-7003C or GGA-6002C	Air Cond. & Pow. St.
GGA-6003A	Special

►*SPECIAL GENERATOR NOTE:* GGA and GJC type generators used. Performance specifications below apply equally to all generators within either of the two groups specified.

Performance Data - GJC

Amperes	Volts	RPM Cold
20.0 ①	15.0	1750 Max.
30.0 ①	15.0	2050-2250

Performance Data - GGA

Amperes	Volts	RPM (70° F.)
4.0	14.6	950 Max.
40.0 ①	14.6	1600 Max.
40.0 ①	15.0	1600 Max.

① - Do not operate generator for any length of time in excess of controlled output setting. To do so may result in burned armatures and fields.

Brush Spring Tension - (GGA) 34-41 ozs., (GJC) 18-36 ozs., with new brushes.

Field Current - (GGA) 1.1-1.3 amperes, (GJC) 1.2-1.3 amperes, all at 10.0 volts (70° F.)

Motoring Current - (GGA) 2.3-2.6 amperes. 3.1-3.5 amperes with felt oil seal in drive end head. (GJC) 3.4-3.9 amperes. All at 10.0 volts.

Rotation - Counter-clockwise at commutator end.

Belt Adjustment: Loosen generator adjusting strap and generator-to-generator bracket mounting bolts. With Tool C-3379 hooked over generator and a torque wrench attached to tool, apply torque of 45 ft. lbs. (new belt), 27 ft. lbs. (old belt), to pull generator outward. While holding generator outward at required torque, securely tighten generator mounting bolts and adjusting strap.

REGULATOR

Auto-Lite. *12 Volt.* Used with generators as follows:

Auto-Lite Regulator No.	Generator
VAT-6201A	GGA
VRX-6201A	GJC

Cut Out Relay

Cuts In - 13.0-13.7 volts (VRX), 13.0-13.75 volts (VAT).

Cuts Out - 8.2-9.3 volts (approx. 3-5 amps. discharge).

Contact Gap - .015".

Air Gap - .031-.034".

Voltage Regulator

Setting – 14.5 volts at 80° F. while charging at 10.0 amperes or with .25 ohm resistor in series between regulator and battery.

Air Gap – .048-.052" with contacts just opening.

Checking & Adjusting – *See Electrical Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A – Operating Amperes	Test B
VRX	36 Max.	30 (28-32)
VAT	46 Max.	40 (38-42)

Test A – After 15 minutes operation charging at 10 amps.

Test B – After additional 15 minutes operation on current regulator (load applied to hold voltage at 13.7-13.9 volts (VAT), 13.6-13.8 (VRX).

Air Gap – .048-.052" with contacts just opening.

Checking & Adjusting – *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Direction Signal: *See Electrical Section.*

►*IGNITION-STARTER SWITCH CAUTION: When installing accessories, use accessory terminal only on ignition-starter switch and not the ammeter terminal post.*

Lighting & Panel Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut. Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft. Headlamp knob is held on its shaft by means of a recessed hex screw.

Stop Light Switch Location: On forward end of master cylinder.

CIRCUIT BREAKERS: Lighting – Three circuit breakers on back of lighting switch. Protect circuits as follows:

15 Ampere – Protects Head & Beam Indicator Lights.

6 Ampere – Protects Parking, Tail, License Plate, Instrument, Ignition and Clock lights.

6 Ampere – Protects Stop, Map, Dome, Glove Compartment, Courtesy and Trunk Compartment lights.

Windshield Wiper & Back-Up Lights: 5 Ampere. Mounted on rear of windshield wiper switch.

Window Lifts: 20 Ampere. Mounted behind left front kick panel.

Four Way Seat: 15 Ampere. Mounted behind left front kick panel.

HORNS: Auto-Lite or Sparton. Dual horns with Relay. *12 Volt.*

Horn Relay: Auto-Lite RAH-4002. *12 Volt.*

ENGINE

6 CYL. ENGINES

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditiining equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Sect.*

ENGINE SPECIFICATIONS: Six Cylinder "L" head.

Bore	Stroke	Displacement
3.25"	4.63"	230 cu. ins.

Compr. Ratio	Rated HP	Developed HP
7.4-1	25.4	123 at 3600 RPM

Compression & Vacuum Reading—*See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Dodge Special Data.*

►*MANIFOLD INSTALLATION CAUTION:* Two long capscrews extend into cylinder block water passage. Before installing, apply sealer to these capscrews. It is important that conical washers at flange ends of exhaust manifold be installed to permit expansion and contraction without loosening.

OIL PAN REMOVAL: Drain engine oil. As soon as oil is drained, install drain plug and tighten securely. Remove clutch housing pan to prevent damaging oil pan gaskets on clutch housing pan dust seal. Remove oil level indicator and drop pan on tie rod. Lift up oil strainer so it clears baffle inside pan. With strainer lifted, slide pan to rear and remove. NOTE—New end gaskets should protrude 1/4" to 1/8" above oil pan. *Ends must not be cut off.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, U-slot, cam ground type.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bore .020" oversize.*

Weight—16 ozs. (stripped).

Removal—Pistons and rods removed from above.

Fitting New Pistons: Clearance between piston skirt (¼-¾" from bottom of piston) and cylinder wall should be .0002-.0012" at 70° F. Pull to withdraw feeler, .002" x ½", should be 6-10 lbs. (piston inverted in bore, pin and rings removed).

Replacement Pistons: Std., .005", .020", .030", .040", .060" oversize.

Installing Pistons: "U" slot away from valves.

PISTON PINS

Full floating type.

Diameter—55/64". **Length**—2-3/4".

Pin Fit in Piston—.0000-.0005". DOUBLE THUMB push fit at room temperature (70° F.)

Pin Fit in Rod Bushing—.0001-.0002". Tight thumb push fit at room temperature (70° F.)

Replacement Pins: Std., .003", .008" oversize.

NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.010-.020"	.0025-.004"
Compr. (#2)	3/32"	.010-.020"	.002-.0035"
Oil (#3)	5/32"	.010-.020"	.001-.0025"
Oil (#4)	5/32"	.010-.020"	.001-.003"

Replacement Rings: Std., .010", .020", .030", .040", .050", .060" oversize.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Installing Rings: #1 Compression, with step on inner edge up. #2 Compression with step on inner edge up (step down, if step on outer edge).

CONNECTING RODS

Length (Center to Center)—7-13/16". **Weight**—27.9 ozs.
Crankpin Journal Diameter—2.0625".
Maximum out-of-round and taper limits—.001"
Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*
Clearance—.0005-.0015".
Endplay—.006-.011".
Bearing Adjustment: None. Replace bearings.
Replacement Bearings: Std. and .001", .002", .003", .010", .012", .020", .030", .040" undersize.
Installing Rods: Oil metering hole toward valve side of engine.

CRANKSHAFT

Journal Diameter—2.4995-2.5005". Four bearing.
Bearing Type—Removable, precision type, thin babbitt on steel. No shims.
►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows: **.010" UNDERSIZE (All Main & Connecting Rod Journals)**—Letter "B" stamped with engine serial number indicates that ALL Main & Connecting Rod Journals are .010" undersize.
Clearance—.0005-.0015" desired.
Replacement Bearings: Std. and .001", .002", .003", .010", .012", .030", .040" undersize.
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*
End Thrust: Taken by flanged faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT

Journal Diamet rs—(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-1'4".
Bearings—Removable, steel-backed babbitt lined bushings (exc. #4—machined in crankcase).
Clearance—.001-.003". NOTE—If clearance exceeds .005" (measure with dial indicator placed against cam lobe and pry toward indicator), install new camshaft for test and if clearance is greater than .0035", replace bearings.
End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain: **Width**—1". **Pitch**—.500". **Length**—24" or 48 links.
Camshaft Setting: Sprockets marked. Mesh chain with sprockets so that "O" marks on sprockets are adjacent and in line with a straightedge across shaft centers.
Engine Front Cover Installation: *See "Engine Front Cover" in Dodge Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance: .010" Intake. .010" Exhaust (engine hot and idling). NOTE—.002" additional clearance on exhaust tappets if car driven at continuous high speed.

Valves	Head Diam.	Stem Diam.	Length
Intake	1-17/32"	.340-.341"	4-27/32"
Exhaust	1-13/32"	.340-.341"	4-25/32"

Valves	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.001-.003"
Exhaust	45°	23/64"	.003-.005"

Valve Seat Width—1/16-3/32". Runout .0015" maximum.
►*VALVE SEAT INSERT CAUTION: See "Valve System" in Dodge Special Data.*
Valve Guides: Remove from above. Press new guides in with upper end 7/8" below top of block, finish ream to give correct valve stem clearance (See Valve Stem Clearance above). *CAUTION—Guides must be installed with counterbore end UP on exhaust valves and counterbore end DOWN on intake valves.*

Valve Springs: Install with closely coiled end up.
Free Length—1 15/16".

Valve Spring Specifications

	Spring Pressure	Length
Valve Closed	49-57 lbs.	1 11/16"
Valve Open	134-146 lbs.	1 5/16"

Valve Lifters: Mushroom type (remove from below).
Stem Diameter—5/8". Ream holes from above (pilot in guide). Oversizes .001", .008", .030".
Lifter Clearance in Block—.000-.001".

ENGINE

V8 ENGINES

►*TWO ENGINES USED AS FOLLOWS:* **D-63-1, 2, 3**—Polyspherical combustion chamber with lateral valves (single rocker arm shaft).
D-500—Hemispherical combustion chamber with laterally inclined valves (double rocker arm shafts).

ENGINE SPECIFICATIONS: 90° V8 (All Models).

Model	Bore	Stroke	Displmnt
D-63-1	3.625"	3.256"	270 cu. ins.
D-63-2, 3	3.63"	3.80"	315 cu. ins.
D-500	3.63"	3.80"	315 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
D-63-1	8.0-1	42.2	189 at 4400 RPM
D-63-2, 3	8.0-1	42.2	218 at 4400 RPM
D-63-2, 3 ①	8.0-1	42.2	230 at 4400 RPM
D-500	9.25-1	42.2	260 at 4800 RPM
D-500 ②	9.25-1	42.2	

①—With Power Package (Carter WCFB 4-Barrel Carburetor and Dual Exhaust System).
②—With Power Package (Two Carter WCFB 4-Barrel Carburetors).

Compression & Vacuum Reading—*See TUNE-UP.*
ENGINE REMOVAL: *See "Engine" in Dodge Special Data.*
OIL PAN REMOVAL: Remove oil level indicator, drain oil, disconnect steering linkage at idler arm support bracket, and allow linkage to drop. Remove bolts that hold oil pan to cylinder block and slide pan out, down, and away from engine.
CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, horizontal slot, elliptically turned, tin plated, thermally controlled by steel band.
►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" oversize.*
Weight—16.2 ozs. (D-63-1), 17.2 ozs. (D-63-2, 3), 18.0 ozs. (D-500).
Removal—Pistons and rods removed from above.
Clearance—.0005-.0015" at top of skirt.
Fitting New Pistons: Insert piston in bore, upside down, with .0015" x ½" feeler stock between thrust face of piston and cylinder wall. Pull required to withdraw feeler stock should be 5-10 lbs. at 70° F.
Replacement Pistons: Std., .005", .020", .030", .040", .060" Oversize.
Installing Pistons: Notch on head of piston must point toward front of engine and larger chamfer of connecting rod bore must be installed toward crankshaft journal fillet. *See Rod Installation below.*

PISTON PINS

Floating type with lock ring at each end.
Diameter—.8591-.8593" (D-63-1), .9215-.9218" (Others).
Length—2.880-.2.890" (D-63-1), 3.065-3.075" (Others).
Pin Fit in Piston—.0000—.0005". Tight thumb press fit at 70° F.
Pin Fit in Rod Bushing—.0001—.0004". Tight thumb press fit at 70° F. Selective fit.
Replacement Pins: Std., .003", .008" Oversize.
NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearanc
Compr. (#1)	.0775-.0780"	.010-.020"	.0015-.0030"
Compr. (#2)	.0775-.0780"	.010-.020"	.0010-.0025"
Oil (#3)	.1860-.1865"	.010-.020"	.001-.003"

Replacement Rings: Furnished Std., .005", .020", .030", .040", .060" Oversize.
Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length (Center to Center)—5.9335-5.9375" (D-63-1), 6.616-6.620" (Others).
Weight—21.2 ozs. (D-63-1), 24.0 ozs. (Others).
Crankpin Journal Diameter -1.9365-1.9375" (D-63-1), 2.2495-2.2505" (Others).
Maximum out-of-round and taper limits .001".
Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.
►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*
Clearance—.0005—.0015". Maximum—.0025".
Endplay—.006—.014".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Bearing Adjustment–None. Replace bearings.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize.

Installing Rods: *(NOTE* – Connecting rod bores are chamfered more on one side than other. This larger chamfer must be installed toward crankshaft fillet). When installing lower bearing shell, make certain that "V" groove in shell is in line with "V" groove in cap. This allows lubrication of cylinder wall. Bearing shells should always be installed so that small formed tang fits into machined grooves of rod. Oil ring expander gap should be toward outside of "V" of engine. Oil ring gap should be toward inside of "V" of engine. *See Piston Installation above.*

►*CAUTION:* Rods are **interchangeable.** However, when rods are assembled to piston, the assemblies of one engine bank **are not interchangeable** with the other bank.

CRANKSHAFT

Journal Diameter–2.3745-2.3755" (D-63-1), 2.5" (Others).

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*

.010" UNDERSIZE (Main & Connecting Rod Journals)– Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" Undersize.

Bearings–Removable, precision type, steel-backed, babbitt lined. No shims.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize. Halves of Nos. 1, 2, and 4 bearings are interchangeable with one another (caps are not interchangeable); upper and lower halves of No. 3 bearing are interchangeable; No. 5 halves are NOT INTERCHANGEABLE.

End Thrust: Taken by center (#3) main Bearing.

Clearance–.0005-.0015".

Endplay–.002-.007". Maximum .010".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.998–1.999", (2) 1.982–1.983", (3) 1.967–1.968", (4) 1.951–1.952", (5) 1.4355–1.4365".

Bearings–Removable, steel-backed, babbitt lined bushings.

Clearance–.001–.003". Maximum–.005".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay–.002–.006". Maximum–.010".

Timing Chain: Width–1-1/8". **Pitch**–.375". **Length**–68 links.

Camshaft Setting: Timing Check: Mark on gears should be adjacent and in line with straightedge across shaft centers. **Chain Installation:** Install chain and gears as an assembly. Mesh crankshaft gear in chain with keyway out toward chain, mesh camshaft gear in chain with keyway toward crankshaft gear and mark on gear in line with **23rd chain pin** clockwise from pin at mark on crankshaft gear. Install assembly on engine, turning crankshaft and camshaft to line up keys with gear keyways, install fuel pump eccentric (must engage camshaft key), tighten camshaft cupwasher and bolt to **35 ft. lbs.** Check timing as above.

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Dodge Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance (D-500) .012" Intake, .022" Exhaust, with engine hot and idling.

(D-63-1, 2, 3) None in service (hydraulic).

►***CAUTION: Valve train on D-500 different than on other engines.***

D-63-1, 2, 3

Valve	Head Diameter	Stem Diameter	Length
Intake	1.72"	① .371-.372"	4.25"
Exhaust	1.47"	① .372-.373"	4.20"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.360"	.002"
Exhaust	45°	.360"	.003"

D-500

Valve	Head Diameter	Stem Diameter	Length
Intake	1.87"	Ⓒ .371-.372"	4.83"
Exhaust	1.53"	Ⓒ .372-.373"	4.85"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.400"	.002"
Exhaust	45°	.409"	.003"

Ⓒ – Standard Valve. *See Valve Guides (below).*

Intake Valve Stem Oil Seal–Seal installed on intake valve stem after valve is inserted in head and before installation of springs. Seal will seat itself in correct position on guides.

►*VALVE GRINDING CAUTION:* If the position of the valve in the head has been changed (due to valve or valve seat grinding) so as to shorten the operating length by 1/32" or more from its factory installed position, the dimension from valve spring seat in the head to valve tip should be checked with gauge C-3436. If the valve tip exceeds the maximum allowable on the gauge, grind the tip as necessary (do not go below the minimum allowable on the gauge). Improper valve clearance at high speed will result if this condition is not corrected.

Valve Springs: *SINGLE springs used on D-63-1, 2, 3, DOUBLE springs used on D-500.*

Valve Spring Specifications
D-63-1, 2, 3

Valve	Lbs. Pressure	Length
Closed	53 lbs.	1.69"
Open	140 lbs.	1.31"

	Inner Springs		Outer Springs	
Valve	Lbs. Press.	Length	Lbs. Press.	Length
Closed	28	1.52"	61.5	1.66"
Open	66.5	1.09"	158.5	1.22"

►*CAUTION: Springs must be square within 1/16". (Use steel square on surface plate–revolve spring against square noting alignment of top coil).*

►*VALVE SPRING HEIGHT CAUTION:* If valves or seats are reground, check **installed** height of spring. If height of spring is 1-11/16" or greater, install a 1/16" spacer under valve spring.

►*VALVE SPRING LOAD CAUTION: Hydraulic lifter "pump-up" will restrict engine speed and cause valves to burn if spring loads are not maintained.*

Valve Guides: D-63-1, 2, 3– Guides are integral with head. If valve stem clearance excessive, use tool set to ream hole to NEXT oversize and install valve with OVERSIZE stem. Valves are furnished .005", .015", .030" oversize.

►***OVERSIZE VALVE STEM REAMING NOTE:*** Before reaming valve guides, check rocker cover gasket boss at one end of cylinder head for either a stamped "E" (exhaust) or "I" (Intake). If a letter is found, all guides in the head (either intake or exhaust, depending on letter) will be oversize. Standard production reaming of both intake and exhaust is .374-.375". Use reamer C-3433 to ream to .379-.380", C-3430 to ream to .389-.390", C-3427 to ream to .404-.405".

D-500 – Guides are separate pressed-in parts and are serviced by installing new guide and reaming to size for standard valve. Remove guides by driving out through top of head using tool C-3159. Install new guides by driving them up through valve port opening. To install INTAKE valve guide, place a steel scale across combustion chamber and drive valve guide in until punch mark on tool C-3159 is flush with face of cylinder head. To install EXHAUST valve guide, drive it in until it is flush with the machined face of the hole. Ream guide to .374-.375" with tool C-741.

►*CAUTION: Oil hole in top of exhaust guide must face up.*

NOTE–If Valve Guide Tool C-3159 is not available, drive guide in, measuring from top of valve seat as follows: **Intake**–15/16". **Exhaust**–1-3/32".

Hydraulic Valve Lifters: *NOTE* – **Not used on D-500.**

Diameter–.9040-.9045". **Clearance**–.0005-.0015".

Lifter Overhaul & Testing–*See "Valve System" in Dodge Special Data.*

Rocker Arm Assembly: *See "Valve System" in Dodge Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

6 Cyl. D-62-1 & 2

Intake Valves–Open 12° BTDC. Close 44° ALDC.
Exhaust Valves–Open 50° BLDC. Close 6° ATDC.

V8 ENGINES

See "Camshaft Setting" under CAMSHAFT above.

V8 D-63-1

Intake Valves – Open 14° BTDC. Close 50° ALDC.
Exhaust Valves – Open 52° BLDC. Close 12° ATDC.

V8 D-63-2, 3

Intake Valves – Open 11° BTDC. Close 53° ALDC.
Exhaust Valves – Open 49° BLDC. Close 15° ATDC.

D-500

Intake Valves – Open 12° BTDC. Close 60° ALDC.
Exhaust Valves – Open 54° BLDC. Close 18° ATDC.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Timing Check (6 Cyl.) – With .014" (Cold) tappet clearance, No. 6 valve should open with No. 6 piston 12-13° BTDC or .0766-.0770" BTDC. Reset tappet clearance to .010" HOT running clearance.

Valve Timing Check (D-63-1, 2, 3) – With No. 1 intake valve closed, insert a .210" spacer between rocker arm and #1 intake valve stem, install dial indicator over this valve so that pointer contacts valve spring at a right angle. Wait until seat stops moving (indicating that plunger bottomed so that lifter is solid). Set dial indicator at "Zero", turn crankshaft until dial indicator shows that valve has lifted .024". Pointer on cover should indicate between 5° BTDC and 7° ATDC if timing correct. Then turn crankshaft counter-clockwise until lifter is back down to the valve closed position. Remove spacer from between rocker arm and valve stem. *See "Camshaft Setting" under CAMSHAFT above.*

▷*CAUTION: Do not turn crankshaft further than indicated above. To do so might bottom spring and damage valve mechanism.*

OILING SYSTEM

6 CYL. ENGINES

Crankcase Capacity: 5 qts. (refill). Add one additional quart when filter changed.

Normal Oil Pressure: 40-50 lbs. at 25-30 MPH.

Oil Pressure Relief Valve–Oil pressure relief valve opens at 45-55 lbs. Under plug on left side of crankcase below starting motor. Provides additional oil at idling speeds. Adjustable by replacing springs (3 types). (1) Standard spring is not painted. (2) Lighter than standard painted RED. (3) Heavier than standard painted GREEN. When replacing springs, same color springs should be used.

Oil Pressure Gauge – Auto-Lite 14008A. Not electric.

Oil Pump: Rotor type on right side of crankcase.

Overhaul–*See "Oiling System" in Dodge Special Data.*

Oil Filter: By-pass type. On left side of engine above starter.

Servicing–Install new filter element and cover gasket at 8000 mile intervals (more often in dusty areas). Change oil at same time filter is changed.

Crankcase Ventilation: Filter in oil filler tube and air cleaner in crankcase ventilation outlet pipe.

V8 ENGINES

Crankcase Capacity: 5 qts. (refill). Add one additional quart if filter changed.

Normal Oil Pressure: 50-65 lbs. with warm oil and engine operating at 1500 RPM.

Oil Pressure Relief Valve–Mounted in oil pump. Adjustable by replacing springs (3 types). (1) Standard spring painted RED. (2) Lighter than standard spring painted GRAY. (3) Heavier than standard spring painted BROWN. When replacing relief valve spring use same color spring.

Oil Pressure Gauge: Auto-Lite 14008A. Not electric.

Oil Pump: Rotary type. In crankcase at rear end. Mounted on rear bearing cap.

Overhaul – *See "Oiling System" in Dodge Special Data.*

Priming Oil Pump (After Overhaul): Prime pump before installing oil pump and strainer to rear main bearing cap.

Oil Filter: Shunt type. A portion of oil from oil pump is directed through this filter and the remainder flows directly into engine lubrication system.

Filter Element–Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.

COOLING

6 CYL. ENGINES

Water Capacity: 13 qts. (14 qts. with heater).

Pressure Valve: Dodge No. 1373136. Radiator filler cap. Opens at 7 lbs.

Thermostat: By-pass type in cylinder head water outlet. Starts to open at 155-160° F.

Water Pump: Packless type. Grease fitting for lubrication. *See Water Pump Section for data.*

Pump Removal–Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs. Remove pump.

Water Distribution Tube: *See "Cooling System" in Dodge Special Data.*

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit – Auto-Lite 14009A.

Engine Unit – Auto-Lite 13550A.

See "Temperature Gauges" in Misc. Section.

V8 ENGINES

Water Capacity: 19 qts. (D-63-1), 20 qts. (Others). One additional quart with heater.

Pressure Valve: Radiator filler cap. Opens at 7 lbs (D-63-1), 14 lbs. (Others).

Thermostat: Choke type. In water pump to radiator connector. Starts to open at 157-162° F.

Water Pump: Packless, ball bearing type. No lubrication required.

See Water Pump Section for data.

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit – Auto-Lite 14009A.

Engine Unit – Auto-Lite 13550A.

See "Temperature Gauges" in Misc. Section.

CLUTCH

6 CYL. ENGINES

Borg & Bock	Model	Assy. No.	Disc No.
Std. (Exc. Sta. Wgn.)	9A7	361373	382237
Sta. Wgn.	10A7	361368	382358

Auburn – No. 100052-2 (Standard).

See "Borg & Bock" & "Auburn" Clutches in Clutch Sect.

V8 ENGINES

Borg & Bock	Model	Assy. No.	Disc No.
Std. (D-63-2,	10A7	361376	382366
Hvy. Duty	11A6	361382	381850

See "Borg & Bock" Clutches in Clutch Section.

Pedal Adjustment: Adjust the fork rod to secure 3/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: (*NOTE*–Over-center spring located above brake pedal and attached to pedal mounting bracket). Disconnect clutch pedal pushrod. Remove overcenter eyebolt adjusting nut. Reinstall adjusting nut, tighten finger tight, then further tighten four complete turns. This adjustment will require 12-15 lbs. pressure to hold clutch pedal down when it is 1" from fully released position.

Removal: Remove transmission or transmission and overdrive (See Synchro-mesh Transmission). Remove clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission is to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

OVERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down. *See "Warner R10" Overdrive in Transmission Section.*

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated planetary transmission.

See "PowerFlite" Transmission in Transmission Section.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).

▷*OVERFILLING CAUTION:* High engine speed or high temperature operating conditions may cause transmission oil to expand to point where transmission is, in effect, overfilled, causing governor pressure to drop to point to permit a high speed downshift in transmission. *See "Checking Fluid Level" below.*

Checking Fluid Level – *NOTE* – Manufacturer recommends checking fluid level with engine cold (normal temperature of 70° F.)

Cold Check – If oil level between (L) Low mark and end of dipstick, 1 pint of Transmission Fluid Type "A" may be added, but no more than 1 pint.

After Operation Check – If oil level is above (L) Low mark, do not add oil. If oil level is above the (F) Full

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

mark, drain to ½" below full mark. Add only WHEN OIL LEVEL IS BELOW THE (L) LOW MARK on dipstick, and transmission has been brought up to operating temperature by actual driving. In this case add 1 pint of oil only.

Oil Filler Tube Location: At right rear of engine compartment.

►*CAUTION:* To prevent dirt from entering transmission make sure oil level indicator is properly seated in filler tube.

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universal. Ball & Trunnion (6 Cyl. & D-63-1 front and rear, others front only). Cross type D-63-2, 3 & D-500 rear only).

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE* – "Barrel" type differential assembly used on V8 Cars with PowerFlite (four differential pinion and two side gears); others use differential assembly with two pinion and two side gears.

See "Dodge Hypoid" in Rear Axle Section.

Standard ..... Ⓒ 3.73-1 (41-11), 3.9-1 (39-10)
Overdrive 4.1-1 (41-10), 4.3-1 (43-10)
PowerFlite ..... Ⓒ 3.54-1 (39-11), 3.73-1 (41-11)

Ⓒ – D-500 has six optional ratios ranging from 3.54-1 to 4.78-1 available for use with 8¼" Pinion Ring Gear, and ten optional ratios ranging from 3.07-1 to 4.89-1 for use with 8¾" Pinion Ring Gear.

Backlash–.006-.010".

Thrust Pad Clearance (Barrel Type)–.006-.008".

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly.

Axle Shaft Removal: Remove wheel, hub and drum assembly (Use puller C-845). *(CAUTION–Do not strike end of axle shaft to loosen hub; otherwise, possible damage to axle shaft bearings and thrust block might result).* Block brake pedal, disconnect brake line at wheel cylinders, remove axle shaft key, install sleeve C-757 in axle bearing outer oil seal before removing brake support plate from axle housing. Remove shims from each end of axle housing. (Each set should be kept separate so that at reassembly, central location of axle shafts, wheels and thrust block, will be assured). Remove axle shafts and bearings from housing (Use puller C-293-C to remove bearings from axle shafts, puller C-637 to remove inner oil seal, drift C-241 to install seal.

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel hub removed, check end play with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**–.003-.008".

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. Coil springs and direct-acting shock absorbers.

See "Dodge" in Front Suspension Section.

Kingpin Inclination–5-1/2° at 0° camber.

Caster–Neg. 2° to 0° (Neg. 2° preferred with Manual Steering, 0° preferred with Power Steering). Left side should be between 0° and ¾° more negative than right side.

Camber–Pos. 1/4°±3/8° (Left side Pos. ½°, Right side 0° preferred).

Toe-In – 1/8" preferred.

Toe-Out on Turns – With outside wheel at 20°, inside wheel should be 21½°±1°.

STEERING

Manual: Gemmer. Worm and three-tooth roller.

See "Gemmer Worm & Roller" in Steering Section.

Power Steering: Coaxial. Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column.

See "Coaxial" Power Steering in Steering Section.

►*JERKY OPERATION OF POWER STEERING GEAR CORRECTION:* Adjust generator drive belt (See Generator), then adjust fan drive belt so that a maximum of ¼" deflection is obtained when applying a 10 lb. pull with spring scale at middle of widest belt span.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: Dodge "Safe-Guard" Lockheed hydraulic (Except D-500). Center Plane (Floating Shoe) hydraulic (D-500).

See Dodge "Safe-Guard" or "Center Plane" Brakes in Brake Section.

Drum Diameter – 12" (D-500), 11" (Others).

Wheel Cylinder Diameter–1-1/8". Single acting (front), double acting (rear wheels).

Replacement Linings & Shoes–Linings or shoes with linings are furnished Standard and .030" Oversize.

Lining–Molded asbestos (bonded to shoe).

Length (D-500) – 12.57" per shoe.

Length (Others)–(Primary, front & rear) 11.5", (Secondary, front) 11.5", (Secondary, rear) 8.8".

Width – (D-500) 2.5", (Others) 2".

Thickness – (D-500) 13/64", (Others) .200".

Braking Power – 60% front, 40% rear.

Clearance (Exc. D-500)–.006" at each end of all shoes.

Clearance (D-500)–Front Wheels – Turn each adjusting cam in direction of forward wheel rotation until shoe lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.

Rear Wheels – Same as front wheels except on rear wheels forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of reverse wheel rotation.

►*BRAKE "SQUEAK" CORRECTION: (CENTER PLANE BRAKES): See Dodge "Center Plane" Brakes in Brake Section.*

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid–Filler plug at top of master cylinder (on dash panel in engine compartment).

Removal – Disconnect brake line tube at master cylinder. Disconnect stop light switch leads, remove four stud nuts from studs, remove master cylinder.

Power Brakes: "Integral", "Bellows" or "Piston" Assist types used. "Integral" type replaces regular master cylinder and is mounted on engine side of firewall. "Bellows" and "Piston" Assist types are mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder).

See "Dodge Power Unit (Integral Type)" or Chrysler, DeSoto, Dodge, Plymouth "Bellows" or "Piston" Type Power Brakes in Brake Section.

Removal of Integral Type Power Unit – Same as for standard master cylinder, after stop light wires and hydraulic lines are removed.

Removal of "Bellows" & "Piston" Type Power Units – Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond extremities of bracket *(NOTE* – If pedal linkage is allowed to extend through hole in dash panel, trigger arm may be damaged). Disconnect vacuum hose at power unit. Remove complete power unit and bracket assembly by removing four nuts and lockwashers. Carefully withdraw unit from dash panel.

Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans. 7" internal expanding type used with Automatic Transmissions.

Adjustment–*See "Hand Brake Notes" in Dodge Special Data.*

Lining–	Width	Thickness	Length
6" Ext. Type	2"	5/32"	15-3/8"
7" Int. Type	2"	5/32"	13-1/16"

Clearance (Internal Expanding) – Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

Clearance (External Contracting) – Adjust anchor screw so clearance between band and drum at anchor is .015-.020".

MISC. MECHANICAL

Windshield Wipers: Auto-Lite. Electric.

Car Model	Auto-Lite No.
D-62-1, 2; D-63-1 Std.	EPH-4101A
Others Std., D-62-1, 2 & D-63-1 Optl. 2-Spd.	EPF-4001A

See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.

Air Conditioning: Dodge "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Electric Window Regulators" in Misc. Section.*

Power Seat Adjuster: Electric type. *See "Power Seat Adjusters" in Miscellaneous Section.*

Convertible Top Control: Electrical-hydraulic type. *See "Power Top Controls" in Miscellaneous Section.*

℄ – See Cylinder Head Installation (below) for head tightening procedure. Three different torque applications must be made.

ENGINE

ALL PASSENGER CARS (EXCEPT THUNDERBIRD)

ENGINE REMOVAL: Disconnect transmission from engine

1) Cars with Standard r Overdrive Transmission: Disconnect clutch release spring Remove screws retaining equalizer bar support to flywheel housing, then remove support and bushing Disconnect accelerator linkage at manifold bellcrank Remove two upper flywheel housing bolts Remove flywheel housing cover, support transmission with jack, then remove remaining flywheel housing bolts Then following procedures under **3)** below

2) Cars With F rd matic Transmission: Disconnect transmission throttle linkage at cross shaft, tie linkage to dash panel Remove idler arm bracket Fold back floor mat, remove two rubber plugs, then two top converter housing-to-engine bolts Jack up front of vehicle and position safety stands Support transmission with jack, then remove remaining converter housing-to-engine bolts Remove converter housing lower access cover, then turn flywheel till flywheel drive plate is in position to remove three bolts. Turn flywheel 180° and remove other three bolts. *CAUTION* - Turn drive plate 90° so that flex plates will not catch on converter housing when engine is removed. Drain transmission. Remove bracket that secures transmission oil level indicator tube to engine. Disconnect tube at transmission oil pan, and remove tube assembly. Remove transmission control linkage splash shield from cylinder block, then remove oil filter.

3) Engine Rem val – Remove hood, drain cooling system and crankcase. Remove heater hoses, heater inlet duct and blower motor. Remove radiator upper and lower hoses and remove radiator, and fan. Disconnect battery ground cable at cylinder block and fuel flex line at fuel pump. Disconnect windshield wiper vacuum hose, temperature sending unit wire, and oil pressure sending unit wire. Disconnect primary wire at coil, remove starter cable at starter, ground cable at rear of engine. Remove air cleaner and tape air horn closed. Disconnect choke cable at carburetor and disconnect accelerator linkage. Disconnect muffler inlet pipes at exhaust manifold Attach engine lifting hook(s) and remove right and left front splash aprons. On 8 cylinder engines, remove retainer and lower insulator from engine front steady rest. On 6 cylinder engines, loosen the two engine front steady rest to spacer bolts. Raise car and position safety stands. On 8 cylinder engines, remove engine left insulator. Remove cap screws from engine right insulator at the engine. On 6 cylinder engines, remove left insulator to bracket bolts at the insulator and the right bracket bolts at the engine. Raise engine slightly, then carefully pull it from transmission. Carefully lift engine out of engine compartment. Do not let engine swing against grille.

THUNDERBIRD

ENGINE REMOVAL: Disconnect transmission from engine, follow steps **1)** or **2)** under "Engine Removal–All Passenger Cars (Except Thunderbird)" above, then remove engine as follows Remove hood, drain cooling system and crankcase Remove fan, then remove radiator and shroud as an assembly Remove air cleaner Disconnect engine ground wire at dash Disconnect battery ground cable at engine and battery-to-starter relay cable at battery, Disconnect vacuum pump line, and fuel inlet line at fuel pump Disconnect starter cable at starter solenoid, then remove cable clamp at dash panel Disconnect ignition switch-to-coil wire at coil. Disconnect the two heater hoses Remove generator wires, and wires from oil pressure and temperature sending units Remove heater blower assembly Disconnect tachometer cable Disconnect accelerator rod, then disconnect link bracket at block (this bracket also serves as ignition cable bracket) Raise vehicle and position safety stands Disconnect exhaust pipes at exhaust manifold Remove engine front mount bolt and insulator. Remove engine right and left steady rest bracket bolts, at the engine, then turn the brackets to one side so engine will clear them upon removal. Remove safety stands and lower vehicle. Install engine lifting sling. Raise engine slightly, then carefully pull engine from transmission. Carefully lift engine out of engine compartment.

CONVENTIONAL TRUCKS

ENGINE REMOVAL· *For trucks equipped with Fordomatic, see Note below.* Drain cooling system and crankcase Remove hood, fan assembly and fan belt Disconnect heater hoses at engine. Remove radiator and shroud assembly. Remove air cleaner, then tape carburetor air horn closed. Disconnect windshield wiper hose at manifold Disconnect hand throttle control, choke cable, accelerator rod, and accelerator retracting spring at carburetor Disconnect engine temperature and oil pressure sending unit wires, and ignition coil primary wire Disconnect generator wires Disconnect flexible fuel line at fuel pump and muffler inlet pipe at exhaust manifold Disconnect clutch release lever retracting spring, starter cable at starter, and battery ground strap at engine. Remove starter assembly Install engine lifting sling Remove flywheel housing-to-engine bolts, then flywheel housing lower cover. Remove bolts from engine front support. Take up weight of engine with hoist. Support transmission with jack, then move engine forward to separate clutch from transmission input shaft Lift engine carefully from chassis

►*FORDOMATIC ENGINE REMOVAL NOTE*· On Conventional & Cab Forward Trucks. In addition to procedures given, perform following. Disconnect transmission oil-to-water cooler inlet and outlet tubes Remove upper and lower screws retaining converter housing to engine Remove converter housing lower access cover, then using Tool T52L-7950-A, turn flywheel until flywheel drive plate is in position so that three bolts can be removed Turn flywheel 180°, and remove other three bolts Install engine lifting sling and remove engine in usual manner

CAB FORWARD TRUCKS

ENGINE REMOVAL: *For trucks with Fordomatic Transmission, see NOTE at end of "Conventional Truck Engine Removal" immediately above.* Drain cooling system and crankcase. Disconnect throttle return spring Remove floor mat, then battery cover. Disconnect one of battery cables. Remove floor pan. Disconnect ignition coil primary wire and ground wire at coil mounting bracket Remove screws securing loom clip, tail light wire clip, and speedometer cable, then move wires and speedometer cable out of way Remove distributor cap and rotor Remove fan assembly, belt, and air cleaner Tape carburetor air horn closed Disconnect radiator upper and lower hoses, and heater hoses at engine. Remove upper and center grille sheet metal. Remove radiator, shroud assembly, and radiator-to-front fender apron supports Disconnect hand throttle control and choke control Disconnect accelerator linkage. Remove windshield wiper hose from intake manifold (or vacuum pump inlet) Remove temperature sending unit wire and generator wires Remove oil dipstick. Remove engine front support nuts and washers. Disconnect flexible fuel line at fuel pump Close off main fuel line to prevent loss of fuel. Disconnect muffler inlet pipe, and pull it away from manifold flange. Remove flywheel housing lower cover. Remove flywheel housing-to-engine retaining screws Disconnect starter cable and battery ground strap, remove starter Install engine lifting sling. Position floor jack under engine, place wood block between jack and oil pan Raise engine slightly, and remove engine front support bolts and rubber pad Raise engine carefully with hoist, move it forward to clear transmission input shaft, and remove it from chassis

PARCEL DELIVERY

ENGINE REMOVAL: (*NOTE*–Engine & transmission re-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

moved as assembly). Remove driver's seat and support. Drain crankcase. Disconnect air cleaner tube and elbow from carburetor, then remove air cleaner from engine cover bracket. Tape carburetor air horn closed. Drain cooling system. Remove clutch pedal plate. Remove brake pedal pad, then remove pedal opening plate and slide it over brake pedal rod. Remove pedal opening rubber mat. Remove two screws retaining dimmer switch, and drop switch through floor board. Disconnect accelerator rod from pedal. Remove left floor plate (the accelerator pedal and engine front cover hood lock are removed with floor plate). Remove brake master cylinder inspection cover. Remove ten screws from engine cover base plate. Remove nuts and bolts retaining center floor plate to engine cover base plate. Loosen three bolts securing crossmember reinforcing plate to left and right wheel housings. (*NOTE*–Drive wedge between reinforcing plate and left and right wheel housings). Remove center floor plate, then remove one reinforcing plate-to-crossmember bolt from end of body crossmember. Remove engine cover and base plate assembly. Disconnect windshield wiper vacuum line at fuel pump, and the fuel flex line at tank fuel line. (*NOTE*–On Fordomatic equipped vehicles disconnect transmission selector rods at transmission). Disconnect radiator upper and lower hoses at radiator. Disconnect radiator-to-cylinder outlet tube and hose at water pump. Disconnect primary wire from coil and ground wire at coil bracket. Disconnect heat and oil pressure indicator wires. Disconnect starter cable at solenoid and starter ground strap at starter. Disconnect exhaust inlet pipe at exhaust manifold. Remove emergency brake cable clevis pin, then remove emergency brake holding bracket. Remove emergency brake holding bracket. Remove emergency brake hold down bracket. Pull emergency brake cable out of way. Remove speedometer cable holding bracket, then remove speedometer cable from transmission speedometer gear, and move assembly out of way. Remove fan assembly and belt. Disconnect generator wires. Remove body crossmember. Disconnect choke cable at carburetor. Remove engine front support bolts, rear support mount bolts and lower right and left-hand pads. Remove universal joint "U" bolts and drop rear of drive shaft. Disconnect universal joint knuckle dust cap. Remove drive shaft spline from universal joint knuckle and plug assembly. Remove carburetor inlet fitting and fuel line from carburetor. Remove valve rocker arm cover, then install the appropriate engine lifting bracket. Position hoist through right door and attach it to lifting bracket. Lift engine and remove engine and transmission through the front door.

ENGINE MOUNTINGS

(EXCEPT THUNDERBIRD)

ENGINE FRONT STEADY REST REMOVAL & INSTALLATION: Removal – On 8 cylinder engine, drain cooling system, remove radiator, fan, drive belts, and crankshaft damper. All engines, remove two clamp bolts at front of steady rest bracket. Remove spacer bolt that retains insulators in bracket. Remove three bolts (6 Cyl.), four bolts (8 Cyl.) that secure bracket to engine and remove bracket.

Installation – Install bracket on front engine cover, tighten bolts to 23-28 ft. lbs. torque. Install, but do not tighten insulators, spacer bolts, and clamp bolts. If necessary, center spacer bolt in frame bracket by shifting engine mounts in frame brackets. Tighten spacer bolts to 20-25 ft. lbs. torque. Make sure engine weight is not transferred to insulators, then tighten clamp bolts 25-30 ft. lbs. torque. On 8 Cylinder engines, install crankshaft damper, drive belts, and radiator.

(THUNDERBIRD)

ENGINE STEADY REST REMOVAL, ASSEMBLY & ADJUSTMENT: Removal – Remove upper and lower bracket retaining bolts and remove steady rests as assemblies.

Assembly – Assemble bottom nut, washer, insulator and bracket on the upper end of rod. Install the top insulator washer, and nut on the upper end of rod. Assemble top washer, bushing, and bracket on lower end of rod. Install bottom washer, bushing, washer, and nut on lower end of rod.

Installation & Adjustment – Install assembly in car and tighten bracket bolts to 30-35 ft. lbs. torque. **Adjust insulators as follows:** Loosen lower rod and upper nuts on both steady rests. Let engine seek its own level position. Turn lower rod assembly nut, washer and insulator of each steady rest up against lower (chassis) support bracket. Tighten lower nut until overall dimension of insulator with retainer is 1.29-1.33". Turn lower nut, washer, and insulator at top of each rod assembly up against the engine support bracket, so dimension of lower retainer and insulator is 1.08", then turn upper nut, washer and insulator at top of rod assembly down against engine support bracket until dimension of this insulator is .77". Overall dimension of top portion of rod assembly should be 1.97-2.02".

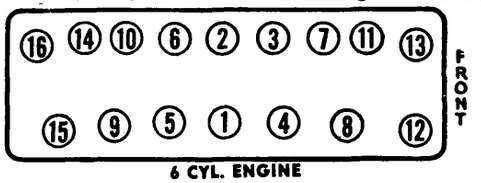
CYLINDER HEAD & MANIFOLD

6 CYL. ENGINE

CYLINDER HEAD: Removal – Drain cooling system, remove radiator upper hose and heater hose, air cleaner and tape carburetor air horn closed. Disconnect battery cable at cylinder head. Disconnect windshield wiper vacuum line, accelerator rod, choke cable, temperature sending unit wire, and oil pressure sending unit wire. Disconnect coil from head (move it to one side), and remove spark plug wires and spark plugs. Disconnect fuel line at carburetor and fuel pump, distributor vacuum line at carburetor and distributor. Disconnect manifold vacuum line at manifold and at booster pump, then remove three lines as an assembly. Remove rocker arm cover, the capscrew and clip from No. 6 rocker arm support bracket. Pull oil feed line out of bracket, then pull it out of block with pliers. DO NOT damage line. Loosen all rocker arm adjusting screws (to remove valve spring load from rocker arms), then remove rocker arm shaft assembly. Remove pushrods in sequence and identify them for installation in original positions. Remove manifold to head bolts, pull manifold assembly away from head, bracing assembly so that inlet pipe will not be damaged. Install cylinder head holding fixture, remove all cylinder head bolts, install cylinder head guide studs (7/16" - 14 x 6" bolt, cut off head, taper end and slot for screw driver), lift cylinder head assembly off engine.

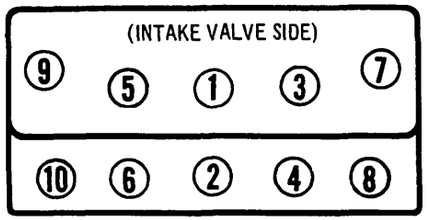
Installation – Apply coating of cylinder head gasket sealer to both sides of gasket, position gasket over guide studs, place cylinder head over guides and lower carefully. Coat threads of each bolt with small amount of water resistant sealer, install two bolts at opposite ends of head to hold gasket in place and remove guide studs. Install balance of bolts, remove cylinder head holding fixture and tighten bolts in sequence as shown in diagram, as follows: 1) Tighten to 55 ft. lbs. (cold) in proper sequence, then 65 ft. lbs. in proper sequence (cold). Install pushrods in proper locations, position rocker arm assembly on head and install oil drain line, clip and retaining screw on No. 1 bracket. Make sure line enters shaft locating hole. Position oil feed line on No. 6 bracket, with lower end of oil line "O" ring seal in oil supply counterbore, then install bolt. Tighten all remaining bolts to 45-55 ft. lbs. torque. Make preliminary (cold) valve lash adjustment. Install manifolds, lines, and wires. Connect wiper hose, battery cable and fill cooling system. Remove tape from air horn, connect choke wire, start and run engine at 1200 RPM for approximately 30 minutes. Tighten cylinder head bolts in proper sequence to 75 ft. lbs. torque (hot) recheck valve lash and engine idle as necessary.

V8 ENGINES



CYLINDER HEAD: Removal– Drain cooling system. Clean outside of valve chamber cover. Remove cover, exhaust manifold, spark plugs, intake manifold, ignition harness bracket from right hand cylinder head (remove distributor cap when removing right hand head from Thunderbird). On cars, others than Thunderbird, disconnect battery ground cable, and oil dipstick tube bracket from cylinder head. Remove generator bracket-to-cylinder head bolt, remove generator from mounting bolt, and move generator out of way. Release spring tension on rocker arms by loosening adjusting screws, then remove rocker arm assembly and oil baffle plates. Remove valve pushrods in sequence. Identify pushrods so that they can be replaced in original positions. Disconnect wire from temperature sending unit (left-hand head). Remove cylinder head bolts. Install cylinder head holding fixtures. (*NOTE*–Distributor location on Thunderbird will not permit installation of rear holding fixture on right hand head in its normal position. Install fixture one hole forward). Lift cylinder head off block. Do not pry between head and block. Remove head gasket.

Installation: Using new gasket with sealer applied to both sides, position cylinder head on engine. Remove holding fixture brackets. Install cylinder head bolts, and tighten them to 55 ft. lbs. torque (cold) in proper sequence (see diagram). Repeat operation and tighten to 65 ft. lbs. (cold). (See Cylinder Head Torquing following for special tools required). Install pushrods in their proper locations. Position oil baffle plates on head. Place rocker arm assembly on plates, then install bracket retaining screws and nuts. Be sure to install the oil drain tube on same end bracket from which it was removed. The bracket end of the tube must enter locating hole in rocker shaft. (*CAUTION*–Be



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

sure rocker shaft support brackets are not upside down when assembly installed. There is a .020" difference in bracket height when reversed. Tightening the screws with brackets reversed can result in a broken rocker shaft). Tighten bracket retaining screws and

6 CYL. ENGINE

V8 ENGINE

nuts to 12-15 ft. lbs. torque. Make a preliminary valve lash adjustment. Connect temperature sending unit (left hand head). After installing right hand head on all vehicles **xc pt Thunderbird,** position generator, install the generator front mounting bolt, then fasten generator bracket to cylinder head. Connect battery ground cable and dipstick bracket. After installing right hand head on Thunderbird, install distributor cap. Install ignition harness bracket on right hand cylinder head. Install intake manifold. Install spark plugs, then install heat shields and exhaust manifold. Fill cooling system, and run engine until it has reached normal operating temperature. Then tighten head bolts to 75 ft. lbs. torque (hot). Check the valve lash and adjust the lash as necessary. Cement new gasket on rocker arm cover if necessary, then install cover. Tighten cover nuts to 2.0-2.5 ft lb. torque.

►*V8 CYLINDER HEAD TIGHTENING NOTE:* Due to position of rocker arm assemblies and exhaust manifolds, special tools are required to properly torque cylinder head. On both right and left hand bolts 1-2-3-4-5-6-7-8-9 use Wrench S-8663-A. On right hand bolt No. 10 use 11/16" socket, 1 5/16" long plus SX-5 Extension. On left hand bolt No. 10 use S-8663-A Wrench. *When using socket and extension on a Fordomatic equipped vehicle, work from the top of the manifold, and force the socket extension past the Fordomatic oil level indicator tube in order to get the socket on the bolt head.*

MANIFOLD HEAT CONTROL

V8 "256" ENGINE

►*1954-55 "256" ENG. MANIFOLD HEAT CONTROL INSTALLATION (For Cold Weather Op ration):* If poor engine operation encountered on 256 Eng. Trucks under stop and go conditions, an exhaust thermostat control valve may be installed on 1954-55 models as follows:

Engin s Built Thr ugh S pt mb r 2, 1954: Equipped with EBU-5267-B crossover pipe and B5T-5293-A spacer. Remove spacer and install B4A-9685-A exhaust thermostat control valve.

Engines Built From September 2, 1954 to December 1, 1954: Equipped with EBZ-5267-A crossover pipe and four attaching studs (353721-S). Remove pipe and studs, and replace with EBU-5267-B crossover pipe, 88413-S studs, 33816-S nuts. Install B4A-9685-A exhaust thermostat control valve.

Engines Built From December 1, 1954 Through 1955: Equipped with B5C-5267-A crossover pipe, four attaching studs (88448-S), and EBU-9450-B gaskets. Remove pipe, studs, and gaskets. Replace with B5A-5267-B crossover pipe, 88413-S studs, 33816-S nuts, B5A-9450-A gaskets. Install B5A-9685-C exhaust thermostat control valve. *NOTE*–B5A-9685-D exhaust thermostat control valve has been released to minimize engine stalling and improve fuel distribution. See Ford Truck Model pages.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

►*1956 CRANKSHAFT & CRANKSHAFT FRONT OIL SLINGER PRODUCTION CHANGE (To improve seals):* New crankshafts with integral rear oil slingers are used in production on 6 and V8 engines. A Front Oil Slinger. Ford No. B6A-6310-A (6 Cyl. Engine), No. B6A-6310-B (All V8 Engines) can be installed to improve crankshaft front oil seal operation. *6 CYL. ENGINE CAUTION -* New Cylinder Front Cover, Ford No. B6A-6019-A must be used when this front oil slinger is installed.

►*INSTALLATION OF CRANKSHAFT WITH INTEGRAL REAR OIL SLINGER & USE OF FRONT OIL SLINGER ON 1952-56 ENGINES:* New type crankshaft with integral rear oil slinger and separate front oil slinger can be installed on previous engine models as follows:

1952-53 6 Cyl. "215" Engine – Front Oil Slinger, No. B6A-6310-A. *NOTE* - New Cylinder Front Cover No. B6A-6019-A must be used with this slinger.

1954-56 6 Cyl. "223" Engine – Crankshaft No. B6A-6303-E, Front Oil Slinger No. B6A-6310-A. *NOTE* - New Cylinder Front Cover No. B6A-6019-A must be used with this front slinger.

1954-55 V8 "239" & "256" Truck Engines – Crankshaft Front Oil Slinger No. B6A-6310-B.

1955-56 V8 "272", "292", & "312" Engines – Crankshaft No. B6A-6303-D (272 & 292 Engines), No. B6A-6303-C (312 Engine), Front Oil Slinger No. B6A-6310-B.

(ALL ENGINES)

CRANKSHAFT THRUST BEARING ALIGNMENT: Install No. 1, 2 & 4 main bearing caps and torque to specifications. Install No. 3 main bearing cap with bolts finger tight. Pry crankshaft forward against upper half of No. 3 main bearing, pry No. 3 main bearing cap to rear to align thrust surfaces of both halves, and tighten bolts, while holding shaft forward and cap to rear, to torque specifications. Check crankshaft end play.

(ALL ENGINES)

REAR MAIN BEARING OIL SEALS: *NOTE* - Crankshaft seal is installed in groove in block and in bearing cap (6 Cyl.) or in seal retainer directly behind rear main bearing (V8). Bearing cap or retainer is sealed in block by special sealing strips inserted in vertical grooves in sides of bearing cap or retainer after they are installed in block.

Seal Installation: Install new seal in groove in cylinder block using Tool T52L-6701-AGD to drive it in place. Install seal in Bearing cap groove (6 Cyl.), in retainer groove (V8), using Tool as above. Cut surplus seal flush with block, bearing cap or retainer. Coat Bearing cap (6 Cyl.) or retainer (V8) mating surfaces with sealer, install bearing cap (6 Cyl.) or retainer (V8), and tighten bolts to correct torque. Dip side seals in engine oil and quickly install them in vertical grooves. *NOTE*– It may be necessary to drive seals in place the last ½" of travel. DO NOT use sealer on side seals. They will expand when dipped in engine oil.

Testing Seal Installation – To check vertical seal installation for leaks, squirt a few drops of oil into parting lines between cap or retainer and cylinder block from the outside. Blow compressed air against seals from the inside of the block. If air bubbles appear in the oil, it is an indication of oil leakage.

ENGINE FRONT COVER

6 CYL. ENGINES

ENGINE FRONT COVER: Removal – Remove radiator, crankshaft damper, oil pan, and cover retaining screws, cover and gasket. **Installation** – Coat gasket surface of block and cover with sealer. Install cover and tighten screws to specifications. Install oil pan, crankshaft damper and belt. On Power Steering cars, install power steering pump pulley and belt. Install radiator.

V8 ENGINES

ENGINE FRONT COVER: Removal – Remove radiator, fan blades and hub, dampener, fuel pump, and oil pan. On Power Steering Cars, disconnect power steering pump bracket from water pump, and move power steering pump out of way. On passenger cars, remove engine steady rest. On Thunderbirds, support engine, then remove engine support. On Air Conditioned cars, remove condenser brackets from front cover and move out of way. Remove generator mounting bracket bolts from cylinder front cover, and move bracket out of way. Loosen generator adjusting bracket and move it out of way. Disconnect water by-pass tube. Remove remaining bolts, then remove water pump (and spacer on Thunderbird), and front cover as an assembly.

Installation – Coat gasket surface of block, cover and cover bolt threads with sealer. Place new gasket in position. Insert large diameter end of oil seal pilot in bore of cover, position cover and pilot assembly over end of crankshaft and against block. Push in on pilot at same time tighten cover bolts to specifications. Install oil pan. On passenger cars, install engine steady rest. On Thunderbird, install engine front support. On power Steering cars. connect power steering pump bracket to water pump. On Air Conditioned cars, connect condenser brackets to cylinder front cover. Install water by-pass tube and crankshaft damper. Install fuel pump (with new gasket), fan blades and hub, install and adjust drive belts. Install radiator.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FRONT COVER OIL SEAL: Drive out old seal with a pin punch, then clean out recess in cover. Coat new seal with grease, then install seal with Tool T52L-6700-BEE. Drive seal in until it is fully seated in recess. Check seal to be sure spring did not come out during installation.

CAMSHAFT & BEARINGS

(6 CYL. ENGINE)

CAMSHAFT REMOVAL: Remove radiator support bar, radiator, radiator grille assembly, cylinder front cover, and oil pan. Remove rocker arm cover, disconnect ignition switch to coil wire from engine clips, then remove pushrod chamber cover. Remove rocker arm assembly, pushrods in sequence. Remove camshaft sprocket bolt. Turn crankshaft until marks on sprockets and chain are on driving side with 12 pins between marks. Remove distributor cap, scribe line on distributor housing and cylinder block to mark position of rotor and distributor housing for installation, remove distributor. Remove sprockets and timing chain, camshaft thrust plate, woodruff key and spacer. Turn camshaft until lifters can be raised up with a magnet or fingers clear of the camshaft lobes and secure them in this position. Carefully remove camshaft.

6 CYL. ENGINE

CAMSHAFT BEARING REMOVAL & INSTALLATION: Remove camshaft, drill a ½" hole in plug at rear camshaft bearing bore, remove plug with Tool 7600-E. Remove bearings from block with Tool T52L-6261-CEE. To install, position bearing at bearing bore and press it into place with Tool T52L-6261-CEE. No. 1 cam bearing must be pressed in .005-.025" below front face of bearing bore. Press remaining bearings in sufficiently to align oil supply holes. Clean out plug recess in camshaft rear bore. Coat outer rim of new plug lightly with Sealer 8A-19554-A, and install plug with Tool T52L-6266-BGD. Install camshaft. *NOTE*–No. 3 Bearing not interchangeable with other bearings.

(V8 ENGINE)

CAMSHAFT REMOVAL: Remove radiator, radiator grille support bracket, cylinder front cover and oil pan. Remove intake manifold, carburetor and coil as an assembly. Remove rocker arm covers, rocker arm assemblies and valve pushrods in sequence. Remove pushrod chamber cover. Crank engine until timing marks on sprockets and chain are both on drive side of chain and 12 pins between marks. Remove distributor cap, scribe line on distributor housing and cylinder block to mark position of rotor and distributor housing for installation, then remove distributor. Remove camshaft sprocket bolt, fuel pump eccentric and counterweight. Remove sprockets and timing chain as an assembly. Remove camshaft thrust plate, woodruff key and spacer. Turn camshaft until lifters can be raised up, with a magnet or fingers, until clear of cam lobes, and secure them in this position. Carefully remove camshaft.

V8 ENGINES

CAMSHAFT BEARING REMOVAL & INSTALLATION: Remove camshaft. Drill ½" hole through plug at camshaft rear bearing bore, then remove plug with Tool 7600-E. Pull bearings out of block with Tool T52L-6261-CEE. To install bearings use Tool T52L-6261-CEE (A bearing adapter with larger flange is used to install bearings in cylinder block). (*NOTE*–No. 1 camshaft bearing has one oil hole, other four camshaft bearings have five holes and are interchangeable) *Be sure to align holes in camshaft bearings with oil holes in cylinder block when bearings are installed.* Particular care should be taken with No. 3 cam bearing since it supplies oil to rocker arms. *CAUTION* - Front camshaft bearing should be installed .005-.020" below front face of cylinder block to allow proper installation of thrust plate. After all bearings are installed, coat new camshaft rear bearing bore plug with oil resistant sealer and install plug with Tool T53L-200-A (Handle), T54L-6266-A (Adapter).

VALVE SYSTEM

► *EXHAUST VALVE STEM DIAMETER CHANGE FOR INCREASED STEM CLEARANCE (All Overhead Valve Engines except 1956 272-ECR Heavy Duty Engine):* Exhaust valve stem diameter decreased .0005" for increased stem to guide clearance. New Valve sizes are as follows:

Exhaust Valves

Size	Stem Diameter
Std. (Red)	.3400 - .3405"
Std. (Green)	.3405 - .3410"
.003" (Oversize)	.3430 - .3440"
.015" (Oversize)	.3555 - .3560"
.030" (Oversize)	.3700 - .3710"

ALL ENGINES

ROTATABLE VALVES: "Rotatable" type valves operate directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal: Use Tool 6513-EE to compress valve springs, remove vaove spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.

Valve Assembly Installation: Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

VALVE SEAT INSERTS

V8 "256" ENGINE

"256" ENGINE VALVE SEAT INSERT: Removal–Invert head and insert drift through exhaust valve port, drive seat out.

Installation: Counterbore insert recess to engine specifications. Cut slightly (.001-.002") below old counterbore depth to clean up this face. Clean out chips and all oil from recess. Chill oversize insert and installation tool in dry ice for ½ hour. Position insert on tool with small radius on outer edge facing outward. Pilot the driving tool in valve guide, then drive the insert into counterbore until it is fully seated. Do not peen area around insert. Reface new valve seat insert. *CAUTION*–Installation of insert must be performed immediately on removal of tool and insert from dry ice. Protect hands with gloves when handling chilled insert and tool.

VALVE GUIDES
ALL ENGINES

VALVE GUIDES (Oversize Valve Stem Installati n): Use Tool T52L-6085-AEE Piloted Reamer to ream cylinder head valve guides for oversize stems. Reamers are furnished in .003", .015", .030" oversizes. Pilots are furnished Standard, .003", .015". Use reamers with correct pilots in sequence when reaming from standard to oversize holes. Regrind valve seats AFTER reaming guides.

ROCKER ARMS
(6 CYL. ENGINES)

ROCKER ARMS: Removal – Remove rocker arm cover, cap screw and clip from No. 6 rocker arm support bracket, pull oil feed line out of bracket, then pull it out of block with pliers, being careful not to damage line. Loosen rocker arm adjusting screws to remove valve spring load from rocker arms, then remove rocker shaft assembly.

Disassembly – Pull oil drain line and clip out of No. 1 support bracket, remove cotter pins at each end of rocker arm shaft, and remove flat washers and spring washers, and plugs from each end of shaft. *NOTE* - Plugs are interference fit. To remove, drill or pierce plug at one end, then force other end out with steel rod, and repeat on first plug. Slide rocker arms, springs, and brackets off of shaft, being sure to identify parts.

Reassembly – Oil all parts with engine oil. Drive new plugs in each end of shaft with cup side out using a blunt tool, install a flat washer, spring washer, another flat washer, and a cotter pin on end of shaft. Install rocker arms, support brackets, and springs in order shown in diagram, and complete assembly by installing remaining flat washers with spring washer between them and install cotter key.

(V8 ENGINES)

ROCKER ARMS: Removal – Remove rocker arm cover, loosen adjusting screws to release valve spring tension on rocker arms, then remove rocker arm assembly, and baffle plates. Note position of oil tube and bracket for oil drain into No. 1 exhaust (right rocker arm assembly), No. 8 exhaust (left rocker arm assembly). Remove and identify pushrods for correct reassembly.

Disassembly – Remove cotter pin from each end of rocker shaft, remove flat washers and spring washers, slide rocker arms, springs and brackets off shaft. *NOTE* - Oil tubes must go in same bracket from which they were removed. Identify parts for correct reassembly. Remove plugs from each end of shaft. *NOTE* - Plugs are interference fit. To remove, drill or pierce plug at one end, then force out other plug with steel rod, then force out first plug.

Reass mbly – Oil all parts with engine oil. Drive new plugs in each end of shaft with cup side out, using a blunt tool. Install a flat washer, spring washer, another flat washer, and a cotter pin on end of shaft. Install

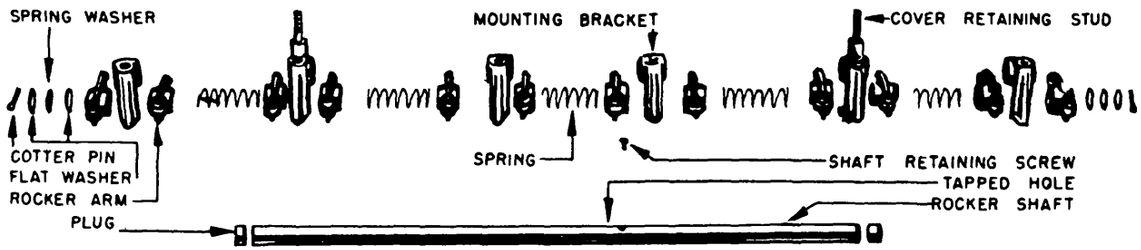
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

rocker arms, support brackets, and springs in order shown in diagram, and complete assembly by installing remaining washers with spring washer between them and install cotter key. Position oil baffle plates on cylinder head, place rocker arm assembly on plates. Install but do not tighten bracket retaining screws and nuts. Be sure to install the oil drain tube on the same end bracket from which it was removed. The bracket end of tube must enter locating hole in rocker shaft to properly position shaft. Position oil drain tube on right rocker arm assembly so oil will drain in the front (No. 1 exhaust) pushrod opening, and position oil drain in end (No. 8 exhaust) opening. *CAUTION* - Be sure rocker support brackets are not installed upside down as there is a difference in height when installed in this position. Tighten bracket retaining screws and nuts to specifications.

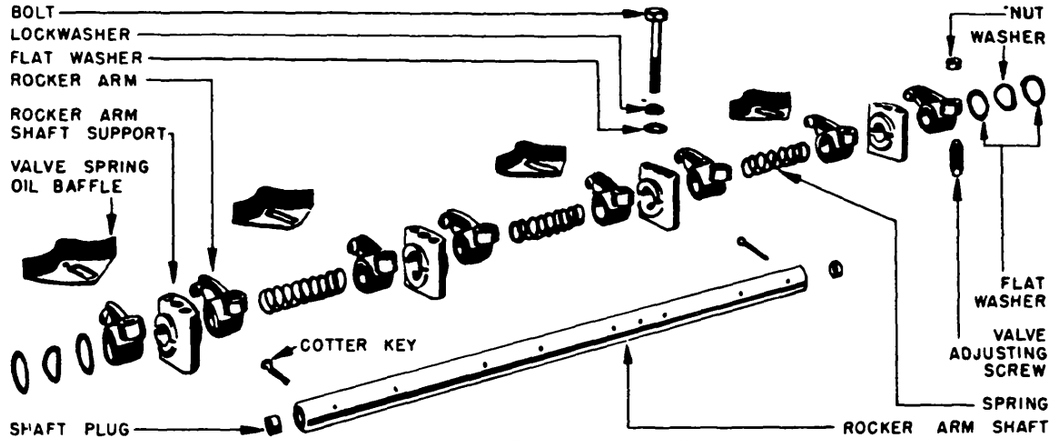
OILING SYSTEM

OIL PUMP



6 CYL. ENGINE

OIL PUMP- Gear type oil pump mounted in crankcase in line with distributor Pump driven by means of a hex drive shaft Shaft is pinned in end of distributor drive shaft by a roll pin, and other end seats in end of oil pump drive shaft Pressure relief valve is incorporated in oil pump housing



R m val – Remove distributor, oil level indicator, and oil pan. Remove two nuts and lockwashers retaining pump to cylinder block. Remove pump and gasket.

Disass mbly: Remove screen assembly retaining screws, screen assembly, and gaskets Remove cover retaining screws, cover, and gasket. Push pump drive shaft and drive gear assembly from pump housing Remove driven gear. Remove oil pressure relief valve plug, spring, and and plunger Remove snap wire retaining pump screen, and remove screen from housing

Insp cti n- Wash all parts in a solvent and dry them thoroughly Use a brush to clean inside of pump housing and pressure relief valve bore. Be sure all dirt and chips are removed Remove all old gasket material from pump body and cover. Check pump housing for damage or excessive wear Check pump gear teeth for damage or wear Check compression of relief valve spring (9.76-9 84 lbs at 1 56") Check relief valve clearance in relief valve bore Check driven shaft clearance (.001- 002" maximum) Pump shaft should be free running fit without excessive play in pump housing (0015-.0029") Replace any worn or defective parts

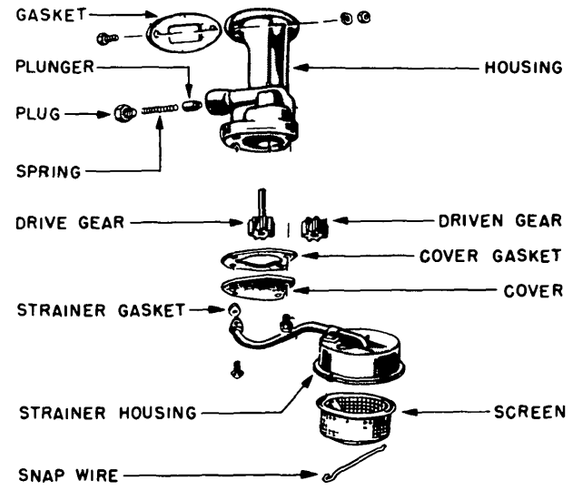
6 CYL. ENGINE ROCKER ARM ASSEMBLY

V8 ENGINE ROCKER ARM ASSEMBLY

Reassembly: Place snap ring on groove on upper end of lower drive shaft Slide drive gear and shaft assembly into housing. Position gasket on housing, then lay a piece of Plastigage over face of gear and install cover Remove cover and note reading on Plastigage Gear endplay may be .0015-.0055" (Clearance of .0015-.003" preferred) An alternate method of checking gear endplay is as follows Position gasket on housing, and lay a straightedge across gasket directly over gear Check gear endplay by placing tip of dial indicator on gear and moving gear back and forth, between housing and straightedge Subtract .005" from reading to allow for compression of gasket Install pump drive gear, cover plate gasket, cover plate, and retaining screws Tighten screws to 12-15 ft. lbs Install pressure relief valve plunger, spring, and plug. Tighten plug to 33-38 ft. lbs Install screen in screen cover and secure it with snap wire Install gasket, screen and cover assembly, and retaining screws Tighten screws to 10-12 ft. lbs Rotate pump shaft by hand to make sure it turns freely.

Installation: Place new gasket on retaining bolts, slide pump mounting flange over retaining bolts, install lockwashers and nuts Install oil pan, fill crankcase Run engine, check pressure

V8 ENGINES



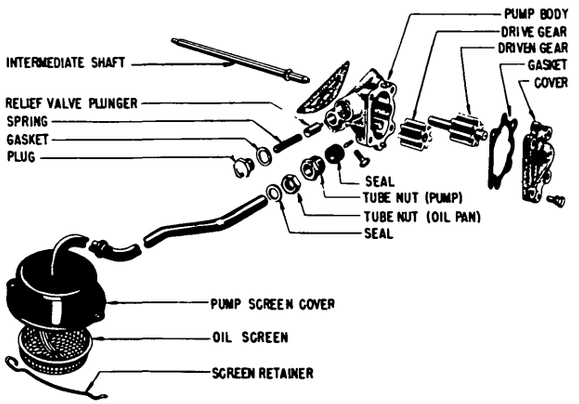
OIL PUMP: Gear type pump Oil pressure relief valve is mounted in pump housing Pump is driven by an intermediate shaft from distributor shaft

Removal: Disconnect pump inlet tube at pump, and loosen tube at pan Remove three cap screws and lockwashers securing pump body to block Remove pump and gasket and intermediate shaft (if it comes out with pump)

Disassembly: Remove four capscrews retaining pump cover to pump body Remove the cover plate and gasket *Do not tap pump drive shaft to drive cover off pump body.* Remove oil pump gear and shaft assembly and oil pump idler gear Remove oil pressure relief valve plug, gasket, spring, and plunger

Inspection- Wash all parts in a solvent and dry them thoroughly Use a brush to clean inside of pump housing and pressure relief valve bore Be sure all dirt and chips are removed Remove all old gasket material

CONTINUED ON NEXT PAGE



6 CYL. OIL PUMP

CONTINUED FROM PRECEDING PAGE

from pump body and cover. Check pump housing for damage or excessive wear. Check pump gear teeth for damage or wear. Check compression of relief valve spring (10.82-10.90 lbs. at 1.40"). Check relief valve clearance in relief valve bore. Check driven shaft clearance (.001-.002" maximum). Pump shaft should be free running fit without excessive play in housing (.0015-.0029"). Replace any worn or defective parts.

R assembly: Oil all parts thoroughly. Install oil pressure relief valve plunger, spring, cover plug, and gasket. Install idler gear and oil pump gear and shaft assembly. Install cover plate with new gasket, and tighten cover plate screws to 12-15 lbs. Check oil pump shaft endplay with a dial indicator or Plastigage (.0015-.0055")

V8 OIL PUMP

Installation: Insert oil pump intermediate shaft in oil pump shaft. Note position of distributor shaft, and set oil pump shaft so that intermediate shaft will engage distributor shaft. Coat both sides of a new gasket with with sealer, position pump housing and gasket on block, install three retaining screws, and tighten them to 12-15 ft. lbs. (*CAUTION*– Do not attempt to force pump in position if it will not seat against block. Intermediate shaft may be out of alignment with seat in distributor shaft. Align seat and shaft if necessary). Install oil pump inlet tube and new seal in pump. Tighten oil tube-to-oil pump nut and oil to-oil pan nut to 10-12 ft. lbs.

OIL FILTER
ALL ENGINES

OIL FILTER: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions).

►*REPLACEMENT CAUTION: Use Replacement Kit, Part No. B2A-6731-A, which includes correct filter element and NEW GASKETS WHICH MUST BE USED. CAUTION–Use of by-pass filter element would restrict oil flow and might cause failure of engine.*

Filter Installation: Wash all parts in a solvent and dry them thoroughly. Make sure all openings in center bolt are clean. Install new fibre gasket on center bolt, then place bolt through filter housing. Install spring and spring assembly on bolt, making sure seat tangs are engaged in spring. Install a new neoprene gasket and new filter element over center bolt. (*NOTE*–Be sure two elongated holes in oil filter diaphragm are at top when positioned on block). Install new neoprene gasket in filter housing recess. Place filter assembly in position, and thread center bolt into adapter, finger tight. Rotate filter assembly slightly, in each direction, to make sure gasket is seated evenly. Tighten center bolt ¾-1 complete turn (20-25 ft. lbs.). With engine at normal operating temperature and operating at fast idle, check for oil leaks past housing gasket or around center bolt gasket. If oil leaks past housing gasket, check housing for proper seating. If oil leaks past center bolt gasket, check center bolt for proper torque or replace gasket. *NOTE*–Pressed paper type element does not use neoprene gasket.

TRANSMISSION NOTES
(ALL CARS)

►*1955-56 PREMATURE GEAR TOOTH WEAR CORRECTION:* When interference between gear shift and clutch rods result in improper gear engagement and excessive gear tooth wear, install parts as follows:

Conventional Trans.
B6A-7326-C Rod (2nd and High).
B6A-7521-A Rod (Clutch Release).
B6A-7515-A Lever (Clutch Release) ①
B6A-7542-A Bracket (Clutch Retracting Spring) ②

Overdrive
B6A-7328-B Rod (Low and Reverse).
B6A-7326-B Rod (2nd and High).
B6A-7515-A Lever (Clutch Release) ①
B6A-7542-A Bracket (Clutch Retracting Spring) ②

① – 1954-56. ② – 1954-55.

CLUTCH NOTES
THUNDERBIRD

►*CLUTCH PEDAL INTERFERENCE (Thunderbird) CORRECTION:* Rework stabilizer bar by grinding a relief section, starting 10½" from end having horizontal holes and continue for 4½". Remove material (1" radius) at 10 o'clock position of round hole in insulator and remove felt section of insulator at upper left side of oblong hole for a distance of 1¾" horizontally in line with top of hole and down to point 4" from top of insulator.

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate on left front body pillar.

First Numb r—100001.

►*VEHICLE NUMBER NOTE:* Vehicle number (example *A6FS 100001*) includes following identification data in sequence:

Eng. Type ①	Year ②	Assy. Plant	Body Style ③	Serial No.
A	6	See below	See below	100001 up

①—**A**—6 Cyl., 223 cu. in. engine; **M**—8 Cyl., 292 cu. in. engine; **P**—8 Cyl., 312 cu. in. engine (Thunderbird & & Interceptor); **U**—8 Cyl., 272 cu. in. engine.

②—Last digit of model year.

③—**C**—Sunliner (Conv.); **F**—Victoria (Fairlane 4-Dr.) **H**—Thunderbird; **R**—Ranch Wagon (Customline); **S**—Sedan Delivery; **T**—Fordor & Tudor (Fairlane); **V**—Victoria (2-Dr.); **W**—Crown Victoria; **X**—Country Sedan; **Y**—Country Squire; **G**—All others (Fordor, Tudor—Mainline & Customline).

Ass mbly Plant Designation

A—Atlanta	**F**—Dearborn	**N**—Norfolk
B—Buffalo	**G**—Chicago	**P**—St. Paul
C—Chester	**K**—Kansas City	**R**—San Jose
D—Dallas	**L**—Long Beach	**S**—Somerville
E—Mahwah	**M**—Memphis	**U**—Louisville

TUNE-UP

►*SUDDEN ENGINE STOPPAGE CORRECTION:* Inspect distributor primary terminal wire assembly Ford No. B6A-12216-A for defective welds at brass terminals.

COMPRESSION PRESSURE: 150 lbs. at cranking speed. Maximum variation between cylinders 10 lbs.

VACUUM READING: Steady 18-19" idling at 475-500 RPM in neutral.

VALVE TAPPET CLEARANCE: .019" Intake and Exhaust (Hot & Cold).

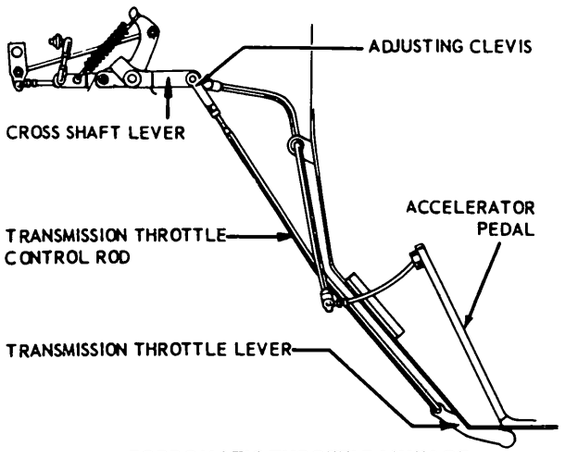
MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve is closed when engine is at normal operating temperature and *running at slow idle,* and opens when *operating at high RPM.* Spring is installed with ¾ turn wind-up and hooked over stop pin.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .032-.036".

Spark Plugs—Champion 870. 18mm.



►*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be torque tightened within the range 15-20 ft. lbs.

COIL: Ford N . B6A-12029-B. *12 Volt.*

Igniti n Curr nt—2.5 amps. idling, 4.5 amps. stopped.

R sistor—Ford B6A-12250-B (Early), **B6A-12250-C** (Later). Mounted next to coil.

►*IGNITION RESISTOR PRODUCTION CHANGES:* Two types of resistors, Ford No. B6A-12250-C used in production to replace original resistor B6A-12250-B. First type replacement identified by copper flashing on heads of rivets which support elements. A piece of fibre glass is cemented to inside channel of support bracket.

FORDOMATIC THROTTLE LINKAGE

Second type has sheet metal cover snapped over channel and rivets are cadmium plated. Replace original type when servicing ignition system.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Ford No. B6A-12127-E. *12 Volt.*

►*DISTRIBUTOR DIAPHRAGM PRODUCTION CHANGE:* A new distributor diaphragm, Ford No. B6A-12370-B, used on all engines after Nov. 15, 1955, and is available for replacement of all B6A-12370-A diaphragms. It can be identified by a die cast end cover in place of stamped cover and incorporates new type material in secondary diaphragm giving it much greater strength.

Condenser—Ford 7RA-12300-C. **Capacity**—.21-.25 mfd.

Contact Point Set—Ford FAA-12171-A.

Breaker Gap—.024-.026".

Cam Angle—35-38°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Advance Performance
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
0±½	18	300
¼-1¼	32	400
1¾-2¾	50	500
8-9¼	2.59	1200
10¾-11¾	4.22	1600
13-14½	6.00	2000

►*DISTRIBUTOR INSTALLATION CAUTION:* Be sure oil pump intermediate shaft engages the seat in the oil pump. It may be necessary to turn over the engine with starter after distributor drive gear is partially engaged, in order to engage intermediate shaft fully in oil pump.

Initial Distribut r Timing: Set engine crankshaft so that No. 1 cylinder is at TDC after compression stroke (with timing mark in line with pointer). Install distributor so that rotor points to the No. 1 spark plug wire terminal in distributor cap.

IGNITION TIMING

Setting—4° BTDC (Std.), 6° BTDC (Fordomatic) with engine idling at 475 RPM and vacuum line disconnected. *See Initial Distributor Timing above. NOTE*—Maximum initial timing recommended is 6° BTDC (Std.) and 8° BTDC (Fordomatic).

Timing Mark—Vibration damper marked "TDC", and "3", "5", "7", "9" degrees BTDC. Align correct mark with pointer on cylinder front cover.

CARBURETOR

Ford No. B6A-9510-H (Exc. Fordomatic), B6A-9510-G (Fordomatic). "Visi-flo", single barrel.

►*CARBURETOR MAIN METERING JETS PRODUCTION CHANGE:* For main metering jets used in production starting approximately June 1st, 1956 *See "Ford Visi-Flo" in Carburetion Section.*

Initial Setting – Initial setting 1 turn open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll from rich mixture. Turn screw in until engine runs smoothly. Favor a slightly rich mixture.

Idle Speed – 475-500 RPM (Std. & O.D.), 475-500 RPM (Fordomatic) with selector lever in Neutral with 425-450 RPM final check with selector lever in Dr. range.

Fuel Level – 11/16" ± 1/32" below power valve mounting surface. (Tool T52L-9550-AEE) *See "Ford Visi-flo" in Carburetion Section.*

Accelerating Pump: Inner hole for average or hot weather operation, outer hole for cold weather operation.

Fast Idle: Integral type operated by choke valve. No adjustment required.

Throttle Linkage Adjustment (Fordomatic Cars): Adjust engine idle speed to 475-500 RPM with selector lever in "N" position and engine at normal operating temperature. Adjust anti-stall dashpot (see below). Remove cotter pin and clevis pin from upper end of throttle control rod. Pull upward firmly but gently on throttle control rod to hold transmission lever against its internal stop. Rotate throttle rod clevis until pin enters holes in the clevis and the accelerator assembly shaft. Lengthen throttle control rod by rotating clevis 2½ turns counter-clockwise. Assemble throttle control rod to accelerator assembly shaft with clevis pin and cotter pin. Adjust accelerator pedal height by turning threaded trunnion on accelerator connecting link until top surface of accelerator pedal is 4 9/16" from floor pan. Check throttle linkage, and relieve any binding conditions. Road test car. If band or clutch slippage is evident, increase rod length to 3 turns, *but do not exceed 3½ turns of the clevis.*

Anti-Stall Dashpot (Fordomatic Cars): Adjust engine idle speed to 475-500 RPM with selector lever in "N" position and engine at normal operating temperature. Loosen dashpot adjusting screw locknut. Hold throttle in closed position, and turn dashpot adjusting screw out (counter-clockwise) until head of screw pushes dashpot rod up to the end of its travel. Turn dashpot adjusting screw in (clockwise) 1½-2 turns to obtain a clearance of .045-.064" between rod and screw head. After adjustment made, tighten adjusting screw locknut.

Fu l Pump Pressur : 4-5 lbs. at 500 RPM.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARB. EQUIPMENT

Fuel Pump: **Ford 35A-9350-A,** Fuel only (Except Fordomatic & Overdrive Cars), **B5A-9350-B,** Fuel & Vacuum (Fordomatic & Overdrive Cars).
Fuel Pump Pressure – 4-5 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: King-Seeley Electric.
Dash Unit – Ford B6A-9280-D.
Tank Unit – Ford B6A-9275-C (Exc. Sta. Wgn. & Sed. Del.). Ford B6A-9275-B (Sta. Wgn. & Sed. Del.).
See "Fuel Gauges" in Carburetion Section.

BATTERY

Ford No. B6A-10655-C. *12 Volt,* 11 plate, 55 Ampere hour capacity, or **B6A-10655-E.** *12 Volt,* 13 plate, 70 Ampere hour capacity.
Battery Ground – Negative to engine block.
► *CAUTION: This is reversed from previous models.*
Engine Ground – Cylinder head to dash.

STARTER

Ford No. B6A-11002-A. *12 Volt.* **Armature–**B6A-11005-A.
► *IMPULSE STARTING (Back-Up Light Equipped Cars) CORRECTION:* Before replacing neutral safety switch to correct short between light and solenoid terminals causing engine to start, interchange leads at switch. Connect longest lead (beyond taped portion of harness) to "A" terminal and short lead to "B" terminal.
Drive – Ford 1CM-11350-C. Bendix "Folo-Thru".
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 48-56 ozs.
Cranking Speed – 150-180 RPM with engine warm.

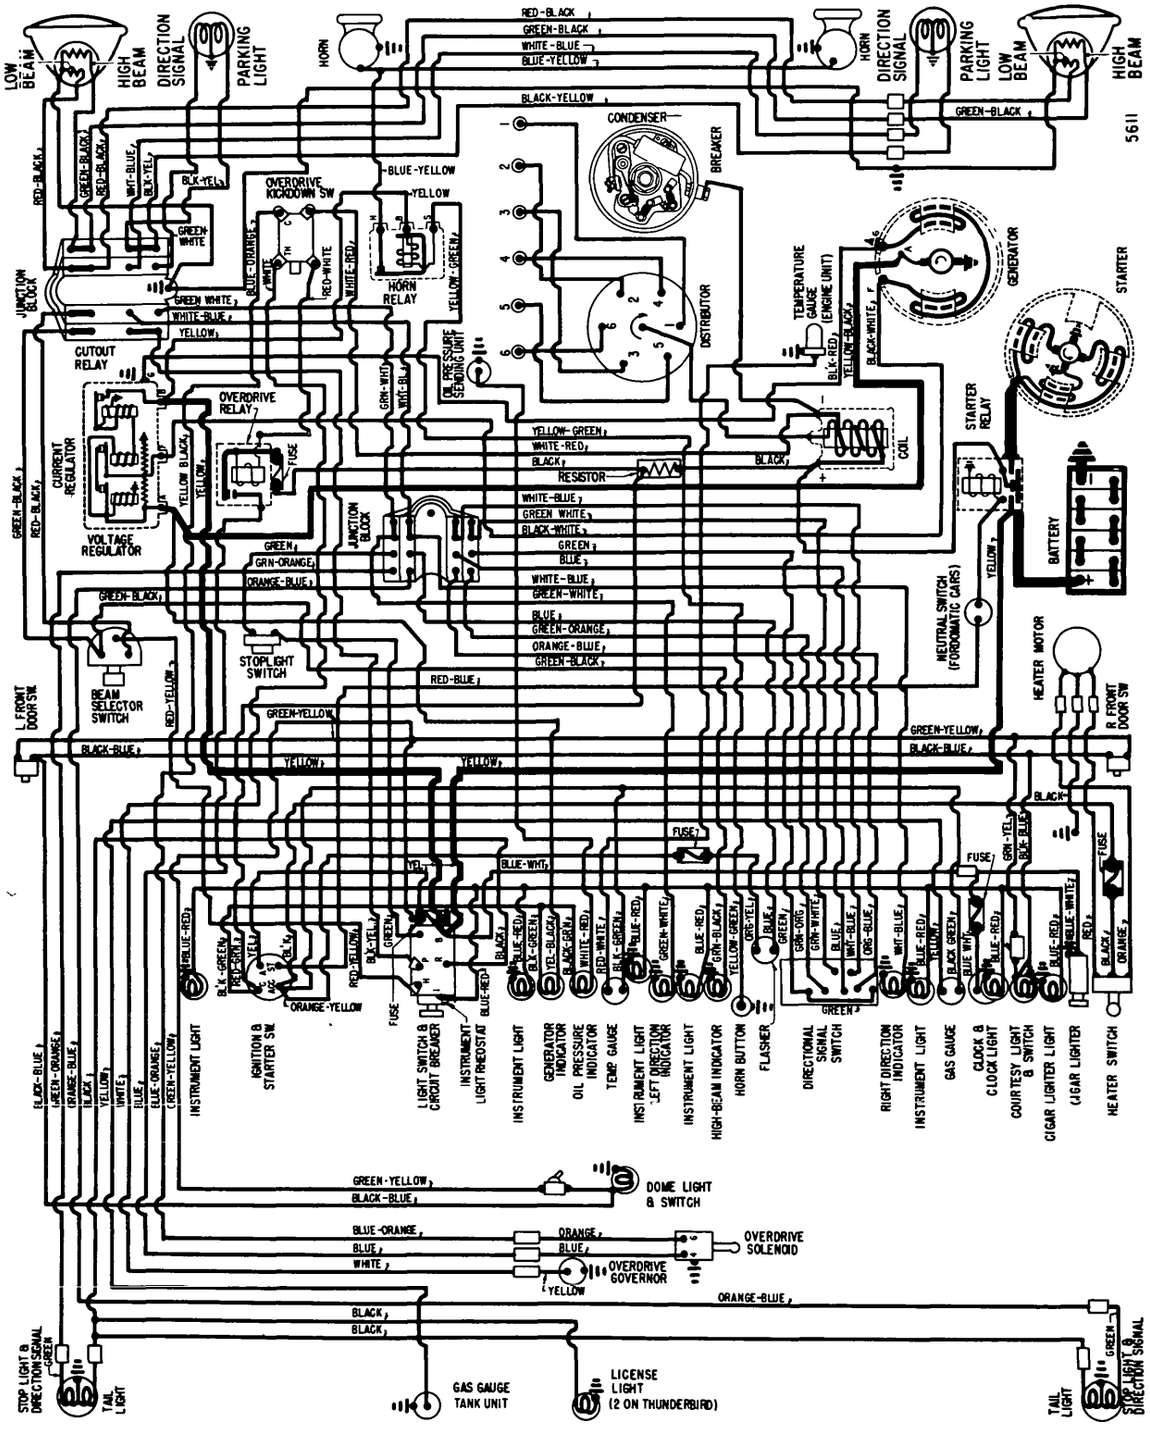
Performance Data.

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	120
	150-180 ②		190 max.

① – With starter on engine and engine idling.
② – Cranking speed with engine warm.

Starting Switch: Magnetic type, Ford No. B6A-11450-A. Starter Switch is controlled by ignition switch. *NOTE* - Neutral Safety Switch used on Fordomatic transmission cars.
Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C.
Adjustment – *See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR



Ford No. B6A-10002-A, *12 Volt.* **Armature –** B6A-10005-A.
► *GENERATOR INDICATOR LIGHT (Idle Speed) CORRECTION:* When generator light comes "ON" when engine idles, install a 75 ohm, 25 Watt resistor (Vitreous enamel type with eyelets moulded into resistor body), at terminal "A" of regulator in series with indicator light wire (Yellow with black tracer). Adjust engine idle speed to high limit. *NOTE* - Light will now have lower illumination than oil indicator light.

Performance Data

Amperes ①	Eng. RPM
30	1250

① – See Regulator for maximum charging rate.
Brush Spring Tension – 26-34 ozs.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Field Current – 1.4-1.6 amperes at 12.0 volts.
Rotation – Counter-clockwise at commutator end.
Belt Adjustment: ¼" belt deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Ford No. B6A-10505-A. *12 Volt.*

► *SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 75° F., ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.*

Cutout Relay

Cuts In – 12.0-12.8 volts.

Voltage Regulator

Setting – 14.6-15.4 volts.
Checking & Adjusting – *See Electrical Section.*

Current Regulator

Setting – 28-32 amperes.
Checking & Adjusting – *See Electrical Section.*

MISC. ELECTRICAL

► *DOME LIGHT FAILURE (High Voltage) CORRECTION:* When dome lights fail due to high voltage, remove head light switch, remove dome light wire from switch (green wire with yellow tracer) and install 1.5 Ohm, 5-Watt vitreous enamel resistor in dome light circuit.

Head Lamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Lighting Switch Removal: With control knob in "OFF" position, press spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.
Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), on top of booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.
FUSES: Located as follows:
Interior Lights – 7.5 ampere. On lighting switch.
Overdrive – 30 ampere on overdrive relay.
Cigar Lighter – Special fuse in lighter base.
Clock – 3 amps. in clock lead.
Heater – 7.5 amps. in blower switch lead.
Radio – 7.5 amps. on radio signal speaker.
Turn Signal Fuse – 7.5 amps. In flasher to switch lead.
CIRCUIT BREAKERS: On headlight switch. Combination headlight switch, circuit breaker, and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument, parking, stop and tail light circuits.
► *1956 CIGAR LIGHTER CAUTION:* 12 volt socket and element smaller than 6 volt. 12 volt socket has ink mark stamped on it for identification. DO NOT use 12 volt element in 6 volt socket as heated element will eject onto front seat.
HORNS: (Except West Coast). Ford B5T-13832-B (High Pitch), B5T-13833-B (Low Pitch). *12 Volt.*
(West Coast Only). Ford B6A-13832-A (High Pitch), use bracket Ford No. B6A-13830-A, Ford B6A-13833-A (Low Pitch), use bracket Ford No. B6A-13831-A. *12 Volt.*
Horn Current – 9.2-9.6 amperes at 12-12.6 volts.
Horn Relay: Ford No. 2G-13853-A.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. Valve-in-head.

Bore	Stroke	Displacement
3.62"	3.60"	223 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
8.0-1	31.54	137 at 4200 RPM

Compression & Vacuum Reading – *See TUNE-UP.*
► *CRANKSHAFT OIL SEAL LEAK CORRECTION:* For application of new type front oil slinger and crankshaft with integral oil slinger, *See "Crankshaft & Main Bearings" in Ford Special Data.*
CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data.*
ENGINE REMOVAL: *See "Engine" in Ford Special Data.*
ENGINE FRONT MOUNTING: *See "Engine Mountings" in Ford Special Data.*
OIL PAN REMOVAL: Drain crankcase. Remove oil level indicator. Remove engine left and right front splash aprons. Remove flywheel housing inspection cover. Remove oil pan retaining screws and remove pan.

PISTONS

Autothermic type. Solid skirt with three rings above pin.
Removal – Pistons and rods removed from above.
Fitting New Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:
New Piston in New Bore – .0015" feeler. 5-10 lbs. pull.
New Piston in Used Bore – .002" feeler. 5-10 lbs. pull.
Used Piston in Used Bore – .0025" feeler. 5-10 lbs. pull.
Replacement Pistons: Standard size, .020", .030", .040", .060" Oversize. Pistons furnished only with fitted pins.
Installing Pistons: Install with small indentation in head toward FRONT of engine.

PISTON PINS

Floating type with lock rings at each end.
► *1955-56 PISTON PIN INSTALLATION CAUTION:* New B5A-6135-A Pin used in 1956 cars is heavier than the EAA-6135-B Pin used in 1955. *The two pins should not be mixed in any one engine assembly as a vibration or unbalanced condition may result.* New pin can be identified from old pin by machining of the ends. Old pin may be almost flush or chamfered at the internal diameter. New pin will have either a recessed internal diameter as though the ends of the pin were spot faced, or will not be completely drilled through.
Diameter – .9120-.9123". **Length** – 3.016-3.030".
Pin Fit in Piston – .0001-.0008". Hand push fit at 70° F.
Pin Fit in Rod Bushing – .0001-.0008" clearance. Selective fit. Light thumb press fit at 70° F.
Replacement Pins: Standard and .001" and .002" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	3/32"	.010-.027"	.006"
Oil (3)	3/16"	.015-.062"	

Replacement Rings: Standard, .020", .030", .040" and .060" Oversize.
► *REPLACEMENT PISTON RING NOTE:* "Snap Type" rings furnished in Std. size only. "Expander Type" furnished in all oversizes above. "Steel Section Type" furnished in Standard, .020" and .030" Oversize.

CONNECTING RODS

Journal Diameter – 2.2980-2.2988".
Clearance – .0033" maximum.
Side Clearance – .012" maximum.
Replacement Bearings: Standard size (4 sizes marked **Red & Blue** for selective fitting) and .010", .020", .030", Undersize.
Installing Rods: Install rod in piston so that squirt hole is to right when indentation on top of piston is toward front of engine.

CRANKSHAFT

► *CRANKSHAFT PRODUCTION CHANGE: See "Crankshaft Oil Seal Leak Correction" under ENGINE above.*
Journal Diameter – 2.4980-2.4988". Four Bearings.
Bearings – Steel backed, copper lead alloy, or lead babbitt.
Clearance – .0031" maximum (lead babbit bearings), .0035" (copper lead bearings).
Replacement Bearings: Standard size, (4 sizes marked **Red** or **Blue** for selective fitting) and .010", .020", .030" Undersize.
End Thrust: Taken on rear intermediate No. 3 bearing.
Thrust Bearing Alignment – *See "Crankshaft & Main Bearings" in Ford Special Data.*
End Play – .012" maximum.
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Ford Special Data.*
► *OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all cars and truck engines to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley and cylinder front cover. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

CAMSHAFT

Journal Diameter – 1.9255-1.9265".
Clearance – .006".
End Thrust: Taken by thrust plate and spacer (between camshaft sprocket and shoulder on camshaft). *NOTE* - Chamfer on inside of spacer must be to the rear in assembly.
End Play – .012".
Replacement Bearings: Finished bearings furnished Standard and .015" Undersize. *CAUTION* - Rear intermediate (No. 3) bearing not interchangeable with other bearings.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data.*
Timing Chain: Side-guide type. Length 56 links.
► *REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side). Remove and install chain endless as a unit with both sprockets.
Camshaft Setting: Sprockets marked by "O" at one tooth. Mesh chain so that there are 12 pins between "O" marks on driving side of chain.
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Ford Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVES

Tappet Clearance: .019" Intake & Exhaust (Hot or Cold).

Valve	Head Diameter	Stem Diameter ①
Intake	1.775-1.785"	② .3415-.3420" or ③ .3420-.3425"
Exhaust	1.505-1.515"	② .3400-.3405" or ③ .3405-.3410"

Valve	Seat Angle	Lift ④	Stem Clearance
Intake	45°	.268" min.	.004" max.
Exhaust	45°	.268" min.	.006" max.

① – Furnished with .003", .015", .030" oversize stems. *See "Valve System" in Ford Special Data.*

② – Color coded RED. Use with RED valve guide.

③ – Color coded GREEN. Use with GREEN valve guide.

④ – Cam lobe lift service limit.

►*EXHAUST VALVE STEM DIAMETER PRODUCTION CHANGE: Stem diameter decreased .0005" for increased stem-to-guide clearance to minimize valve sticking. See "Valve System" in Ford Special Data.*

Valve Seat Width – .060.,080" (Intake), .070-.090" (Exhaust).

►*ROTATABLE VALVE NOTE:* All valves are rotatable type. *See "Valve System" in Ford Special Data.*

Valve Stem Oil Seals – "Umbrella" type oil seals used on intake and exhaust valve stems. Seals are installed with cupped side down on valve stem at guide boss on cylinder head. *Install new seals whenever valves removed or when seals become loose on stem.*

Valve Springs: Install with closed coil end toward cylinder head.

Free Length – 2.09" approximately.

Valve Spring Specifications

	Pressure	Length
Valve closed	64-79 lbs.	1.780"
Valve open	145-177 lbs.	1.390"

►*VALVE SPRING INSTALLATION NOTE:* Measure valve spring assembled height from machined surface of cylinder head spring pad to spring retainer contact surface. If assembled height is 1 13/16" or greater, install .030" spacer between cylinder head valve spring pad and valve spring to bring assembled height to recommended dimension of 1 25/32-1 13/16". *CAUTION* - Use of spacers in excess of recommendations will result in overstressing valve springs and lead to excessive load loss and spring breakage.

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above), ream guides and install oversize valves. *See "Valve System" in Ford Special Data.*

Valve Lifters: Mushroom type. Removed from below with camshaft out.

Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: The following valve opening and closing points are with camlift as indicated.*

Intak Valves–Open 24° ① BTDC. Close 46° ② ALDC.

Exhaust Valves–Open 68° ① BLDC. Close 2° ② ATDC.

① – Camlift .016". ② – Camlift .019".

Valve Timing Check – Remove rocker arm cover. Back off No. 1 intake valve adjusting screw, slide rocker arm assembly to one side. With push rod in lifter socket, install dial indicator to indicate push rod movement. Turn engine slowly until cam lobe contacts lifter. Zero indicator and continue to turn crankshaft until .016" (desired lift) is obtained. Timing indicator on pulley should read 24° BTDC.

OILING SYSTEM

Crankcase Capacity: 4 qts. (refill), 5 qts. (when filter changed).

Normal Oil Pressure: 45-50 lbs. at 2000 RPM.

Pressure Regulator Valve–In pump body, not adjustable.

Oil Pressure Indicator – Indicator light on instrument panel, operated by Engine Unit – Ford No. FDA-9278-A (Stamped No. 7 on Hex.). Lights when ignition switch turned on, goes out when engine starts and pump operates.

Oil Pump: Gear type pump located in crankcase, in line with distributor.

►*OIL PUMP CAUTION: New type oil pump has aluminum body. Use extreme care when servicing to prevent damaging body.*

Pump Overhaul: *See "Oil Pump" in Ford Special Data.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

Replacement Filter Element – Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION: This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication). See "Oil Filter" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

Water Capacity: 14.5 qts., add 1 qt. for heater.

►*LOSS OF COOLANT CORRECTION:* Lower generator mounting bracket bolt holes are tapped into cylinder water jacket. For loss of water at this point, or when replacing bolts, apply a good coating of waterproof sealer.

Pressure Valve: Ford LA-8100-A Radiator filler cap. Opens at 12-15 lbs. *CAUTION* - If replacement required use 12-15 lb. type.

Thermostat: Ford No. EAA-8575-A (157-162°) standard. Ford EAA-8575-B, (177-182 lb.) for use with permanent anti-freeze.

Water Pump: Packless, sealed ball bearing type. *See "Ford 6" in Water Pump Section.*

Temperature Gauge: King-Seeley Electric.

Dash Unit – Ford No. B6A-10883-A.

Engine Unit – Ford No. B6A-10884-A.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 9½ CF, No. 268594. Semi-centrifugal type.

►*HEAVY DUTY CLUTCH PRODUCTION CHANGE:* Heavy duty clutch Ford No. B6A-7563-A, incorporating oil slinger; and release bearing incorporating lubrication fitting now used in production. New heavy duty clutch disc Ford No. B6A-7550-A released for service. *See "Long Clutches" in Clutch Section.*

Clutch Disc – Long No. 288824.

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper and bracket until correct travel is within limits. Adjust assist spring link to give assist spring length of 6 5/8" when clutch is fully released.

Pedal Free Travel – 1 1/8 - 1 3/8". Loosen locknut on clutch pedal release rod, turn adjusting nut until correct travel is reached. *NOTE* - Check free travel by operating engine at 3000 RPM with transmission in neutral position. There should be a minimum of ½" free travel under these conditions. Readjust as necessary.

Removal: Remove transmission (see Transmission removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel & clutch housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install Tool 7563 and remove clutch pressure plate assembly (if tool not available, clutch may be released by backing off the attaching bolts evenly).

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).

►*PREMATURE GEAR TOOTH WEAR CORRECTION:* Caused by incorrect gear engagement, *See "Transmission Control Notes" in Ford Special Data.*

►*SYNCHRO-MESH & OVERDRIVE THREE SPEED TRANSMISSION GEAR REPLACEMENT CAUTION:* Shot peened gears used in 1956 models. Shot peened gears can be used in past model transmissions. DO NOT use past model gears in 1956 transmission. *See "Ford Synchro-mesh" in Transmission Section.*

Transmission Control: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect gearshift linkage at transmission. Remove speedometer cable and gear. Disconnect drive shaft at transmission and remove the capscrews attaching transmission extension to rear engine support. Place a support under engine and remove the frame cross member and rear engine support. Remove transmission-to-flywheel housing capscrews and install two guide pins. Pull transmission back until main drive gear splines clear housing, and lower transmission from car.

OVERDRIVE

Warner Model AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. No Lock-Out Switch used. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock. *See "Fordomatic & Mercomatic" in Transmission Sect.*

►*FORDOMATIC PRODUCTION CHANGES:* For improved Throttle Control Inner Lever Installation, change in Pressure Regulator Valve Body, and new location of pressure take off plug, *See "Fordomatic & Mercomatic"*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in Transmission Section.

►*FORDOMATIC "LOCK-UP" CORRECTION (1955-56 Cars & Trucks):* Caused by cross leakage in front servo piston. *See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication – Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain & refill every 15,000 miles.

Checking Fluid Lev l – Apply parking brakes, place transmission selector lever in "N" position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (Parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator. Wipe indicator clean and insert in tube (make sure indicator is pushed down all the way). Remove indicator and read level. Add sufficient fluid to raise level to full mark on indicator. Replace indicator.

►*FORDOMATIC TRANSMISSION FLUID CHANGE CAUTION:* New type oil is green colored, similar to engine oil. DO NOT USE IT IMPROPERLY. "Type A" (reddish brown) may be used when adding oil to transmission filled with new type oil.

Throttl Linkag Adjustment: *See CARBURETOR above.*

►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.

►*CAUTION (All Cars Except Station Wagon & Sedan Delivery): Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford & Mercury (Separate Carrier Type) Hypoid" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own. Separate Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle not same as Station Wagon & Sedan Delivery. See "Ford & Mercury (Separate Carrier Type) Hypoid" in Rear Axle Section.*

►*LUBRICATION BAFFLE NOTE:* 1956 rear axle housing has lubrication baffle, held in place by two housing bolts, for directing lubricant to differential side bearings. Recommended for installation on earlier models. Ford No. B5A-4018-A.

Axl Ratios

Synchro-mesh	Overdrive	Fordomatic
3.89-1 (35-9)	4.11-1 (37-9)	Ⓒ 3.22-1 (29-9)

Ⓒ – 3.55-1 (32-9) Optl.

►*RATIO, DRIVE GEAR & DIFFERENTIAL CASE IDENTIFICATION:* When differential case is to be replaced, be sure new case is same as old one. Refer to following table for identification:

Driv G ar Ratio	Gear T th Drive	Pinion	Diff r ntial Case Color
3.22-1	29	9	Gray
3.55-1	32	9	Red
3.89-1	35	9	Black
4.11-1	37	9	Black

Backlash – .003-.008".

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: Disconnect rear universal. Remove axle shafts (see above). Remove carrier from housing.

Wheel Bearing Adjustment: None required.

STA WGN. & SED. DEL.

Own. Integral Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle not same as passenger cars. See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.*

Ratios

Standard Transmission – 4.09-1 (45-11).
Overdrive Transmission – 4.27-1 (47-11).
Fordomatic Transmission – 3.54-1 (46-13).

Axle Shaft Removal: Same as Pass. Cars (above).

Rear Axle Assembly Removal: Remove hub caps, loosen wheel stud nuts, raise car at rear and disconnect hydraulic brake hose from brake line at rear axle. Disconnect parking brake cable from equalizer rod, remove cable assembly from frame brackets. Remove wheels, disconnect drive drive at rear axle universal joint flange. Remove "U" bolts. Remove assembly from under car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Model	Ⓒ Front	Ⓒ Rear
Pass. Cars (Std.)	B5A-18124-A	B5A-18125-A
Pass. Cars (Hvy. Duty)	B5A-18124-D	B5A-18125-C
Sta. Wgn. & Sed. Del.		B5A-18125-D

Ⓒ – Furnished in kits which include shock absorber mounting bushings.

►*SHOCK ABSORBERS (1955-56 Taxi Cabs) PRODUCTION CHANGE:* Export type shock absorbers used in production as standard equipment, in place of heavy duty type on taxi cab units to eliminate possibility of "bottoming". *NOTE* - Replace heavy duty type with export type in sets only.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs. *See "Lincoln, Mercury, Ford (Ball Joint)" in Suspensions and Wheel Alignment Section.*

Kingpin Inclinati n – 6 - 7° crosswise.
Cast r – Pos. ½° to Pos. 1½°
Camb r – Pos. ¼° to Pos. 1¼°.
T e-In – 1/16" to 1/8".

►*TOE-IN ADJUSTMENT NOTE:* When checking toe-in on cars with Power Steering, engine should be running so that power steering control valve will be properly centered.

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type. *See "Gemmer Worm & Roller (3 tooth)" in Steering S ct.*

Power Steering: Ford-Mercury Bendix Linkage type. Used in conjunction with standard type steering gear. *See "Ford & Mercury Bendix" in Steering Section.*

►*STEERING ARM INTERFERENCE (Power Steering Cars):* To correct interference between steering connecting rod clamps and/or bolts with power steering control valve, *See "Ford & Mercury Bendix Linkag Power Steering" in Steering Section.*

►*POWER STEERING BELT SQUEAL CORRECTION:* When belt slippage or squeal cannot be corrected by belt adjustment, install new pulley, Ford No. B6A-33556-A, and new solid type belt, Ford No. B6A-33558-A. *NOTE* - Previous type belt (with serrations) can be used with either type pulley.

Steering Linkage: *See "Steering Linkage" in Steering Sect.*

Steering Wheel & Horn Button Removal: *See "Gemm r Worm & Roller (3 tooth)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (3 tooth)" in Steering Section.*

BRAKES

Ford-Bendix Hydraulic. Hand lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section.

►*BRAKE DESIGN CHANGES:* Front wheel brakes do not have eccentric and front and rear anchor pins are fixed (No adjustment).

Drum Diameter – 11" front and rear.

Wheel Cylinder Diameter – 1 1/8" (Front - All), 7/8" (Rear - Pass. Cars), 15/16" (Rear - Sta. Wgn. & Sed. Del.).

Lining Specifications

Passenger Car

Lining	Width	Thickness	Length
Front Primary	2¼"	3/16"	10 27/32"
Front Secondary	2¼"	15/64"	10 27/32"
Rear - All	1¾"	3/16"	10 27/32"

Sedan Delivery & Station Wagon

Lining	Width	Thickness	Length

Front Secondary	2¼"	7/32"	11 15/16"
Rear Primary	2"	7/32"	9 9/32"
Rear Secondary	2"	7/32"	11 15/16"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Clearance – Adjusting screw backed off 10 to 12 notches from point where shoes are tight against drum.

Brake Pedal Free Play Adjustment: 5/16" to 7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder: Located on engine side of firewall.

Checking Fluid – Maintain fluid level to within ½" of top of reservoir.

Removal – Disconnect brake line from master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lockwashers attaching master cylinder to firewall.

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinders. There are no mechanical connections and no adjustments are required.
See "Midland Power Unit" in Brake Section.

Checking Fluid – Same as for manual brakes (above).

Removal of Power Unit – Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at the power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket boltsand lockwashers and remove the power unit.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Misc. Sect.*

Power Top Control: Electric-Hydraulic with reversible pump motor. *See "Power Top Controls" in Misc. Sect.*

Power Seat Adjusters: "Fourway" Electric Screw and jack type with individual motors and transmissions for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate, on left front body pillar (V8 Pass. Cars), on dash panel in engine compartment (Thunderbird).
First Number–100001.

►*VEHICLE NUMBER NOTE:* Vehicle number (Example *M6FS 100001*) includes following identification data in sequence:

Eng. Type ①	Year ②	Assy. Plant	Body Style ③	Serial No.
M	6	See below	See below	100001 up

①–**A**–6 Cyl., 223 cu. in. engine; **M**–8 Cyl., 292 cu. in. engine; **P**–8 Cyl., 312 cu. in. engine (Thunderbird & Interceptor) **U**–8 Cyl., 272 cu. in. engine.
②–Last digit of model year.
③–**C**–Sunliner (Conv.); **F**–Victoria (Fairlane 4-Dr.) **H**–Thunderbird; **R**–Ranch Wagon (Customline); **S**–Sedan Delivery; **T**–Tudor & Fordor (Fairlane); **V**–Victoria (2-Dr.); **W**–Crown Victoria; **X**–Country Sedan; **Y**–Country Squire; **G**–All others (Fordor, Tudor–Mainline & Customline).

Assembly Plant Designation

A–Atlanta	**F**–Dearborn	**N**–Norfolk
B–Buffalo	**G**–Chicago	**P**–St. Paul
C–Chester	**K**–Kansas City	**R**–San Jose
D–Dallas	**L**–Long Beach	**S**–Somerville
E–Mahwah	**M**–Memphis	**U**–Louisville

TUNE-UP

►*SUDDEN ENGINE STOPPAGE CORRECTION:* Inspect distributor primary terminal wire assembly Ford No. B6A-12216-A for defective welds at brass terminals.

COMPRESSION PRESSURE: At cranking speed, compression pressures are as follows:

Engine	Compr. Ratio	Compr. Press.
272 cu. in.	8.0-1	160 lbs.
272 cu. in.	8.4-1	165 lbs.
292 cu. in.	8.0-1	155 lbs.
292 cu. in.	8.4-1	160 lbs.
312 cu. in.	8.0-1	155 lbs.
312 cu. in.	8.4-1	160 lbs.
312 cu. in.	9.0-1	165 lbs.

VACUUM READING: 19-20" at 475-500 RPM in neutral.

VALVE TAPPET CLEARANCE: .019" Intake and Exhaust (Hot & Cold).

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve on cars with single exhaust system is located between front end of right hand exhaust manifold and crossover pipe. Valve on cars with dual exhaust system is located between rear end of right hand exhaust manifold and muffler inlet pipe. Thermostat spring is installed with a ¾ turn wind-up and hooked over stop pin. *Valve is closed when engine is at normal operating temperature and running at slow idle, and opens when op rating at high RPM.*

►*DUAL EXHAUST NOTE:* When valve closed, most exhaust gases are discharged through left hand exhaust pipe.

►*LUBRICATION NOTE:* Use lock lubricant Ford No. B6Q-19587-A at shaft and spring bearing positions.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders–RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036".
Spark Plugs–Champion 870. 18mm.

►*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be torque tightened within range 15-20 ft. lbs.

►*SPARK PLUG MISFIRING CORRECTION:* If misfiring occurs between No. 6 and No. 8 cylinders, interchange No. 5 and No. 6 spark plug wire positions in all insulator blocks and separator blocks on left side of engine.

COIL: Ford No. B6A-12029-B. *12 Volt.*
Ignition Current – 2.5 amps. idling, 4.5 amps. stopped.
Resistor – Ford B6A-12250-B, (Early), B6A-12250-C, (Later). Mounted next to coil. *See changes following.*

►*IGNITION RESISTOR PRODUCTION CHANGES:* Two types of resistors Ford No. B6A-12250-C used in production to replace original resistor B6A-12250-B. First type replacement identified by copper flashing on heads of rivets which support elements. A piece of fibre glass is cemented to inside channel of support bracket. Second type replacement has sheet metal cover snapped over channel and rivets are cadmium plated. Replace original type when servicing ignition system.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Ford No. B6A-12127-A (272 Eng. with 2-Barrel Carb.), **B6A-12127-B** (272, 292, & 312 Engs. with 4-Barrel Carb.) *12 Volt.* New double diaphragm, pressure type with separate vacuum lines to manifold and carburetor used with cars equipped with 4-Barrel Carburetors.

►*DISTRIBUTOR DIAPHRAGM PRODUCTION CHANGE:* A new distributor diaphragm Ford No. B6A-12370-B used on all engines after Nov. 15th, 1955, and is available for replacement of all B6A-12370-A diaphragms. It can be identified by the die cast end cover in place of stamped cover and it incorporates new type material in secondary diaphragm giving it much greater strength.

►*POOR ACCELERATION OR ROUGH IDLE CORRECTION (Due to Distributor Diaphragm Leaking on Cars Equipped With 4-Barrel Carbs.):* Check for leaks as follows: Disconnect carburetor and manifold fittings at diaphragm. Attach screw-in adapter from distributor stroboscope to primary diaphragm (large fitting). Adjust distributor stroboscope vacuum pump to a steady reading of 20" of vacuum. Connect hose to primary diaphragm fitting. If reading less than 20" of vacuum, one or both diaphragms are leaking and should be replaced If readings hold at 20" of vacuum, further check for small pin holes in the diaphragm by adjusting distributor stroboscope vacuum pump to obtain a steady 3-5" of vacuum. Again connect hose to primary diaphragm fitting. If a steady reading is not maintained, one or both diaphragms are leaking and should be replaced. New diaphragm assemblies, Part No. B6A-12370-D, should be checked at both vacuum settings before installation.
Condenser–Ford FAB-12300-A. **Capacity**–.21-.25 mfd.
Contact Point Set–Ford FAB-12171-B.
Breaker Gap–.014-.016".
Cam Angle – 26-28° ± 5°.
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Counter-clockwise viewed from above.

Advance Performance–B6A-12127-A
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
0±½	15	300
¼-1¼	28	400
6½-7½	96	800
11½-12¾	2.21	1200
14½-15½	3.41	1600
16-17¼	4.60	2000

Advance Performance–B6A-12127-B
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
0±½	16	300
0-1	29	400
5½-6½	88	800
8½-9½	1.27	1200
11-12	1.73	1600
13-14¼	2.19	2000

►*DISTRIBUTOR INSTALLATION CAUTION:* Be sure distributor shaft engages oil pump intermediate hex shaft. If may be necessary to turn engine over with starter, after the distributor drive gear is partially engaged, in order to engage the intermediate shaft.

Initial Distributor Timing: Remove No. 1 spark plug. Hold thumb over spark plug hole until piston starts up on compression. Slowly "bump" engine over with starter until timing mark is aligned with pointer. Find No. 1 spark plug socket in distributor cap and fit distributor cap to distributor housing. Mark distributor housing to indicate No. 1 spark plug wire position. Position rotor approximately 20° counter-clockwise from mark made on distributor housing. Engage distributor drive gear and install distributor in engine.

IGNITION TIMING

Setting–3° BTDC (Std.), 6° BTDC (Fordomatic) with engine idling at 475 RPM and vacuum line disconnected (2-Barrel Carb.), PRIMARY (inner diaphragm) vacuum line disconnected (4-Barrel Carb.). *See Initial Distributor Timing above. NOTE*–Maximum initial timing recommended is 6° BTDC (Std.), 8° BTDC (272,292 Eng. Fordomatic), 6° BTDC (312 Eng. Fordomatic).

Timing Mark–Vibration damper marked "TDC", and "2", "4", "6", "8", "10" degrees BTDC. Align correct mark with pointer (bolted to water pump).

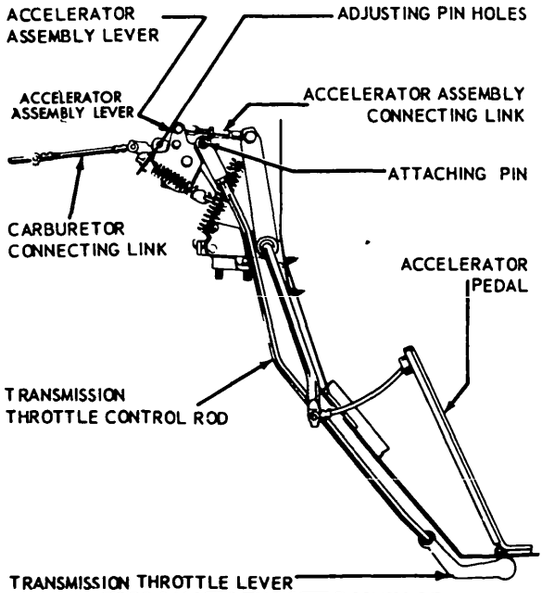
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARBURETOR

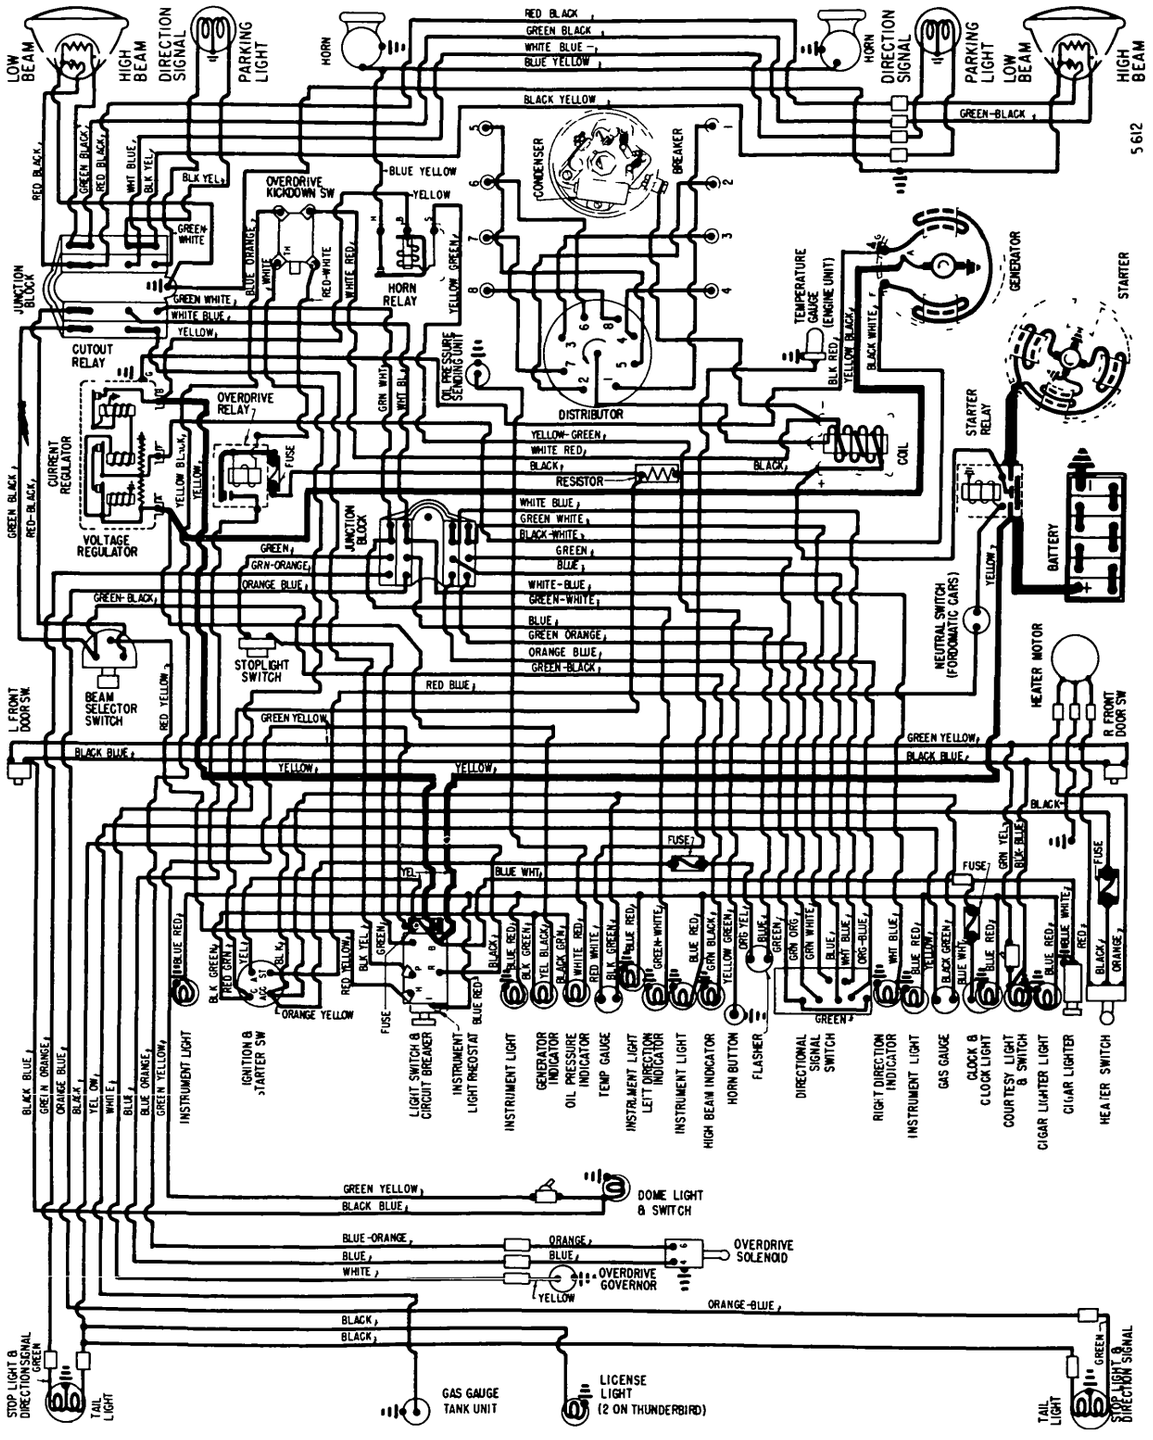
►*CARBURETOR APPLICATION Two-barrel Carburetors used on 272 cu in engine Four-barrel Carburetors used on 292 and 312 cu in engines*

►*WIDE OPEN THROTTLE INTERFERENCE CORRECTION (272 Eng.)* Interference with intake manifold may prevent accelerator assembly bar from traveling to wide open position To correct, bend forward upper end if accelerator assembly bar



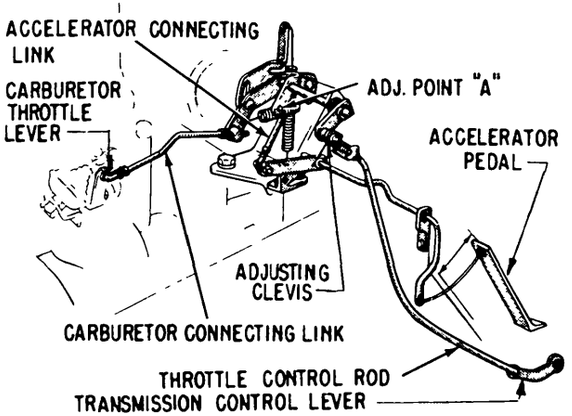
►*HARD STARTING (272 Pass. Car Eng.) CORRECTION:* New choke thermostat with the new bi-metal spring Ford No. B6A-9848-D, identification mark "56F1" can be installed to replace early choke thermostats with identifications either "56F" or "56D".

►*ACCELERATOR PUMP PISTON ROD STICKING CORRECTION (272 Eng.):* When this rod sticks or binds, install new rod Ford B6A-9531-A, identified by deep blue color. Old rod was zinc plated. Free carburetor of burrs or foreign material when installing new rod.

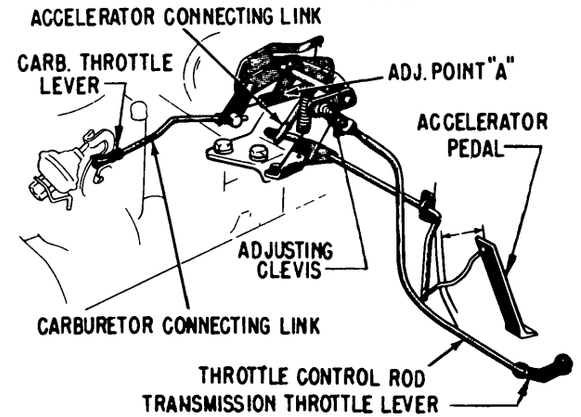


►*ACCELERATOR ASSEMBLY BAR INTERFERENCE CORRECTION:* For elimination of bind or interference (Std. & O.D. Trans.) between bar and distributor diaphragm vacuum line or intake manifold. *See "Ford Dual Downdraft Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment (Fordomatic Cars): Set hand brake and adjust engine idle speed to 475-500 RPM with engine at normal operating temperature and transmission in "N" (Neutral) position *Make sure that fast idle cam is in slow position* Adjust anti-stall dashpot (see below) Turn engine off Disconnect throttle control rod from accelerator assembly Insert a



CONTINUED ON NEXT PAGE



FORDOMATIC THROTTLE LINKAGE (2-BARREL CARBURETOR)

CONTINUED FROM PRECEDING PAGE

FORDOMATIC THROTTLE LINKAGE (4-BARREL CARBURETOR)

FORDOMATIC THROTTLE LINKAGE (THUNDERBIRD)

locking pin (¼" drill rod) through holes in lever and assembly. Adjust length of carburetor connecting link to close carburetor against its stop. Adjust the accelerator assembly connecting link to obtain a pedal height of 3 11/16" (cars with 2-barrel carburetors), 3 9/16" (cars with 4-barrel carburetors except Thunderbird cars), 4 1/4" (Thunderbird Cars). Remove locking pin and check alignment. Pin must re-enter freely. Remove locking pin and adjust throttle control rod. Pull upward gently but firmly on rod to hold transmission lever against its internal stop. Rotate clevis until clevis freely fits pin on accelerator assembly lever. Lengthen throttle control rod by rotating clevis 3 turns counter-clockwise. Assemble throttle control rod to the accelerator assembly lever. Hold clevis in alignment to prevent binding, tighten locknut. Check throttle linkage, and relieve any binding conditions. Road Test car. If band or clutch slippage is evident, increase length of the throttle control rod to 3½ turns, but d not xc d f ur turns of the cl vis. On cars with 2-barrel carburetors, check alignment of the accelerator cross shaft-to-accelerator assembly lever connecting link. Connecting link must be parallel to centerline of engine. If connecting link is misaligned, loosen the adjustment screw locknut, then turn adjustment screw until correct alignment is obtained.

Dashpot Adjustment (Fordomatic Cars): Adjust engine idle speed to 475-500 RPM with selector lever in "N" position, engine at normal operating temperature. *Make sure that fast idle cam is in slow position.* Loosen dashpot adjusting screw locknut. Hold throttle in closed position, and turn dashpot adjusting screw out (counter-clockwise) until head of screw pushes dashpot rod up to the end of its travel. Turn dashpot adjusting screw in (clockwise) 1½-2 turns to obtain a clearance of .045-.064" between rod and screw head. After adjustment made, tighten adjusting screw locknut.

FORD TWO-BARREL

Ford No. B6A-9510-J (Exc. Fordomatic), B6A-9510-K (Fordomatic). Dual, downdraft type.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting—Initial setting 1 turn open. Set both screws alike. Turn adjusting screws in until engine begins to run rough from the lean mixture, then turn screws out until engine begins to roll from rich mixture. Turn screws in until engine runs smoothly. Favor a slightly rich mixture. Turn screws out for richer mixture.

Idle Speed—475-500 RPM (Std. & O.D.), 475-500 RPM (Fordomatic) with selector lever in "N" position.

Fuel Level—11/16" below top surface of float bowl (Tool T52L-9550-AGE).

Float Level—1.374-1.438" from flange surface of air horn (inverted) to edge of soldered seam on bottom side of float. It should be equal on both ends of float.

Accelerating Pump: Center hole for normal operation, shortest stroke (closest hole to throttle shaft) for hot weather operation, longest stroke for cold weather operation.

Fast Idle: Integral type operated by choke valve. No adjustment required.

Automatic Choke: Index mark on cover aligned with center mark on housing.

Throttle Linkage Adjustment (Fordomatic Cars): *See CARBURETOR above.*

►*OTHER DATA: See "Ford Dual Downdraft Carburetors" in Carburetion Section.*

Fuel Pump Pressure: 4-5 lbs. at 500 RPM.

FORD FOUR-BARREL

Ford No. B6A-9510-L (Early Exc. Fordomatic), B6A-9510-M (Early Fordomatic), B6A-9510-N, Q, (Later).

►*CARBURETOR PRODUCTION CHANGES & RECOMMENDED CHANGES FOR IMPROVED STARTING & WARM-UP PERFORMANCE: See "Ford, Lincoln, Mercury 4-Barrel Centri-Quad" in Carburetion Section.*

►*ACCELERATOR RETURN SPRING (Fordomatic) BIND:* To eliminate bind causing throttle to stick open or prevent transmission from kicking down, shorten each end hook of accelerator bellcrank lever spring 1/16".

►*ROUGH IDLE (Caus d by Plugg d S c ndary High Sp d Air Bl ed):* When adjusting idle mixture screws does not correct condition, look for fuel being discharged from secondary transfer holes or secondary discharge nozzles. Clean bleed holes to eliminate siphoning.

►*AIR CLEANER WING SCREW TIGHTENING CAUTION:* Tighten anchor screw to 135 inch lbs. only, and wing nut just finger tight. Overtightening will permit anchor screw removal with air cleaner and cause lock washer to be drawn into carburetor venturi and engine.

►*4-BARREL CARBURETOR CHOKE LINKAGE INTERFERENCE CORRECTION:* Heat baffle or shield front portion may be bent toward the rear, causing it to bind on carburetor choke linkage.

►*4-BARREL CARBURETOR HARD COLD STARTING CORRECTION:* Choke plates may be operating improperly because wire link in choke housing has become disconnected from choke piston or the choke spring link. Move choke plates manually to see if any spring tension is present. If choke plates are completely free, correct as follows: Remove choke thermostat housing assembly and thermostatic housing plate and connect wire link. It is suggested that ends of wire link be bent slightly in order to make link more secure in proper holes. *NOTE*—Care should be exercised when reworking this link so that shape of link is not changed. Change of shape might cause a bind in the choke mechanism.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting—Initial setting 5/8 turn open. Place choke fast idle cam in slow position. Turn both screws in until engine begins to run roughly from lean mixture. Turn screws out until engine begins to roll from rich mixture. Then turn screws in until engine begins to run smoothly. Favor a slightly rich mixture. Final setting may vary ½ turn between screws.

Idle Speed—475-500 RPM (Std. & O.D.), 475-500 RPM (Fordomatic) with selector lever in "N" position.

Throttle Linkage Adjustment (Fordomatic Cars): *See CARBURETOR above.*

►*OTHER DATA: See "Ford, Lincoln, Mercury, Centri-Quad Carburetors" in Carburetion Section.*

Fuel Pump Pressure: 4-5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Fuel only or Fuel & Vacuum.

Model	Ford Pump No.
Thunderbird (Std. Trans.)	B5S-9350-A
Thunderbird (O.D. & Fordomatic)	B5S-9350-B
All Others (Std. Trans.)	B5A-9350-C
All Others (O.D. & Fordomatic)	B5A-9350-D

Pressure – 4-5 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric.

Model	Dash Unit	Tank Unit
Thunderbird	B6S-9280-A	B6A-9275-C
Sta. Wgn. & Sed. Del.	B6A-9280-D	B6A-9275-B

BATTERY

Ford N . B6A-10655-C. *12 V lt,* 11 Plate, 55 ampere hour capacity **r F rd N . B6A-10655-E,** *12 Volt,* 13 plate, 70 ampere hour capacity.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Battery Ground – Negative, to engine block.
► *CAUTION: This is reversed from previous models.*
Engine Ground – Cylinder head to dash.

STARTER

Ford No. B6A-11002-A. *12 Volt.* **Armature–B6A-11005-A.**

► *IMPULSE STARTING (Back Up Light Equipped Cars) CORRECTION:* Before replacing neutral safety switch to correct short between light and solenoid terminals causing engine to start, interchange leads at switch. Connect longest lead (beyond taped portion of harness) to "A" terminal and short lead to "B" terminal.

Drive – Ford 1CM-11350-C. Bendix "Folo-Thru".
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 48-56 ozs.
Cranking Speed – 150-180 RPM with warm engine.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	120
	150-180 ②		190 max.

① – With starter on engine and engine idling.
② – Cranking speed with warm engine.

Starting Switch: Magnetic type, Ford No. B6A-11450-A, Starter Switch is controlled by ignition switch. *NOTE* - Neutral Safety switch used on Fordomatic transmissions.
Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C.
Adjustment – *See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford No. B6A-10002-A (Exc. Thunderbird), B6S-10002-A (Thunderbird). *12 Volt.*
Armature – Ford No. B6A-10005-A (All).

► *GENERATOR INDICATOR LIGHT (Idle Speed) CORRECTION:* When generator light comes "ON" when engine idles, install a 75 ohm, 25 Watt resistor (Vitreous enamel type with eyelets moulded into resistor body), at "A" terminal of regulator in series with indicator light wire (Yellow with black tracer). Adjust engine idle to high limit. *NOTE* - Light will now have lower illumination than oil indicator light.

Performance Data

Amperes ①	Eng. RPM
30	1388

① – See Regulator for maximum charging rate.
Brush Spring Tension – 26-34 ozs.
Field Current – 1.4-1.6 amps. at 12.0 volts.
Rotation – Counter-clockwise at commutator end.
Belt Adjustment: Approximately ½" deflection on belts midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Ford No. B6A-10505-A. *12 Volt.*

► *SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 75° F. ambient (engine compartment) temperature, after ½ hour operation in vehicl , or aft r regulator h ated and stabiliz d.*

Cut ut Relay
Cuts In – 12.0-12.8 volts.

V ltag R gulat r
Setting – 14.6-15.4 volts.
Checking & Adjusting – *S El ctrical S cti n.*

Curr nt R gulator
Setting – 28-32 amperes.
Checking & Adjusting – *See Electrical Section.*

MISC. ELECTRICAL

► *DOME LIGHT FAILURE (High Voltage) CORRECTION:* When dome lights fail due to high voltage, remove head light switch, remove dome light wire from switch (green wire with yellow tracer), and install 1.5 Ohm, 5 Watt Vitreous enamel resistor in dome light circuit.
Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Lighting Switch Removal: With control knob in the "OFF" position, press spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N.
Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of brake booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.
FUSES: Located as follows:
Interior Lights – 14 ampere. On lighting switch.
Overdrive – 30 ampere. On overdrive relay.
Cigar Lighter – Special fuse in lighter base.
Clock – 3 ampere. In clock lead.
Heater – 14 ampere. In blower switch lead.
Radio – 7.5 ampere. On radio signal speaker.
Turn Signal Fuse–7.5 ampere. In flasher to switch lead.
CIRCUIT BREAKERS: On headlight switch. Combination headlight switch, circuit breaker, and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument, parking, stop and tail light circuits.
► *1956 CIGAR LIGHTER CAUTION:* 12 volt socket and element smaller than 6 volt. 12 volt socket has ink mark stamped on it for identification. DO NOT use 12 volt element in a 6 volt socket as element when heated will eject onto front seat.
HORNS: (Except West Coast). Ford B5T-13832-B (High Pitch), B5T-13833-B (Low Pitch). *12 Volt.*
(West Coast Only) Ford B6A-13832-A (High Pitch),use bracket Ford No. B6A-13830-A; Ford B6A-13833-A (Low pitch), use bracket Ford No. B6A-13831-A. *12 Volt.*
Horn Current – 9.2-9.6 amperes at 12 - 12.6 volts.
Horn Relay: Ford No. 2Q-13853-A.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

ENGINE SPECIFICATIONS: 90° V8 (All Models).

Engine	Bore	Stroke	Displmnt
272 Eng.	3.62"	3.30"	272 cu. ins.
292 Eng.	3.75"	3.30"	292 cu. ins.
312 Eng.	3.80"	3.44"	312 cu. ins.

Engine	Rated HP	Compr. Ratio	Dev. HP at RPM
272 Eng. ①	42.05	8.0-1	173 at 4400
272 Eng. ②	42.05	8.4-1	176 at 4400
292 Eng. ③	45.00	8.0-1	200 at 4600
292 Eng. ④	45.00	8.4-1	202 at 4600

①–Customline & Mainline (Synchro-mesh Trans. & Overdrive). 2-barrel Carburetor.
②–Customline & Mainline (Fordomatic). 2-barrel Carburetor.
③–Fairlane & Station Wagon Models (Synchro-mesh Trans. & Overdrive). 4-barrel Carburetor & Dual Exhaust.
④–Fairlane & Station Wagon Models (Fordomatic). Thunderbird (Synchro-mesh Trans.), 4-barrel Carburetor & Dual Exhaust.
⑤–Police Interceptor (Synchro-mesh Trans. & Overdrive). 4-barrel Carburetor & Dual Exhaust.
⑥–Police Interceptor (Fordomatic) & Thunderbird (Overdrive). Optl. on Fairlane & Station Wagon. 4-barrel Carburetor & Dual Exhaust.
⑦–Thunderbird Engine (Fordomatic). Optional on Fairlane & Station Wagon. 4-barrel Carburetor & Dual Exhaust.

Compression & Vacuum R ading–*See TUNE-UP.*

CYLINDER HEAD: *See "Cylind r Head & Manifold" in Ford Special Data.*

► *CYLINDER HEAD IDENTIFICATION: H ads can be identified by designation cast in top of head as list d below. Use of incorrect head will caus rough engine.*

Engine	Compr. Rati	H ad Id nt.
272	8.0-1	ECZ-C
272	8.4-1	ECG-H
292	8.0-1	ECZ-B
292	8.4-1	ECZ-C
292	9.0-1	ECG-H
312	8.0-1	ECZ-A
312	8.4-1	ECZ-B
312	9.0-1	ECZ-C

► *CYLINDER HEAD PART NO. CHANGE (272 & 292 ENGINES):* Cylinder Heads Nos. B6A-6049-K and B6A-6049-E have been used on these engines. See Valve Springs for types used with each head.

► *CYLINDER HEAD BOLT INSTALLATION CAUTION:* Cylinder head olts used on 1956 cars differ from those used previously. New bolt (B6A-6066-B), used at the four dowel hole locations, is 5/16" longer than other cylinder head bolts. (B6A-6066-A). New bolts should be used at dowel hole locations only, as there is a possibility that bolts will bottom at other locations. Use of regular shorter bolts at dowel hole locations may result in cylinder block thread failure.

► *CRANKCASE VENTILATOR COVER OIL LEAK CORRECTION:* Install new .090" thick cover gasket. Old type gasket was .060".

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data.*
ENGINE REMOVAL: *See "Engine" in Ford Spec. Data.*
ENGINE FRONT MOUNTING: *S "Engin M untings" in Ford Special Data.*

► *EXCESSIVE VIBRATION (312 Eng.) CORRECTION:* Replace insulator assemblies AE-6038-B (identified by ½" band of white paint), with AE-6038-A insulator assemblies.

OIL PAN REMOVAL: Remove oil level indicator, drain crankcase. Remove engine front splash pans. On Ford-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

omatic equipped cars, remove converter housing cover assembly. Disconnect oil pump inlet pipe at oil pump. Remove "O" ring seal from pump end of tube. Remove oil pan retaining nuts and screws, then remove oil pan. *NOTE* - No. 5 piston must be approximately TDC before oil pan can be removed.

PISTONS

Autothermic type. Solid skirt with three rings above pin.

Rem val – Pistons and rods removed from above.

Fitting N w Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Pull to withdraw feeler should be 5-10 lbs. with feeler thickness as follows: .0015" (New Piston in New Bore), .002" (New Piston in Used Bore), .002" (Used Piston in Used Bore).

Replacement Pistons: Standard, .020", .030", .040", .060" Oversize. Pistons furnished only with fitted pins.

Installing Pist ns: Install with small indentation in head toward FRONT of engine. *See Rod Installation.*

PISTON PINS

Floating type with lock rings at each end.

Diamet r – .9120-.9123". **Length** – 3.016-3.030".

Pin Fit in Pist n – .0001-.0008" clearance or light thumb push fit at 70° F.

Pin Fit in Rod Bushing – .0008" clearance or light thumb push fit at 70° F.

Replac ment Pins: Standard (Green), & .001" (Blue), .002" (Yellow) Oversize. Fitted pins furnished with new pistons.

PISTON RINGS

Two compression, one oil ring per piston. Oil ring is "side-sealing" type (two steel rails with spring spacer between them).

Ring	Width	End Gap	Side Clearance
Compr.(1 & 2)	3/32"	.010-.027" ①	.006" max.
Oil (3)	3/16"	.015-.062" ②	③

① – .012-.029" on 312 Engine.
② – On rails.
③ – "Side-sealing" type.

R plac ment Rings: Furnished in sets as follows: **"Snap Typ "** Std. & .020", .030", .040", .060" Oversize (except Std. size only for 312 Engine), **"Steel Section"** Std. & .020", .030" Oversize (272 Engine), Std. & .020", .030", .040", .060" Oversize (292 Engine).

CONNECTING RODS

Crankpin J urnal Diam t r – 2.1880-2.1888".

Low r B aring – Steel backed, copper lead alloy lined type. Upper and lower halves interchangeable.

Clearance – .0037" (272, 292 Engs.), .0036" (312 Eng.) maximum.

Sid Clearanc – .019" (two rods) maximum.

R plac m nt B arings: Standard (2 sizes marked **Red** and **Blu** for selective fitting) and .010", .020", .030" Undersize.

Installing Rods: Install rod in piston so that rod bearing lock slots in connecting rod are toward outside of engine when indentation in head of piston is toward front of engine. Numbers on bearing caps and rods must be on same side when installed. Install in same numbered cylinders.

CRANKSHAFT

►*1956 CRANKSHAFT PRODUCTION CHANGE (To minimize oil leaks at front and rear oil seals):* New Crankshaft with integral Rear Oil Slinger, Part No. B6A-6303-D (272 & 292 Engines), B6A-6303-C (312 Engine), used with separate Front Oil Slinger, Part No. B6A-6310-B. Slingers will divert oil away from seals. *NOTE* - New crankshaft and front slinger can be installed in 1955 272 & 292 engines also.

Journal Diameter – 2.4980-2.4988" (272 & 292 Eng.), 2.6235-2.6243" (312 Eng.).

Bearings – Steel-backed, lead-babbitt (272 Eng.), copper-lead (292 & 312 Eng.).

Clearance – .0031" max. (272 Eng.), .0042" max. (292 Eng.), .0036" max. (312 Eng.).

Replacement Bearings: Standard (2 sizes marked **Red & Blue** for selective fitting) and .010", .020", .030" Undersize.

End Thrust: Taken by No. 3 main bearing. Replace bearing if end play excessive.

Thrust Bearing Alignment – *See "Crankshaft & Main Bearings" in Ford Special Data.*

Endplay – .010" max.

Crankshaft Rear Oil Seal Installation: *See "Crankshaft and Main Bearings" in Ford Special Data.*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Special Data.*

CAMSHAFT

►*CAMSHAFT REPLACEMENT INSTALLATION CAUTION:* 1956 camshafts have an oil groove around perimeter of journal, replacing oil holes in 1955 camshaft. 1955 and 1956 camshafts and center bearings are **not** interchangeable.

►*312 ENGINE CAMSHAFT PRODUCTION CHANGE (Fordomatic Engines):* New camshaft, Part No. B6A-6250-C (superseding No. B6A-6250-B) used in production beginning Sept. 7, 1956 to reduce engine noise level. Engines with this camshaft marked by daub of blue paint on right side near date stamp. Cam lobe lift and tappet clearance are unchanged with this new camshaft. *See Valve Timing below.*

Journal Diameters – 1.9255-1.9265".

Clearance – .006" max.

End Thrust: Taken by thrust plate and spacer located between camshaft sprocket and shoulder on camshaft.

►*CAMSHAFT THRUST SPACER NOTE:* Chamfer on the inside of spacer must be to the rear or face camshaft journal.

End Play – .012" max.

Replacement Camshaft Bearings: Finished bearings furnished Standard and .015" undersize.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data.*

Timing Chain: Double strand "Diamond" (272 Eng.), Side-guide type (Others). Length 56 links.

►*TIMING CHAIN REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side). Remove and install chain "endless" as a unit with both sprockets.

Camshaft Setting: Sprockets marked by round depressions on one tooth. Mesh chain so that there are 12 chain link pins between timing marks on sprockets when marks are both on drive side of chain.

Engin Fr nt Cov r Oil S al (Crankshaft Fr nt S al) Installation: *See "Engine Front Cover" in Ford Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Ford Special Data.*

VALVES

Tappet Clearance: .019" (Intake or Exhaust) either cold or hot. *NOTE* - Valve tappet clearance on truck engines is different.

Valve	Head Diam.	Stem Diam. ①	Length
Intake	1.775-1.785"	②	5.02"
Exhaust	1.505-1.515"	③	5.02"

Valve	Seat Angle	Lift ④	Stem Clearanc
Intake	45°	.259"	.004" max.
Exhaust	45°	.267"	.006" max.

① – Furnished with .003", .015", .030" oversize stems.
② – .3415-.3420" (Coded RED), .3420-.3425" (Coded GREEN).
③ – .3400-.3405" (Coded RED), .3405-.3410" (Coded GREEN).
④ – Cam lobe lift. Service limit.

►*EXHAUST VALVE STEM DIAMETER PRODUCTION CHANGE:* Valve stem diameter decreased .0005" for increased stem clearance to minimize valve sticking. *See "Valve System" in Ford Special Data.*

Valve Seat Width – .060-.080" (Intake), .070-.090" (Exhaust).

►*ROTATABLE VALVE NOTE:* All valves are rotatable type. *See "Valve System" in Ford Special Data.*

Valve Stem Oil Seals – "Umbrella" type seals on intake and exhaust valve stems. Install seals on valve stems with cupped side down to cover guide boss on head. Install new seals whenever valves removed or when seals become loose on valve stems.

►*VALVE SPRING OIL BAFFLE PRODUCTION CHANGE:* Valve spring oil baffles were discontinued on all 8 cylinder engines approximately May 14th, 1956. Improved rocker arm lubrication eliminates need for these baffles.

Valve Springs: Install with closed coil end toward cylinder head.

►*VALVE SPRING CAUTION:* Valve Spring No. EAA-6513-A (7½ coils, 2.12" free length) used with Cylinder Head No. B6A-6049-K, Spring No. B6A-6513-A (7 coils, 2.09" free length) used with Cylinder Head No. B6A-6049-E. *See Cylinder Head Change above.*

Spring Specifications

	Pressure	Length
Valve Closed	64-79 lbs.	1.780"
Valve Open	145-177 lbs.	1.390"

►*VALVE SPRING INSTALLATION NOTE:* Measure valve spring assembled height from machined surface of cylinder head spring pad to under side of spring retainer. If assembled height is 1 13/16" or greater, install necessary .030" spacers between cylinder head valve spring pad and valve spring to bring assembled height to recommended 1 25/32 - 1 13/16". *CAUTION - DO NOT install spacers unless necessary.*

Valv Guid s: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (See table above), ream guides and install oversize valves. *See "Valve System" in Ford Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Lifters: Mushroom type. Remove from below after camshaft removed from engine.
Clearance – .0026".

Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated.

►*312 ENGINE WITH FORDOMATIC CAMSHAFT PRODUCTION & VALVE TIMING CHANGES:* For production change, *See CAMSHAFT above; For Valve Timing change, see below.*

Valve Timing
Exc. 312 Eng. With B6A-6250-C Camshaft
Intake Valves—Open 12° ① BTDC. Close 54° ② ALDC.
Exhaust Valves—Open 58° ③ BLDC. Close 8° ④ ATDC.
312 Eng. With B6A-6250-C Camshaft (Fordomatic)
Intake Valves—Open 20° ⑤ BTDC. Close 54° ② ALDC.
Exhaust Valves—Open 58° ③ BLDC. Close 8° ④ ATDC.
①— Camlift .016". ②—Camlift .019". ③—Camlift .015"
④— Camlift .018". ⑤—Camlift .014".

Valve Timing Check: Remove right rocker arm cover. Back off No. 1 intake valve adjusting screw, slide rocker arm assembly to one side. With push rod in lifter socket, install dial indicator to indicate push rod movement. Turn engine slowly until cam lobe contacts lifter. Zero indicator and continue to turn engine until correct lift is obtained (see table above). Compare degrees on pulley with specifications.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill), 6 qts. (when filter changed).

Normal Oil Pressure: 45-50 lbs. at 2000 RPM (Hot).
Pressure Regulator Valve—In pump body, not adjustable.
Oil Pressure Indicator – Indicator light on instrument panel, operated by Engine Unit, Ford No. FDA-9278-A (stamped No. 7 on Hex.). Lights when ignition switch turned on, goes out when engine starts and pump pressure reaches a safe value (7 lbs.).

Oil Pump: Gear type, located on left side of engine crankcase, driven by distributor shaft.
Pump Overhaul—*See "Oiling System" in Ford Spec. Data.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000 miles or when oil dirty or polluted.
Filter Element Installation – *See "Oiling System" in Ford Special Data.*
Replacement Filter Element – Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION: This Special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication). See "Oil Filter" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

Water Capacity: 19 qts. (Pass. Cars and Sta. Wgn.), 20 qts. (Thunderbird). Add 1 qt. for heater.

►*LOSS OF COOLANT CORRECTION:* Lower generator mounting bracket bolt holes are tapped into cylinder water jacket. For loss of coolant at this point or when replacing bolts, apply a good coating of waterproof sealer.

Pressure Valve: Radiator filler cap. Ford No. LA-8100-A, 12-15 lbs. (marked "13" or "14"). *CAUTION* - If replacement required, use 12-15 lb. type.

►*OIL PUMP CAUTION:* New type oil pump has aluminum body. Use extreme care when servicing, to save damaging body.

Thermostat: 157-162° F. (Std.), 177-182° F. (High Temp.) for use with permanent type anti-freeze.

Water Pump: Packless, sealed ball bearing type.
See "Ford V8" in Water Pump Section.
Pump Removal – (On Thunderbird) remove engine left hand splash shield). Drain cooling system, disconnect lower radiator hose and heater hose. Remove fan belt, fan, fan spacer, and pulley. (On Thunderbird, remove generator support bracket bolt at the water pump housing and bolt at generator, then move bracket out of way, remove remaining bolts, retaining water pump assembly and timing pointer). On other cars, remove four bolts retaining water pump to cover. Remove pump and timing pointer.

Temperature Gauge: King-Seeley Electric.
Dash Unit – Ford No. B6S-10883-A (Thunderbird), B6A-10883-D (Others).
Engine Unit – Ford No. B6A-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 10CF (272 & 292 Eng.), 11CF (Taxi, Interceptor & Thunderbird 292 & 312 Eng.). Single plate, semi-centrifugal type. *NOTE* - 11CF used on 272 & 292 Engines as Heavy Duty equipment.

Cover Assembly	Long No.	Ford No.
10CF	265125	B6A-7563-B
11CF	265126	B6A-7563-A
Clutch Disc	**Long No.**	**Ford No.**
272 Pass. Car	284978	B5A-7550-B
292 Pass. Car	285182	B6A-7550-C
272, 292 H.D.	281982	B5A-7550-B
Thunderbird	281982	B5S-7550-A
Interceptor	284961	

See "Long Clutches" in Clutch Section.

►*HEAVY DUTY CLUTCH PRODUCTION CHANGE:* Heavy Duty clutch incorporating an oil slinger to protect disc from excessive lubrication along with release bearing incorporating lubrication fitting, used in production. New heavy duty disc, Ford No. B6A-7550-A, released for service.

►*CLUTCH PEDAL INTERFERENCE (Thunderbird):* For rework of dash panel stabilizer or dash panel insulator to eliminate binding or interference by clutch pedal, *See "Clutch Notes" in Ford Special Data.*

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper and bracket until correct travel is within limits. Adjust assist spring link to give assist spring length of 6 5/8" when clutch is fully released.
Pedal Free Travel – 1 1/8" - 1 3/4". Loosen locknut on clutch pedal release rod, turn adjusting nut until correct travel is reached. *NOTE* - Check free travel by operating engine at 3000 RPM with transmission in neutral position. There should be a minimum of ½" free travel under these conditions. Readjust as necessary.

Removal (Exc. Thunderbird): Remove transmission (see transmission below), slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar. Remove split bronze bushing from bracket, remove flywheel housing. Install Tool 7563 and remove clutch pressure plate assembly (if tool not available, clutch may be released by backing off attaching bolts evenly).
Thunderbird – Drain transmission, remove drive shaft, disconnect shift rods at transmission, disconnect transmission from flywheel housing, move transmission back, so that clutch parts can be removed from flywheel housing. Slide clutch release bearing and hub assembly off end of release lever assembly. Remove pressure plate and cover assembly and clutch disc from engine flywheel.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). *See "Ford Synchro-mesh" in Transmission Section.*

►*SYNCHRO-MESH & OVERDRIVE THREE SPEED TRANSMISSION GEAR REPLACEMENT CAUTION:* Shot peened gears used in 1956 models. DO NOT use past model gears in 1956 transmission.

►*GEARSHIFT LINKAGE & CLUTCH RELEASE RODS PRODUCTION CHANGES AND CORRECTIONS:* For application of parts to eliminate interference causing premature gear tooth wear, *See "Transmission Control Notes" in Ford Special Data.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: (Exc. Thunderbird) – Drain transmission, disconnect gear shift linkage at transmission. Remove speedometer cable and gear, remove drive shaft. Remove bolts which hold transmission extension to engine rear support. Remove frame crossmember and engine rear support. Remove bolts and lockwashers which attach transmission to clutch housing, then install two guide pins. Move transmission assembly to rear until input shaft splines clear clutch housing, then lower transmission and pull forward to remove from car.
Thunderbird – Drain transmission, disconnect gear shift linkage at transmission. Remove speedometer cable and gear. Remove drive shaft. Remove cover from bottom of clutch housing, then remove starter from clutch housing. Disconnect clutch pedal linkage from clutch release lever. Raise rear of engine slightly, disconnect engine rear mount and remove frame crossmember. Support transmission on jack, and remove transmission to clutch housing bolts. Move transmission to rear so that clutch parts can be removed from clutch housing. Slide clutch release bearing and hub assembly off end of release lever assembly. Remove pressure plate and cover assembly and clutch disc from engine flywheel. Remove clutch housing-to-engine bolts and lower the clutch housing, then remove transmission.

OVERDRIVE

Warner AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. Lockout switch not used on this model.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 Overdrive Control" in Transmission Section.*

R moval: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock. *See "Fordomatic & Mercomatic" in Transmission Sect.*

► *FORDOMATIC "LOCK-UP" CORRECTION (1955-56 Cars & Trucks):* Caused by cross leakage in front servo piston. *See "Fordomatic & Mercomatic" in Transmission Section.*

► *FORDOMATIC TRANSMISSION FLUID COLOR CHANGE CAUTION:* New Fordomatic transmission oil used in production is green colored, similar to color of engine oil. DO NOT USE IT IMPROPERLY. "Type A" (reddish brown) may be used when adding oil to transmission filled with new type oil.

► *FORDOMATIC PRODUCTION CHANGES:* For improved Throttle Control Inner Lever Installation, change in Pressure Regulator Valve Body and new location of pressure take off plug, *See "Fordomatic & Mercomatic" in Transmission Section.*

► *PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubricati n – Check transmission fluid level at 1000 mile intervals and maintain level at "F" (Full) mark on indicator. Drain & refill every 15,000 miles.

Ch cking Fluid Level: With selector lever in "N" (Neutral) and emergency brake applied, run engine approximately four minutes at idle speed. Check to see that emergency brake is applied and that engine is on slow idle, then move selector lever to "P" (Park) position. *NOTE -* When engine and transmission are at normal operating temperature move selector lever through all ranges to assure fluid distribution throughout transmission. Remove indicator and read fluid level. Add Automatic Transmission Fluid as necessary to bring fluid level to "Full" mark on indicator.

THROTTLE LINKAGE ADJUSTMENT: *See CARBURETOR above.*

► *OTHER "FORDOMATIC" SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.

► *CAUTION (All Cars Except Sta. Wgn., Sed. Del. & Interceptor):* Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). *See "Ford & Mercury" (Separate Carrier)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own. Separate Carrier, semi-floating hypoid with Hotchkiss drive.

► *LUBRICATION BAFFLE NOTE:* 1956 rear axle housing has lubrication baffle (retained by two housing bolts) to direct lubricant to differential side bearings. *NOTE-* This baffle, Ford No. B5A-4018-A, can be installed on earlier models.

► *THUNDERBIRD REAR SPRING THUMP CORRECTION:* Replace early type rubber bumper with new soft rubber bumper Ford No. B6A-5783-B.

NOTE- Axle not same as Station Wagons & Sedan Delivery. *See "Ford & Mercury (Separate Carrier)" in Rear Axle Section.*

Ratios	Standard	Overdrive	Fordomatic
V8 Cars	3.78-1 or 3.89-1	4.11-1	3.22-1 or 3.55-1

► *RATIO, DRIVE GEAR & DIFFERENTIAL CASE IDENTIFICATION:* When differential case is to be replaced be sure new case is same as old one. Refer to following table for identification.

Drive Gear Ratio	Gear Teeth Drive	Pinion	Differential Case Color
3.22-1	29	9	Gray
3.55-1	32	9	Red
3.78-1	34	9	Black
3.89-1	35	9	Black
4.11-1	37	9	Black

Backlash – .003-.008"

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: Drain lubricant from rear axle housing. Remove carrier-to-housing nuts, then remove identification tag (ratio) and set it aside for reference during assembly of axle. Remove carrier assembly from axle housing.

STA. WGN., SED. DEL., THUNDERBIRD & INTERCEPTOR

Own. Integral Carrier, semi-floating hypoid with Hotchkiss drive.

► *NOTE:* Axle assembly not same as passenger cars. *See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.*

Ratios	Standard	Overdrive	Fordomatic
S.W. & S.D.	4.09-1	4.27-1	3.54-1
Thbd. & Intr.	3.73-1	3.92-1	3.31-1 or 3.54-1

Axle Shaft Removal: Same as passenger cars (above).

Rear Axle Assembly Removal: Remove hub caps, loosen wheel stud nuts, raise car at rear and disconnect hydraulic brake hose from brake line at rear axle. Disconnect parking brake cable from equalizer rod, remove cable assembly from frame brackets. Remove wheels, disconnect drive shaft at rear axle universal joint flange. Remove "U" bolts. Remove assembly from under car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Model	© Front	© Rear
All (Exc. S.W. & S.D.)	B5A-18124-A	B5A-18125-A
All (Hvy. Dty.)	B5A-18124-D	B5A-18125-C
S. W. & S.D.		B5A-18125-D
Thunderbird	B5S-18124-C	B5S-18125-B

© — Furnished in kits which include shock absorber mounting bushings.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs. *See "Lincoln, Mercury, Ford (Ball Joint)" in Suspension and Wheel Alignment Section.*

Kingpin Inclination – 6-7°, crosswise.

Caster – Pos. ½° to Pos. 1½°. Maximum variation between wheels ½°.

Camber – Pos. ¼° to Pos. 1¼°. Maximum variation between wheels ¼°.

Toe-In – 1/16-1/8". *NOTE -* When checking toe-in on cars with power steering, engine should be running so that power steering control valve will be properly centered.

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type. *See "Gemmer Worm & Roller (Type 305)" in Steering Sect.*

Power Steering: Ford - Mercury Linkage type. Used in conjunction with standard steering. *See "Ford & Mercury Bendix Linkage Type" in Steering Section.*

► *STEERING ARM INTERFERENCE (Power Steering Cars) CORRECTION:* To correct interference between steering connecting rod clamps and bolts with power steering control valve, *See "Ford & Mercury Bendix Linkage Type" Power Steering in Steering Section.*

► *POWER STEERING BELT SQUEAL CORRECTION:* When belt slippage or squeal cannot be corrected by belt adjustment, install new pulley Ford No. B6A-33556-A and new solid type belt Ford No. B6S-33558-A (Thunderbird), B6A-33558-A (Others). *NOTE -* Old type belt with serrations can be used with either the new or old type pulley.

Pump Belt Adjustment: Install torque wrench on pump pulley bolt. Check torque required to slip pulley against belt friction. If torque is not 14-16 ft. lbs. adjustment is required. To adjust, position a heavy duty 1½" "C" clamp with bottom against lower side of pump support bracket and top of clamp resting on pump bracket at its center. Loosen four pump attaching bolts until pump body may be repositioned by tightening "C" clamp. Tighten "C" clamp until torque of 14-16 ft. lbs. is required to slide pump pulley. *(NOTE -* Hold final torque as close as possible to upper limit). Tighten pump attaching bolts, remove "C" clamp, and make a final check of pulley sliding torque.

Steering Linkag : *See "Steering Linkage" in Steering Sect.*

Steering Wh l & H rn Butt n R m val: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor. Hand lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section.
► *BRAKE DESIGN CHANGES:* Front wheels do not have eccentric and front and rear anchor pins are fixed (No adjustment).
Drum Diameter – 11" front and rear.

LINING SPECIFICATIONS

Passenger Car

Lining	Width	Thickness	Length
Front Primary	2¼"	3/16"	10 27/32"
Front Secondary	2¼"	15/64"	10 27/32"
All-Rear	1¾"	3/16"	10 27/32"

Sedan Delivery & Station Wagon

Lining	Width	Thickness	Length
Front Primary	2¼"	7/32"	9 9/32"
Front Secondary	2¼"	7/32"	11 15/16"
Rear Primary	2"	7/32"	9 9/32"
Rear Secondary	2"	7/32"	11 15/16"

Thunderbird

Lining	Width	Thickness	Length
Front Primary	1¾"	3/16"	10 27/32"
Front Secondary	2¼"	15/64"	10 27/32"
All-Rear	1¾"	3/16"	10 27/32"

Clearance – Adjusting screw backed off 10 to 12 notches from point where shoes are tight against drum.

Brake Pedal Free Play Adjustment: 5/16" to 7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder: Located on engine side of firewall.

Checking Fluid – Maintain fluid level to within ½" of top of reservoir.

Removal – Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to firewall.

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinder. There are no mechanical connections and no adjustments are required.
See "Midland Power Unit" in Brake Section.
Checking Brake Fluid – Same as for manual brakes (above).
Removal of Power Unit – Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket bolts and lockwashers and remove power unit.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*
Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Misc. Sect.*
Power Top Control: Electric-Hydraulic with reversible pump motor. *See "Power Top Controls" in Misc. Sect.*
Power Seat Adjusters: "Four-way" type. Electric screw and jack type with individual motors for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*
Air Conditioning: *See Ford "SelectAire" in Misc. Sect.*

MODEL IDENTIFICATION

VEHICLE NUMBER: On Rating Plate attached to inside of glove compartment door. Vehicle Number is also Engine Number.
First Number - 10001.

► *ENGINE IDENTIFICATION NOTE*· 6 Cyl. and V8 engines used. 6 Cyl. (223 Eng. prefix EBR-S-T), V8 (272 Eng. prefix ECY-W, light duty, ECR heavy duty). Reference is made to engine by displacement (223 Eng. -223" displacement).

► *VEHICLE NUMBER NOTE.* Vehicle number (Example "F10D6 10001") includes identification in the following sequence.

Serial Code ①	Engine Symbol ②	Year ③	Assy. Plant	Serial Number
F10	D	6	See below	10001 up

① - See Model & Serial Code Table below.
② - **D** - 6 Cyl. 223 Eng., **V** - V8 Eng. (2-Barrel Carb. Light Duty), **Z** - V8 Eng. (2-barrel Carb. Heavy Duty), **R** - V8 Eng. (4-barrel Carb. Heavy Duty).
③ - Last digit of model year (1956).

	M–Memphis	

TUNE-UP

COMPRESSION PRESSURE: At cranking speed, compression pressures are as follows:

Engine	Compr. Ratio	Compr. Press.
223 Eng.	7.8-1	150 lbs.
272 Eng. (ECY-W)	7.8-1	160 lbs
272 Eng.(ECR–2 Bbl. Carb.)	7.8-1	160 lbs.
272 Eng. (ECR–4 Bbl. Carb.)	7.8-1	155 lbs.

VACUUM READING: 18-19" (223 Eng.), 19-20" (272 Eng.) idling at 475-500 RPM in neutral.

VALVE TAPPET CLEARANCE: .019" (223 Eng.), .018" (272 Eng.) Intake and Exhaust (Hot & Cold).

MANIFOLD HEAT CONTROL: *(NOTE*–Manifold heat control valve is **n t** used on 272 ECR Engine). Automatic thermostatic type with counterweight. On 6 Cylinder engine valve is located at outlet of exhaust manifold. On 8 Cylinder engine valve is located between crossover pipe and inlet of right exhaust manifold Spring stop is at top of valve housing and spring is hooked on stop pin when valve is properly installed. Valve is closed when engine is at normal operating temperature and *running at idle speed, and opens at high RPM.*

IGNITION

FIRING ORDER: 6 Cyl. Engine–1-5-3-6-2-4. **8 Cyl. Engine**–1-5-4-8-6-3-7-2.

Cylinders (8 Cyl. Eng.)–RIGHT BANK 1-2-3-4 LEFT BANK 5-6-7-8.

SPARK PLUG GAP: 028"-.032"
Spark Plugs–Champion 860 18mm.

► *V8 ENGINE SPARK PLUG MISFIRE CORRECTION*· If misfiring occurs at either No. 6 or No. 8 cylinders, interchange position of No. 5 and No. 6 spark plug cables in all insulator blocks and separator blocks on left side of engine.

► *SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be torque tightened within limits 15-20 ft

COIL: Ford No. B6A-12029-B. *12 Volt*
Ignition Current–2 5 amps idling, 4 5 amps stopped
Resistor–**Ford B6A-12250-B** (Early), **B6A-12250-C** (Later), Mounted next to coil.

► *IGNITION RESISTOR PRODUCTION CHANGES:* Two types of resistors Ford No. B6A-12250-C used in production to replace original resistor B6A-12250-B. First type replacement identified by copper flashings on heads of rivets which support elements. A piece of fibre glass is cemented to inside of support bracket. Second type has sheet metal cover snapped over channel and rivets are cadmium plated. Replace earlier type when servicing ignition system.

► *COIL RESISTOR NOTE*· Resistor is connected in lead from ignition switch to coil Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil

DISTRIBUTOR: *12 Volt.* Ford distributors used as follows

Engine	Carb.	Air. Cl.	Distr. No.
223 Eng. (EBR-S-T)	1-Bb	Oil Bath	B6A-12127-E
223 Eng. (EBR-S-T)	1 Bbl.	Dry Type	B6A-12127-E
272 Eng. (ECY-W)	2 Bbl		B6A-12127-A
272 Eng (ECR)	2 Bbl.		B6T-12127-A
272 Eng. (ECR)	4 Bbl.		B6T-12127-B

► *SUDDEN ENGINE STOPPAGE CORRECTION:* Inspect distributor primary terminal wire assembly Ford No. B6A-12216-A, for defective welds at brass terminals.

► *DISTRIBUTOR DIAPHRAGM PRODUCTION CHANGE:* A new distributor diaphragm Ford No. B6A-12370-B used on all engines after Nov. 15th. 1955, and is available for replacement of all B6A-12370-A diaphragms. It can be identified by die cast end cover in place of stamped cover and incorporates new type material in secondary diaphragm giving it much greater strength.

Condenser–Ford 7RA-12300-C (223 Eng.), FAB-12300-A (272 Eng.) **Capacity**– 21- 25 microfarad.
Contact Point Set–Ford FAA-12171-A (223 Eng.), FAB-12171-B (272 Eng).
Breaker Gap– 024- 026" (6 Cyl), 014-.016" (8 Cyl)
Cam Angle–35-38° (6 Cyl), 26-28 5° (8 Cyl)
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Clockwise (6 Cyl.), counter-clockwise (8 Cyl) viewed from above.

► *DISTRIBUTOR INSTALLATION CAUTION* On 6 Cylinder engines, be sure oil pump intermediate shaft

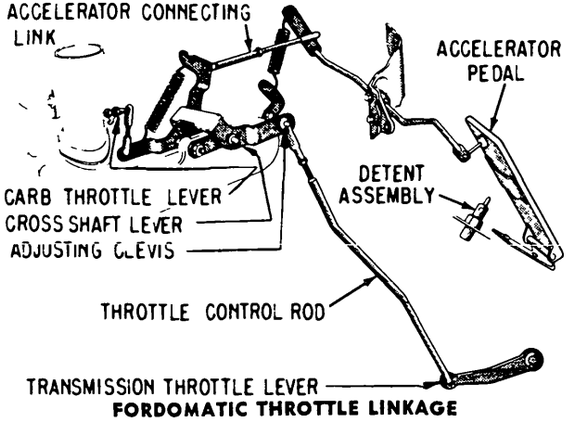
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

engages seat in oil pump. On 8 Cylinder engines, be sure distributor shaft engages oil pump intermediate hex shaft

Initial Distributor Timing (6 Cyl. Engine): Set engine crankshaft so that No 1 cylinder is at TDC after compression stroke (with timing mark in line with pointer) Install distributor so that rotor points to the No. 1 spark plug wire terminal in distributor cap

Initial Distributor Timing (8 Cyl Engine): Remove No. 1 spark plug. Hold thumb over spark plug hole until piston starts up on compression. Slowly "bump" engine over with starter until timing mark is aligned with pointer, Find No. 1 spark plug sprocket in distributor cap and fit distributor cap to distributor housing. Mark distributor housing to indicate No. 1 spark plug wire position. Position rotor approximately 20° counter-clockwise from mark made on distributor housing. Engage distributor drive gear and install distributor in engine.



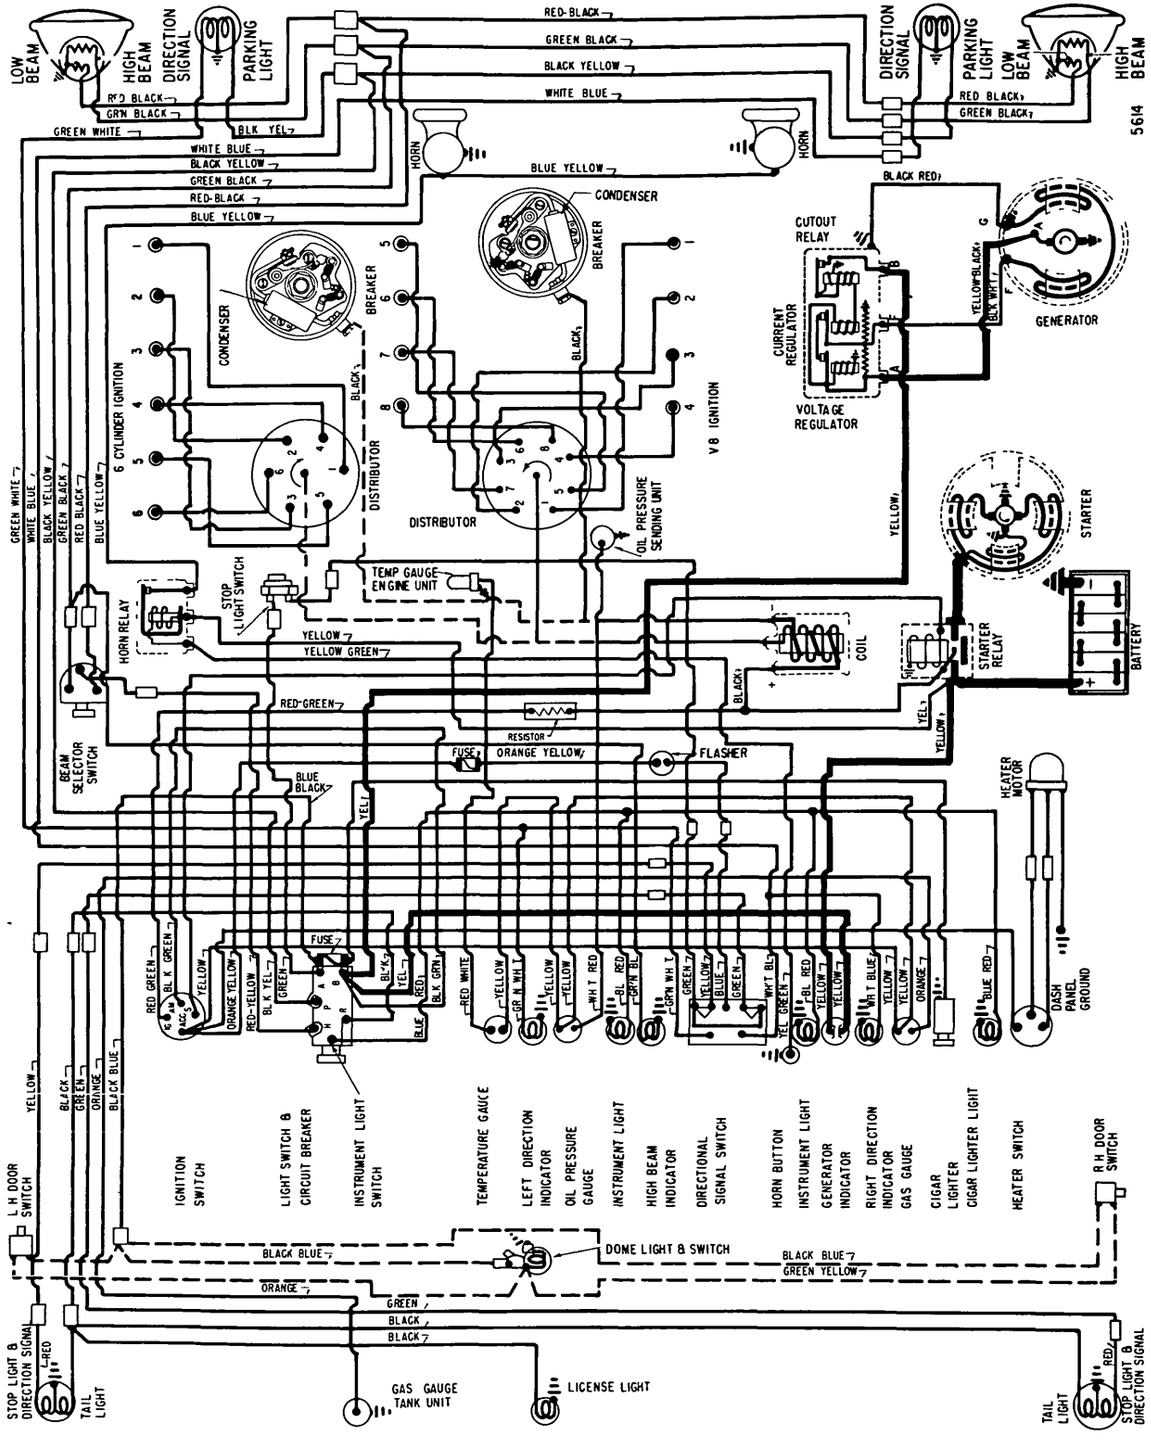
IGNITION TIMING

Setting–223 Engine–5° BTDC (Std & Fordomatic) with engine idling at 475 RPM and vacuum line disconnected. *NOTE*–Maximum initial timing recommended is 5° BTDC (Std.), 6° BTDC (Fordomatic). *See Initial Distributor Timing above.*

272 Engine–10° BTDC (Std. & Fordomatic) with engine idling at 475 RPM and vacuum line disconnected. *NOTE*–Maximum initial timing recommended is 10° BTDC. *See Initial Distributor Timing above.*

Timing Mark–6 Cyl. Engine–Vibration damper marked "TDC", and "3", "5", "7", "9" degrees BTDC Align correct mark with pointer on cylinder front cover.

8 Cyl. Engine–Vibration damper marked "TDC", and "2", "4", "6", "8", "10" degrees BTDC Align correct mark with pointer (bolted to water pump).

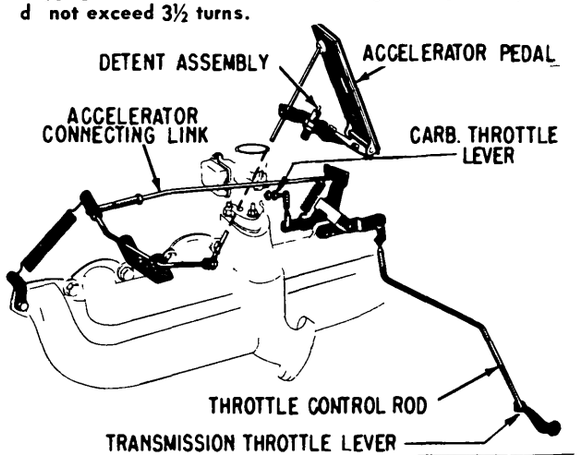


FORDOMATIC THROTTLE LINKAGE (6 CYLINDER TRUCKS)

CARBURETOR

► *CARBURETOR APPLICATION:* Ford Single Barrel Carburetor used on 223 Engine, and Ford 2-Barrel and 4-Barrel Carburetors on the 272 Engine (2-Barrel on ECW-Y Eng., 2-Barrel & 4-Barrel on ECR Eng.).

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

►*LOW POWER OUTPUT (4-Barrel Carburetor) CORRECTION:* Incorrect routing of governor vacuum lines at fitting (Governor Housing) causes governor to close throttle plates at speeds above 700 RPM, limiting power output. Attach line from vacuum pump to hole at bend of fitting. Attach line from governor controlling unit in conventional or side opening. *NOTE* - Be sure throttle stops have been removed.

►*AIR CLEANER WING SCREW TIGHTENING (4-Barrel Carbur tor) CAUTION:* Tighten anchor screw to 135 inch lbs. only, and wing nut just finger tight. Overtightening will permit anchor screw removal with air cleaner and cause lock washer to be drawn into carburetor venturi and engine.

►*AIR CLEANER AIR LEAK CORRECTION (C-500 & 600 Series Trucks):* Correct by installing two gaskets between elbow and carburetor and reversing holding clamp to provide better seating.

Throttle Linkage & Dashpot Adjustments (Fordomatic): *See "Carburetor" on Ford 6 and V8 Passenger Car pages and note the following exceptions:* Adjust accelerator pedal height so pedal just touches detent stem when carburetor lever hits its wide-open stop (2 5/8" on V8 trucks). Initial adjustment of control rod is 2½ turns counter-clockwise. If band or clutch slippage evident, increase rod length to 3 turns, **but d not exceed 3½ turns.**

F RDOMATIC THROTTLE LINKAGE (PARCEL DELIVERY)

FORD SINGLE BARREL 223 ENGINE

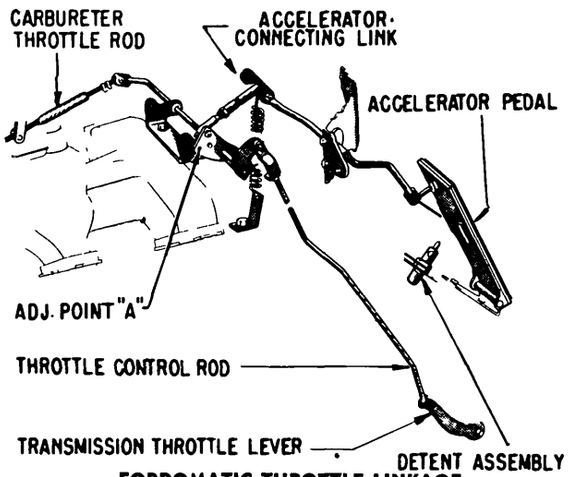
Ford N . B6C-9510-A (Exc. Fordomatic), **B6A-9510-G** (Fordomatic). Single barrel, downdraft type, with manual choke.

►*6 CYL. TRUCK ECONOMY CARBURETOR:* Carburetor B5A-9510-S has been released for owners who desire more fuel economy, but do not require maximum acceleration or top speed.

Idle Setting–Initial setting 1½ turns open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll from rich mixture. Turn screw in until engine runs smoothly. Favor a slightly richer mixture. Turn screw out for richer mixture.

Idle Speed–475-500 RPM (Std. & Overdrive), 475-500 RPM (Fordomatic) with selector lever in "N" position.

Fuel Level–11/16"±1/32" below power valve mounting surface (Tool T52L-9550-AEE). *See "Ford Visi-flo" in Carburetion Section of Manual.*



Accelerating Pump: Shortest stroke (closest hole to throttle shaft) for average or hot weather operation, longest stroke for cold weather operation.

Fast Idle: Integral type operated by choke valve. No adjustment required.

Throttle Linkage Adjustment (Fordomatic Trucks): *See CARBURETOR above.*

►*OTHER DATA: See "Ford Visi-flo" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 3.5-5.5 lbs. at 500 RPM.

FORDOMATIC THROTTLE LINKAGE (V8 ENGINE TRUCKS)

FORD TWO-BARREL 272 (ECY-W) ENGINE

Ford No. B6Y-9510-A (Exc. Fordomatic), **B6C-9510-C** (Fordomatic). Dual barrel, downdraft type, with manual choke.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting–Initial setting 1 turn open. Set both screw s alike. Turn adjusting screws in until engine begins to run roughly from lean mixture, then turn screws out until engine begins to roll from rich mixture. Turn screws in until engine runs smoothly. Favor a slightly richer mixture. Turn screws out for richer mixture.

Idle Speed–475-500 (Std. & Overdrive) 475-500 RPM (Fordomatic) with selector lever in "N" position.

Fuel Level–11/16"±1/32" below power valve mounting surface (Tool T56L-9562-A).

Float Level–1.374-1.438" from air horn gasket surface to float bottom (carburetor inverted). It should be equal on both ends of float.

Acc lerating Pump: Center hole for normal operation, shortest stroke (closest hole to throttle shaft) for hot weather operations, longest stroke for cold weather.

Fast Idle: Integral type operated by choke valve. No adjustment required.

Throttle Linkage Adjustment (Fordomatic Trucks): *See CARBURETOR above.*

►*OTHER DATA: See "Holley Ford" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 3.5-5.5 lbs. at 500 RPM.

FORD TWO-BARREL 272 (ECR) ENGINE

Ford No. B6T-9510-A. Dual "Concentric" downdraft type with manual choke control, governor actuating assembly, and "depopper" valve.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting–Initial setting ½ turn open. Set both screws alike. Turn screws in until engine begins to run roughly from lean mixture, then turn screws out until engine begins to roll from rich mixture. Then turn screws in until engine runs smoothly. Favor a slightly rich mixture. Turn screws out for richer mixture.

Idle Speed–475-500 RPM (Std.), 475-500 RPM (Fordomatic) with selector lever in "N" position.

Fuel Level–½"±1/32" below top surface of float bowl, with engine idling.

Accelerating Pump: Center hole for normal operation, shortest strike (nearest hole to throttle shaft) for hot weather operation, longest stroke for cold weather operation.

Fast Idle: No adjustment required.

Throttle Linkage Adjustment (Fordomatic Trucks): *S CARBURETOR above.*

Depopper Valve Adjustment: *See "Ford Truck Dual Centri-flo" Carburetor in Carburetion Section.*

►*OTHER DATA: See "Ford Truck Dual Centri-flo" Carburetor in Carburetion Section.*

Fuel Pump Pressure: 3.5-5.5 lbs. at 500 RPM.

FORD FOUR-BARREL 272 (ECR) ENGINE

Ford No. B6T-9510-B. "Centri-Quad" 4-Barrel, downdraft type, with manual choke control, and NEW ball-type "depopper" device.

►*MANIFOLD FUEL DISTRIBUTION:* Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels feed 1-4-6-7.

Idle Setting - Initial setting 1/2 turn open. Turn both screws in until engine begins to run roughly from lean mixture, then turn screws out until engine begins to roll from rich mixture. Then turn screws in until engine begins to run smoothly. Favor a richer mixture. Final setting may vary 1/2 turn difference between the screws.

Idle Speed - 475-500 RPM (Std.), 475-500 RPM (Fordomatic) with selector lever in "N" position.

Depopper Valve Adjustment: *See "Ford, Lincoln, Mercury Centri-Quad 4-Barrel" Carburetor in Carburetion Section.*

Throttle Linkage Adjustment (Fordomatic Trucks): *S CARBURETOR above.*

►*OTHER DATA: Se "Ford, Linc ln, M rcury C ntri-Quad 4-Barrel" Carburet r in Carbur tion Secti n.*

Fu l Pump Pr ssur : 3.5-5.5 lbs. at 500 RPM.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARB. EQUIPMENT

► *AIR CLEANER AIR LEAK (C-500, 600 Trucks) CORRECTION:* Install two gaskets between elbow and carburetor, and reverse the holding clamps to provide better seating.

Fuel Pump: AC. Fuel only or Fuel & Vacuum types.

Car Model	Ford Pump No.
223 Eng. (Fuel only)	B5A-9350-A
272 Eng. (2-Bbl. Carb.)	B6C-9350-A
223 & 272 Opt'l. (Fuel & Vacuum)	B6T-9350-A
272 Eng. (4-Bbl. Carb.)	B6T-9350-A

Pressure - 3.5-4.5 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric.
Dash Unit - Ford No. B6C-9280-B (P-350, P-500); B6C-9280-C (All Others Exc. Open Face Cowl); B6C-9280-D (All Others with Open Face Cowl Exc. C-500, C-600).
Tank Unit - Ford No. B6C-9275-A (All with Closed Cab exc. P-350, P-500), No. B6C-9275-B (F-100, 250, 350 without Closed Cab & P-350, P-500 with 17 Gal. Tank), No. B6T-9273-A (F-500, 600; B-500, 600; and P-500 with 30 Gal. Tank).
See "Fuel Gauges" in Carburetion Section.

BATTERY

Ford No. B6A-10655-C. *12 Volt,* 11 plate, 55 ampere hour capacity, or **B6A-10655-E.** *12 Volt,* 13 plate, 70 ampere hour capacity.
Grounded Terminal - Negative to engine block.
► *CAUTION: This is reversed from previous models.*
Engine Ground - Cylinder head to dash.

STARTER

Ford No. B6A-11002-A. Armature B6A-11005-A. *12 Volt.*
► *IMPULSE STARTING (Back-Up Light Equipped Cars) CORRECTION:* Before replacing neutral safety switch to correct short between light and solenoid terminals causing engine to start, interchange leads at switch. Connect longest lead (beyond taped portion of harness) to "A" terminal and short lead to "B" terminal.
Drive - Ford 1CM-11350-C. Bendix "Folo-Thru".
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 48-56 ozs.
Cranking Speed - 150-180 RPM with warm engine.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	120
	150-180 ②		190 max.

① - With starter on engine and engine idling.
② - Cranking speed with warm engine.

Starting Switch: Magnetic type, Ford No. B6A-11450-A, Starter switch is controlled by ignition switch. *NOTE* - Neutral Safety switch used on Fordomatic transmissions.
Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C.
Adjustment - *See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford No. B6A-10002-A. *12 Volt.*
Armature - Ford No. B6A-10005-A (223 Eng. - with rear bushing), No. B6A-10005-B (223 & 272 Eng. - with rear ball bearing).

Performance Data

Generator	Armature	Amperes①	RPM
B6A-10002-A	B6A-10005-A	30	1250
B6A-10002-A	B6A-10005-B	30	1388

①—See Regulator for maximum charging rate.
Brush Spring Tension—26-34 ozs.
Field Current—1.4-1.6 amps. at 12.0 volts.
Rotation—Counter-clockwise at commutator end.

Belt Adjustment: (*NOTE*—Two belt arrangements used. In one, fan and generator are driven by a single belt. In the other, fan and generator are driven by separate belts). Adjust belt or belts to have ½" deflection midway between generator and fan pulleys or generator and water pump pulleys, with normal thumb pressure.

REGULATOR

Ford No. B6A-10505-A. *12 Volt.*
► *SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 75°F. ambient (engine compartment) temperature, after ½ hour operation, or after regulator heated and stabilized.*

Cutout Relay
Cuts In - 12.0-12.8 volts.

Voltage Regulator
Setting - 14.6-15.4 volts.
Checking & Adjusting - *See Electrical Section.*

Current Regulator
Setting - 28-32 amps.
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signal - *See Electrical Section.*
Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.
Stop Light Switch Location: On brake master cylinder, or on brake power unit assembly. Master cylinder located on engine side of firewall (F-100), and on bracket attached to left frame member below brake pedal (Other Trucks).
LIGHTING CIRCUIT BREAKERS: Combination headlight switch, circuit breaker and fuse assembly is used. One circuit breaker protects headlight circuit, and second circuit breaker protects remaining lighting circuits. Fuse, on back of assembly, protects the interior lighting circuit.

FUSES: Heater—14 amps. On blower switch.
Interior Lights—7.5 amps. On headlight switch.
Overdrive—3AG 15 amps. On overdrive relay.
Directional Signals—7.5 amps. In flasher to switch lead.

HORNS (Exc. West Cast): Ford No. B5T-13832-B (High Pitch), No. B5T-13833-B (Low Pitch). *12 Volt.*
(West Cast Only exc. Parcel Delivery) - Ford No. B6A-13832-A (High Pitch), No. B6A-13833-A (Low Pitch), *12 Volt. NOTE* - Use Bracket Nos. B6A-13830-A and B6A-13831-A with these horns.
Horn Current - 9.2-9.6 amperes at 12-12.6 volts.
Horn Relay: Ford No. 2Q-13853-A. *12 Volt.*

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. 223" Engine (EBR-S-T), and V8 272" Engine (ECY-W and ECR Heavy Duty). All engines are Overhead Valve type.

Engine	Bore	Stroke	Displacement
223	3.62"	3.60"	223 Cu. Ins.
272	3.62"	3.30"	272 Cu. Ins.

Engine	Compr. Ratio	Rated HP	Developed HP
223	7.8-1	31.5	133 at 4000 RPM
272 (ECY-W)	7.8-1	42.0	167 at 4400 RPM
272 (ECR) ①	7.8-1	42.0	158 at 3800 RPM
272 (ECR) ②	7.8-1	42.0	168 at 3800 RPM

① - 2-Bbl. Carb. ② - 4-Bbl. Carb.

CYLINDER HEAD: *See Ford Special Data.*
► *272" V8 CYLINDER HEAD CHANGE:* Cylinder head Part No. B6A-6049-K and R6A-6049-E have been used on these engines. See Valve Springs for type used with each head. *NOTE* - On 1955 256" Engines, Head Part No. has been changed from B6A-6049-K to B5T-6049-C (use with No. B5T-6049-B).
TIGHTENING TORQUES: *See Ford Special Data.*
ENGINE REMOVAL: *See Ford Special Data.*
OIL PAN REMOVAL (223" Engine): Drain crankcase. Pull dipstick out of tube. Remove flywheel housing inspection cover. Remove oil pan retaining screws and remove oil pan and gasket.
OIL PAN REMOVAL (272" Engine): Drain crankcase, remove oil level indicator, engine front splash pans. On Fordomatic equipped trucks, remove converter housing dust cover. Disconnect oil pump inlet tube at oil pump. Remove "O" ring seal from pump end of tube. Remove retaining screws and remove oil pan and gasket.

223" 6 CYL. ENGINES
(See Engine Specifications Above)

See 1956 Ford 6 Passenger Car Pages. Engine is similar to those used in 1956 Pass. Cars, and all passenger car engine data applies to truck engines.

272" V8 ENGINES
(See Engine Specifications Above)

See 1956 Ford V8 Passenger Car Pages. Engine is similar to those used in 1956 Pass. Cars, and all passenger car engine data applies to truck engines EXCEPT AS NOTED BELOW.
► *272" H. D. ENGINE EXHAUST VALVE CAUTION:* Exhaust valves are Sodium cooled and require special disposal handling to prevent possibility of fire or explosion due to chemical reaction. DO NOT DISCARD SODIUM COOLED VALVES with other scrap material. Bury in ground not subjected to excavation or in deep water not subjected to dredging.
► *MAIN BEARING REPLACEMENT CAUTION (272-ECR Eng.):* Some early production 272-ECR engines may have either lead-babbitt or copper-lead type bearings. Replace all lead-babbitt type bearings found in 272 ECR engines with copper-lead type when overhauling engines.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVES:

	Head Diameter	Stem Diameter ①	Length
Intake	1.775-1.785"	②	④ 5.02"
Exhaust	1.505-1.515"	③	④ 5.02"

Valve	Seat Angle	Lift ⑤	Stem Clearance
Intake	45°	⑥	.004"
Exhaust	45°	⑦	⑧ .006"

① - Furnished with .003", .015", .030" oversize stems.
② - .3415-.3420" (Coded RED), .3420-.3425" (Coded GREEN).
③ - .3400-.3405" (Coded RED), .3405-.3410" (Coded GREEN) late engines. Early engines and All 272 H.D. engines .0005" greater (both colors).
④ - 272 H.D. engine, Intake 5.0275", Exhaust 4.920".
⑤ - Cam lobe lift. Service limit.
⑥ - .268" (L.D. eng.), .259" (H.D. eng.).
⑦ - .268" (L.D. eng.), .257" (H.D. eng.).
⑧ - 272 H.D. Eng. .005".

VALVE TIMING: *NOTE - The following valve opening and closing points are with cam lift as indicated.*

272" V8 Engine Valve Timing

Intake Valves - Open 8° ① BTDC. Close 44° ② ALDC.
Exhaust Valves - Open 47° ① BLDC. Close 5° ② ATDC.
① - Cam lift .015". ② - Cam lift .019".
Valve Seat Width - .060-.080" (Intake), .070-.090" (Exhaust).

OILING

Crankcase Capacity: 6 qts. (272 H.D. Eng. with 4-barrel Carb.), 5 qts. (Others). 1 qt. additional with filter change.
Normal Oil Pressure: 45-50 lbs at 2000 RPM (Hot).
Pressure Regulator Valve - In oil pump body. Not adjustable. *NOTE* - Valve spring pressure should be 9.80 lbs. at 1.56" (223 Eng.) 10.86 lbs. at 1.40"(272 Eng.).
Oil Pressure Indicator: Warning light (F-100, 250, 350, 500, 600), King-Seeley Gauge (P-350, 500; C-500, 600).
Dash Unit - Ford No. B6D-9273-B (P-350, 500; C-500, 600).
Engine Unit - Ford No. B6A-9278-A (P-350, 500; C-500, 600), FDA-9278-A (F-100, 250, 350, 500, 600).
See "King-Seeley Gauges" in Miscellaneous Section.
Oil Pump: Gear type pump mounted inside crankcase in line with distributor shaft (223 Eng.), externally mounted on lower left corner of engine (272 Eng.). An external inlet tube from oil pan feeds inlet side of pump.
Pump Removal & Overhaul - *See "Oil Pump" in Ford Special Data.*
Oil Filter: Full-flow (Std. Equip.) with pressure relief valve in center bolt. Replace filter element at 5000 mile intervals or when oil becomes dirty or polluted.
Replacement Filter Element - Ford No. B2A-6731-A (Kit includes new gasket).
► *CAUTION:* This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication).
► *FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION: See "Oiling System" in Ford Special Data.*
Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

► *LOSS OF COOLANT CORRECTION:* Lower generator mounting bracket bolt holes are tapped into cylinder water jacket. For loss of coolant at this point or when replacing bolts, apply a good coating of waterproof sealer.
Water Capacity (Without Heater): 18.5 qts. (223 Eng.), 23 qts. (272 Eng. except C,D,Y), 22 qts.(272 Eng.C,D,Y).
Pressure Valve: Ford No. LT-8100-A, Radiator filler cap (opens at 4 lbs.).
Thermostat: **223 Eng.** Ford No. B5C-8575-A (152-157°), EBR-8575-A (167-172°). **272 Eng.** Ford No. B4C-8575-A (152-157°), B4C-8575-B (167-172°). Single, spring and cartridge type.
Water Pump: Packless, sealed ball bearing type. *See "Ford 6" or "Ford V8" in Water Pump Section.*
Temperature Gauge: King-Seeley Electric type.
Dash Unit - Ford No. B6J-10883-A (P-350, P-500). B6C-10883-B (All others with open face cowl Exc. C-500, C-600). B6C-10883-C (All others Exc. open face cowl).
Engine Unit - Ford No. B6C-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long L-5222 (10"), 264300 (10½"), L1478 (11") Semi-centrifugal type used as follows:

Model	Long No.	Ford No.
F-100,250 (6 Cyl.) ①	L5222	② AE-7563-A
F-100 (8 Cyl.) ①	264300	B6C-7563-A
F-100,250 Optl.	L1478	③ 8MTH-7563-A
All Others	L1478	③ 8MTH-7563-A

① - 3 Spd. L.D. or H.D. Trans. and/or O.D.
② - Supersedes AB-7563-C.
③ - Supersedes 51-7563-A.

Clutch Disc - Use with cover assembly as follows:

Model	Long No.	Ford No.
F-100,250 (6 Cyl.) ①	② CD 870	B4C-7550-A
F-100,250 (8 Cyl.) ①	284299	B6C-7550-A
F-100,250 Optl.	③ CD 606	④ ⑤ 81T-7550-A
All Others	③ CD 606	④ ⑤ 81T-7550-A

① - 3 Spd. L.D. or H.D. Trans. and/or O.D.
② - CD 887 Heavy Duty.
③ - CD 607 Heavy Duty.
④ - Supersedes 59T-7550-A.
⑤ - Moulded linings. Woven linings (Thermoid) TDAA-7550-A.

Pedal Adjustment: 1 1/8-1 3/8" free travel. Adjusting clevis provided at forward end of connecting rod between pedal shaft and equalizer shaft. *NOTE* - Check free travel by operating engine at 3000 RPM with transmission in neutral position. There should be a minimum of ½" free travel under these conditions. Readjust as necessary.
Removal: Disconnect clutch pedal retracting spring from clutch release lever. Remove lock nut and adjusting nut from release lever rod, then remove rod. Remove transmission assembly from clutch housing (see below). Remove clutch release bearing and hub from release lever. Mark pressure plate and cover assembly and flywheel so that parts may be reinstalled in same relative positions. Loosen pressure plate and cover assembly-to-flywheel bolts until pressure plate springs are expanded, then remove bolts. Remove pressure plate and cover assembly and clutch disc assembly through opening in bottom of clutch housing. Remove pilot bearing from flywheel with Tool 7600-E.

SYNCHRO-MESH TRANSMISSION

3-SPEED (LIGHT DUTY)

Own. 3-speed, all helical gear. Constant mesh, synchro-mesh (second and high), sliding gear (low and reverse). Steering column shift standard.
See "Ford Truck 3-Speed (Light Duty)" in Transmission Section.
► *SYNCHRO-MESH & OVERDRIVE THREE SPEED TRANSMISSION GEAR REPLACEMENT CAUTION:* Shot peened gears used in 1956 models. Shot peened gears can be used in past model transmissions. DO NOT use past model gears in 1956 transmissions.
Removal: Remove floor mat and floor plate. Loosen two nuts that secure top of transmission to clutch housing studs. Raise truck, then drain lubricant from transmission. Disconnect the drive shaft from the transmission. If truck equipped with band-type parking brake, disconnect brake cable at brake and at gear shift housing. Disconnect gear shift linkage at transmission, then disconnect clutch pedal retracting spring from clutch release lever. Remove bolts and lockwashers which attach clutch release equalizer bar anchor bracket to transmission. Disconnect speedometer cable from transmission. Remove dust cover from bottom of clutch housing. Position transmission jack under transmission. Remove two top nuts, two bottom bolts, and lockwashers that secure transmission to clutch housing. Move transmission to rear until input shaft splines clear clutch housing. Be careful not to allow clutch release bearing and hub to drop out of release lever fork. Lower transmission to floor.

3-SPEED (MEDIUM DUTY)

Own. 3-Speed medium duty with steering column shift standard. *See "Ford Truck 3-Speed (Medium Duty)" in Transmission Section.*
► *3-SPEED (M.D.) TRANSMISSION SHIFT TUBE LEVER & BRAKE PEDAL INTERFERENCE CORRECTION:* To correct, disconnect shift rods at transmission levers, turn sleeve on rod to increase length, leaving ¼" of rod beyond sleeve. Check brake pedal movement and readjust rods to obtain proper cross-over with full travel into transmission detents.
Removal: Same as for 3-Speed (Light Duty) above.

3-SPEED (HEAVY DUTY)

Own. 3-Speed, helical gear (second & high), spur gear (low & reverse). Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Steering column shift standard.
See "Ford Truck 3-Speed (Heavy Duty)" Transmission in Transmission Section.
► *3-SPEED HEAVY DUTY TRANSMISSION SHIFT LEVER BREAKAGE CORRECTION: For corrective parts and procedures see "Ford Truck 3-Speed Heavy Duty" Transmission in Transmission Section.*
Removal: Same as for 3-Speed (Light Duty) above.

4-SPEED

Own. 4-Speed, Constant mesh, synchro-mesh (second, third & high). Helical gears used for second, third & high. Spur gears used for low & reverse. Center, floor mounted gear shift lever standard.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

See "Ford Truck 4-Speed (Synchro-mesh)" in Transmission Section.

Removal: Same as for 3-Speed (Light Duty) above and note following *If hoist not used, it may be necessary to remove gear shift lever assembly and lever housing before transmission can be removed from truck.* Disconnect drive shaft, or coupling shaft, at parking brake drum. If truck equipped with coupling shaft support disconnect support bracket from support plate, then remove coupling shaft.

OVERDRIVE

Warner Model AS4-R10F. Overdrive with solenoid operated (no centrifugal pawls) with governor control and throttle operated kick-down. There is no lockout switch on this unit.

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for 3-Speed Synchro-mesh Transmission (above), after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

See "Fordomatic & Mercomatic" in Transmission Section.

► *FORDOMATIC "LOCK-UP" CORRECTION (1955-56 Trucks).* Caused by cross leakage in front servo piston. *See "Fordomatic & Mercomatic" in Transmission Section.*

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION. See "Fordomatic & Mercomatic" in Transmission Section.*

► *TESTING & TROUBLE SHOOTING See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication - Check transmission oil every 1000 miles and maintain fluid level at "Full" mark on dipstick. Drain and refill every 15,000 miles. *See Fluid Change Caution below.*

► *FORDOMATIC TRANSMISSION FLUID CHANGE CAUTION.* New type fluid is green colored, similar to engine oil. DO NOT USE IT IMPROPERLY "Type A" (reddish brown) may be used when adding oil to transmission filled with new type oil.

Checking Fluid Level - Apply parking brakes, place transmission selector lever in "N" (neutral) position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator. Wipe clean and insert in tube (make sure indicator is pushed all the way down). Remove indicator and read level. Add sufficient fluid to raise level to full mark on indicator. Replace indicator.

► *OTHER FORDOMATIC SERVICE DATA See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

► *UNIVERSAL JOINT INSTALLATION CAUTION.* Make sure that all universal joint yokes in drive line are in same plane to avoid drive line unbalance.

Coupling Shaft Center Bearing: Consists of cushion mounted ball bearing bolted to underside of frame intermediate cross member. Bearing is mounted on end of coupling shaft in a sleeve with felt retainer on each end and bearing baffle on front end.

REAR AXLE

SEMI-FLOATING

Own. Semi-floating, hypoid gear with Hotchkiss drive. *NOTE* - Same axle as used in Station Wagon & Sedan Delivery.

See "Ford & Mercury (Integral Carrier Type) Hypoid" in Rear Axle Section.

Ratios - 3 92-1, 4 27-1, 4 09-1.

Backlash - .003-.008".

Axle Shaft Removal: Remove brake drum from axle flange. Work through hole in axle shaft flange to remove bolts that secure brake carrier plate to axle housing. Use Tool 4235-N to pull axle shaft assembly out of housing, but DO NOT DISLODGE BRAKE CARRIER PLATE OR DAMAGE OIL SEAL in housing.

Axle Assembly Removal: Raise rear of truck, then disconnect hydraulic brake hose from hydraulic brake line at rear axle. Disconnect parking brake cable from equalizer rod, then remove screws which attach brake cable brackets to frame crossmember. Disconnect drive shaft at rear axle universal joint flange. Remove nuts from rear spring clips (U-bolts), then remove spring clips. Loosen shock absorber stud nuts and move shock absorbers out of way. Roll axle assembly away from truck, remove wheels.

Wheel Bearing Adjustment: None required in service.

FULL FLOATING

Own. Full floating, Hypoid gear, with Hotchkiss drive.

Model	Rear Axle Type
F-250, P-350	Integral Housing
F-350 and 500, 600 Series	Banjo Housing

See Various types of Ford Rear Axles in Rear Axle Section.

Axle Ratios

Model	Axle Ratios
F-250,P-350	4.56-1(41-9), 4.88-1(39-8), 5.88-1(37-8) ①
F-350	4.86-1(39-7), 5.14-1(36-7), 5.83-1(35-6) ②
F,C,P,B-500	5.83-1(35-6), 6.2-1(31-5), 6.8-1(34-5) ③
F,C,B-600	6.17-1(37-6) ④, 6 67-1(40-6) ③

① - .008 .013" backlash. ② - .004-.018" backlash.
③ - .006-.012" backlash. ④ - .006-.016" backlash.

Axle Shaft Removal: Drain lubricant from axle housing, then remove axle shaft stud nuts and washers. Tap center of axle flanges to loosen tapered dowels, then remove dowels. Remove axle shaft from housing, remove hub and drum assembly.

Axle Assembly Removal: (Integral Carrier) - See "Semi-floating" above. **(Banjo Housing)** - Loosen wheel stud nuts, raise rear of truck, disconnect hydraulic brake hose from hydraulic brake pipe. Disconnect drive shaft at rear universal joint flange, remove spring clips (U bolts), roll axle from under car and remove wheels.

Wheel Bearing Adjustment: Remove axle shafts (see above), use special bearing adjusting wrench and remove bearing locknut (outer nut), and lockwasher. Adjust bearings by turning bearing adjusting nut (inner nut) up until tight then backing off 1/8 turn. Install bearing lockwasher. *(NOTE* - If adjusting nut equipped with dowel, make sure lockwasher fits over dowel). Install bearing locknut and draw nut up tight. If flange type lockwasher is used, bend one flange over adjusting nut and one flange over locknut. Install axle shaft and lower vehicle.

TWO-SPEED

Own. Electrically operated shift, Two-speed, Full-floating spur gear planetary unit (reduction gearing). Spiral bevel gear final drive.

See "Ford Truck Two-Speed" in Rear Axle Section.

Ratio - 5 83-1 (Direct Speed), 8.11-1 (Second Speed); 6.33-1 (Direct Speed), 8.81-1 (Second Speed).

Backlash - .006-.016".

Removal: Same as for standard axle (above) after removal of wiring harness.

SHOCK ABSORBERS

Direct acting hydraulic. Shock absorbers are sealed units and are not adjustable or refillable.

► *REPLACEMENT SHOCK ABSORBER NOTE* Shocks are supplied for service replacement in kits consisting of shock absorber and necessary bushings.

Replacement Shock Absorbers

Model	Front Ford Nos.	Rear
F-100	B6C-18124-A	B6C-18125-A
F-250	B6D-18124-A	B6C-18125-A
F-350	B6D-18124-A	B3Y-18125-A
P-350	B6J-18124-A	B6C-18125-A
P,F,C-500, F,C-600	B3T-18124-A	B3T-18125-A

FRONT SUSPENSION

Conventional "I" beam section front axle with Reverse-Elliot ends and semi-elliptical springs.

Kingpin Inclination - 4° ± ½°.

Caster	Min.	Max.
F-100,250	3°	4°
F-350,500,(Exc. F-500 154" W B)	3°	5°
B-500,600, F-600 & F-500 154" W B)	3½°	5½°
C,P-500,C-600	2½°	.4°

½° maximum variation between wheels.

Camber - ¼° to 1° Pos. ¼° maximum variation between wheels.

Toe-In - 0 to 1/16".

STEERING

Own. (Gemmer 305 & 335 Design). Worm-and-roller types with push-pull adjustment.

► *F-100, 250 DRAG LINK INSTALLATION CAUTION.* Due to design of drag link (THAA-3305-A) it is possible to install link in a reverse position causing steering interference. When properly installed, offset end of drag link is attached to sector shaft arm, and lubrication fittings will be at bottom side of link.

See "Gemmer Worm-and-Roller Types" in Steering Section.

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305 & 335)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305 & 335)" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BRAKES

Brake types are as listed in application table below. Hand lever applies rear wheel service brakes on F-100 only (independent shaft brake on other models).

► *SECONDARY BRAKE LINING PRODUCTION CHANGE (F-100 8 Cyl.)* Thickness of secondary lining, on F-100 8 cyl. trucks, increased to ¼" from 3/16". *CAUTION* - DO NOT MISMATCH LININGS when servicing F-100 truck. ¼" thick lining kits for both 6 and 8 cyl. are B6C-2007-A (Front), B6C-2007-B (Rear).

► *REAR WHEEL BRAKE LEAK CORRECTION (1953-56F, C, B-500, 600, P-500).* Install Brake Cylinder Assembly B5T-2261-A (Front), B5T-2262-A (Rear) and Link B5T-2042-A or Conversion Kit B5T-2222-A.

Brake Type Application

Truck Model	Front	Rear
F-100	Duo-Servo	Duo-Servo
F,P-250,F-350	Uni-Servo	Duo-Servo
F,B,C,P-500,F,B,C-600	Uni-Servo	2 Cyl.

Uni-Servo - Ford-Bendix. Single anchor. Wheel cylinder actuates primary shoe. Ratchet adjusting screw.
See "Ford-Bendix Uni-Servo Hydraulic" in Brake Section.

Duo-Servo - Ford-Bendix. Single anchor, self energizing. Wheel cylinder actuates both shoes. Ratchet adjusting screw.
See "Ford-Bendix Hydraulic" in Brake Section.

Two-Cylinder Type - Two wheel cylinders in each brake assembly.
See "Ford Truck Two-Cylinder" in Brake Section.

Brake Drum Diameter

Model	Front	Rear
F-100	11"	11"
F-250	12"	12 1/8"
F-350 Conventional	12"	13"

F-600 All Models	12 45/64"	15 11/32"

Lining Length (Secondary Shoe)

Model	Front Wheel	Rear Wheel
F-100	11 29/32"	11 29/32"
F-250	12 31/32"	12 31/32"
F-350 Conventional	12 31/32"	13 61/64"
P-350 Parcel Delivery	12 31/32"	12 31/32"
F-500 Single Speed	13 61/64"	14 29/64"
F-500 Two Speed	13 61/64"	15 11/32"
F-600 All Models	13 61/64"	15 11/32"

Clearance - Brake lining to drum clearance differ as follows

Uni-Servo & Duo-Servo - .010" clearance measured 1½" from each end of secondary shoe.

Two-Cylinder Type - Reduce clearance until drum drags, back off until drum is free, plus one turn to give working clearance.

Hand Brake (Exc. F-100): External contracting type, consisting of a brake drum bolted to transmission main shaft companion flange, and an external contracting band mounted on rear of transmission.

Adjustment—On cable controlled parking brakes, move lever to full released position. On transmission mounted parking brake levers, set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, adjust clevis rod to allow flat portion to rest on brake band bracket. Install clevis and cotter pins. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until .010" clearance is established between brake lining and drum at anchor bracket. Loosen locknut on adjusting screw from lower half of brake band. Adjust for .010" clearance between lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting rod nut until .010" clearance is established between upper half of band and drum. Re-install lockwire in anchor adjusting screw.

Hand Brake Drum Diameter—(F-250, 350) 8", (Others) 7 13/16"

Hand Brake Lining

Series	Length	Width	Thickness
F-250, 350	24 5/8"	2"	5/32"
P-350, 500①	23 5/64'	2½"	1/4"
B, C, F-500, 600	24 5/8"	2½"	1/4"

①—Three-piece lining used

Brake Pedal Free Play Adjustment: 3/16-3/8". Adjust free play by loosening brake pedal-to-master cylinder push rod and rotating rod to obtain correct free play. Tighten lock nut while holding push rod securely.

Standard Master Cylinder: Located on bracket attached to left frame side member below brake pedal.

Checking Fluid—Maintain fluid level to within ½" of top of reservoir.

Removal—Disconnect brake lines from master cylinder and depress brake pedal a few times to empty master cylinder. Remove brake pedal return spring from brake pedal clevis pin and remove clevis pin. Disconnect stop light switch wires at switch. Remove assembly from bracket.

Power Brakes: Midland or Hydrovac unit mounted in various positions depending on truck model and connected in hydraulic brake line between master cylinder and wheel cylinders. There are no mechanical connections and adjustments are not required.
See "Midland" or "Hydrovac" Power Units in Brake Section.

Checking Brake Fluid—Same as for manual brakes (above).

Removal of Power Unit—Depress brake pedal several times to remove all vacuum from system. Loosen brake power unit air inlet tube clamp and remove tube. Disconnect master cylinder to power unit hydraulic line at power unit. Disconnect vacuum tube at power unit. If stop light switch located on brake power unit, disconnect wires. Remove mounting bracket bolts and power unit.

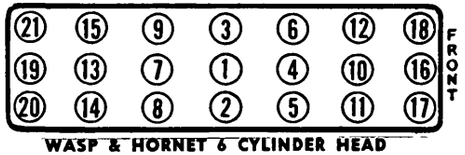
Con Rod Caps	40-45	40-45
Camshaft Sprocket	20-30	20-30
Engine Front Cover	15-20	15-20



①—Aluminum heads tightened at room temperature. Cast Iron heads at operating temperature.

② - Supersedes original specification of 75-80 ft. lbs.

CYLINDER HEAD & MANIFOLD

HUDSON 6

CYLINDER HEAD INSTALLATION: Use torque indicating wrench to tighten cylinder head capscrews in sequence shown in diagram.

WASP & HORNET 6 CYLINDER HEAD

CYLINDER HEAD GASKET INSTALLATION: Inspect the mating surfaces of cylinder head and block for cleanliness and squareness with a straight edge. Use guide pins 3" x ½"-13 (Hornet) 3" x 7/16"-14 (Wasp) to properly locate gasket on cylinder block. Use non-hardening gasket paste on gasket and a sealing compound on all cylinder head capscrews.

ORIGINAL BORE & PISTONS

HUDSON 6

ORIGINAL BORE LETTER CODE: A three letter code stamped adjacent to engine number indicates as follows:

Letter Sequence Code

First letter ..... Size of Bore
Second letter ..... Size of Main Bearings
Third letter ..... Size of Con Rod Bearings

Letter Size Code

Letter "A" ..... Standard
Letter "B" ..... .010" Undersize.
Letter "C" ..... .010" Oversize.
Letter "D" ..... .001" Undersize

ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD.

REPLACEMENT PISTONS: Pistons furnished (less Piston Pin) in Oversizes and Code markings as follows:

Code	Oversize	Code	Oversize	Code	Oversize
(B)	Std.	(P)	.007"	(BB)	.020"
(D)	.001"	(BO)	.010"	(DD)	.021"
(F)	.002"	(DO)	.011"	(FF)	.022"
(J)	.004"	(FO) ①	.0115"	(B000)	.030"
(L)	.005"	(LO) ②	.0145"	(E000)	.0315"

①—(Wasp). Hornet .012" ②—(Wasp). Hornet .015"

ORIGINAL BEARING SIZES

HUDSON 6

ORIGINAL BEARING LETTER CODE: A three letter code stamped adjacent to engine number indicates as follows:

Letter Sequence Code

First letter ..... Size of Bore
Second letter ..... Size of Main Bearings
Third letter ..... Size of Con Rod Bearings

Letter Size Code

Letter "A" ..... Standard
Letter "B" ..... .010" Undersize
Letter "C" ..... .010" Oversize
Letter "D" ..... .001" Undersize

ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD.

CRANKSHAFT & MAIN BEARINGS

HUDSON 6

CRANKSHAFT FRONT & REAR MAIN BEARING SEALS: Metal backed neoprene lined seal (two identical halves), plus cotton waste for vertical and horizontal packing holes in cap.

Removal—Upper half can be removed without removing crankshaft by using ¼" brass rod to drive old seal from around shaft while rotating shaft.

Installation—Coat groove of seal with non-hardening sealer. Use 4" punch with diameter smaller than vertical holes to force cotton waste into vertical holes, leaving enough waste protruding to seal between pan gasket and bearing cap.

VIBRATION DAMPENER

HUDSON 6

VIBRATION DAMPENER: Removal—Remove radiator core for puller clearance, remove retaining capscrew. **Hornet** vibration dampener has two punch marks for alignment to maintain proper balance when dampener is disassembled for replacement of rubber discs. **Wasp** vibration dampener has an offset screw location to insure proper reassembly for balance. Use pulley Remover J-676-C and Replacer J-483 for **Hornet** and Remover J-5371 and Replacer J-5369 for **Wasp.** Tighten retaining screw to specifications shown in table above.

ENGINE FRONT COVER

HUDSON 6

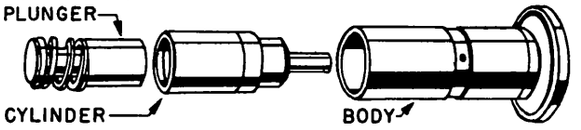
ENGINE FRONT COVER: Removal—Remove Vibration Dampener (see above), remove retaining screws attaching cover to block and remove cover.

Installation: Reverse removal procedure, cover alignment is automatically made during assembly.

ENGINE FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Remove engine front cover (see above). Use Tool J-2776 to remove and install seal. Insert collar so that slot in collar engages depression in cover. Support cover when driving out seal with straight side of driver. Use tapered side of driver for installing seal. *NOTE*—Apply coating of white or red lead in well in timing cover and recheck to make sure that lip of leather is in good condition and not curled over.

CAMSHAFT & BEARINGS

HUDSON 6



CAMSHAFT REMOVAL: Remove radiator, radiator grille, fan assembly, intake and exhaust manifolds. Remove vibration dampener, (see above). Remove engine front cover, (see above). Cut sprocket mounting bolt safety wire, rotate engine to bring timing marks on chain to marks on sprockets, remove camshaft sprocket and chain assembly (Puller J-471). Remove valve side covers, raise valves and install tools J-1612-3-A to hold lifters out of way. Remove oil spout on Wasp, spout and chain silencer on Hornet. Remove thrust plate and camshaft.

VALVE SYSTEM

HYDRAULIC LIFTERS

HORNET 6

HYDRAULIC VALVE LIFTERS: Removal - Remove Cylinder head, valve cover, valve springs and valves. Cylinder assembly of lifter may now be removed from lifter body without removing camshaft. *NOTE* - To clean or replace lifter body (Mushroom type) it is necessary to remove camshaft.

HORNET 6 HYDRAULIC LIFTER

Disassembly: Remove plunger from cylinder assembly by twisting plunger and spring (in spring windup direction), while pulling on plunger. If plunger sticks, release oil from compression chamber by raising ball check off of seat with small round rod. With oil released, plunger will drop down and it will be possible to remove carbon ring usually found between plunger and spring. Remove plunger. *CAUTION* - Keep parts of each lifter together as components are selectively fitted. Only complete assemblies supplied for service.

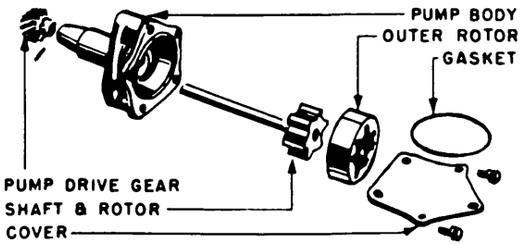
Inspection: Clean all parts in solvent to remove engine oil, soft carbon, or varnish deposits. Inspect for scratches, nicks, or plugged oil passages. Plunger must be free fit in cylinder.

Testing: Clean unit completely, removing all traces of oil. Hold cylinder in one hand and start plunger in cylinder. Depress plunger and release quickly. Plunger should bounce. If plunger does not bounce, it indicates air leakage through ball check or past plunger. To check for **ball check** leakage, hold finger over inlet hole and depress plunger and release quickly. If plunger now bounces it indicates that plunger fit is proper but leakage occurs at ball check. However if plunger will not bounce, it indicates leakage occurs past plunger (fit is defective), and lifter must be replaced. *NOTE* - Always repeat above check several times (cleaning cylinder assembly before each check) before replacing lifter.

Reassembly: Reinstall plunger in cylinder and engage spring by pushing "IN" and twisting plunger and spring in direction of spring windup.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



OILING SYSTEM

IL PUMP

HUDSON 6

OIL PUMP: Removal– Lift off distributor cap, rotate engine crankshaft until distributor is in firing position for No 6 cylinder **Do not** disturb this position of engine while oil pump is removed Remove oil pump to block attaching screws, remove oil pump

Overhaul: Remove pump cover and mark one lobe of inner rotor and corresponding point on outer rotor to insure reassembling in same relative position With rotors meshed in this position, measure clearance between inner and outer rotors at point diametrically opposite marks Replace rotors and shaft if clearance exceeds .010". Rotor end clearance (measure between rotors and straightedge laid across cover flange on body) must not exceed .004" Outer rotor clearance in body (press rotor against body and measure clearance on opposite side) must not exceed .008" Inner surface of cover must not be worn more than 002"

WASP & HORNET 6 OIL PUMP

Installati n: If crankshaft inadvertently turned while pump removed, install pump as follows to insure correct timing

1) **Hornet–**Crank engine to TDC position (exhaust stroke) of No 1 cylinder **Wasp–**Crank engine to TDC position (firing position) of No 1 cylinder

2) Install Aligning Tool J-2794 in distributor mounting hole so that guide pin indexes with distributor mounting screw hole

3) Install oil pump, turn pump shaft so that slot in shaft indexes with tang on aligning tool (tool will be pushed out as pump installed)

4) Install distributor with rotor turned to No. 6 cylinder terminal in cap (Hornet), No. 1 cylinder terminal (Wasp)

FOR HUDSON HORNET V8 SPECIAL DATA
SEE NASH & HUDSON SPECIAL DATA (PG. 140)

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disc nnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model	Model No.
Wasp 6	35640
Hornet 6	35660

SERIAL NUMBER: Stamped on plate attached to cowl under hood

Starting Serial Number (Wasp)—Domestic W-8101, Unassembled Export WKD-1201, Canada WT-1401

Starting Serial Number (Hornet)—Domestic X-7601, Unassembled Export XKD-1401

ENGINE NUMBER: Stamped on machined surface on left side of cylinder block at No. 2 cylinder.

Starting Engine Number—(Wasp) M-8701, (Hornet) F-8601

TUNE-UP

COMPRESSION PRESSURE: 100 lbs minimum at cranking speed. Allowable variation limit 10 lbs

VACUUM READING: 17-20" at idling speed

VALVE TAPPET CLEARANCE: Wasp—Intake 010" (Go), 011" (No Go), Exhaust 014" (Go), 015" (No Go), COLD **Hornet**—None in service (hydraulic lifters)

MANIFOLD HEAT CONTROL: Automatic thermostatic type No adjustment Valve must operate freely

IGNITION

FIRING ORDER: 1-5-3-6-2-4

SPARK PLUG GAP: (Wasp) 032", (Hornet) 030"

Spark Plug—(Wasp)-Champion H-10, torque to 30 lbs (Cast Iron Head), 25 ft. lbs. (Aluminum Head).

(Hornet) – Champion H-11. Torque to 25 ft. lbs.

COIL: Auto-Lite CAF-4003. *12 Volt.*

NOTE: No resistor used in the coil circuit.

Ignition Current – 2.75 amperes (stopped).

►***IGNITION COIL POLARITY CAUTION:*** Negative (—) coil primary terminal must be connected to distributor breaker terminal (misfiring and short breaker point life will result if coil terminals reversed).

DISTRIBUTOR: (Wasp) Auto-Lite IAT-4202, (Hornet) Auto-Lite IAT-4203A.

Condenser—Auto-Lite IAT-2015R **Capacity**— 21-25 mfd.

Contact Point Set—Auto-Lite IGW-3028BS

Breaker Gap— 020"± 002"

Cam Angle – 39° ± 3°.

Breaker Arm Spring Tension—17-20 ozs

Rotation—Clockwise viewed from above

IGNITION TIMING

Setting—TDC at idle speed

Timing Mark—(Wasp)—Long line before "1UDC" on damper (Hornet)—Long line before "UDC1" on flywheel

CARBURETOR

►*CARBURETOR APPLICATION NOTE· One or two (Twin-H-Power) Carburetors used as follows*

Model	Carter No.
Wasp (HI-TORQUE)	WA1 2009SA
Wasp (TWIN-H-POWER)	WA1 2013S
Hornet (CHAMPIONSHIP 6)	WGD 2252S
Hornet (TWIN-H-POWER)	WA1 2113S

Throttle Linkage Adjustment (Hydra-Matic): Adjust idle speed at 490-510 RPM (with compressor running), engine at normal operating temperature, transmission warm and selector lever in neutral position

Wasp—Use aligning pins J-2544 at rear upper throttle lever and lower bell crank One pin to adjust carburetor rods to rear upper throttle lever, one pin to adjust vertical rod between upper carburetor control lever and lower bell crank. Adjust rods so that both pins index at rear upper throttle lever and lower bell crank, and hole in boss on cylinder block

Hornet—Aligning pin J-2544 should fit freely in bell crank lever and hole in boss in cylinder block If pin does *not* index with lever and hole in boss, remove carburetor to throttle rod lever clevis pins and adjust carburetor idle adjusting screws

All Models—Disconnect throttle rod at left side of transmission case Clean machined surface at back of transmission case and check lever using Tool J-2195 flush against the transmission side of cover. Gauge rod should fit freely in hole of throttle valve lever Use bending Tool J-3310 to bend lever as necessary Loosen two locking nuts on throttle valve rod trunnion (Wasp), at bell crank (Hornet) and adjust trunnion so that rod fits freely in hole in trunnion, then shorten throttle rod 1/16" or approximately two turns Reconnect throttle rods

CARTER WA1 (Wasp HI-TORQUE) (2009SA Singl Carb).

Idle Setting—½-1½ turns open Turn screw out for richer mixture

Idle Speed (Without Air C nditi ning)—540-560 RPM (Standard Trans), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral)

Idle Speed (With Air Conditi ning)—Same as above with compressor running

Float Level—7/16" from tip of cover projection to soldered edge of seam on float with cover inverted

Accelerating Pump—Outer hole normal, inner hole if less charge is required

Fast Idle: 5/8" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) fast idle cam Adjust by bending link at lower offset

Automatic Choke Setting: Set at Index

Throttle Linkage Adjustment: See *CARBURETOR above.*

►***OTHER DATA: See "Carter WA1" carburetors in Carburetion Section.***

Fuel Pump Pressure: 3½ – 5½ lbs. Max.

CARTER WGD (Hornet Championship 6) (2252S Singl Carb.)

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 1-2-3, LEFT barrel 4-5-6.*

Idle Setting—1¾-2¾ turns open Turn screw out for richer mixture

Idle Speed (Without Air Conditioning)—540-560 RPM (Standard Trans), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral)

Idle Speed (With Air Conditioning)—Same as above with compressor running.

Float Level—¼" between top of float and bowl cover (gasket removed) and cover inverted

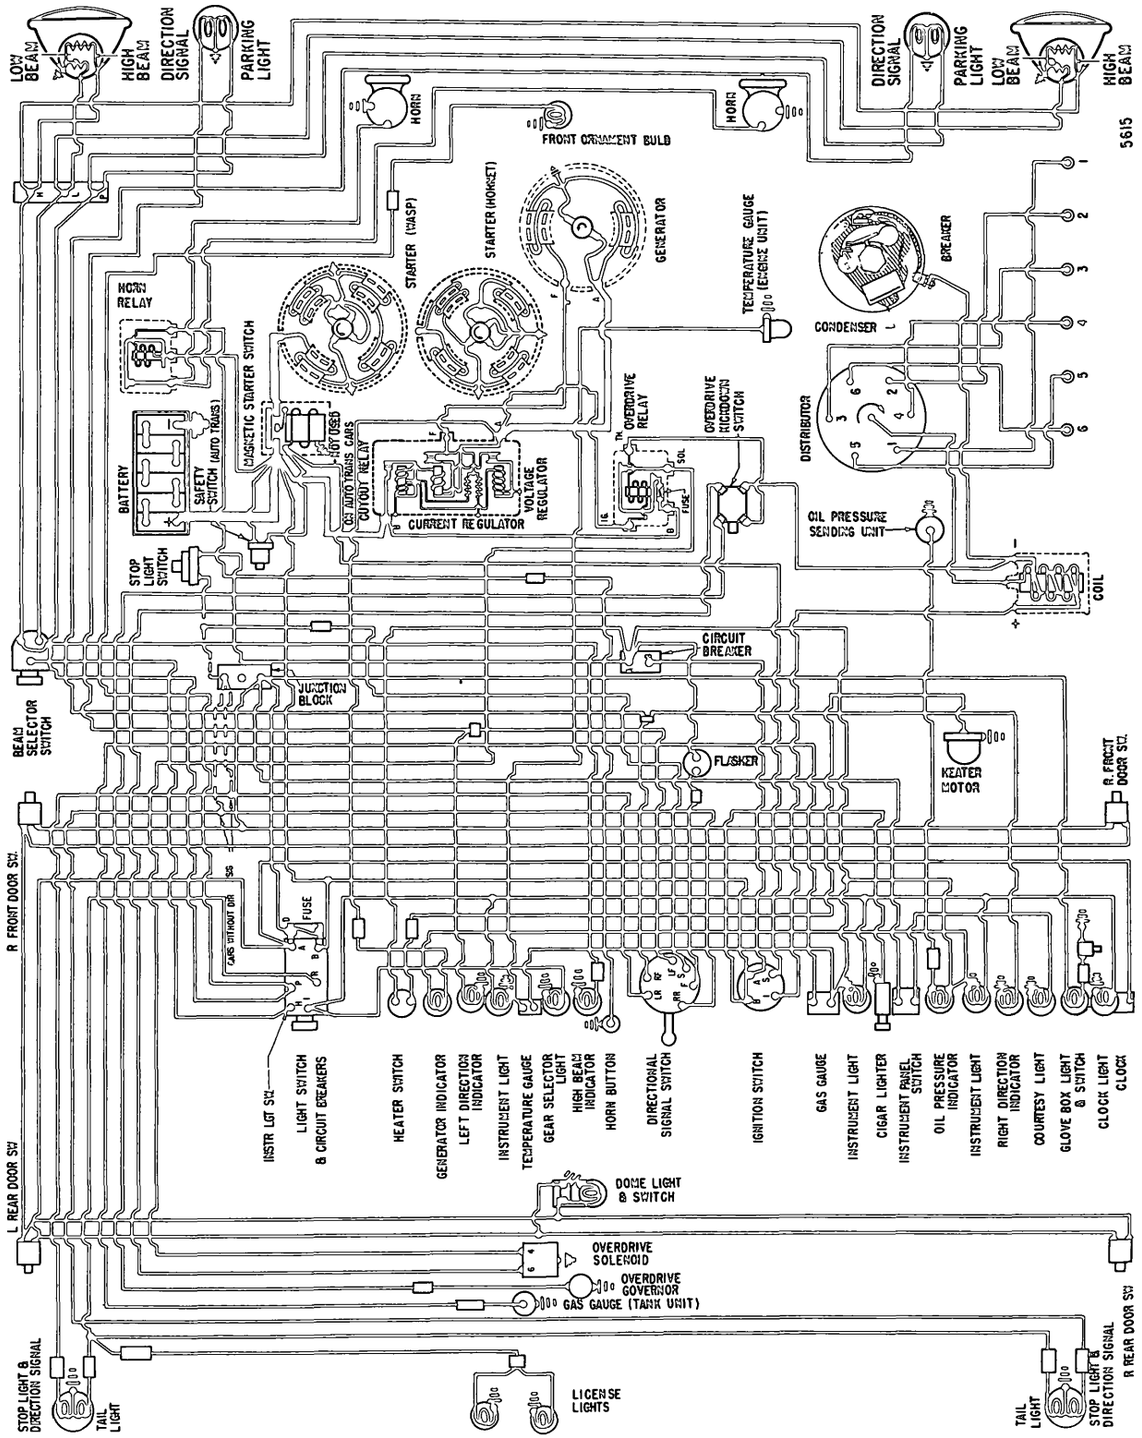
Accelerating Pump—No seasonal adjustment

Fast Idle: .030" clearance between throttle valve and bore of carburetor (side opposite idle port) with choke valve closed

Automatic Choke Setting: Set at Index

Throttle Linkage Adjustment: See *CARBURETOR above.*

►***OTHER DATA: See "Carter Dual WGD" carbur tors in Carburetion Section.***



Fuel Pump Pressure: 3½ – 5½ lbs. Max.

Carter WA1 (TWIN H-POWER) (2013S & 2113S)

►*MANIFOLD FUEL DISTRIBUTION: An internal manifold compensator port incorporated in twin carburetor manifolds.*

Idle Setting—For correct synchronization of both carburetors Remove clevis pins from throttle shaft to carburetor rod clevis Connect vacuum gauge and tachometer Hold fast idle cam in normal idle position and adjust idle speed screws until throttle valves just seated in closed position. Adjust idle mixture screws (½-1½ turns out (Wasp), 1¼-2¼ turns out (Hornet) Run engine until temperature normalized Hold front carburetor throttle valve closed and adjust rear carburetor

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

idle speed 25-40 RPM less than specified. After rear carburetor mixture for best operation. Adjust front carburetor idle speed to where an increase of 10-15 RPM is noted (Idle mixtures). Readjust the rear carburetor until the specified RPM is obtained and then adjust the front carburetor until a slight increase in RPM is noted. Readjust idle mixture to obtain best mixture and manifold vacuum. Adjust throttle shaft to carburetor rod clevis, retaining the throttle valves in idle position and accelerator linkage in released position. Reinstall clevis pins.

Idle Speed (Without Air Conditioning)–540-560 RPM (Standard Trans.), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral).

Idle Speed (With Air Conditioning)–Same as above with compressor running.

Float Level–¼" (2013S), ½" (2113S) from tip on lower edge of cover to seam on float with cover inverted.

Accelerating Pump–Outer hole normal, inner hole if less charge is desired.

Fast Idle: ½" (2013S), 5/8" (2113S) clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending link at offset portion.

Automatic Choke Setting: Set one point lean.

Throttle Linkage Adjustment: See *CARBURETOR* above.

▷ *OTHER DATA: See "Carter WA1" carburetors in Carburation Section.*

Fuel Pump Pressure: **3½ - 5½ lbs. Max.**

CARB. EQUIPMENT

Air Cleaner: *DRY TYPE - DO NOT WASH.* **Clean at 1,000 mile intervals by removing cartridge and shaking thoroughly to remove dirt. Replace cartridge every 10,000 miles or six months.**

Fuel Pump: **(Wasp) Carter M-729SZ (Std. Trans. Single Action). (Wasp & Hornet) AC 4250 (With Overdrive & Twin Carb.), or (With Hydra-Matic Drive & Single Carb.). Fuel & Vacuum. (Hornet) Carter M-2033S. Fuel & Vacuum.**

Pressure – **3½ - 5½ lbs. Max.**

See "Fuel Pumps" in Carburation Section.

Gasoline Gauge: **Stewart Warner & Auto-Lite. Electric.**

Dash Unit – **Hudson No. 3119555.**

Tank Unit – **Hudson No. 3146814.**

See "Fuel Gauges" in Carburation Section.

BATTERY

(Std.) – Auto-Lite 11-HS-50. *12 Volt,* 11 Plate, 50 Ampere hour capacity (20 hr. rate).

(Air Cond. Cars) – Auto-Lite 11-HS-60. *12 Volt,* 11 Plate, 60 Ampere hour capacity (20 hr. rate).

Battery Ground – Negative. Grounded to engine.

▷ *CAUTION:* **This is reversed from previous models.**

Engine Ground – Transmission to rear engine cross-member.

CONTINUED FROM PRECEDING PAGE

STARTER

Auto-Lite. *12 Volt.* Used as follows:

Auto-Lite No.	Starter	Armature
Wasp (Std. & O.D. Trans.)	MBG-4101	MZ-2312A
Wasp (Hydra-Matic)	MBG-4102	MZ-2023
Hornet (Std. & O.D. Trans.)	MDF-6011	MDF-2026
Hornet (Hydra-Matic)	MDF-6012	MDF-2088

Drive – Bendix.
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 42-53 ozs.

Performance Data (MBG-4101 & 4102)

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10	50
5.2 ft. lbs.	Lock	4	235

(MDF-6011 & 6012)

0 ft. lbs.	3200	10	60
6.5 ft. lbs.	Lock	4	240

GENERATOR

Auto-Lite. *12 Volt.* Used as follows:

Auto-Lite No.	Generator	Armature
Standard	GJC-7008A	GJC-2030 F
Air Cond. Cars	GJC-7008B	

Maximum Charging Rate – *See Voltage Regulator.*

Performance Data (Cold)

Volts	Amperes	Max. RPM
15.0	20.0	1750
15.0	30.0	2050-2250

Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 18-36 ozs.
Field Current – 1.2-1.3 Amps. at 10 volts, at 70° F.

REGULATOR

Auto-Lite VRX-6008A. *12 Volt.*

Cutout Relay

Cuts In – 13.0-13.7 Volts.
Cuts Out – 8.2-9.3 Volts.
Contact Gap – .015" minimum.
Air Gap – .031-.034".

Voltage Regulator

Setting – 14.5 volts at 80° F. charging at 10 amps.
Air Gap –.048-.052" with contacts just opening.
Checking & Adjusting – *See "Auto-Lite Regulators" in Electrical Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

Test A	Operating Amperes	Test B
36 max.		30 (28-32)

Test A – After 15 minutes run at 10 amps. output.
Test B – After additional 15 minutes operation with current regulator operating.
Air Gap – .048-.052".
Checking & Adjusting – *See "Auto-Lite Regulators" in Electrical Section.*

MISC. ELECTRICAL

►*BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars): Incorrect assembly of wire to back-up light switch and circuit breaker causes back-up light to operate incorrectly. See "Electrical Notes" in Hudson Special Data.*

Head Lamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Light Switch Removal: Disconnect battery. With Switch in "OFF" position, press button release on top of light switch assembly, pull knob and shaft clear of switch. Remove slotted nut, pull switch out to rear of instrument panel.
Stop Light Switch: Located at tee fitting in line to left front brake.
FUSES: 7.5 Ampere. On lighting switch for Courtesy and Glove Box lights.
15 Ampere. Located on overdrive relay.
5 Ampere. Located in radio wire back of instrument panel.
CIRCUIT BREAKERS: Three used as follows:
12 Ampere. On light switch for Instrument, Tail and Dome lights.
12 Ampere. On light switch for Head and Parking Lights.
30 Ampere. For Stop Lights, Instruments and Indicators, Heater and Directional Signals. Located back of Instrument panel.
HORNS: Auto-Lite No. HAD-4737 (Low Pitch), **HAD-4738** (High Pitch). *12 volt.*
Horn Relay – Nash No. 3145684.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 6 cylinder "L" head.

Model	Bore	Stroke	Displacement
Wasp	3"	4¾"	202 cu. ins.
Hornet	3 13/16"	4½"	308 cu. ins.

Model	Compr. Ratio	Rated HP	Dev. HP & RPM
Wasp	7.5-1	21.6	120 at 4000
(Twin Carb.)	7.5-1	21.6	130 at 4000
Hornet	Ⓒ 7.5-1	34.88	165 at 3800
(Twin Carb.)	Ⓒ 7.5-1	34.88	175 at 4000

Ⓒ – Optional Ratio 8.0-1.

Compression & Vacuum Reading – *See TUNE-UP.*
CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Hudson Special Data.*
►*CYLINDER HEAD TORQUE CHANGE (1955-56 Hornet):* Tightening torque for ½" cylinder head capscrews has been increased to 85-90 ft. lbs. Cold (was 75-80 ft. lbs.) to prevent corrosion and leakage at cylinder head.
TIGHTENING TORQUES: *See "Tightening Specifications" in Hudson Special Data.*

PISTONS

Aluminum alloy, cam ground, with taper ground skirt.
Original Bore & Pistons – *See "Original Bore & Pistons" in Hudson Special Data.*
Weight – 10.4 ozs. (Wasp), 18.5 ozs. (Hornet).
Removal – Pistons & rods removed from above.
Fitting New Pistons: Use ribbon feeler .002" thick and scale with both piston and cylinder bore at 70°F. Pull required to remove feeler 3-4 lbs.
Replacement Pistons: *See "Original Bore & Pistons" in Hudson Special Data.*
Installing Pistons: Notch in top of piston must be toward front of engine.

PISTON PINS

Floating type with locking ring at each end.

	Length	Diameter
Wasp	2.4375" ±.005"	.7499"+.000" - .00025"
Hornet	2.942-2.932"	.9687-.96845"

Clearance in Piston – Hand push fit with piston heated to 200°F.

Clearance in Rod – .0003". Rod should turn in piston under its own weight.
Replacement Pins: (Wasp) Std. & .002", .005", .010", .015", .020" Oversize. (Hornet) Std. & .002", .005", .010" Oversize.

PISTON RINGS

	Width	End Gap	Side Clearance
Compr.	.0775"	.004-.009" ①	.002-.004"
Oil #3	.186"	.004-.009" ①	.001-.003"
Oil #4	1514"	.004-.009" ①	.001-.003"

①–Wasp, (Hornet .006-.014").

Replacement Rings: Sets of Std. and .020" Oversize.
Installing Rings: Rings are pinned in piston to prevent rotation. Ring clearance on pin must be same as end gap.

CONNECTING RODS

Crankpin Journal Diameter – 1.937-1.938" (Wasp), 2.1244-2.1254" (Hornet).
Original Bearing Sizes – *See "Original Bearing Sizes" in Hudson Special Data.*
Bearings – Steel backed babbitt. No shims.
Clearance – .0005-.0015". **Side Play** – .007-.013".
Replacement Bearings: Std. .001", .002", .010", .012" Undersize.
Installing Rods: Notch in top of piston toward front of engine. Spit hole in rod to thrust or camshaft side of engine.

CRANKSHAFT

Journal Diameter – 2.4988-2.4998". Four bearings.
Original Bearing Sizes – *See "Original Bearing Sizes" in Hudson Special Data.*
Bearings – Steel-backed babbitt. No Shims.
Clearance – .0005-.0015".
Replacement Bearings: Std., .001", .002", .010", .012" Undersize.
End Thrust: Taken by No. 3 main bearing.
End Play – .003-.009".
Crankshaft Front & Rear Bearing Oil Seals: *See "Crankshaft & Main Bearings" in Hudson Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Hudson Special Data.*
VIBRATION DAMPENER: *See "Vibration Dampener" in Hudson Special Data.*

CAMSHAFT

Bearings – Steel-backed babbitt-lined bushings.
Clearance – .0005-.0015" (Wasp), .0015-.002" (Hornet).
Camshaft Removal – *See "Camshaft & Bearings" in Hudson Special Data.*
End Thrust: Controlled by thrust plate behind camshaft sprocket.
End Play – .003-.005".
Timing Chain: Link Belt. **Width** 1.000" (Wasp), 1.250" (Hornet). **Pitch** .375". **Length** 60 links.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Camshaft S tting: Timing chain has two marked links, six full links apart Both crankshaft and camshaft have a marked tooth With crankshaft sprocket installed and turned to TDC position, install one marked link of chain over crankshaft marked tooth, insert camshaft sprocket into chain with marked link over marked tooth, rotate camshaft until screw holes line up and install screws

Engine Front C ver Oil S al (Crankshaft Front Seal): *See "Engine Front Cover" in Hudson Special Data.*

VALVES

Tappet Cl aranc : (Wasp) Intake .010" (Go), .011" (No Go); Exhaust .014" (Go), .015" (No Go).
(H rn t) – None in service (Hydraulic lifters).

Wasp Valves

Valv	H ad Diam.	Stem Diam.	Length
Intake	1 495-1 505"	3412- 3422"	5 045"
Exhaust	1 390-1 400"	3412- 3422"	5 043"

Valve	Seat Angl	Lift	Stem Clearance
Intake	45°	346"	001- 003"
Exhaust	46°	346"	002- 004"

H rnet Valves

Valv	Head Diam.	Stem Diam.	Length
Intake	1 831/"	3412- 3422"	5 815"
Exhaust	1 556"	3402- 3412"	5.815"

Valv	S at Angle	Lift	Stem Clearance
Intake	45°	.346"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

NOTE–Valve face and valve seat angle are the same

►*VALVE GRINDING CAUTION:* Replace valve when grinding reduces distance from upper edge of valve seat to top of valve to less than 1/16"

Valv Springs: Install springs with closed coils toward head of valve

Valv Spring Specifications

Wasp	Pr ssure	Length
Open	116-124 lbs	1 19/32"
Closed	40-48 lbs.	1 61/64"

Fr Length–2 3/16" approximately

Hornet	Pressure	Length
Open	153-165 lbs.	1 27/32"
Closed	73-81 lbs.	2 3/16"

Free Length– 2½" approximately

Valve Guides: Remove old guides through valve seat opening using Tool J-2814 Install new guides as follows· **Wasp**–Use Tool J-883-A with Pilot J-883-10 to install guides to depth of 1 9/32" from top of guide to top face of block. **H rnet**–Use Tool J-883-A with Pilot J-883-8 or 9 and install guides to depth of 1 7/16' (Intake), 1 3/32" (Exhaust) from top of guide to top face of block

Valv Lift rs (Wasp): Mushroom type fitted directly in crankcase. Remove from below with camshaft out.

Valv Lift rs (H rn t): Hydraulic with mushroom type body.

Hydraulic Valv Lift r R moval, Overhaul, & Testing: *S e "Valv System" in Huds n Sp cial Data.*

VALVE TIMING

S "Camshaft Setting" under CAMSHAFT abov .

Wasp Valv Timing ℄

Intak Valv s – Open 26.8° BTDC. Close 99.7° ALDC
Exhaust Valv s–Open 64.9° BLDC. Close 45.7° ATDC.

H rnet Valv Timing

Intak Valv s–Open 33.7° BTDC. Close 80.1° ALDC.
Exhaust–Valves–Open 73.9° BLDC. Close 28.4°ATDC.
℄ – Valve lash .008" Intake. .010" Exhaust.

Valve Timing Check (Wasp) – Crank engine to TDC, exhaust stroke of No. 1 cylinder. Install dial indicator on No. 1 exhaust valve head through spark plug opening. Crank engine until indicator indicates valve seated. Chalk mark edge of vibration damper directly below pointer. Valve timing will be correct when distance from chalk mark around perimeter of damper to TDC is 1¾" ± 1/8" with cold valve lash of .015". *NOTE* – For one tooth off, dimension will be affected 19/32" (Camshaft sprocket), 1 3/16" ' (Crankshaft sprocket).

OILING SYSTEM

Crankcase Capacity: 5 qts (Wasp), 7 qts (Hornet) Add ½ qt. for dry engine

Normal Oil Pressure: 40 lbs. at 30 MPH

Pressure Regulator Valve–Non-adjustable spring loaded, located on left side of cylinder block

Oil Pressure Indicator Switch: King-Seeley 47185 (Wasp), 47170 (Hornet). On right side of engine above oil pump Contacts open at 11-15 lbs Switch is sealed (not adjustable)

Oil Pump: Rotor type. Angle mounted on right side of engine and driven by camshaft

Pump Overhaul, Removal & Installation–*See "Oiling System" in Hudson Special Data*

Oil Filter· Fram or Hudson. Replace filter cartridge at 5000 mile intervals

Replacement Filter Element–Hudson No. 8990183

Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake) Outlet pipe in rear valve compartment cover on right side of engine

COOLING

Water Capacity: 13 qts. (Wasp), 18.5 qts. (Hornet). Add 1 qt. for heater.

Pressure Valve: Radiator filler cap. 7 lb. standard, 13 lb. with air conditioning.

Thermostat: Hudson No. 5325066 Std. (157-162°), No. 3131817 (167-173°) or No. 3131985 (177-182°) for Permanent anti-freeze. Located in cylinder head water outlet housing.

Water Pump: Centrifugal type with non-adjustable packless type seal. *NOTE* – **Water pump discharges into brass water distributing tube to provide uniform circulation around valves.**
See "Hudson" in Water Pump Section.
Pump Removal – **Remove generator adjusting bracket, remove fan blade assembly, remove pump mounting bolts.**

Temperature Gauge: Stewart Warner & Auto-Lite. Electric.
Dash Unit – Hudson No. 3119681.
Engine Unit – Hudson No. 3144585.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck. (Wasp) 9A7, (Hornet) 10A6.
Assembly No.–(Wasp) 1361, (Hornet) 1385
Clutch Disc. N .–(Wasp) 382118 Std , 382191 Overdrive
Clutch Disc. N .–(Hornet) 382372 Std , 382215 Overdrive

Pedal Adjustment: Pedal free travel ½-¾" Adjust length of beam to throw-out lever rod Lengthening rod reduces free play *NOTE*–Do not disturb clutch pedal to beam rod adjustment

►*CAUTION.* Pedal-to-beam rod should not be disturbed in service. This rod can be checked (with pedal against floor board) as follows: **Wasp**–Clearance between flat surface of beam lever and rear edge of bracket should be 7/8". **Hornet**–Outer end of beam lever should project 5/16" from beam toward the rear.

►*WASP CLUTCH BEAM INSULATOR DISTORTION CORRECTION:* To correct this condition, reinforce the new insulator with .015" shim made up to same dimensions as insulator

Removal: Remove transmission (see below), disconnect clutch pedal linkage, remove housing and pan, punchmark flywheel, clutch cover, and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange Remove clutch and driven disc

SYNCHRO-MESH TRANSMISSION

Warner. 3 Speed Std. Transmission & Overdrive Optl
See "Warner Transmissions" in Transmission Section

►***TRANSMISSION REAR BEARING SNAP RING BREAKAGE CORRECTION:*** **Caused by heavy duty operation or maladjustment of torque tube trunnion. For installation of sleeve and adjustment of trunnion See *"Nash Transmission" in Transmission Section.***

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect brake tube bracket on underside of body. Disconnect torque tube (see Rear Axle Removal below). Disconnect hand brake cable at bellcrank and brake cable housing at bellcrank bracket. Move rear axle to rear to disconnect front universal joint from transmission mainshaft Disconnect speedometer cable and shift rods (On Overdrive Cars, disconnect overdrive control and wiring) Remove two upper transmission mounting screws, install guide pins (Tool J-1434) in these holes, remove two lower mounting screws, slide transmission straight back to clear clutch pilot bearing, remove transmission from beneath car

OVERDRIVE

Warner R10. *See "Warner R10 Overdrive" in Transmission Section*

Overdrive Control: *See "Warner R10 Overdrive Controls" in Transmission Section*

HYDRA-MATIC DRIVE

Dual Range four speed automatic transmission with fluid coupling
See "Hydra-Matic Drive" in Transmission Section

►***HYDRA-MATIC REVERSE GEAR SLIP-OUT CORRECTION:*** **To check and correct this condition, first dis-**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

connect back-up light switch at manual control lever on side of transmission, and operate transmission in reverse. If condition not corrected, adjust back-up light switch to proper tension by placing control lever in reverse, and adjusting switch cable just enough to allow spring to pull switch to the contact position.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section*

Lubrication—Check fluid every 1000 miles, drain and refill at 25,000 mile intervals

Capacity—8½ qts. (9½ qts. after overhaul)

Checking Fluid Level—Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of two minutes after transmission has reached normal operating temperature. With selector lever in "N" position, remove dipstick and check fluid level (dipstick located under right front floor plate). Add "AQ-ATF" Hydra-Matic fluid to bring level to "F" mark.

►*CAUTION.* Do not check fluid level when transmission is excessively hot and do not fill above "F" mark on dipstick

►*OTHER HYDRA-MATIC DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer (Wasp—Std.), Detroit (Hornet—Std.), Mechanics (All Models - Hydra-Matic). One used on forward end of driveshaft.

REAR AXLE

Own. Semi-floating, hypoid gear type with torque tube drive.

See "Hudson Rear Axles" in Rear Axle Section.

Axle Ratio	Std.	Overdrive	Hydra-Matic
Wasp	4.4-1 (9-40)	4.9-1 (8-39)	3.6-1 (12-43)
Hornet	4.1-1 (10-41)	4.4-1 (9-40)	3.2-1 (13-41)

Backlash— 002-.006". Shim adjustment.

Axle Shaft Removal: Remove wheel Pull drum (use hub puller J-736-B) Disconnect brake line and cable Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims Withdraw axle shaft with puller J-2498 Do not drag shaft splines on inner oil seal

Rear Axle Assembly Removal: Raise and support rear of body Disconnect hand brake cable at bell crank and cable housing at bracket. Disconnect torque tube at transmission, rear brake hose at bracket on body floor pan, rear springs and shock absorbers from axle tube, and stabilizer bar at tube. Roll assembly from beneath car

Wheel Bearing Adjustment: Shims behind brake backing plate

Rear Suspension: *See "Hudson & Nash" in Suspensions & Wheel Alignment Section.*

SHOCK ABSORBERS

Direct acting hydraulic type. Serviced by replacement. **Front** — Hudson No. 3140879. **Rear** — Hudson No. 3140406.

►*REAR SHOCK ABSORBER NOISE CORRECTION (Early Cars):* Before replacing a rear shock absorber for being noisy, check for damaged shock absorber grommet spacer or limit sleeve, (caused by incorrect retainer with oversize hole). If grommet spacer damaged, discard it. When reassembling without grommet spacer, do not use retainer Hudson No. 3136432; however, do not compress shock absorber grommets excessively.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper end of steering knuckle pin and seat in outer wheel house panel.

See "Hudson" in Suspensions & Wheel Alignment Sect.

►*EXCESSIVE TIRE WEAR (Early Cars) CAUTION:* Set stop screws on pitman arms to limit turning radius to 36°. Should tires still contact brake hose brackets, trim rear corner of brackets approximately 1/8".

►*TOE-IN ADJUSTMENT (POWER STEERING) CAUTION:* Operate engine so that power steering pump will supply oil pressure to center spool in power cylinder valve.

Drum Diameter — 10" (Wasp), 11" (Hornet).

Wheel Cylinder Diameter — 1 1/8" Front, 15/16" (Early Cars), 7/8" (Later Cars) Rear.

King Pin Inclination—3°36'

Caster—(Without Power Steering) Pos. ½° desired, limits 0° to Pos. ½°. (With Power Steering) 1° desired, limits Pos. ½° to Pos. 1°

Camber—0° desired, limits Neg. ¼° to Pos. ¼°

Toe-In—1/16-3/16"

Toe-Out on Turns—Outer wheel 20°, Inner wheel 24° (Wasp), 26° (Hornet)

STEERING

Gemmer. Worm & Roller with push-pull adjustments

See "Gemmer Worm & Roller" in Steering Section

Power Steering: Monroe Linkage type *See "Monroe Linkage Power Steering" in Steering Section*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" Steering Gear in Steering Section*

Steering Gear Removal: *See "Gemmer Worm & Roller" Steering Gear in Steering Section*

BRAKES

Bendix Hydraulic, Single Anchor (without Eccentric). Service brake system has "Mechanical Follow-up" linkage (between pedal and parking brake linkage) Hand lever applies rear wheel service brakes

See "Bendix Hydraulic, Single Anchor" in Brake Section.

►*REAR WHEEL BRAKE CYLINDER PRODUCTION CHANGE:* Beginning with Serial No. W-9403 (Wasp), No. X-9204 (Hornet), the diameter of the rear wheel brake cylinder was decreased to 7/8" from 15/16" to improve brake distribution.

Replacement Linings & Shoes—Shoes with linings, or linings only, furnished in Std. size only.

	Lining Width & Length	
Wasp	**Front**	**Rear**
Primary	2" x 8 7/8"	1¾" x 8 7/16"
Secondary	2½" x 10 31/32"	1¾" x 10 25/32"
Hornet	**Front**	**Rear**
Primary	2½" x 9 3/8"	2" x 9 5/16"
Secondary	2½" x 12"	2" x 12"

Clearance—.015" heel and toe of secondary shoe with primary shoe out against drum, or adjusting screw backed off 14 notches or clicks from point where wheel can just be turned by hand.

Mechanical Follow-up Cable Adjustment—Depress brake pedal against 3½" spacer block on floor (with pedal cable and pushrod disconnected), adjust mechanical follow-up cable length at clevis end so that clevis pin can be installed freely with no slack in cable

Standard Master Cylinder: Under front floor at left of transmission.

Checking Fluid—Roll back floor mat, remove access hole cover in floor pan, maintain fluid ½-1" below filler opening.

Removal—Remove from beneath car. Not necessary to disturb other parts

Power Brakes: Bendix Power Unit. *See "Bendix Power Unit" in Brake Section*

Checking Fluid—Check every 1,000 miles. Maintain fluid to within ½" of filler opening

MISC. MECHANICAL

Windshield Wipers: Vacuum operated type. *See "Windshield Wipers" in Miscellaneous Section*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit

See "Nash-Hudson Air Conditioning" in Miscellaneous Section

Power Window Regulators: Electric. Reversible motor in each door.

See "Power Window Regulators" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head Bolts	① 90 (Hot)
Intake & Exhaust Manifolds	23-28
Main Bearing Cap Bolts	120-130
Oil Pan	12-15
Flywheel	75-85
Oil Pump	12-15
Oil Filter	20-25
Engine Front Cover	23-28
Water Outlet Connection	23-28
Camshaft Sprocket	15-18
Crankshaft Damper or Pulley	130-145
Con Rod Nuts	45-50
Rocker Shaft Support	22-25
Rocker Arm Clearance Locknut	30-35
Rocker Arm Cover	2-2½
Valve Chamber Covers	2-2½
Water Pump	23-28
Oil Pump Pick-up Tube Nut	10-12
Oil Pan Pick-up Tube Nut	28-32

① – See Cylinder Head Installation (below) for tightening procedure. Three different torque applications must be made.

ENGINE

▷ *1955 SPECIAL ENGINE OVERHUAL CAUTION (Engines identified by yellow paint at water outlet connection housing)* Approximately 600 engines at close of 1955 production have special parts listed below which are not identical with regular engine parts. *Observe the following cautions when working on these engines.*

Crankshaft & Main Bearings - Crankshaft main bearing journal diameters are .0005" smaller (increasing clearance from 0007-.0029" to 0015-.0033") and the main bearings listed below must be used with this crankshaft.

Piston Pin - Pins are heavier but they can be intermixed and used in any engine.

Crankshaft Rear Oil Seal - This seal is approximately .012" less in thickness than regular engine seal but can be used with either crankshaft.

Special Engine Parts

Part	Part No.
Crankshaft	EAM-6303-B
Main Bearing (Rear)	① EAM-6331-J, ② EAM-6331-K
(Frt. & Int.)	① EAM-6333-J, ② EAM-6333-K
(Center)	① EAM-6337-J, ② EAM-6337-K
Rear Oil Seal	EAM-6701-A
Piston Pin	EAM-6135-A or D

① - Marked RED. ② - Marked BLUE.

▷ *1955 VALVE STEM OIL SEAL CHANGE* New oil seal, Part No. B5A-6571-A, was used in production on later 1955 engines and is furnished for use on all 1955 engines. This seal has a skirt lengthened .100" to protect more of the valve stem from oil splash.

LINCOLN

ENGINE REMOVAL (Less Transmission):

1) Disconnect battery, drain radiator and cylinder block, remove hood.

2) Disconnect distributor primary wire at coil, pull secondary coil lead from distributor cap. Disconnect and remove defroster blower motor and duct assembly, loosen two duct clips on firewall and disconnect wires at bullet connectors.

3) Remove capscrew securing transmission oil filler tube bracket to exhaust manifold. Disconnect two right heater hoses at water pump and cylinder block.

4) Disconnect generator wires at generator, remove carburetor air cleaner and air duct as an assembly.

5) Disconnect upper and lower radiator hoses and remove radiator. Remove fan, spacer, water pump pulley, and belts. Disconnect left heater inlet hose at pipe and power brake vacuum line at vacuum pipe.

6) Loosen power steering drive belt and capscrew securing power steering hose bracket to cylinder block. Remove power steering pump. Wire pipe securely to left hood hinge in a position that will prevent oil leakage.

7) Remove accelerator shaft retracting springs. Disconnect carburetor-to-control shaft rod at carburetor. Remove capscrews securing control shaft assembly and accelerator shaft bracket to engine. Wire control shaft assembly and accelerator shaft bracket to dash panel.

8) Disconnect engine ground strap at engine. Disconnect temperature sending unit at sending unit and oil pressure warning light wire at bullet connector. Disconnect wiper at vacuum pipe.

9) Raise vehicle. Remove starter. Disconnect resonator inlet pipes from exhaust manifolds. Remove radiator splash shields. Drain engine oil and remove oil filter.

10) Remove converter housing-to-cylinder block capscrews. Remove converter cover, then bolts securing converter to flex plate. Lower vehicle. Support transmission with floor jack.

11) Disconnect and remove radio speaker. Fold back front center floor carpet and pad. Remove two rubber plugs from access holes in dash panel. Remove two converter housing-to-cylinder block capscrews. Remove two capscrews from each engine front support bracket.

12) Attach Engine Hoisting Sling Tools 6000-B-A and 6000-C. Position sling to lift engine less transmission. Lift engine slightly. Have second mechanic push forward to clear dash panel. Continue to lift engine until clear of engine compartment while second mechanic guides engine.

CONTINENTAL

ENGINE REMOVAL (Less Transmission);

1) Drain radiator and block, remove hood.

2) Disconnect distributor primary wire at distributor. Pull secondary coil lead from distributor cap.

3) Remove capscrew securing transmission oil filler tube bracket to exhaust manifold. Disconnect two right heater hoses at heater control valve and return pipe. Disconnect right heater control valve vacuum hose at valve

4) Remove nuts and lockwashers securing right front exhaust pipe to exhaust manifold. Slide inlet stud free of studs (*NOTE* - Hold exhaust control valve with nut).

5) Remove carburetor air cleaner and duct as an assembly. Disconnect upper and lower radiator hoses. Remove capscrews and lockwashers securing radiator to its support. Remove radiator. Remove fan, spacer, water pump pulley, and drive belts.

6) Loosen power steering drive belt and capscrew securing power steering hose bracket to cylinder block. Remove power steering pump. Wire pump securely to left hood hinge in position to prevent oil leakage.

7) Disconnect battery ground cable. Remove converter housing-to-cylinder block capscrews. Remove two accelerator shaft retracting springs. Disconnect carburetor-control shaft rod at carburetor. Remove capscrews securing control shaft assembly to engine, wire control shaft assembly to dash panel.

8) Disconnect temperature sending unit wire at sending unit and oil pressure gauge sending unit at bullet connector. Remove capscrew, lockwasher, and clamp and disconnect tachometer drive cable at distributor (*CAUTION - Remove tachometer drive assembly from cable*). Remove nuts and lockwashers securing left front exhaust pipe to exhaust manifold. Slide pipe free of studs.

9) Disconnect two left heater hoses at heater control valve and return pipe. Disconnect left heater control valve vacuum line at valve and power brake vacuum hose at intake manifold pipe.

10) Raise vehicle. Disconnect generator wires at generator. Disconnect starter cable and engine ground cable at starter. Remove starter. Disconnect antenna and windshield washer vacuum line at connection under generator. Disconnect flex hose at fuel line, plug fuel line. Drain engine and remove oil filter.

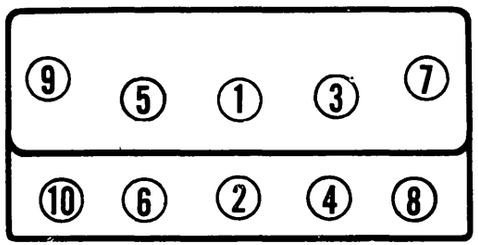
11) Remove throttle linkage splash pan and lower left converter housing-to-cylinder block capscrew. Remove converter cover, then remove bolts securing converter to flex plate.

12) Lower vehicle and support transmission with floor jack. Remove capscrews from each engine support bracket. Attach Hoisting Sling Tools 6000-B-A and 6000-C to exhaust manifolds. Position sling to lift engine less transmission. Lift engine slightly. Have another mechanic push engine forward slightly and then guide assembly as it is lifted from engine compartment.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD REMOVAL: Loosen all pushrod adjusting nuts and screws to relieve tension on pushrods. Remove all rocker arm bracket attaching screws and nuts, remove oil overflow pipe from end support (front end on right bank, rear end on left bank), lift rocker arm assembly up over studs and remove as an assembly (see Rocker Arm data under "Valve System" below). Remove all pushrods, remove oil baffle plates from rocker arm pads. Remove the two end cylinder head capscrews and install Pilot Studs, Part No. 6051-A, in these two holes. Install cylinder head holding fixture 6085-A (CAUTION—this fixture recommended to protect machined surfaces of head while it is off the engine AND SHOULD NOT BE REMOVED FROM HEAD UNTIL IT IS RE-INSTALLED ON ENGINE). Remove remaining cylinder head capscrews, lift head up and off the locating dowels and pilot studs Remove gasket. *CAUTION—Never pry between cylinder head and block.*

▷ *CYLINDER HEAD INTERCHANGEABILITY:* Heads can be changed from one bank to the other if the rocker arm shafts and supports are changed to properly line up oil feed and drain passages Water jacket plugs must be installed in hole at rear of the cylinder head. Use Tool 6085-C to install new plugs.



CYLINDER HEAD INSTALLATION: Install pilot studs, Tool 6051-A in two end capscrew holes in block Coat NEW steel head gasket lightly with 8M-19554 sealer and install gasket over pilot studs and dowels Install cylinder head assembly over

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

studs and dowels **with plugged water jacket hole to rear of engine.** Install 8 cylinder head capscrews, then remove pilot studs and install remaining two capscrews in these holes. Tighten all capscrews evenly as follows with Cyl. Head Wrench and adapter (Snap-On Tool Nos. S-9513-C & S-9526). ***(CAUTION—Three torque applications must be made as indicated below).*** **Initial** COLD torque should be 70 ft. lbs. **Second** COLD torque should be 80 ft. lbs., **Third** HOT torque should be 90 ft. lbs. after 20 minute fast idle warm up. *NOTE*—After above procedure has been completed, the cylinder head capscrews require no additional torquing and should not be disturbed for installation of engine lifting hooks, etc.

►***CYLINDER HEAD GASKET INSTALLATION CAUTION:*** Gaskets are interchangeable from one cylinder bank to the other but MUST BE INSTALLED WITH MARK "FRONT" TOWARD FRONT OF ENGINE. Make certain that water passage holes in gasket and block line up.

EXHAUST SIDE

CRANKSHAFT & MAIN BEARINGS

►*1956 CRANKSHAFT & CRANKSHAFT FRONT OIL SLINGER PRODUCTION CHANGE (To Improve Oil Seals):* New crankshaft with integral rear oil slinger used in production on later engines. A separate Front Oil Slinger is also used in conjunction with a new Front Cylinder Cover. Slingers divert oil away from the oil seals.

►*INSTALLATION OF CRANKSHAFT WITH INTEGRAL REAR OIL SLINGER AND USE OF FRONT OIL SLINGER ON 1952-56 ENGINES:* New type crankshaft with integral rear oil slinger can be installed on early 1956 engines, and separate front oil slinger can be installed on 1952-56 engines as follows:

1956 Engine – Crankshaft No. ECU-6303-B, Front Oil Slinger No. B6Q-6310-B. Cylinder Front Cover No. B6Q-6059-C. *NOTE* - New Cylinder Front Cover must be used with front oil slinger.

1952-55 Engines - Front Oil Slinger No. B6Q-6310-B and Cylinder Front Cover No. B6Q-6059-C. *NOTE* - Both these parts must be used together.

REAR MAIN BEARING OIL SEAL: Install new packing in crankcase and bearing cap using Tool 6701 to seat packing. Before removing tool cut off edges flush with surface. Make certain there are no ragged edges protruding. Install outer "L" shaped neoprene seal on bearing cap and coat with lubricant. Install Pilot Studs Tool 6336-A1, and place unit over pilot studs. Push bearing cap through tool and into position in block. Remove bearing replacing tool and trim vertical seals, leaving approximately 5/64" of seal above cap. Remove pilot studs and install the self locking main bearing cap bolts. Tighten to 120-130 ft. lbs. torque.

CRANKSHAFT THRUST BEARING ALIGNMENT: After #1, #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert. Install capscrews snug, then pry crankshaft toward rear of engine. Reverse this action by prying crankshaft forward (toward front of engine). This will align thrust surfaces of both halves of thrust bearing. RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 120-130 ft. lbs. torque. Check crankshaft endplay which should be .004-.008"

ENGINE FRONT COVER

CRANKSHAFT FRONT OIL SEAL (In Timing Chain Cover): Coat new seal with engine oil and install on Tool 6700. Center seal and tool over front cover boss and drive in until seated. Make sure spring on inside of seal is properly seated.

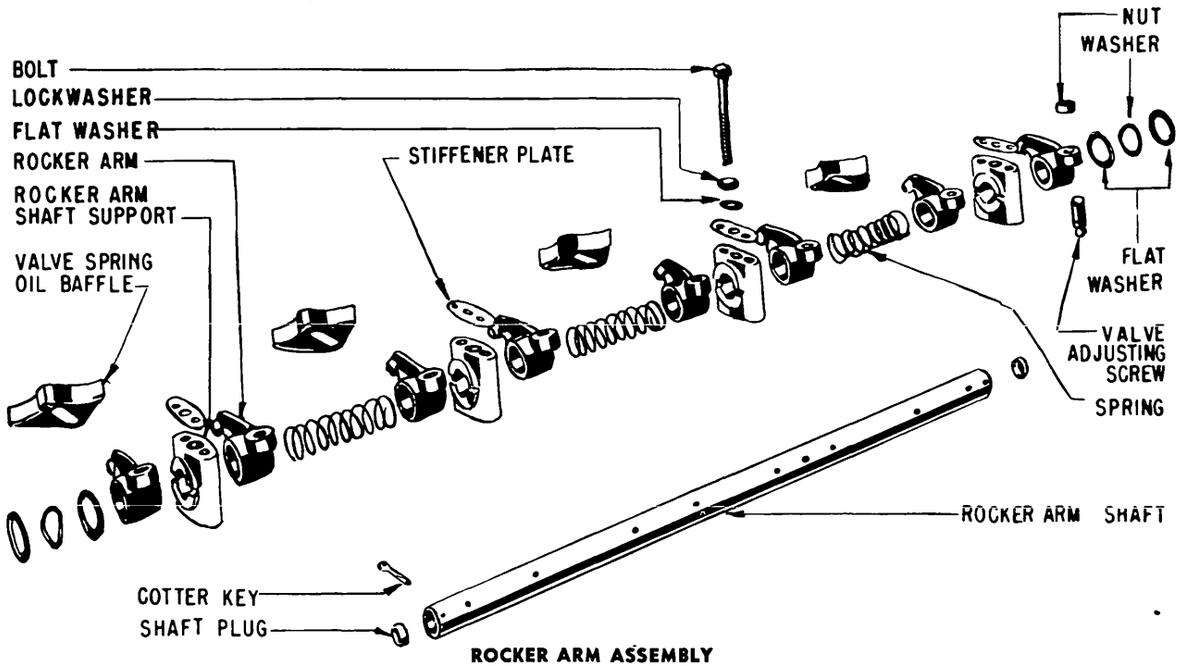
ENGINE FRONT COVER INSTALLATION: Coat new cover gasket with sealer, install gasket and front cover on engine. Align cover and oil seal on crankshaft, BEFORE installing capscrews by positioning Tool 6059 on crankshaft. Tighten cover capscrews to correct torque (see Tightening Specifications).

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove cylinder Head covers and rocker arm assemblies from cylinder heads (see Cylinder Head Removal). Remove valve pushrods and hydraulic valve lifters. Remove timing chain and sprockets (see Timing Chain). Remove fuel pump drive sleeve from camshaft eccentric and remove timing chain oil deflection plate. With Tool 9400-B remove snap ring retainer from fuel pump push rod and remove rod. Carefully withdraw camshaft to avoid damaging camshaft bearings.

VALVE SYSTEM

EXHAUST VALVE STEM DIAMETER CHANGE FOR INCREASED STEM CLEARANCE (1952-56 Engines): Exhaust valve stem diameter has been decreased .0005" to provide increased stem to guide clearance. These valves furnished for service on 1952-56 engines as follows:



1952-56 Exhaust Valves

Size	Stem Diameter
Std. (Red)	.3400-.3405"
Std. (Green)	.3405-.3410"
.003" Oversize	.3430-.3440"
.015" Oversize	.3550-.3560"
.030" Oversize	.3700-.3710"

SELF-LOCKING VALVE TAPPET ADJUSTING SCREWS (1956 Production Change): "Self-locking" adjusting screws used with new type rocker arms on later 1956 engines. Torque specifications for these new self-locking screws is 7-15 ft. lbs. This torque decreases with each valve adjustment and rocker arms should be replaced when torque decreases to 3 ft. lbs.

►*INSTALLATION OF SELF-LOCKING TAPPET ADJUSTING SCREWS IN EARLIER ENGINES (1952-56):* When installing self-locking screws to replace earlier type (with locknut), all parts listed below must be installed as a unit:

CONTINUED ON NEXT PAGE

ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

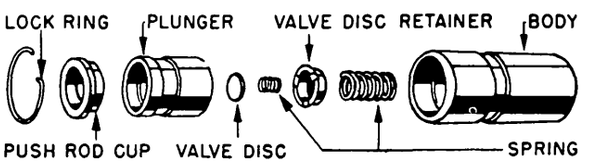
Adjusting Screw – Lincoln No. B6A-6549-C.
Rocker Arms – Lincoln No. ECU-6564-B (Right Hand), No. ECU-6576-B (Left Hand).
Pushrod – Lincoln No. ECU-6565-B. *NOTE* - These pushrods are 1/8" shorter to compensate for longer length of new adjusting screws .

OVERSIZE VALVE STEM INSTALLATION: Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems. Reamers are furnished in .003", .015", & .030" oversizes. Pilots are furnished Std., .003", & .015". Use reamers in sequence with correct pilots when reaming from standard to oversize. Regrind valve seats AFTER reaming guides.

INITIAL VALVE CLEARANCE: To insure valve being on the low side of the cam, make all adjustments in the following sequence, and with No. 1 & No. 6 pistons in the indicated position.
No. 1 Piston at TDC (Compression Stroke)—Adjust **No. 1** In. & Ex., **No. 2** In. & Ex., **No. 5** In. & Ex., **No. 7** In., **No. 4** Ex.
No. 6 Piston at TDC (Compression Stroke)—Adjust **No. 6** In. & Ex., **No. 3** In. & Ex., **No. 7** Ex., **No. 8** In. & Ex., **No. 4** In.
Turn valve adjusting screw clockwise while moving push rod up and down until **all slack is removed.** ***(CAUTION—Plunger unit of hydraulic lifter should not be forced down into body during this operation).*** With all slack removed, turn adjusting screw an **additional 2½ turns.** Hold adjusting screw, tighten locknut to 30-35 ft.lbs. torque. *NOTE*—If lifter is noisy in operation, adjustment can be varied by turning adjusting screw ±¼ turn from original 2½ turn setting. Repeat operation on all valves.

ROCKER ARMS

ROCKER ARM ASSEMBLY: After assembly removed from cylinder head (see Cylinder Head Removal above), disassemble and reassemble the assembly as follows:



Rocker Arm Disassembly: Remove cotter keys, washers, rocker arms, springs, supports and plugs from shaft. ***Keep all parts in order as removed so they may be reinstalled in same position.*** Inspect all parts for wear and replace worn parts. If rocker arm radius is scored, replace arm, do not try to regrind radius.

Rocker Arm Reassembly: Reverse disassembly procedure. Install so valve ends of arms point outward away from support. See Illustration.

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTERS: Lifters are "barrel type," integral units with a flat, disc type check valve. Lifter has three holes in outside diameter groove and four holes in plunger. Lifters are furnished in unit packs of eight.

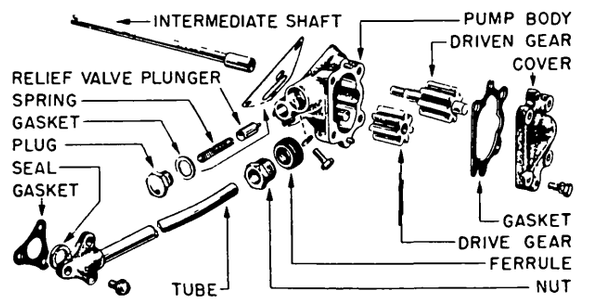
Removal: Remove cylinder head covers. Take out rocker arm assembly support bolts and remove rocker arm assemblies, and valve push rods. Valve lifters can then be removed from lifter bores in block.

HYDRAULIC VALVE LIFTER

Disassembly: Immerse all lifters in solvent to remove all varnish and carbon deposits. DO NOT CUT OR SCRAPE CARBON FROM LIFTER. With needle nose pliers, remove lock ring from top of body. Remove push rod seat, plunger, valve disc assembly and spring from body. ***(CAUTION—Disassemble one lifter at a time to avoid inter-mixing lifter parts).***

Reassembly: Place push rod seat upside down on bench. Install plunger on push rod seat and place valve disc assembly on plunger and set spring on valve disc retainer. Place body over assemblies and push body down over plunger. Lift assembly and push plunger and push rod seat up into body. Install lock ring using tool 6500-C.

OILING SYSTEM



OIL PUMP

GEAR TYPE OIL PUMP

Removal: Disconnect external oil line. Remove attaching capscrews and remove pump and intermediate shaft.

Disassembly: Remove capscrews retaining bottom cover to pump body. Tap cover gently with a soft hammer if stuck. (CAUTION—Do not tap end of drive gear shaft). Remove gears from pump body, relief valve plug gasket, spring and relief valve. Pull oil inlet pipe ferrule assembly from large hole of pump body.

Inspection: Wash all parts in solvent. Check all parts for signs of wear, or grooves that might cause an oil leak. Check drive gear shaft length (short end .500"± .030"). If more than .530" replace drive gear shaft to insure proper engagement of distributor shaft to intermediate shaft groove when distributor assembled to engine. Check oil pump relief valve spring tension which should be 9.82 lbs. at 1.71". Check gears, and if worn or scored, replace as necessary.

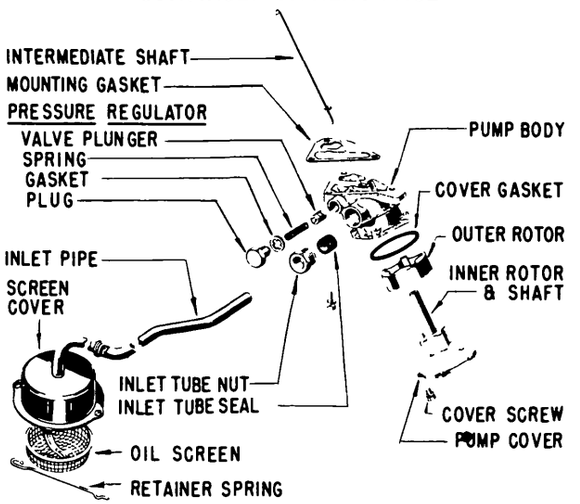
GEAR TYPE OIL PUMP

Reassembly: Install gears in pump body and install cover using a new gasket. Install new oil inlet tube ferrule assembly in large hole of pump body. Position relief valve in bore and install spring and plug with new gasket.

ROTOR TYPE OIL PUMP

Removal: Disconnect external oil line. Remove attaching capscrews (two from bottom, one from above). Remove pump and intermediate shaft.

Disassembly: Remove capscrew securing cover to body assembly. Remove cover and "O" ring gasket. Remove rotor and shaft assembly. Remove relief valve nut, spring and relief valve.



Inspection: Clean all parts in suitable solvent. Check pump housing and rotors for damage or excessive wear. Check compression of relief valve spring which should be 6.1-7.3 lbs. at .80". Check relief valve clearance in body assembly. Measure outer rotor race to body clearance. Clearance should be .006-.009". With rotor and shaft assembly installed in housing, place straightedge over rotor assembly and pump body. Measure clearance between straightedge and pump at rotor. Clearance should be .001-.0035". Check cover for wear, and if scored or grooved, replace it. Drive gear shaft length should be 3.36-3.38" from rotor assembly face to shaft end. *NOTE* - Outer rotor and shaft and rotor assembly are replaced as a unit.

Reassembly: Reverse disassembly procedures. Check assembled pump to see that it rotates without bind.

OIL FILTER

OIL FILTER SERVICING: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions).

CONTINUED ON NEXT PAGE

ROTOR TYPE OIL PUMP

CONTINUED FROM PRECEDING PAGE

►*REPLACEMENT CAUTION*—Use Replacement Kit, Part No. HCK-6731-A, which includes correct Filter Element and NEW GASKETS WHICH MUST BE USED.

Filter Removal: Take out center bolt in filter cover, remove filter assembly. Remove and discard cover mounting gasket from filter mounting pad, remove and discard filter element. Remove and discard neoprene gasket from center bolt, remove spring and seat assembly from center bolt, then remove center bolt from cover, remove and discard fiber center bolt-to-cover gasket. Wash all parts and filter pad on block with solvent and make certain they are clean.

Filter Installation: Install NEW fiber gasket on center bolt, install bolt in cover, install spring and seat assembly on bolt with open end of seat toward cover (*CAUTION*—seat must be attached to spring by tangs). Install NEW neoprene gasket on center bolt next to spring seat, install new filter element. Install NEW filter mounting gasket in block recess (*CAUTION*—DO NOT use sealing compound on this gasket). Install filter assembly on engine making certain that filter is seated in recess and not "cocked" over shoulder of recess. Tighten center bolt just enough to bring case up against gasket, rotate housing slightly to assure even seating, then tighten center bolt to 20-25 ft.lbs. torque. *CAUTION*—DO NOT overtighten the bolt which may strip threads, distort cover, or cause leaks. After engine started up, allow it to idle until lubrication established and normal oil pressure secured, then speed up engine and check for oil leaks.

FUEL SYSTEM NOTES

LINCOLN & CONTINENTAL

CARBURETOR AIR INTAKE DUCT ASSEMBLY (WITH THERMOSTATIC CONTROL): Thermostatically controlled valve in air intake duct assembly should be fully closed at 65° F. (for air intake from rear "heated" opening), and should start to open at 75° F. At temperature of 95° F., valve should be wide open (for air intake from front "cool" opening). If valve does not operate satisfactorily, remove duct assembly and test operation as follows:

Duct Assembly Removal: Loosen clampscrew and slide flexible hose off end of duct. Remove wing nut retaining air cleaner on carburetor, remove nut and washer retaining duct assembly on bracket. Lift air cleaner and duct assembly off engine. Loosen two clampscrews and slide duct assembly from air cleaner.

Testing: Place duct assembly in pan of water at temperature below 65° F. (thermostat must be covered by water). Valve should be in closed "heat on" position. Heat the water slowly. At temperature of 75° F., valve should start to open (*NOTE* - If valve does not start to open, hold water temperature at 75° F. for eight minutes before discarding thermostat as defective). Increase water temperature to 95° F. Valve should now be wide open in "heat off" position (*NOTE* - If valve not wide open, hold water temperature at 95° F. for eight minutes before discarding thermostat as defective). If valve operation not satisfactory, remove thermostat and spring assembly and check valve shaft for binding. If valve moves freely, replace thermostat and duct assembly. If valve does not operate correctly, adjust thermostat rod as follows:

Adjustment: Increase rod length to move valve toward "heat off" position, decrease rod length to move valve toward "heat on" position.

▷*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to left front body pillar between door hinges.
First Number – (Lincoln) 5001, (Continental) 1001.

▷*LINCOLN SERIAL NUMBER NOTE: Serial number (example *56LA5001L*) includes following identification data in sequence.*

Year	Assy. Plant	Serial No.	Engine Type
56	Ⓒ	5001	Ⓔ L

Ⓒ – LA – Los Angeles. WA – Wayne. Ⓔ – Lincoln.

▷*CONTINENTAL SERIAL NUMBER NOTE: Serial number (example *C5681001*) includes following identification data in sequence.*

Eng. Type	Year	Month	Serial No.
C Ⓒ	56	Ⓔ	1001

Ⓒ – Continental.
Ⓔ – Model year began June, 1955. Numbers (6 for June through 9 for September and 0 for October) or letters (beginning with A for November 1955 and alphabetically thereafter) are used

TUNE-UP

▷*HARD STARTING CORRECTION: See CARBURETOR below.*

COMPRESSION PRESSURE: 150±10 lbs. at cranking speed.

VACUUM READING: 18-19" at 475-500 RPM in neutral.

VALVE TAPPET CLEARANCE: None in service (hydraulic). Adjustment required only when servicing valves or hydraulic lifters.
Initial Valve Tappet Clearance Adjustment - See "Valve System" in Lincoln Special Data.

▷*TAPPET CLEARANCE ADJUSTING SCREW NOTE: "Self-l cking" screws used on later cars. See "Valve System" in Lincoln Special Data.*

LINCOLN MANIFOLD HEAT CONTROL: External valve at right exhaust manifold connection to exhaust pipe. Valve is automatic, requires no adjustment but should operate freely. When valve is closed, most exhaust gases are discharged through left hand exhaust pipe.

CONTINENTAL MANIFOLD HEAT CONTROL: Valve is mounted at end of right hand manifold. Valve is automatic, requires no adjustment but should operate freely. Dual exhaust system used.

▷*NOTE:* When valve is closed, gases are discharged through left exhaust manifold back through left resonator (one in each exhaust pipe ahead of muffler) to the cross-over pipe where gases are again divided and discharged through the right and left mufflers. Cross-over pipe has been included to equalize exhaust system.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders-RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036".
Spark Plug-Champion 860. 18mm.

▷*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be tightened within limits of 15-18 ft. lbs.

▷*LINCOLN SPARK PLUG MISFIRE CORRECTION:* If misfire condition exists at either No. 8 or No. 6 cylinder, interchange No. 6 & No. 5 spark plug wire positions in all insulator blocks.

COIL: Lincoln No. B6A-12029-A. *12 Volt.*
Ignition Current-2.5 amps. idling, 4.5 amps. stopped.
Resistor-Lincoln No. B6A-12250-B. On bracket attached to top of coil.

▷*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: (Lincoln) Lincoln No. FDU-12127-B, (Continental) No. FEG-12127-A. *12 Volt.* New double diaphragm, pressure type with separate vacuum lines to manifold and carburetor.

▷*LINCOLN GROUNDING OF DISTRIBUTOR TERMINAL PRIMARY WIRE ASSY. CORRECTION:* Screws securing distributor identification plate extend into housing and may penetrate primary wire insulation and ground wire. To correct, grind or file off sharp points, replace damaged wire.

▷*INTERMITTENT OR COMPLETE IGNITION FAILURE CORRECTION:* May be caused by having distributor primary wire improperly welded to one or both of its terminal lugs (insulated wire from terminal on distributor to breaker point terminal).
Condenser-Lincoln No. FAB-12300-A. Capacity .21-.25 microfarad.
Contact Point Set-Lincoln No. FAB-12171-B.
Breaker Gap-.014-.016".
Cam Angle-26-28.5°.
Breaker Arm Spring Tension-17-20 ozs.
Rotation-Counter-clockwise viewed from above.

Advance Performance
▷With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	.12	350
¼-1¼	.21	400
3-4	.46	600
5¼-6¼	.70	800
6¾-8	.90	1000
8¼-9½	1.09	1200
10¼-11½	1.42	1500
12¾-14	1.88	2000

DISTRIBUTOR INSTALLATION NOTE: It may be necessary to crank engine slightly if distributor is not seated properly in cylinder block. Crank engine, while holding distributor down, until intermediate shaft is engaged and distributor drops into place. *CAUTION-Do not start engine until distributor clamp and nut are in place.*

Initial Distributor Timing: Remove No. 1 spark plug. Crank engine until piston starts up on compression. Slowly "bump" engine over with starter until timing mark is aligned with pointer. Find No. 1 spark plug socket in distributor cap and fit cap to distributor housing. Mark distributor housing to indicate No. 1 spark plug wire position. Position rotor approximately 20° counter-clockwise from mark made on distributor housing. Engage distributor drive gear and install distributor in engine.

IGNITION TIMING

Setting-5° BTDC. with engine idling at 475 RPM and PRIMARY (inner diaphragm) vacuum line disconnected. *See Initial Distributor Timing above.*
Timing Mark-Crankshaft pulley marked TDC with twenty 2° lines before this point. Space between 2nd and 3rd line before TDC mark should be aligned with pointer on engine front cover.

CARBURETOR

Lincoln (Holley), ECU-9510-B, C, D, E. 4-Barrel carburetor with integral automatic choke.

▷*CARBURETOR PRODUCTION CHANGES – ECU-9510-D, E (To Provide Improved Choke Operation & Eliminate Possibility of Fuel Leakage at Fuel Inlet Valve): See "Holley (Ford, Lincoln, Mercury) 4-Barrel Centri-Quad" in Carburetion Section.*

▷*CARBURETOR AIR INTAKE DUCT ASSEMBLY (THERMOSTATIC CONTROL):* Carburetor air intake duct to air cleaner has thermostatically controlled valve which provides warm air for cold engine (air taken in through muff or shroud around exhaust manifold), or cool air for warm engine (air taken in at front in front of radiator). Thermostat begins to open valve at 75° F. and valve should be wide open with air temperature of 95° F. or higher. *See "Fuel System Notes" in Lincoln Special Data for testing and adjusting data.*

▷*HARD ENGINE STARTING CORRECTION (Due to Disengagement of Choke Link):* If choke link found disengaged, reinstall choke link and bend tab of choke thermostat lever toward link sufficiently to prevent link from becoming disengaged, allowing sufficient clearance between the tab of thermostat lever and choke link to permit operation without binding or sticking. Loop on thermostat spring must fit over tang on thermostat lever.

▷*HARD STARTING, STALLING & ENGINE BACKFIRE CORRECTION (When Due to Improperly Installed or Broken Automatic Choke Fresh Air Heater Tube):* An improperly installed or broken tube may cause choke plates to stick open creating above conditions. Tube must pass completely through manifold so that ends are visible. New tube, Part No. ECU-9890-A, is available for service replacement. *See "Holley (Ford, Lincoln, Mercury) Centri-Quad" in Carburetion Section.*

▷*HARD COLD STARTING (ECU-9510-B Carburetor):* If, after depressing accelerator, choke plates do not set themselves, choke fast idle cam should be checked. If too much stock has been removed from upper tip of cam at point where cam contacts choke link roller, there is a possibility that the cam will bind and wedge the linkage. This occurs when cam tip falls below roller center line, wedging the linkage.

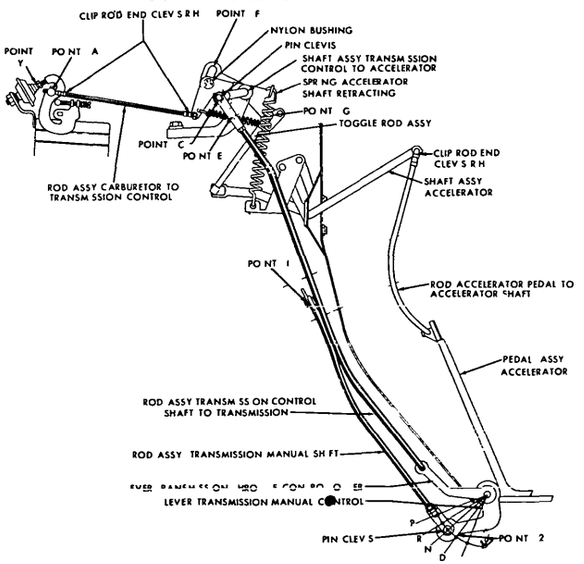
▷*LINCOLN VAPOR LOCK CORRECTION:* Check fuel pump-to-fuel tube hose assembly. Correct hose, Part No. LE-9288-A, has an inside opening of .31". A hose with too small an inside opening will contribute to the vapor lock condition.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

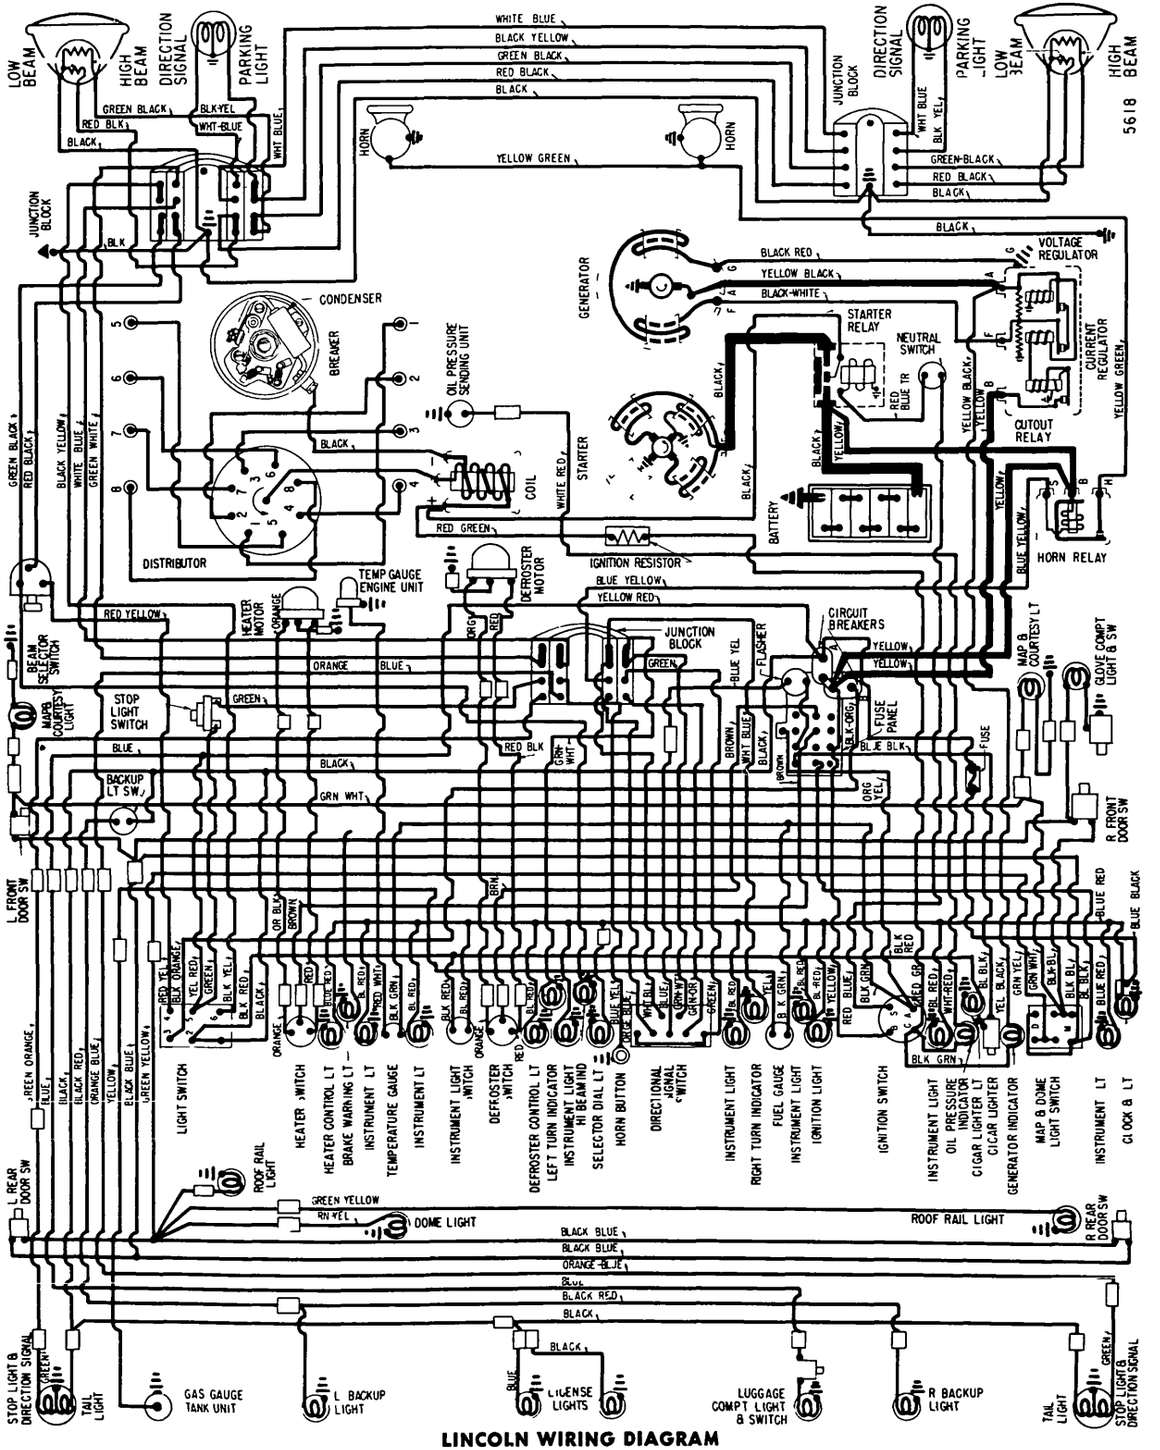
►*IDLE SPEED (AIR CONDITIONED CARS)*· Automatic throttle control is incorporated on air conditioned cars and is adjusted as follows. With engine warm, air conditioning system operating, and transmission in neutral, adjust knurled nut at end of operating rod of the control assembly to obtain an idle speed of 800 RPM, tighten locknut Check idle to make sure that it returns to normal whenever air conditioning is turned off or the transmission is shifted out of neutral

NOTE – Engine idle should be checked and set to specifications before attempting to adjust fast idle device.



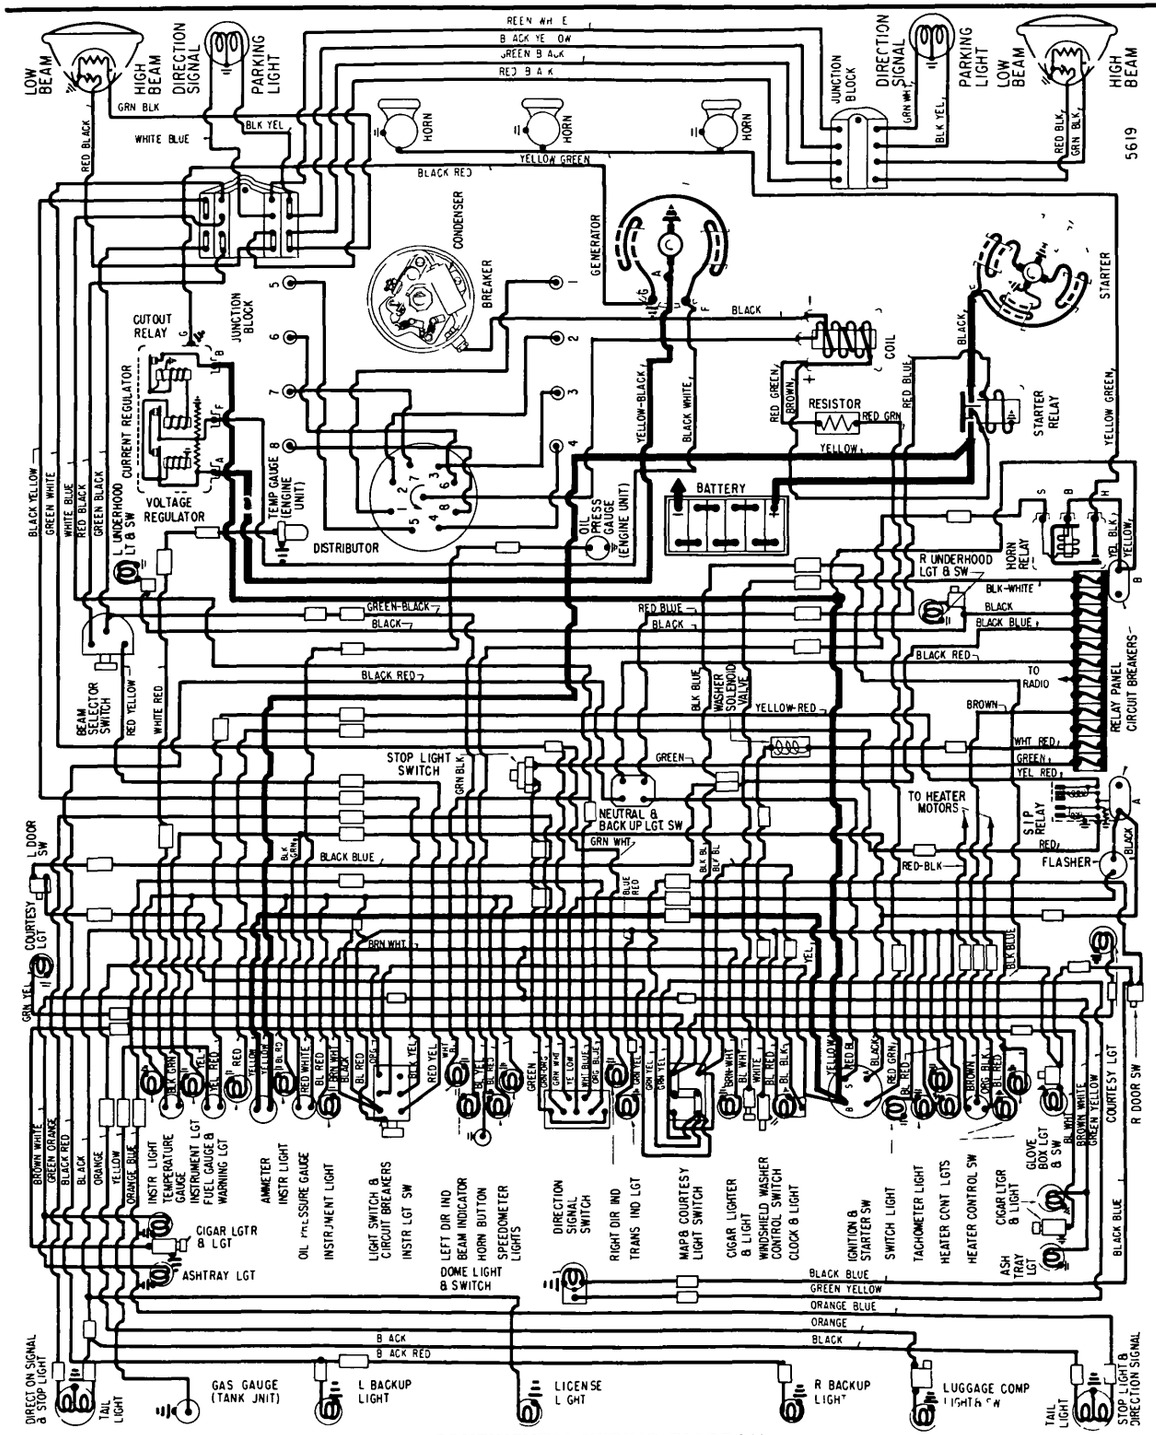
►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl. 2-3-5-8. LEFT barrels 1-4-6-7.*

Idle Setting–1¼ turns open (set both screws alike)



Idle Speed–425-450 RPM with selector lever in "DR" position

Throttle Linkage Adjustment: Set hand brake and adjust engine idle to 425 RPM with engine at normal operating temperature, fast idle cam in low idle position, and transmission in "DR" position Adjust anti-stall dashpot (see below) Disconnect clevis pin from transmission control to accelerator shaft and transmission shaft-to-transmission rod assembly Disconnect carburetor to transmission control rod Insert gauge pin through bellcrank and bracket in transmission control-to-accelerator shaft assembly Set carburetor at low idle manually Adjust carburetor-to-transmission control rod assembly so that with trunnion pin in place at rear end of rod, trunnion at forward end will go in freely Assemble in this position Remove gauge pin Pull upward gently but firmly on transmission control shaft-to-transmission rod assembly This will position



CONTINUED ON NEXT PAGE

TURBO-DRIVE THROTTLE LINKAGE

LINCOLN WIRING DIAGRAM

CONTINENTAL WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

throttle lever in the stop position at transmission. Adjust clevis pin at forward end of transmission control-to-accelerator shaft assembly so that clevis pin enters assembly freely. Lengthen transmission control shaft-to-transmission rod assembly by turning clevis 2½ turns and assemble in place. With ignition off and accelerator depressed to full kickdown position, adjust length of toggle rod assembly so that the nylon bushing has a clearance of .25" (Lincoln), .10" (Continental) from top of slot in accelerator shaft assembly. Adjust lateral angle of toggle rod to a vertical plane, by loosening jam nut at lower end of rod, inserting screwdriver in slot of stud provided and turning ball stud in required direction, tighten jam nuts. *NOTE* - Toggle rod assembly is installed in lower and forward hole (Lincoln) and upper hole (Continental) of transmission control-to-accelerator shaft.

Dashpot Adjustment: Turn throttle lever set screw out until dashpot plunger bottoms, then back it off to give .045-.064" clearance between end of screw and plunger.

► *OTHER DATA: See "Holley (Ford, Lincoln, Mercury) 4-Barrel Centri-Quad" Carburetors in Carburetion Sect.*

Fuel Pump Pressure: 4-6 lbs. at 500 RPM

CARB. EQUIPMENT

Fuel Pump: (Lincoln) Lincoln No. ECU-9350-A, (Continental) No. ECV-9350-A. Fuel and vacuum type.
Pressure – 4-6 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric type.
Dash Unit – (Lincoln) Lincoln No. FDU-9280-A, (Continental) Part of instrument cluster 4049792.
Tank Unit – (Lincoln) Lincoln No. FDU-9275-A, (Continental) No. 4047440.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Lincoln – Lincoln No. FDU-10655-C. *12 Volt,* 13 plate, 65 ampere hour capacity (20 hour rate).

► *LINCOLN BATTERY INSTRUCTION DECAL CAUTION*
A few cars were released with wrong instruction decal on battery box cover, indicating that positive cable grounded. 1956 Lincoln has **negative** ground.

Continental – Lincoln No. 4047942. *12 Volt,* 13 plate, 65 ampere hour capacity (20 hr. rate).

Location – (Lincoln) In vertical compartment beneath right side of dash panel. (Continental) In engine compartment.

Battery Ground – Negative, to engine block.

► *CAUTION: This is reversed from previous Lincoln models.*

Engine Ground – Cylinder head to dash.

STARTER

Lincoln No. B6A-11002-A. Armature – B6A-11005-A. *12 Volt.*
Drive – Bendix "Folo-Thru". Lincoln No. 1CM-11350-C.
Rotation – Counter-clockwise at commutator end.
Brush Spring T nsion – 48-56 ozs.
Cranking Sp ed – 150-180 RPM with warm engine.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4800 max.	12.0	100-120
	150-180 Ⓒ	8 or more	210 max.

Ⓒ – Cranking speed with warm engine.

Starting Switch: Relay, Lincoln No. B6A-11450-A, controlled by Ignition & Starter Switch, Lincoln No. B5A-11572-A, and Turbo-Drive Neutral Safety Switch, located on steering column.

Turbo-Drive Neutral Safety Switch Adjustment: *See "Turbo-Drive" in Transmission Section.*

► *SELF-STARTING OF ENGINES & CONTINUOUS OPERATION OF BACK-UP LIGHTS CORRECTION:* Neutral Safety Switch Insulator Assembly has been modified to prevent above condition. Original Part No. FDK-15827-B remains the same, but modified assembly can be recognized by two ridges approximately .020" high on each side and parallel to brass strip.

GENERATOR

Lincoln No. 86A-10002-A. *12 Volt.* **Armature** – B6A 10005-B.

Performance Data

Amperes	Volts	Gen. RPM
30	15	Ⓒ 2500

Ⓒ – At 1500 Engine RPM.

Brush Spring Tension – 26-34 ozs.

Field Current – 1.5-1.6 amps. at 15 volts (Hot).

Rotation – Counter-clockwise at commutator end.

Belt Adjustment: Approximately ½" deflection on belts midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Lincoln No. B6A-10505-A. *12 Volt.*

► *SETTING NOTE:* Settings are for regulator at NORMAL OPERATING TEMPERATURE (after running engine for 20 minutes at 1500 RPM if started cold, or until temperature gauge is steady for 5 minutes if engine previously warmed up) with room temperature at 75° F.

Cutout Relay

Cuts In – 12.0-12.8 volts.

Cuts Out – 2.0-6.0 amps. (reverse current).

Voltage Regulator

Setting – 14.6-15.4 volts.

Checking & Adjusting – *See Electrical Section.*

Current Regulator

Setting – 28-32 amperes.

Checking & Adjusting – *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Direction Signals: *See Electrical Section.*

Automatic Headlight Dimmer – *See Electrical Section.*

Lighting Switch Removal: (*NOTE* – Toggle type used on Lincoln, push-pull type used on Continental). Remove anti-rattle bezel from switch, then remove switch from rear of dash panel.

► *DIMMER SWITCH INSTALLATION CAUTION:* A few defective dimmer switches, Part No. FDU-13740-A, were installed in early production. Only switches with yellow spot should be installed in service.

Stop Light Switch Location: On forward end of brake master cylinder (integral with power brake unit). Master cylinder or power brake unit located on firewall in engine compartment.

FUSES: Interior Lights – SFE 7.5 amps.
Direction Signals – SFE 7.5 amps.
Heater Blowers – SFE 14 amps. (2 on Lincoln).
Radio – SFE 7.5 amps.
Clock – AG 1 amp.
Cigar Lighter – SFE 15 amps. (Lincoln), SFE 20 amps. (Continental).
Windshield Washer – SFE 7.5 amps.
Back-Up Lights – SFE 7.5 amps.
Underhood Lights – SFE 7.5 amps. (Continental).
Automatic Headlight Dimmer – AGC 3 amps.
Air Conditioning – SFE 20 amps. (Continental).
Radio Antenna – SFE 14 amps. (Lincoln).

CIRCUIT BREAKERS: Lighting – Two 12 ampere circuit breakers (one for headlights, one for auxiliary lights) mounted on headlight switch (Continental) on fuse panel behind instrument panel (Lincoln).
Windows & Seats – One 15 ampere for each window motor. One 15 ampere common to both seat motors.
Convertible Top (Lincoln) – 30 ampere circuit breaker.
Air Conditioning (Lincoln) – 15 ampere circuit breaker.
Underhood Lights (Lincoln) – 12 ampere circuit breaker.
Stop Lights (Continental) – 12 ampere circuit breaker.

HORNS: Dual (Lincoln), Triple (Continental) horns operated by relay. *12 Volt.*

Lincoln Horns

Lincoln Nos.	Trumpet Type	Sea Shell Type
High Pitch	FDT-13832-B	FDU-13832-A
Low Pitch	FDT-13833-B	FDU-13833-A

Continental Horns

Lincoln Nos.	Trumpet Type	Sea Shell Type
High Pitch		B5T-13832-B
Low Pitch		B5T-13833-B
Third Horn	4049179	

Horn Relay – Lincoln No. 2Q-13853-A.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air conditioning Service Cautions" in Misc. Section.*

► *VALVE STEM SEAL & CYLINDER HEAD PRODUCTION CHANGE:* Short length of valve stem seal has been increased .100" in order to shield a greater area of valve stem from oil splash. As a result of seal change it was necessary to increase length of the outside diameter of the valve guide. *New seal should be used with New Head* (New Seal, Part No. B6Q-6571-A. New Head, Part No. ECU-6049-C). Present seals can be used with either the old or new head.

ENGINE SPECIFICATIONS: 90° V8.

Bore	Stroke	Displacement
4.00"	3.66"	368 cu. ins.
Rated HP	**Compr. Ratio**	**Developed HP**
51.2	9.0-1	285 at 4600 RPM

Compression & Vacuum Reading – *See TUNE-UP.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Lincoln Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Lincoln Special Data.*

ENGINE REMOVAL: *See "Engine" in Lincoln Spec. Data.*

OIL PAN REMOVAL: Remove oil inlet pipe hex fittings at oil pump and side of oil pan and remove pipe. Remove oil pan capscrews, then remove oil pan and gasket.

NOTE – When this operation is performed, turn crankshaft until rear counterweights of crankshaft are up. The oil pan can then be removed from front of engine.

PISTONS

Aluminum alloy, autothermic slipper type with three rings above pin. Tin-plated.

► *ORIGINAL BORE & PISTON SIZES:* Std. cylinder bore limits are 4.0000-4.40024" and TWO Standard Pistons are used for selective fitting as follows: 3.9993-3.9996" Diameter (marked "2" on dome), 4.0005-4.0008" Diameter (marked "6" on dome). *NOTE* - Std. piston furnished for service in these two sizes.

Removal – Rod and piston assembly removed from above.

Fitting New Pistons: Using 1/2" wide feeler gauge inserted between piston and cylinder wall at right angle to pin on thrust side, pull should be 6-12 lbs. when using feeler gauge thicknesses as follows: New Piston in New Bore - .0015". New piston in Used Bore - .002". Used Piston in Used Bore - .003".

Replacement Pistons: Standard (Two sizes - see Original Bore & Piston Sizes above), and .020", .030", .040" Oversize.

Installing Pistons: Install all pistons with indentation on head toward front of engine. *See Rod Installation.*

PISTON PINS

Floating type with lock rings at each end.

Diameter – .9120-.9123". **Length** - 3.162-3.176".

Clearance in Piston – .0008" maximum.

Clearance in Rod – .0008" maximum. Select for light thumb press fit at 70° F.

Replacement Pins: Standard (marked Green), and .001" (marked Blue), .002" (marked Yellow) oversize.

PISTON RINGS

► *OIL CONTROL RING PRODUCTION CHANGE:* Effective engines built Jan. 6, 1956 (Continental) and Jan. 17 (Wayne) & Feb. 2, 1956 (Los Angeles) for Lincoln, new type oil control rings are being used in production. These rings are of the side sealing type.

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0775-.0780"	.013-.030"	.006" max.
Compr.(2)	.0925-.0935"	.013-.030"	.006" max.
Oil (3)	.1860-.1865"	.010-.027"	Ⓒ.005" max.

Ⓒ – Early type ring. Later type ring is side sealing type. See Production Change above.

Replacement Rings: Standard size and .020", .030", .040" oversize.

► *SPACING NOTE:* Ring gaps should be spaced 120° apart, with oil ring gap to the side opposite spark plug side of cylinder bores.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CONNECTING RODS

Length – 7.064-7.066". Weight - 28.36 ozs.
Journal Diameter – 2.2482-2.2486" (Color coded BLUE), 2.2486-2.2490" (Color coded RED). Use with bearing of same color.
Lower Bearing – Steel-backed, copper lead alloy lined.
Clearance – .0007-.0036".
Side Clearance – .006-.014". .017" Service max.
Replacement Bearings – Standard (2 sizes marked RED & BLUE for selective fitting) and .010", .020", .030", .040" undersize.
Installing Rods – Assemble rods to piston so indentation embossed on piston head will face front of engine. Numbered side of rods on the right bank should face right side of engine and rods for left bank will face left side of engine. Place caps on connecting rods so numbered sides match and install in same numbered cylinders.

CRANKSHAFT

▷*CRANKSHAFT PRODUCTION CHANGE (To Minimize Oil Leakage at Front & Rear Oil Seals):* New crankshaft has integral rear oil slinger as part of shaft. New front oil slinger may be installed on 1952-56 crankshafts. *See "Crankshaft & Main Bearings" in Lincoln Special Data.*
Journal Diameter – 2.6235-2.6239" (Color coded BLUE), 2.6239-2.6243" (Color coded RED).
Out-of-Round Limits – .0005" max. Taper Limits - .001".
Bearings – Steel-backed copper-lead alloy lined.
Clearance – .008-.0036".

▷*NOTE:* Any combination of Red or Blue bearing inserts may be used to obtain desired clearance. If desired clearance cannot be obtained, it will be necessary to regrind journals and install undersize bearing inserts.
Replacement Bearings: Std. (2 sizes color coded RED & BLUE for selective fitting) and .010", .020", .030", .040" undersize (Center & Rear Bearings), .020", .030" .040" undersize (Front & Intermediate Bearings).
End Thrust: Taken by No. 3 main bearing.
Thrust Bearing Alignment – *See "Crankshaft & Main Bearings" in Lincoln Special Data.*
Endplay – .012" maximum.
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" In Lincoln Special Data.*
Crankshaft Front Seal Installation: *See "Engine Front Cover" in Lincoln Special Data.*

CAMSHAFT

▷*CAMSHAFT PRODUCTION CHANGE:* Two different camshafts used in production. New Camshaft, Part No. ECU-6250-C, replaced Camshaft, Part No. ECU-6250-B, in early production. New camshaft can be identified by by annular grooves around centers of Nos. 2 & 4 journals, instead of cross-drilled holes used previously. Similar groove has been cut in No. 3 journal to increase lubrication to journal. If new shaft installed, it will be necessary to replace EAD-6262-B bearings in No. 2 & 4 positions with new type B6Q-6262-A bearings.
Journal Diameter – 2.1240-2.1247". Out-of-Round Limit - .001".
Bearings – Steel-backed babbit lined bushings.
Clearance – .006" maximum. Endplay - .003" (restrained by thrust spring and plunger).
Replacement Bearings: Std. & .015" undersize.
Camshaft Removal: *See "Camshaft & Bearings" in Lincoln Special Data.*
Timing Chain: Width 1.25". Pitch .5". Length 25".
Deflection – 1/2".
Camshaft Setting: Timing marks on camshaft and crankshaft sprockets adjacent and in line with straightedge across shaft centers.
Timing Chain Cover Seal Installation (Crankshaft Front Seal): *See "Engine Front Cover" in Lincoln Spec. Data.*

VALVES

Valve Tappet Clearance: None in service (hydraulic). Adjustment required only when servicing valves or hydraulic lifters.
Initial Valve Tappet Clearance Adjustment–*See "Valve System" in Lincoln Special Data.*
▷*TAPPET CLEARANCE ADJUSTING SCREW NOTE: "Self-locking" screws used on later cars. See "Valve System" in Lincoln Special Data.*

▷*VALVE STEM SEAL PRODUCTION CHANGE: See "Valve Stem Seal & Cylinder Head Production Change" under ENGINE above.*
▷*EXHAUST VALVE STEM PRODUCTION CHANGE:* Stem diameter of all standard and oversize production and service exhaust valves has been reduced .0005" in order to increase stem-to-guide clearance. *See "Valve System" in Lincoln Special Data.*

Valve	Head Diam.	Stem Diameter Ⓒ
Intake	2.000-2.010"	Ⓒ.3415-.3420" or Ⓖ.3420-.3425"
Exhaust	1.630-1.640"	Ⓒ.3400-.3405" or Ⓖ.3405-.3410"

Valve	Seat Angle	Lift④	Stem Clearance
Intake	45°	256" min.	.001-.004" max.
Exhaust	45°	256" min.	.002-.005" max.

Ⓒ – Furnished with .003", .015", .030" oversize stems
NOTE – Early production exhaust valve stems, both std. and oversize were .0005" larger.
Ⓒ – Color coded RED. Use with RED valve guide.
Ⓖ – Color coded GREEN. Use with GREEN valve guide.
④ – Cam lobe lift (service limit).

Valve Seat Width – 1/16-5/64" (Intake), 5/64-3/32" (Exhaust).
Oversize Valve Stem Installation: *See "Valve System" in Lincoln Special Data.*
Valve Springs: Free Length – 2-1/8".

Spring Specifications

	Pressure	Length
Valve Closed	60 lbs.	1.80"
Valve Open	165 lbs.	1.38"

▷*SPRING HEIGHT CORRECTION:* Measure valve spring assembled height from point where spring contacts cylinder head to point where it contacts retainer. Assembled height of spring should be 1 25/32-1 13/16". Spacers are available in steps of .030" & .060" to bring assembled height within these limits or as near to this measurement as possible.
▷*SPRING SQUARENESS CAUTION:* If springs more than 1/16" out of square, with spring closed coil end on surface plate and measured with steel square, they should be replaced.
Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" intake, .005" exhaust), ream guides and install oversize valves. *See "Valve System" in Lincoln Special Data.*
Valve Lifters: Hydraulic, barrel type. Lifters can be removed from above with camshaft in engine.
Diameter–.8740-.8745". Clearance in Block .0025" max.
Initial Valve Clearance – *See "Valve System" in Lincoln Special Data.*
Lifter Overhaul – *See "Valve System" in Lincoln Special Data.*
Rocker Arm Assembly: *See "Valve System" in Lincoln Special Data.*
▷*ROCKER ARM COVER LEAK CORRECTION (Early Cars):* Grind away approximately 1/16" of inner flange for a length of 1½" at rear of cover.
▷*VALVE ROCKER ARM PRODUCTION CHANGE (Self-locking Valve Adjusting Screws). See "Valve System" in Lincoln Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
▷*VALVE TIMING NOTE: The following valve opening and closing points are with a camlift as indicated.*
Intake Valves – Open 18° Ⓒ BTDC, Close 72° Ⓒ ALDC.
Exhaust Valves – Open 59° Ⓒ BLDC, Close 31° Ⓒ ATDC.
Ⓒ – Camlift .002". Ⓒ – Camlift .004".
Valve Timing Check – With rocker cover removed, loosen adjusting locknut and screw of valve to be tested. Slide rocker arm to one side in order to have pushrod in the clear. With pushrod in tappet socket install a dial indicator in such a manner as to have actuating arm of indicator in the pushrod socket, in the same plane of pushrod movement (dial indicator used should have at least a total movement of .300" or more). Place a quadrant on the crankshaft pulley. If intake valve opening is being checked, engine is rotated slowly until dial indicator shows .002" camlift. At this point the actual opening reading in degrees is taken (18° BTDC). The engine is further rotated to check the valve closing. Dial indicator should read .004" camlift (72° ALDC)

OILING SYSTEM

▷*OIL LEVEL INDICATOR CAUTION:* Two types used. Indicator used with air conditioned cars has expanded anti-rattle section adjacent to tube cover and distance from cover to "Full" mark is 25.97" and is about 3" longer than that used with other cars. Distance from cover to "Full" mark on standard type is 23.01".
Crankcase Capacity) 5 qts. (refill). 6 qts. (when filter changed).
Normal Oil Pressure: 45-50 lbs. at 2000 RPM (Hot).
Pressure Regulator Valve–In pump body. Not adjustable.
Oil Pressure Indicator (Lincoln): Light on instrument panel. Light is on when oil pressure is low.
Oil Pressure Gauge (Continental): King-Seeley Electric.
Engine Unit - (Lincoln) Lincoln No. B6A-9278-A pressure switch. (Continental) No. FDA-9278-A.
See "Oil Pressure Gauges" in Miscellaneous Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pump: Gear and rotor types used. Located on left side of engine crankcase and driven by distributor drive gear.

►*OIL PUMP INSTALLATION CAUTION (Aluminum Body):* Attaching screw, Part No. 20446-S8 (5/16"-18 x 1¼") and lockwasher, Part No. 34806-S7, should be used in threaded hole of pump body instead of 1-1/8" used previously. Former screw had tendency to strip softer aluminum thread. Screw should not be longer than 1¼" to prevent possibility of its bottoming.

Pump Overhaul—*See "Oiling System" in Lincoln Special Data.*

Oil Filter: Full-flow type with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

Replacement Filter Element—HCK-6731-A (Kit includes new gaskets).

See "Oiling System" in Lincoln Special Data.

CAUTION—Special "full-flow" filter element must be used for replacement (use of by-pass type filter element will restrict engine oil flow and result in insufficient engine lubrication).

Crankcase Ventilation: Combination oil filler and road draft tube and air filter cap, located on front of valve pushrod cover. Clean and oil the oil filler cap filter every 2000 miles.

COOLING

Water Capacity: 23 qts. total - without heater (22 qts. recommended). Additional 2.4 qts. with heater.

Pressure Valve: Lincoln No. LA-8100-A3 (14 lbs.), LA-8100-A4 (13 lbs.). Radiator filler cap, stamped with figure "14" or "13".

Thermostat: Lincoln No. EAD-8575-D (157-162° F.), B4Q-8575-B (168-173° - use with permanent anti-freeze)

Water Pump: Packless, sealed ball bearing type.

See "Lincoln" in Water Pump Section.

Temperature Gauge: King-Seeley Electric.

Dash Unit — (Lincoln) Lincoln No. FDU-10883-A, (Continental) Part of Instrument Cluster, Lincoln No. 4049792.

Engine Unit — Lincoln No. B6A-10884-A (All).

See "Temperature Gauges" in Miscellaneous Section.

TURBO-DRIVE TRANSMISSION

Torque converter and three-speed automatic transmission with hydraulic control and mechanical parking lock.

See "Turbo-Drive" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Turbo-Drive" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Turbo-Drive" Transmission in Transmission Section.*

Lubrication — Check transmission oil level every 2000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 16,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level—With selector lever in "N" (Neutral) and emergency brake applied, run engine approximately four minutes at idle speed. Check to see that emergency brake is applied and that engine is on slow idle, move selector lever to the "P" (Park) position. *(NOTE*—When engine and transmission are at normal operating temperature, move selector lever through all ranges to assure fluid distribution throughout transmission). Raise hood and wipe top of oil level indicator. Remove indicator and read fluid level. Add Automatic Transmission Fluid "Type A" if necessary to bring fluid level to "Full" mark on indicator.

THROTTLE LINKAGE ADJUSTMENT: *See CARBURETOR above.*

►*OTHER "TURBO-DRIVE" SERVICE DATA: See "Turbo-Drive" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

REAR AXLE

►*REAR AXLE PINION SEAL "SQUEAL" CORRECTION: See "Ford, Lincoln, Mercury (Integral Carrier)" in Rear Axle Section for installation of special type pinion seal.*

►*LINCOLN REAR SUSPENSION "THUMP" CORRECTION:* May be caused by differential housing hitting against differential bumper. To correct, replace rear spring torque reaction bumpers, Part No. LD-55786-C, with heavier bumpers, Part No. MA-55712. Rear spring riding height should also be checked.

Own. Semi-floating hypoid gear, with Hotchkiss drive. *See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.*

Ratios — 3.07-1 (Std.), 3.31-1 (Optl. on Lincoln).

Backlash—.003-.008" with .002" maximum variation per gear set.

Axle Shaft Removal: Remove rear wheels and take out screws holding brake drum to axle shaft flange. Remove hydraulic brake lines from brake backing plate. Take out axle retainer nuts (working through opening in axle shaft flange). Use Tool 4235-C2 to remove axle shaft and bearing assembly from axle housing. Take off backing plate and gasket and remove axle being careful not to damage oil seal.

Axle Assembly Removal: Raise rear of car and remove axle shafts and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers and spring U-bolts. Remove axle housing assembly from car.

Wheel Bearing Adjustment: None required.

FRONT SUSPENSION

Independent. "Ball-Joint" suspension with direct acting shock absorbers mounted within front coil springs.

See "Lincoln, Mercury, Ford (Ball Joint)" in Suspensions and Wheel Alignment Section.

Alignment Specifications	Lincoln	Continental
Kingpin Inclination	① 7°10'	① 7°
Caster	② 0°-Neg. 1½°	③Pos. 1°±¼°
Camber	③ 0°-Pos. ¾°	③Pos. ¾°±¼°
Toe-In	④ 1/8-3/16"	3/32-5/32"

① — With Pos. 3/4° camber.
② — Within 1/2° from one side of car to other.
③ — Within 1/4° from one side of car to other.
④ — Supersedes previous specification of 1/32-3/32".

Toe-Out on Turns — With wheels at maximum turning angle, outer wheel is at 26° and inner wheel is at 36°.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Shock Absorber Nos.	Front	Rear
Lincoln (Std.)	LD-18045-A	LD-18080-A
Lincoln (Hvy. Duty)	LD-18045-H	LD-18080-H
Continental	4048114	4048113

STEERING

►*TIRE RUBBING ON FRAME CORRECTION:* If front tires rub against frame or any other part of vehicle on a full turn, steering arm stops should be replaced with new stops, Part Nos. LD-33590-C and LD-33591-C. New stops can be identified by half-round notch located on edge of part between mounting holes.

►*LINCOLN STEERING COLUMN RATTLE CORRECTION:* Inspect upper steering column bushing and if steering column shaft-to-bushing clearance is excessive, bushing should be removed and be replaced with a spring-loaded nylon type bearing, Part No. FDT-3517-A.

Power Steering: Saginaw In-Line. *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Gear Removal: *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Sect.*

BRAKES

Bendix Hydraulic. Duo-servo with fixed anchor pins. No eccentric adjustment. Parking lever applies rear wheel service brakes.

See "Ford, Lincoln, Mercury Bendix" in Brake Section.

►*BRAKE "SQUEAL" CORRECTION:* An anti-squeal spring, Part No. 51A-1140, is available for installation on outside of brake drum.

Drums — Diameter 12"front and rear.

Wheel Cylinder Diameter — 1 3/32" (front),,15/16" (rear).

Lining — Molded type riveted to shoe.
Width — 2.5" (front), 2" (rear). **Thickness** — 7/32".

Braking Power — 55.5% (front), 44.5% (rear).
Clearance — Tighten adjusting screw about 5 or 6 clicks after wheel stops turning (shoes tight against drum), then back adjusting screw off 12 to 14 clicks.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Brake P dal Adjustm nt: Adjust eccentric bolt attaching brake pedal to master cylinder pushrod to give 1/4-7/16" free movement of pedal pad before rod moves master cylinder.

Standard Mast r Cylinder: Located on engine side of firewall.

Ch cking Fluid – Maintain fluid level to within ¼" of top of reservoir.

R moval–Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to fire wall.

P w r Brak s: Bendix Vacuum Power Unit (combination vacuum power unit and master cylinder). Unit mounted on engine side of fire wall and replaces regular master cylinder.

Se *"Bendix Power Unit" in Brake Section.*

Checking Fluid–Same as for regular master cylinder.

Removal of Power Unit–Disconnect valve pushrod from brake pedal assembly in drivers compartment. Remove master cylinder outlet fitting bolt from master cylinder.

(NOTE–It is not necessary to remove stop light switch, wires or hose assembly from outlet fitting. Do not disturb outlet fitting in master cylinder). Loosen clamp securing manifold vacuum hose to check valve on power unit. Remove hose from valve. Loosen clamp securing vacuum reserve tank hose to fitting on check valve. Remove four capscrews securing power brake assembly to bracket on dash panel and remove power brake assembly.

MISC. MECHANICAL

Windshield Wip rs: Cable operated vacuum type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Own. *See "Lincoln Air-Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Reversible type motor (mounted under seat) drives two screw type jacks (one on each side) through flexible cables. Controlled by relay and two-way switch. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: Electric type. Individual motor for vertical and horizontal adjustment. *See "P w r Seat Adjusters" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	① 75
Main Bearing Cap Bolts	95-105
Oil Pan	12-15
Flywheel	75-85
Intake & Exhaust Manifolds	23-28
Oil Pump	12-15
Oil Filter	20-25
Engine Front Cover (3/8")	23-28

①—See Cylinder Head Installation (below) for tightening procedure Three different torque applications must be made

ENGINE

ENGINE REMOVAL (LESS TRANSMISSION) · 1) Mask edge of hood, fender and cowl, place fender covers on fenders Remove capscrews that retain hinge assembly to hood, remove hood

2) Remove carburetor air cleaner, disconnect and remove battery

3) Drain cooling system and oil pan (Drain cocks in engine assembly are located on each side and to front of cylinder block)

4) Disconnect both upper and lower radiator hoses, then remove radiator (Radiator is retained by three bolts, nuts and lockwashers at each side) Remove fan assembly

5) Disconnect heater hoses at water control valve and water pump Disconnect and remove heater blower and duct assembly

6) Disconnect starter cable at starter motor (On Merc-O-Matic disconnect transmission fill tube bracket at exhaust manifold) Disconnect primary ignition wire to coil, water temperature gauge sending unit and oil pressure sender unit wires

7) Disconnect flexible fuel line at fuel pump and windshield wiper vacuum hose from vacuum booster pump If car equipped with windshield washer, disconnect and remove windshield washer

8) **On Standard or Overdrive Transmissions,** disconnect clutch pedal retracting spring and release rod from clutch release lever Disengage equalizer bar tension spring and remove equalizer bracket assembly from flywheel housing Let equalizer bar and clutch release rod hang from frame

9) **On Merc-O-Matic Transmissions,** disconnect accelerator linkage (Z-bar) at firewall and throttle valve rod at clevis (linkage remains on engine)

10) Disconnect engine ground strap at firewall

NOTE—If vehicle equipped with power brake or power steering, remove these units at this time

11) From underneath car, remove splash shield in front of linkage and the end and lower converter access covers from transmission bell housing

12) Disconnect accelerator pedal linkage at accelerator shaft

13) Remove starter assembly To remove starter, turn wheels to extreme left turn position and pull starter down between tie rods and tubular engine support crossmember

14) Disconnect generator field and ground wires from generator

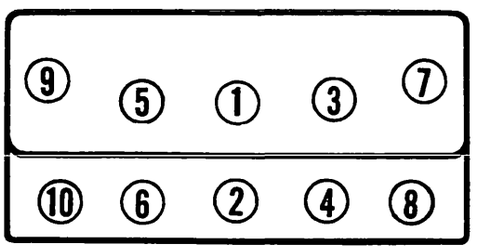
15) Disconnect exhaust manifold-to-muffler inlet pipe

16) Remove hex bolts (6) and nuts securing flex plate to converter (Merc-O-Matic only)

17) Remove capscrews (2) securing engine assembly to flywheel housing

18) Position transmission lift under transmission to support transmission while engine is out of vehicle

19) Remove capscrews (2), each side, securing engine to front engine mounts, and loosen self-locking nuts retaining engine mounts to engine front cover support



20) Inside of vehicle, pull front carpet and insulation away from floor pan and remove rubber grommets (2) covering openings to two upper capscrews securing engine assembly to flywheel housing and remove capscrews

21) Attach hoisting sling to engine, positioning sling to properly lift engine without transmission, and take up load of engine with hoist Adjust transmission lift and gently pull engine away from transmission Raise engine, carefully pull it forward and lift out of engine compartment *CAUTION*—When removing engine, be sure oil pump pickup tube and oil filter are clear of engine mount

Installation: Reverse removal procedure above

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Install pilot studs (made from cylinder head bolts with head cut off) in two end capscrew holes in block, coat NEW steel head gasket lightly with 8M-19554-A Sealer and install gasket over studs and dowels Install cylinder head assembly over studs and dowels with plugged water jacket hole to rear of engine Install cylinder head capscrews and tighten screws as follows Tighten all screws to 55 ft lbs torque, engine cold, then retighten to 65 ft lbs, with engine cold After engine assembly has been completed, run engine for a minimum of 20 minutes at fast idle and retighten all head screws to 75 ft lbs torque Use Tool S-8663-A to tighten all screws on right bank and lower screws on left bank Use Tool P-8675 to tighten screws under rocker arm on left bank

EXHAUST SIDE

MERCURY CYLINDER HEAD

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEALS: *NOTE*—Crankshaft seal is installed in groove in block and in Seal Retainer (directly behind rear main bearing) Retainer is sealed in block by special sealing strips inserted in grooves in sides of retainer after it is installed in the block

Seal Installation: With crankshaft out, install new packing in groove in block and in groove in retainer using Tool 6701-A to seat packing Cut packing off flush with surface before removing tool *(CAUTION*—do not leave frayed edges which may prevent proper seating of retainer in block) After crankshaft installed, coat retainer-to-block mating surface lightly with oil resisting sealing compound install retainer **without** side seals tighten retainer screws securely (see Seal Retainer Production Change above) Dip side seal strips in engine oil and install immediately (seals are special graphite coated rubber asbestos composition and will swell immediately on contact with engine oil) Side seals may be tapped in place with a mallet but should project approximately 050-070' below oil pan gasket surface after installation DO NOT cut off this excess length

Testing Seal Installation—Squirt engine oil along seal retainer-to-block parting line, direct compressed air nozzle at inner upper corners of retainer If air bubbles noted, remove and clean retainer thoroughly, install new side seals

CRANKSHAFT THRUST BEARING ALIGNMENT. After #1 #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert Install capscrews snug, then pry crankshaft toward rear of engine Reverse this action by prying crankshaft forward (toward front of engine) This will align thrust surfaces of both halves of thrust bearing RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 95-105 ft lbs Check crankshaft endplay which should be 002-010"

ENGINE FRONT COVER

CRANKSHAFT FRONT OIL SEAL INSTALLATION Coat seal with engine oil, place seal on Tool 6700-B Center tool and seal over inner end of bore in front cover drive seal in until it is seated

► *FRONT OIL SLINGER CAUTION* Make certain that front oil slinger, Part No. B6A-6310-B, is installed on forward end of crankshaft (in front of crankshaft sprocket) before installing Engine Front Cover.

ENGINE FRONT COVER INSTALLATION Use new gasket and position Tool 6059 on crankshaft to align cover with block before installing cover capscrews Tighten screws to correct torque (see Tightening Specifications)

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL & INSTALLATION: Camshaft can be removed WITH ENGINE IN CAR as follows

Removal· 1) Drain cooling system

2) Disconnect all fuel and vacuum lines, and accelerator linkage, on top of engine. If windshield washer installed, remove container and detachable bracket. Remove heater blower motor and duct assembly.

3) Remove accelerator shaft bracket from engine and

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

wire control shaft assembly and bracket to dash panel.

4) Disconnect upper radiator hose at water outlet connection and bypass tube from water pump. Disconnect heater outlet hose.

5) Remove Intake Manifold and gasket, remove both Rocker Arm Covers and gaskets, remove Push Rod Chamber Cover and gasket.

6) Loosen rocker arm adjusting screws to relieve tension, push rocker arms to one side and remove all push-rods.

7) Disconnect lower radiator hose and remove radiator assembly.

8) Remove generator belt, fan assembly, spacer, and water pump pulley. *NOTE* - If Power Steering installed, remove pump belt, detach pump from engine without disconnecting hoses, place assembly out of the way on fender apron.

9) Remove crankshaft damper with puller (Tool 6316-FF). Remove Water Pump, Timing Indicator, Fuel Pump, Generator and bracket.

10) Remove oil pan and gasket.

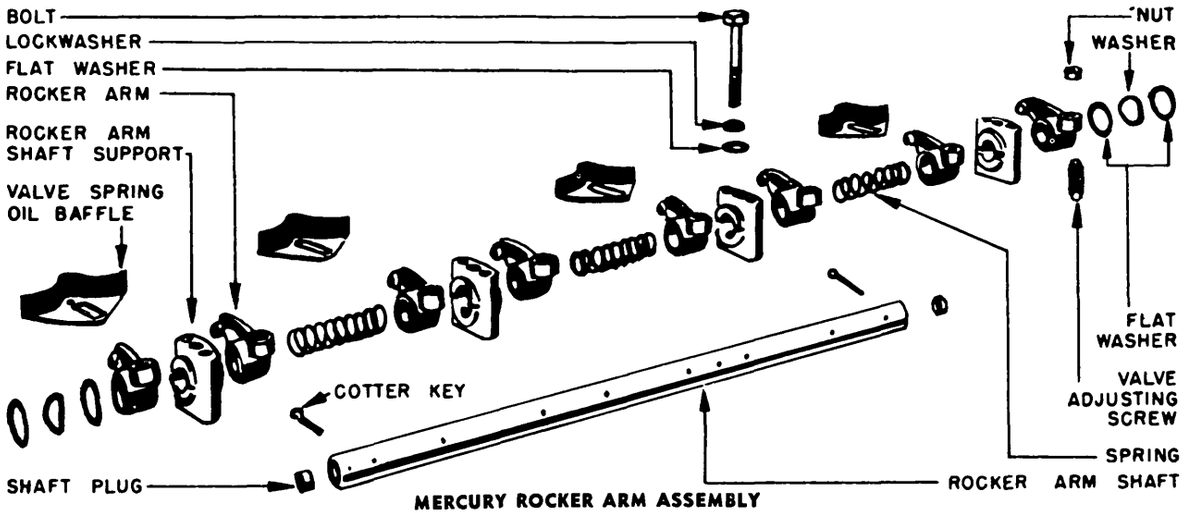
11) Remove Engine Front Cover using care not to damage crankshaft front oil seal. Remove woodruff key and front oil slinger from crankshaft.

12) Remove capscrew from end of camshaft, remove flat washer, spacer, fuel pump eccentric, and counterweight from end of shaft.

13) Remove both sprockets and timing chain as a unit.

14) Remove distributor from engine block. Remove hood lock dowel support, front fender apron, and radiator support tie bar.

15) Block all valve lifters in upper position to clear camshaft lobes (*NOTE* - Spring type clothespins can be used for this purpose by cutting nose of pins down to thickness of 3/16").



16) Remove camshaft thrust plate, woodruff key and spacer.

17) Withdraw camshaft through front of engine. *CAUTION - Use extreme care not to allow camshaft lobes to strike or damage bearings as shaft is withdrawn.*

Installation: Reverse removal procedure and note the following points: Install camshaft spacer with large inside chamfer toward front camshaft journal. Tighten all screws and bolts to specified torque (see Tightening Specifications). Check Camshaft endplay after assembly completed.

CAMSHAFT BEARING REMOVAL & INSTALLATION: **Removal**—Remove camshaft and drill a ½" hole through plug at rear bearing bore and remove plug. Remove bearings from block with Camshaft Bearing Remover & Installer 6261-C and adapter pilots 6261-F.

Installation—Install bearings with same tool used for removal making sure that oil holes in bearings are in line with holes in cylinder block web. Notch on edge of bearing should face front of engine at bottom of bore. *(CAUTION*—#1 camshaft bearing must be at least .005" and not more than .020" below front face of bearing bore in cylinder block. Install bearings with oil hole in line with oil hole in cylinder block web and notch on edge of bearing facing front of engine at bottom of bore

MERCURY ROCKER ARM ASSEMBLY

VALVE SYSTEM

EXHAUST VALVE STEM DIAMETER CHANGE FOR INCREASED STEM CLEARANCE (1954-56 Engines): Exhaust valve stem diameter was decreased .0005" to provide increased stem to guide clearance. These valves furnished for service on 1954-56 engines as follows:

1954-56 Exhaust Valves

Size	Stem Diameter
Std. (Red)	.3400-.3405"
Std. (Green)	.3405-.3410"
.003" Oversize	.3430-.3440"
.015" Oversize	.3550-.3560"
.030" Oversize	.3700-.3710"

OVERSIZE VALVE STEM INSTALLATION: Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems. Reamers are furnished in .003", .015", .030" oversizes. Pilots are Std., .003", .015". Use reamers in sequence with correct pilot when reaming from standard to oversize. Regrind valve seats after reaming guides.

INITIAL VALVE CLEARANCE: To insure valve being on low side of the cam, make all adjustments in the following sequence and with No. 1, 3, & 4 pistons in the indicated position:

No. 1 Piston at TDC (Compression Stroke)—Adjust No. 1 Intake & Exhaust, No. 2 Intake, No. 4 Exhaust, No. 5 Exhaust, and No. 7 Intake.

No. 4 Piston at TDC (Compression Stroke)—*(NOTE —Rotate engine 180° from the point where No. 1 piston is at TDC).* Adjust No. 6 Exhaust, No. 4 Intake, No. 8 Exhaust, No. 5 Intake.

No. 3 Piston at TDC (Compression Stroke)—*(NOTE —Rotate engine 270° from the point where No. 4 piston is at TDC).* Adjust No. 2 Exhaust, No. 3 Intake & Exhaust, No. 6 Intake, No. 7 Exhaust, No. 8 Intake.

►*CAUTION*—Final tappet adjustment is made after engine assembly is completed and with engine at normal operating temperature. The final setting is .019".

VALVE SERVICING: Valves are "Rotatable" type operating directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal—Use Tool 6513-EE to compress valve springs, remove valve spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.

Valve Assembly Installation—Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

ROCKER ARMS

SELF-LOCKING VALVE TAPPET ADJUSTING SCREWS (1956 Production Change): "Self-Locking" adjusting screws used with new type rocker arms on later 1956 engines. Torque specification for new self-locking screws is 7-15 ft. lbs. This torque decreases with each valve adjustment and **rocker arms should be replaced when torque decreases to 3 ft. lbs.**

►*INSTALLATION OF SELF-LOCKING TAPPET ADJUSTING SCREWS IN EARLIER ENGINES (1954-56):* When installing self-locking screws to replace earlier type (with locknut), all parts listed below must be installed as a unit:

1956 Engines – Self-locking Tappet Adjusting Screws Part No. B6A-6549-C AND Valve Rocker Arms Part No. B6A-6564-C.

1954-55 Engines – Self-locking Tappet Adjusting Screws Part No. B6A-6549-C must be used with NEW Valve Rocker Arms Part No. B6A-6564-D and NEW Valve Push Rods Part No. B6A-6565-B.

ROCKER ARM SERVICING: Disassembly—Remove assembly from head by taking out rocker arm shaft bracket retaining screws. Remove cotter pins at each end of rocker arm shaft and remove flat wash-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ers and spring washers. Slide rocker arms, springs, and washers off shaft *(Be sure to identify each part for assembly in same position)*. Pull oil tube out of end rocker arm support to remove shaft from support.

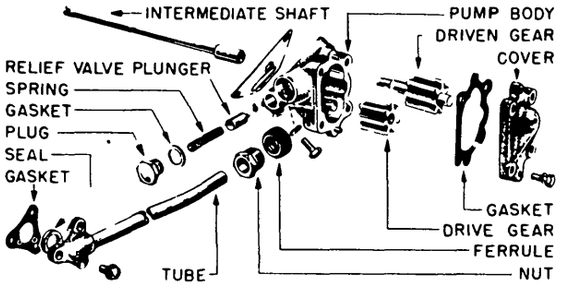
Rocker Arm Shaft Assembly—Oil moving parts with engine oil. Install a plug at each end of shaft. **Do not peen plugs to make them tight.** Assemble rocker arm shaft parts in order shown in illustration. Install oil outlet tube in end of rocker arm support and make certain end of tube enters hole in shaft. Tighten rocker arm shaft support-to-cylinder head bolts to 12-15 ft. lbs. torque. Install rocker arm covers and tighten hold down bolts finger tight after making preliminary valve adjustment. Make final adjustment after engine warmed up to normal operating temperature. Install new gaskets (cement to cover only), install cover, and tighten hold down bolts to 2-2½ ft. lbs. torque.

OILING SYSTEM

OIL PUMP

GEAR TYPE OIL PUMP

OIL PUMP: Gear type pump mounted on left hand side of engine crankcase and driven by intermediate shaft from distributor shaft. Pressure relief valve in oil pump housing.



Removal: Remove oil pump inlet pipe. Remove capscrews and lockwashers securing pump to engine block. Remove pump and gasket, and the intermediate shaft (if shaft comes out with pump).

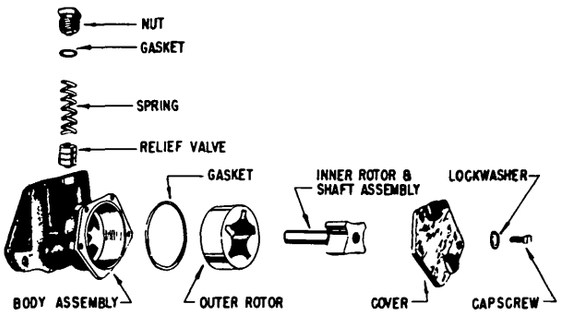
Disassembly: Remove capscrews retaining pump cover to body and remove cover plate and gasket. Do not tap pump drive shaft to drive cover off pump. Remove oil pump gear and shaft assembly and oil pump idler gear. Remove oil pressure relief valve plug, gasket, spring and plunger.

Inspection: Check oil pump housing for cracks or wear. Pump shaft should have a free running fit without excessive play in pump housing (clearance is .0015-.0029" upper end, and .001-.002" lower end). Check pump gear teeth for scratches and wear. Check compression of relief valve spring which should be 10.86 lbs., at 1.40". Replace any worn or defective parts. Short end of drive gear should be .490-.510". If not within limits replace drive shaft to insure proper engagement of distributor shaft and intermediate shaft hex when distributor installed on engine.

Reassembly: Oil all parts thoroughly. Install oil pressure relief valve plunger, spring, and cover plug and gasket. Install idler gear and oil pump gear and shaft assembly. Install cover plate with new gasket, and tighten cover plate screws to 12-15 ft. lbs. torque.

Installation: Reverse removal procedure using a new gasket between pump mounting flange and engine.

GEAR TYPE OIL PUMP



ROTOR TYPE OIL PUMP

Removal: Disconnect external oil line. Remove attaching capscrews (two from bottom, one from above). Remove pump and intermediate shaft.

Disassembly: Remove capscrew securing cover to body assembly. Remove cover and "O" ring gasket. Remove rotor and shaft assembly. Remove relief valve nut, spring and relief valve.

Inspection: Clean all parts in suitable solvent. Check pump housing and rotors for damage and excessive wear. Check compression of relief valve spring which should be 9.2-10.4 lbs. at .80". Check relief valve clearance in body assembly. Measure outer rotor race to body clearance. Clearance should be .006-.009". With rotor and shaft assembly installed in housing, place straightedge over rotor assembly and pump body. Measure clearance between straightedge and pump at rotor. Clearance should be .001-.0035". Check cover for wear, and if scored or grooved, replace it. Drive gear shaft length should be 3.36-3.38" from rotor assembly face to shaft end. NOTE - Outer rotor and shaft and rotor assembly are replaced as a unit.

Reassembly: Reverse disassembly procedures. Check assembled pump to see that it rotates without bind.

ROTOR TYPE OIL PUMP

OIL FILTER

OIL FILTER SERVICING: Filter is full-flow type and should be replaced at 4000-5000 mile intervals (or more often if required by operating conditions).

►***REPLACEMENT CAUTION:*** Use Replacement Kit, Part No. HCK-6731-A, which includes correct Filter Element and NEW GASKETS WHICH MUST BE USED.

Filter Removal: Take out center bolt in filter cover, remove filter assembly. Remove and discard cover mounting gasket from filter mounting pad, remove and discard filter element. Remove and discard neoprene gasket from center bolt, remove center bolt from cover, remove and discard fibre center bolt-to-cover gasket. Wash all parts and filter pad on block with solvent and make certain they are clean.

Filter Installation: Install NEW fibre gasket on center bolt, install bolt in cover, install spring and seat assembly on bolt with open end of seat toward cover *(CAUTION—Seat must be attached to spring by tangs)*. Install NEW neoprene gasket on center bolt next to spring seat, install filter element. Install NEW filter mounting gasket in block recess *(CAUTION—DO NOT use sealing compound on this gasket)*. Install filter element on engine, making sure that filter is seated in recess and not "cocked" over recess of shoulder. Tighten center bolt just enough to bring case up against gasket, rotate housing slightly to seat evenly, then tighten center bolt to 20-25 ft. lbs. torque. *CAUTION*—DO NOT overtighten the bolt which may strip threads, distort cover, or cause leaks. After engine started up allow it to idle until lubrication established and normal oil pressure secured, then speed up engine and check for oil leaks. ***NOTE—An adapter is provided in cylinder block which can be easily replaced in case of stripped threads.***

►*SPECIAL "M-260 ENGINE" NOTE:* This engine is optional equipment and has the following principal components which are special Cylinder Heads, Intake Manifold and Carburetors (two 4-barrel), Camshaft, Valve Train (Lifters, Pushrods, Springs), Fuel Pump Distributor, Spark Plugs, and other small parts. All parts required for conversion of standard engine to this "M-260" are furnished in Optl Engine Kit No MGK-66005-AA

►*1956 AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning S rvice Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to left front body pillar extension.

First Number–10001 Up.

►*SERIAL NUMBER NOTE Serial number (example #56ME10001M#) includes following identification data in sequence.*

Year	Assembly Plant	Serial No.	Eng. Type
56	See Below	.10001	M

Assembly Plants– Indicated in serial number by the following codes: **LA**–Los Angeles. **ME**–Metuchen. **SL**–St. Louis. **WA**–Wayne.

ENGINE IDENTIFICATION: Five different engines used. Engines can be identified by cylinder head identification letters (stamped or cast on outer side of cylinder head between spark plugs and exhaust ports) and color of component parts as follows:

Engin HP & Compr. Ratio	Cyl. Head Ident.	Carb. Type	Air Clnr. Color	Valve Cover
210 HP(8.0-1)	ECZ-A	Holley	Red	Red
215 HP(8.4-1)	ECZ-B	Holley	Red	Red
225 HP(9.0-1)	ECZ-C	①	Blue	Blue
235 HP(9.0-1)②	ECZ-C	①	Blue	Silver
260 HP(9.75-1)		Holley (Two)		

①—Holley or Carter Carburetor.

②—235 HP replaced 225 HP engine beginning engine date code 162V as a result of camshaft production change. *See "Camshaft Production Change" under CAMSHAFT below.*

TUNE-UP

COMPRESSION PRESSURE: (8.0-1 Eng.) 155 lbs.,(8.4-1 Eng.) 160 lbs., (9.0-1 Eng.) 165 lbs. plus or minus 10 lbs. at cranking speed.

VACUUM READING: 19-20" at 475-500 RPM in neutral.

TAPPET CLEARANCE: (Exc. M-260) .019" (Final HOT), Intake & Exhaust. (M-260). .018" (Final HOT), Intake & Exhaust.

►*TAPPET CLEARANCE ADJUSTING SCREW NOTE: "Self-locking" screws used on later cars. See "Valve System" in Mercury Special Data.*

Initial Valv Tappet Clearance Adjustment – *See "Valve System" in Mercury Special Data.*

MANIFOLD HEAT CONTROL: Butterfly type valve mounted between right hand manifold and exhaust pipe (Single & Dual exhaust systems). When installing, make certain counterweight is toward right front.

►*DUAL EXHAUST NOTE:* When valve closed, all exhaust gases are discharged through left hand exhaust pipe.

IGNITION

►*IGNITION FAILURE CORRECTION: Intermittent or* complete ignition failure can result if distributor primary wire is improperly welded to terminal lugs (insulated wire leads from terminal on distributor housing to breaker point terminal). In some cases terminal wires are crimped to wire insulation but not at all or partially welded to wire.

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinders–RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.

SPARK PLUG GAP: 032-036" (exc M-260), 023-028" (M-260 Engine)

Spark Plug–Champion 870. 18mm.

►*SPARK PLUG CAUTION.* Spark plug has tapered seat and does not require a sealing gasket It is important that plugs be tightened within limits of 15-18 ft. lbs.

►*SPARK PLUG MISFIRE CORRECTION:* If misfire occurs at either No. 8 or No. 6 cylinders, interchange position of No. 6 and No. 5 wires in all insulator blocks.

COIL: Mercury No. B6A-12029-B. *12 Volt.*

Ignition Current–2.5 amps. idling, 4 5 amps. stopped.

Resistor–Mercury No. B6A-12250-B. On bracket attached to top of coil.

►*COIL RESISTOR NOTE* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Mercury No. B6A-12127-D (exc. M-260), FDS-12127-E (M-260 Engine). *12 Volt.* New double-diaphragm, pressure type with separate vacuum lines to manifold and carburetor

►*SHORTING OF DISTRIBUTOR TERMINAL PRIMARY WIRE ASSEMBLY CORRECTION:* Screws which secure identification plate to housing extend inside housing and penetrate primary wire insulation, grounding wire. Sharp points should be ground or filed off, replace damaged wire.

Condenser–Mercury No. FAB-12300-A. **Capacity** .21-.25 microfarad.

Contact Point Set–Mercury No. FAB-12171-B.

Breaker Gap–.014-.016'.

Cam Angle–26-28.5°.

Breaker Arm Spring Tension–17-20 ozs.

Rotation–Counter-clockwise viewed from above.

Advance Performance–B6A-12127-D

►With Distributor on Test Stand

Distr. Degrees Plus or Minus ½'	Vacuum (" of HG)	Distr. RPM
0-1	29	400
5½-6½	.88	800
8½-9½	1.27	1200
11-12	1.73	1600
13-14¼	2 19	2000

►*DISTRIBUTOR INSTALLATION NOTE* It may be necessary to crank engine slightly if distributor is not seated properly in cylinder block. Crank engine, while holding distributor down, until intermediate shaft is engaged and distributor drops into place.

Initial Distributor Timing: Remove No. 1 spark plug. Hold thumb over spark plug hole until piston starts up on compression. Slowly "bump" engine over with starter until timing mark is aligned with pointer. Find No. 1 spark plug socket in distributor cap and fit fit distributor cap to distributor housing. Mark distributor housing to indicate No. 1 spark plug wire position. Position rotor approximately 20° counter-clockwise from mark made on distributor housing. Engage distributor drive gear and install distributor in engine.

IGNITION TIMING

Engine	① Std. Setting
With Synchro-mesh or Overdrive	3° BTDC
With Merco-Matic Trans	6° BTDC
"M-260" Engine	12° BTDC

①–With engine idling at 475 RPM and the PRIMARY (inner diaphragm) vacuum line disconnected. *See Initial Distributor Timing above. NOTE*–Maximum recommended initial timing for Standard and Overdrive Transmissions is 6° BTDC.

Timing Mark–Crankshaft pulley is marked at TDC, 10° BTDC, and 20° BTDC, with marks at 2° increments between. Pointer should line up with third mark (6°) on vehicles equipped with automatic transmissions, and half-way between first and second marks (3°) on vehicles equipped with standard transmissions.

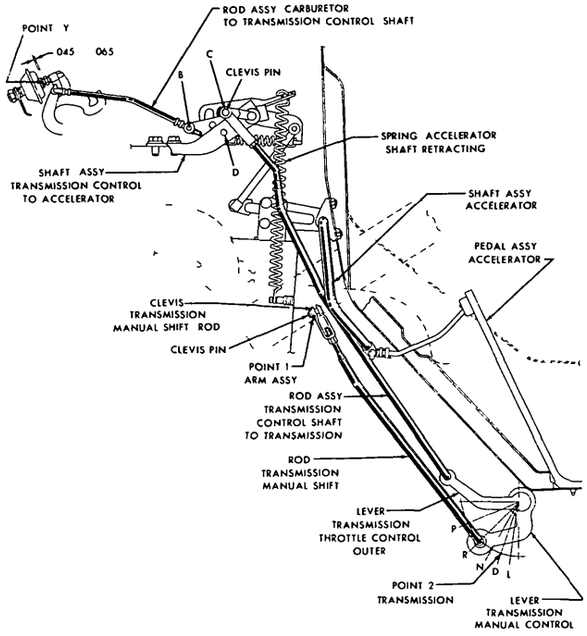
CARBURETOR

►*CARBURETOR APPLICATION NOTE: All carburetors are 4-barrel type. Holley used on 210 & 215 HP Engines, Holley or Carter WCFB used on 225 & 235 HP Engines. TWO Holley carburetors used on special M-260 engine.*

►*HOLLEY CARBURETOR PRODUCTION CHANGES AND RECOMMENDED CHANGES FOR IMPROVED CHOKE OPERATION & HARD STARTING CORRECTION: See "Holley (Ford, Lincoln, Mercury) 4-Barrel Centri-Quad" in Carburetion Section.*

►*AUTOMATIC CHOKE STICKING (Hard Starting, Stalling, Poor Gas Mileage, or Backfiring when cold): May be caused by breakage of Fresh Air Heat Tube in manifold. For installation of tube, see "Ford, Lincoln, Mercury 4-Barrel Centri-quad" in Carburetion Section.*

►*IMPROPER UNLOADER ACTION (MERCOMATIC CARS):* May be caused by transmission control-to-accelerator bellcrank-to-lever spring of less than required load resulting in choke valve not opening sufficiently to unload carburetor. Replace spring with spring Part No. MC-7345B (painted Yellow). *NOTE* - This condition may also cause transmission to downshift prior to reaching detent position during heavy throttle operation.

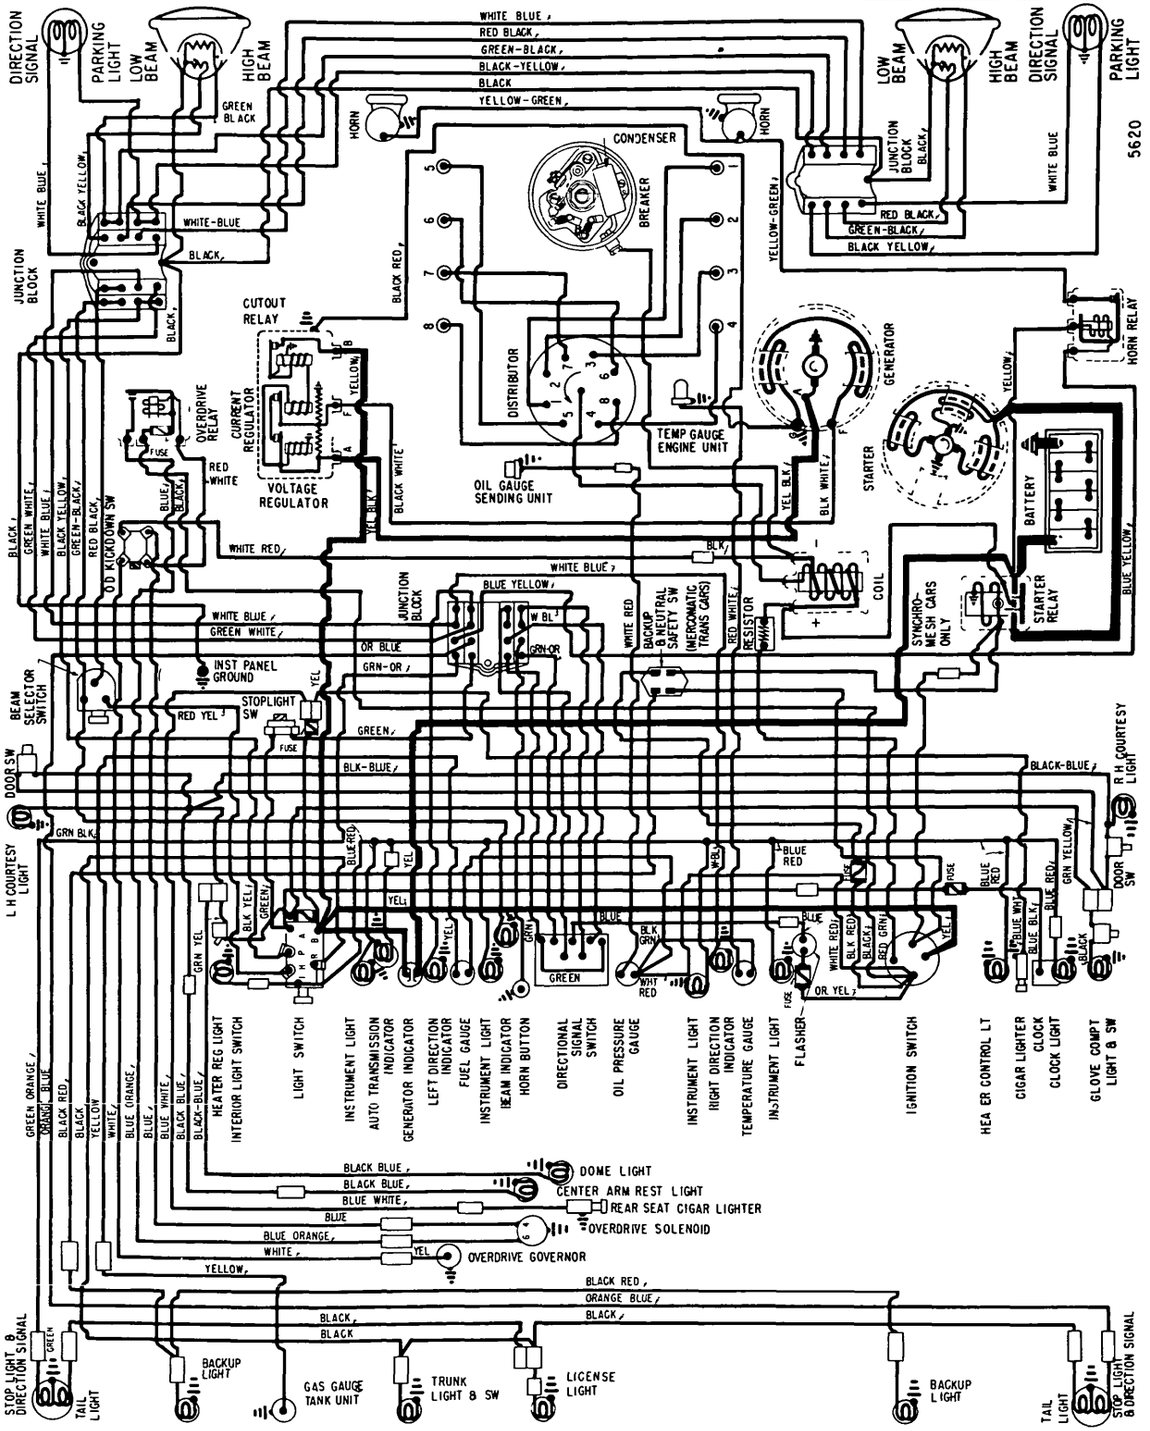


►*IDLE SPEED (AIR CONDITIONED CARS).* Automatic throttle control is incorporated on air conditioned cars and is adjusted as follows With engine warm, air conditioning system operating, and transmission in neutral, adjust knurled nut at end of operating rod of the control assembly to obtain an idle speed of 800 RPM, tighten locknut. Check idle to make sure that it returns to normal whenever air conditioning is turned off or the transmission is shifted out of neutral.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*CARBURETOR THROTTLE LEVER BINDING OR STICKING CORRECTION:* To correct, drive choke fresh air tube into manifold fitting until it bottoms. If this does not correct condition, remove choke fresh air tube and cut approximately ¼" from manifold end of line to provide sufficient clearance for throttle lever. Remove burrs from end of line before installing in manifold fitting.



►*COLD HARD STARTING CORRECTION (Early Cars):* A few early Holley Carburetors built before 3rd week in September, 1955 (date code is shown on accelerator pump tower of float bowl cover—Example: 5-9-3 means 1955, September, 3rd week). To correct this condition, turn automatic choke cover clockwise three (3) additional notches.

MERC-O-MATIC THROTTLE LINKAGE

Throttle Linkage Adjustment (Merc-O-Matic Cars). Set hand brake and adjust engine idle to 425 RPM with engine at normal operating temperature and transmission "DR" range. Adjust anti-stall dashpot (see below). Disconnect clevis pin from transmission control-to-accelerator shaft and transmission control shaft-to-transmission rod assembly. Disconnect carburetor-to-transmission control shaft rod at carburetor. Insert gauge pin through bellcrank and bracket in transmission control-to-accelerator shaft assembly. Set carburetor at low idle manually. Adjust carburetor-to-transmission control rod assembly so that with trunnion pin in place at rear end of rod, trunnion pin at carburetor end

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

will go in freely. Assemble in this position. With gauge pin locking bellcrank, pull upward gently but firmly on transmission control shaft-to-transmission rod assembly. This will position the throttle lever in the stop position at the transmission. Adjust clevis at upper end of transmission control shaft-to-transmission rod assembly so that clevis pin enters clevis and lever on transmission control-to-accelerator shaft assembly freely. Lengthen transmission control shaft-to-transmission rod assembly by turning clevis 3 full turns counter-clockwise and assemble in place. Remove gauge pin.

Dashpot Adjustment: Turn throttle lever set screw out until dashpot plunger bottoms, then back it off to give .045-.064" clearance between end of screw and plunger.

HOLLEY 4-BARREL

M rcury No. B6A-9510-L, M, N, Q. 4-Barrel carburetor with integral automatic choke. *M-260 NOTE* - Two 4-Barrel Carburetors, Part No. EDB-9510-C, used.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8. LEFT barrels 1-4-6-7.*

Idl Setting—Preliminary setting 1¼ turns open (set both screws alike). With engine at normal operating temperature, turn one screw at a time out until engine begins to roll from richness, then turn screw in just enough to provide smoothest idle performance.

Idl Sp d—475-500 RPM (Std. & O.D.); 425-450 RPM (Merc-O-Matic), in "DR" position.

Throttle Linkage Adjustment (Merc-O-Matic Cars): *See CARBURETOR abov .*

►*OTHER DATA: S "Ford, Lincoln, Mercury 4-Barrel Centri-quad" in Carbur tion Section.*

Fuel Pump Pressure: 3½-5½ lbs. at 500 RPM.

CARTER WCFB 4-BARREL

Cart r N . 2361S, SA (Merc-O-Matic Cars). 4-Barrel, downdraft type with automatic choke. *NOTE* - Carburetor is Mercury No. ECZ-9510-D.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting—Preliminary setting 1¼ turns open (set both screws alike). With engine at normal operating temperature, set idle speed (see below). Turn one one screw at a time out until engine begins to roll from richness, then turn screw in just enough to provide smoothest idle performance.

Idl Spe d—425-450 RPM, with selector lever in "DR" position.

Throttle Linkage Adjustm nt (Merc-O-Matic Cars): *See CARBURETOR above.*

►*OTHER DATA: See "Carter WCFB 4-Barrel" in Carbur tion Section.*

Fu l Pump Pr ssure: 3½-5½ lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Mercury No. B5A-9350-D. Fuel & Vacuum.
Pr ssure – 3½-5½ lbs. at 500 RPM.
Se "Fuel Pumps" in Carbur tion Section.
Gas lin Gauge: King-Seeley Electric type.
Dash Unit – Mercury No. FDT-9280-A.
Tank Unit – Mercury No. B6A-9275-B (Sta. Wgn.), B6A-9275-C (Others).
See "Fuel Gauges" in Carburetion Section.

BATTERY

Mercury No. FDT-10655-C. *12 Volt,* 11 plate, 55 ampere hour capacity (20 hr. rate), **or FDU-10655-C.** *12 Volt,* 13 plate, 65 ampere hour capacity (20 hr. rate).
Battery Ground – Negative, to engine block.
►*CAUTION – This is reversed from previous models.*
Engine Ground – Cylinder head to dash.

STARTER

Mercury No. B6A-11002A. *12 Volt.* **Armature** B6A-11005-A.
►*NOISY STARTER MOTOR (Merc-O-Matic with Steel Torque Converter):* May be caused by starter motor seal, No. EBU-6436B, improperly installed or cocked.
Drive – Mercury No. 1CM-11350-C. Bendix "Folo-Thru".
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 48-56 ozs.
Cranking Speed – 150-180 RPM with warm engine.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4800 max.	12.0	100-120
	150-180 Ⓒ	8 or more	210 max.

Ⓒ – Cranking speed with warm engine.

Starting Switch: Relay, Part No. B6A-11450-A, controlled by Ignition and Starter Switch, Part No. B5A-11572-A, and Merc-O-Matic Neutral Safety Switch located on steering column.
►*SELF-STARTING OF ENGINE OR CONTINUOUS OPERATION OF BACK-UP LIGHTS:* May be caused by contact fingers of Neutral Switch Terminal Block touching brass strip on insulator assembly. Correct by installing new Neutral Switch Insulator Assembly No. FDK-15827-B (same number as original type) with two .020" high ridges on each side and parallel to brass strip.
Merc-O-Matic Neutral Safety Switch Adjustment: *See "Fordomatic & Merc-O-Matic" in Transmission Section.*

GENERATOR

Mercury No. B6A-10002-A. *12 Volt.* **Armature** B6A-10005-A.

Performance Data

Amperes	Volts	Gen. RPM
30	15	Ⓒ 2500

Ⓒ – At 1500 Engine RPM.
Brush Spring Tension – 26-34 ozs.
Field Current – 1.5-1.6 amps. at 15 volts (Hot).
Rotation – Counter-clockwise at commutator end.
Belt Adjustment: Approximately ½" deflection on belts midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Mercury No. 36A-10505-A. *12 Volt.*
►*SETTING NOTE:* Settings are for regulator at NORMAL OPERATING TEMPERATURE (after running engine for 20 minutes at 1500 RPM if started cold, or until temperature gauge is steady for 5 minutes if engine previously warmed up) with room temperature at 75° F.

Cut ut Relay

Cuts In – 12.0-12.8 volts.
Cuts Out – 2.0-6.0 amps. (reverse current).

Voltage Regulator

S tting – 14.6-15.4 volts.
Ch cking & Adjusting – *S e El ctrical S ction.*

Current Regulator

Setting – 2&32 amperes.
Checking & Adjusting – *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signals: *See Electrical Section.*
Automatic Headlight Dimmer: *See Electrical Section.*
Lighting Switch Removal: With control knob in "OFF" position, press spring release button on switch housing, turn shaft slightly and pull knob and shaft out of switch. Remove screw assembly from inside bezel. Remove bezel, spacer, then remove switch from behind dash panel.
Stop Light Switch Location: On forward end of brake master cylinder (integral with power brake unit). Master cylinder or power brake unit located on firewall in engine compartment.
FUSES: Interior Lights – SFE 7.5 amps. On light switch.
Turn Signals – SFE 7.5 amps.
Heater Blowers – SFE 14 amps.
Radio – SFE 7.5 amps.
Clock – AG 1 amp.
Cigar Lighter – AGC 15 amps.
Overdrive – AGC 15 amps.
Windshield Washer – SFE 7.5 amps.
Back-Up Lights – SFE 7.5 amps.
Spotlight – SFE 7.5 amps.
Glove Box Light – SFE 7.5 amps. (on interior light circuit).
Automatic Headlight Dimmer – AGC 3 amps.
Multi-Luber – SFE 7.5 amps.
CIRCUIT BREAKERS: Lighting – On headlight switch. Combination headlight switch, circuit breaker and fuse assembly. One circuit breaker protects headlight circuit and second circuit breaker protects auxiliary lights. Fuse protects interior lighting circuit.
Windows & Seats – One 15 ampere circuit breaker for each window motor. One 15 ampere circuit breaker common to both seat motors.
Convertible Top – 30 ampere circuit breaker.
Underhood Lights – 12 ampere circuit breaker.
Air Conditioning – 15 ampere circuit breaker. *NOTE* - 20 ampere circuit breaker should be used if temperatures extremely high. Replace blower switch feed wire from 18 to 16 gauge.
HORNS: Dual horns operated by relay.

Type	High Pitch	Low Pitch
Sea Shell	B5T-13832-B	B5T-13833-B
Trumpet	FDT-13832-B	FDT-13833-B

Horn Relay – Mercury No. 2Q-13853-A.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care before disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

ENGINE SPECIFICATIONS: 90° V8 (All Models). *S "Engin Id ntification" Not " und r MODEL IDENTIFICATION abov .*

CONTINUED FROM PRECEDING PAGE

Engin	Bore	Strok	Displac m nt
All	3.80"	3.44"	312 cu. ins.
Engine	**Compr. Ratio**	**Rated HP**	**Developed HP**
ECZ-6007-F	8.0-1 ①	46.2	210 at 4600 RPM
ECZ-6007-F	8.4-1 ②	46.2	215 at 4600 RPM
ECZ-6007-F, G④	9.0-1 ③	46.2	225 at 4600 RPM
ECZ-6007-F, G④	9.0-1 ③	46.2	235 at 4600 RPM
M-260	9.75-1	46.2	260

① – Head marked "ECZ-A".
② – Head marked "ECZ-B".
③ – Head marked "ECZ-C".
④ – ECA-6007-F (Holley Carb.), ECZ-6007-G (Carter).

Compression & Vacuum Reading – *See TUNE-UP above.*

CYLINDER HEAD: *See "Cylinder Head & Manifold in Mercury Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Mercury Special Data.*

ENGINE REMOVAL: *See "Engine" in Mercury Spec. Data.*

OIL PAN REMOVAL: Remove oil inlet pipe hex fittings at oil pump and side of oil pan, remove pipe. Remove oil pan capscrews, then remove oil pan and gasket.

NOTE - When this operation is performed, turn crankshaft until rear counterweights of crankshaft are up. The oil pan can then be removed from front of engine.

PISTONS

Aluminum alloy, Autothermic, solid skirt type with three rings above pin. *NOTE* - Pin is offset in piston.

► *ORIGINAL BORE & PISTON SIZES:* Std. cylinder bore limits are 3.8000-3.8024" and TWO Std. pistons used for selective fitting as follows: 3.7993-3.7996" Diam. (marked "2" on dome), and 3.8005-3.8008" Diameter (marked "6" on dome). *NOTE* - Std. piston furnished for service in these two sizes.

Removal – Pistons and rods removed from above.

Fitting New Pistons: Use 1/2" wide feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows.

New Piston in New Bore–.0015" feeler. 5-10 lbs. pull.
New Piston in Used Bore–.002" feeler. 5-10 lbs. pull.
Used Piston in Used Bore–.0025" feeler. 5-10 lbs. pull.

Replacement Pistons: Standard (Two sizes - see Original Bore & Piston Sizes above), .0225", .0325", .0425" Oversize. Pistons are furnished with fitted pins.

Installing Pistons: Indentation or notch on top of piston must face toward front of engine. *See Rod Installation.*

PISTON PINS

Clearance in Piston – .0001-.0003" loose. Select fit. Service maximum - .0008".

Clearance in Rod – .0001-.0003" loose. Select fit. Service maximum -.0008".

Replacement Pins: Std. (Green), .001" O.S. (Blue), .002" O.S. (Yellow).

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1)	5/64"	.012-.029"	.006" max.
Compr. (2)	3/32"	.012-.019"	.006" max.
Oil (3)	3/16"	.015-.029"	①

① – Side sealing type ring

SPACING NOTE – Ring gaps should be placed 120° apart, with oil ring gap positioned so it will be on inside of "V" (high side of cylinder bore).

Replacement Rings: Standard size, .020", .030", .040" Oversize.

CONNECTING RODS

► *ROD INSTALLATION CAUTION: Previous installation procedures have been superseded. See "Installing Rods" below.*

Journal Diameter – 2.1880-2.1884" (Color coded BLUE), 2.1884-2.1888" (Color coded RED). Use with bearing of same color.

Out-of-Round Limit – .0005". **Taper Limit** - .001".

Lower Bearing – Steel backed, copper lead lined. Upper and lower halves interchangeable.

Clearance – .0008-.0027". Service Limit .0037".

Side Clearance – Service maximum .019" (two rods).

Replacement Bearings: Standard (two sizes color coded RED and BLUE for selective fitting), .010", .020", .030" Undersize.

Installing Rods: Assemble rods to pistons with oil squirt hole in lower end of rod toward right (right bank rods numbered 1-2-3-4), toward left (left bank rods numbered 5-6-7-8) with indentation on piston head toward front of engine (all pistons). Install piston and rod assemblies in engine with numbered side of rod and bearing cap together, facing toward outside of block, and in same numbered cylinder.

CRANKSHAFT

► *1956 CRANKSHAFT PRODUCTION CHANGE (To minimize oil leaks at front and rear oil seals):* New crankshaft, No. B6A-6303C, used with separate Front Oil Slinger, No. B6A-6310B. Slingers will divert oil away from seals. *1955 NOTE* - Same design crankshaft, No. B6A-6303D, furnished for installation in 1955 cars with same Front Oil Slinger, No. B6A-6310B.

Journal Diameters – 2.6235-2.6239" (Color coded BLUE), 2.6239-2.6243" (Color coded RED).

Out-of-Round Limit – .0005". **Taper Limit** – .001".

Bearings – Steel-backed, copper lead lined.

Clearance – .0008-.0026". Service limit .0036".

Replacement Bearings: Std. size (two sizes color coded RED and BLUE for selective fitting), and .010", .020", .030" Undersize.

End Thrust: Taken by No. 3 main bearing.

Thrust Bearing Alignment – *See "Crankshaft & Main Bearings" in Mercury Special Data.*

Endplay – .010" maximum.

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Mercury Special Data.*

Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Mercury Special Data.*

CAMSHAFT

► *CAMSHAFT PRODUCTION CHANGES:* Four different camshafts used in production and can be identified as follows:

Engine	Camshaft No.	① Identification
Early Engines (All)	B6A-6250B	ECK
Later 210 & 215 HP	B6A-6250C	ECZ
First 235 HP	EDB-6250B	② ECK
Later 235 HP	EDB-6250C	③ ECK

① – Cast in shaft.
② – Letter "E" stamped on hub end also.
③ – Letter "C" stamped on hub end also.

See "Valves" & "Valve Timing" below for camshaft differences.

Journal Diameter – 1.9255-1.9265".

Clearance – .001-.006".

End Thrust: Taken by thrust plate on forward end (between camshaft sprocket and shoulder on block).

Endplay – .003-.012".

Replacement Camshaft Bearings: Finished bearings furnished Standard size, .015" Undersize. *CAUTION– Oil holes in bearings must be lined up correctly. See "Camshaft & Bearings" in Mercury Special Data.*

Camshaft Bearing Removal & Installation: *See "Camshaft & Bearings" in Mercury Special Data.*

Timing Chain: Side-guide type. Length 56 links.

►*REPLACEMENT NOTE:* Replace timing chain and sprockets when deflection on shaft side exceeds 1/2" (take up all slack on driving side, measure slack on opposite side). Remove and install chain "endless" as a unit with both sprockets.

Camshaft Setting: Marks on both sprockets should be aligned with similarly marked links on timing chain with both marks toward **I ft** side of engine (at 3 o'clock facing front of engine after installation made).

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Mercury Special Data.*

Timing Chain Cover Seal Installation (Crankshaft Front Oil Seal): *See "Engine Front Cover" in Mercury Special Data.*

VALVES

► *EXHAUST VALVE STEM DIAMETER CHANGE:* Later production exhaust valves have .0005" smaller stem diameter for increased stem clearance. *See "Valve System" in Mercury Special Data.*

► *VALVE PUSHROD REPLACEMENT CAUTION:* 1956 valve pushrods are shorter than 1954-55 pushrods (similar in appearance) and must not be interchanged. 1956 rods can be identified by two parallel radial ridges on outside of adjusting screw socket end and length of 7.98" plus or minus .010" (1954-55 rod length is 8.11" plus or minus .010").

Tappet Clearance: (Exc. M-260) –.019" (Final HOT), Intake & Exhaust. (M-260) .018" (Final HOT), Intake & Exhaust.

► *TAPPET CLEARANCE ADJUSTING SCREW NOTE: "Self-locking" screws used in rocker arms on later cars. See "Valve System" in Mercury Special Data.*

Initial Valve Tappet Clearanc – *See "Valve System" in Mercury Special Data.*

Valve	Head Diam.	St m Diam t r ①
Intake	1.775-1.785"	②.3415-.3420" or ③.3420-.3425"
Exh.	1.505-1.515"	②.3400-.3405" or ③.3405-.3410"

Valve	Seat Angle	Lift	St m Clearance
Intake	45°	④	. ⑤ .001-.002"
Exhaust	45°	④	⑥ .0025-.0035"

① – Furnished with .003", .015", .030" oversize stems.
② – Color coded RED. Use in RED valve guides.
③ – Color coded GREEN. Use in GREEN valve guides.
④ – See special table below.
⑤ – Service limit .0045".
⑥ – Service limit .0065".

CONTINUED ON NEXT PAGE

(68A-6250B & C Camshaft)

Valv	Normal Lift	⑥ Service Limit
Intake	.264"	.259" min.
Exhaust	.262"	.257" min.
(ED8-6250B Camshaft)		
Intake & Exhaust	.278"	.273" min.
(ED8-6250C Camshaft)		
Intake	.272"	.267" min.
Exhaust	.285"	.280" min.

⑥ – Replace camshaft if lift less than minimum.

Valv S at Width – 1/16-5/64" (Intake), 5/64-3/32" (Exhaust).

Valve St m Oil S als – "Umbrella" type oil seals used on all valves. Seals are installed with cupped side down on valve stem at guide boss on cylinder head. *Install new seals whenever valves removed or when seals become loose on valve stems.*

Valv Springs: Fr L ngth – 2.09" approximately.

Valv Spring Specifications

	Pressure	Length
Valve Closed	64 lbs.	1.780"
Valve Open	145 lbs.	1.390"

Valve Guid s: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" Intake, .005" Exhaust), ream guides and install oversize valves. *See "Valve System" in Mercury Special Data.*

Valv Lifters: Mushroom type. Removed from below with camshaft removed.

R ck r Arm Ass mbly *See "Valve System" in Mercury Special Data.*

►*ROCKER ARM & ADJUSTING SCREW PRODUCTION CHANGE:* New "self-locking" adjusting screws used on later cars with new design rocker arms. Can be installed as an assembly on earlier engines. *See "Valve System" in Mercury Special Data.*

►*TORQUING NOTE (NEW TYPE ROCKER ARMS).* Torque valve adjusting screw to 7-15 ft. lbs. With each valve adjustment this will decrease. When it reaches 3 ft. lbs., rocker arm should be replaced or self-locking screw removed and standard valve adjusting screw and locknut should be installed.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: The following valve opening and closing points are with a camlift as indicated in notes following tables.*

210, 215, 225 HP Eng. Valve Timing
(With 68A-6250B & C Camshaft)

235 HP Eng. Valv Timing
(With EDB-6250-C Camshaft)

Intake Valves–Open 18° ⓒ BTDC. Close 58° ⓒ ALDC.
Exhaust Valves–Open 66° ⓒ BLDC. Close 10° ⓒ ATDC.
ⓒ–Camlift .015". ⓒ–Camlift .014". ⓒ – Camlift .017".

Valve Timing Check–Slide rocker arm to one side and install a dial indicator so reading can be taken from end of valve push rod (use an indicator that will read .300" or more). Install a quadrant (reading in degrees) on crankshaft pulley to check amount of crankshaft rotation. Rotate engine slowly until dial indicator reading for valve being checked is same as indicated in table above. Amount of crankshaft rotation should be the same as shown in valve timing table.

OILING SYSTEM

►*OIL LEVEL INDICATOR CAUTION.* Two different oil level indicators used. With air conditioning, indicator has expanded anti-rattle section adjacent to tube cover, and distance from cover to "Full" mark is 20.94". On cars **not** equipped with air conditioning, anti-rattle section is half-way down to "Full" mark and distance from cover to "Full" mark is 21.35".

Crankcase Capacity: 5 qts. (refill). Add one quart when filter changed.

Normal Oil Pressure· 45-50 lbs. at 2000 RPM (Hot).

Pressure Regulator Valve – In pump body. Not adjustable.

Oil Pressure Indicator: King-Seeley Electric type.
Dash Unit – Mercury No. FDT-9273-A.
Engine Unit – Mercury No. B6A-9278-A.
See "Oil Pressure Gauges" in Miscellaneous Section.

Oil Pump. Gear or rotary type pump. Located on left side of engine crankcase and driven by distributor drive gear.
Pump Overhaul – *See "Oiling System" in Mercury Special Data.*

Oil Filter: Full-flow type with pressure relief valve in center filler bolt. Replace filter element at 4000-5000 mile intervals or when oil becomes dirty or polluted. *See "Oiling System" in Mercury Special Data.*

Replacement Filter Element–Mercury No. HCK-6731-A (Kit includes new gaskets).

►*CAUTION Special "full-flow" filter element must be used for service replacement (use of by-pass type filter element will restrict engine oil flow and result in insufficient engine lubrication).*

Crankcase Ventilation: Filter in oil filler cap (inlet) and road draft tube. Clean and oil every 2,000 miles or more often in dusty areas.

COOLING

Water Capacity· 19 qts. (total capacity), 18 qts.(recommended capacity). Add 1 quart for heater.

Pressure Valve: Mercury No. LA-8100-A (12-15 lbs.). Radiator filler cap.

►*THERMOSTAT INSTALLATION NOTE*· Install thermostat with word "TOP" up and toward front of engine to prevent a retarding of flow of coolant.

Water Pump: Packless, sealed ball bearing type.
See "Mercury" in Water Pump Section.

T mp rature Gaug : King-Seeley Electric type.
Dash Unit – Mercury No. FDT-10883-A.
Engin Unit – Mercury No. B6A-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & B ck M del 10A6. Single plate, dry disc type.

Part	Borg & Beck No.	Mercury N .
Assembly No.	361354	MC-7563-B
Disc No.	382175	MC-7550-A

Pedal Adjustment: If pedal free travel is not 1 to 1-1/4", loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.

Removal: Remove transmission (see Transmission Removal below), and disengage clutch pedal retracting spring and release rod from clutch release lever. Disengage equalizer bar tension spring and remove two capscrews retaining equalizer bracket assembly to flywheel housing. Remove flywheel housing. Mark position of flywheel and pressure plate so parts may be installed in original position. Compress clutch pressure plate assembly with Tool 7563. Remove capscrews, pressure plate and disc.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second and high), sliding gear (low and reverse).
See "Mercury Synchro-mesh" in Transmission Section.

►*20-45 MPH DRIVELINE RINGING NOISE CORRECTION:* New sound-deadened driveshaft, Part No. MC-4602-F (Exc. Sta. Wgn.), MC-4602-G (Sta. Wgn.) is available to correct above condition on 1955-56 cars.

Transmission Control: *See "Transmission Controls" in Transmission Section.*

Removal· If equipped with overdrive, remove kickdown switch retainer nut and push switch through floor. Raise car and drain transmission. On overdrive cars remove governor, solenoid, and control cable. Disconnect speedometer cable and remove speedometer drive gear. Remove transmission shift rods at transmission. Remove bolts retaining rear universal joint to companion flange and remove drive shaft. Support rear of engine and remove the detachable cross-member of the frame. Remove two top capscrews retaining transmission to flywheel housing and install a couple of studs to act as guide pins. Remove lower capscrews and slide transmission to rear as far as possible and lower front end. Remove from below car.

►*SINGLE EXHAUST SYSTEM NOTE:* When removing transmission, it will be necessary to remove nuts that secure muffler inlet and exhaust pipes to exhaust manifold, and to remove manifold outlet pipe from mounting bracket at rear of manifold and move exhaust system away from working area.

OVERDRIVE

Warner Model AS1-R10F. Solenoid operated type, with governor control and throttle operated kickdown. Lockout Switch not used on this model.
See "Warner R10 Overdrive" in Transmission Section.

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MERC-O-MATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

See "Fordomatic & Mercomatic" in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION See "Fordomatic & Mercomatic" in Transmission Section*

►*TESTING & TROUBLE SHOOTING See "Fordomatic & Mercomatic" in Transmission Section*

Lubrication – Check transmission oil level every 2000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 16,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level–Apply parking brakes, place transmission selector lever in "N" (Neutral) position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (Parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator, wipe clean and insert in tube (make sure indicator is pushed all the way down). Remove indicator and read level. Add sufficient fluid to raise level to "Full" mark on indicator. Replace indicator.

THROTTLE LINKAGE ADJUSTMENT· *See CARBURETOR above*

►*OTHER MERCOMATIC SERVICE DATA See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.

REAR AXLE

Own. Integral carrier, semi-floating hypoid type with Hotchkiss Drive.

See "Ford, Lincoln, Mercury (Integral Carrier)" in Rear Axle Section.

►*REAR AXLE "CLUNK" & "SQUEAK" CORRECTION See Ford, Lincoln, Mercury (Integral Carrier)" in Rear Axle Section.*

Transmission	Ratios Standard	Optional
Merc-O-Matic (Sta Wgn)	3 54-1	3 15-1
Merc-O-Matic (Others)	3 15-1	3 54-1
Synchro-mesh (Sta Wgn)	4 09-1	3 73-1
Synchro-mesh (Others)	3 73-1	4 09-1
Overdrive (All)	4 09-1	3 73-1

Backlash – .003-.008".

Axle Shaft Removal· Remove wheel and brake drum Remove axle shaft retainer locking type nuts (work through opening in axle shaft flange) Use Puller and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal) Replace one nut to secure brake backing plate

Rear Axle Assembly Removal Raise rear end of car and disconnect rear universal. Remove axle shafts. Disconnect brake lines at "T" on left side of axle housing. Disconnect hand brake cable, shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Direct acting, non-adjustable Service by replacement.

Front Shock Absorbers

Model	Standard	Heavy Duty
All (Exc.Sta.Wgn.)	MC-18045-F,H	MC-18045-B,K
Station Wagon	MC-18045-E,J	MC-18045-C,L
All (Exc. Conv.& Sta.Wgn.)		MC-18045-G

Rear Shock Absorbers

Model	Standard	Heavy Duty
All (Exc.Sta.Wgn.)	MC-18080-F,J	MC-18080-G,L
Station Wagon	MC-18080-E,K	MC-18080-C,M
All (Exc.Conv.& Sta.Wgn.)		MC-18080-H

FRONT SUSPENSION

Independent. "Ball-Joint" suspension with direct acting shock absorbers mounted within front coil springs.

See "Lincoln, Mercury, Ford (Ball-Joint)" in Front Suspension Section.

Kingpin Inclination–7° with Pos. 3/4° camber.
Caster–0° to Neg. 1-1/2°. Maximum variation between wheels is 1/2°.
Camber–0° to Pos. 3/4°. Maximum variation between wheels is 1/4°.
Toe-In–3/32" to 5/32".
Toe-Out on Turns – With front wheels at maximum turning angle, outer wheel should be 27°40' (Exc. Conv.), 26°50' (Conv.), and inner wheel should be 38° (Exc. Conv.), 36° (Conv.).

STEERING

Manual, Gemmer 2 & 3-Tooth Worm & Roller (Early), **Saginaw** Recirculating Ball Nut type (Later).
See "Gemmer Worm & Roller" or "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering Ford-Mercury Linkage type. Used in conjunction with standard type steering gear.
See "Ford & Mercury Power Unit" in Steering Section

Steering Linkage *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" or "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal *See "Gemmer Worm & Roller" or "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor (Without eccentric and fixed anchor pins). Parking lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section.
Drum Diameter – 11" front and rear.
Wheel Cyl. Diameter – 1 1/8" (Front), 7/8" (Rear)
Lining – Molded type riveted to shoe
Width – 2½' (Front wheels), 2" (Rear wheels) **Thickness** - 3/16"
Braking Power – 55 5% (Front), 44 5% (Rear)
Clearance – Adjusting screw backed off 12 to 14 clicks from point where shoes are tight against drum.

Brake Pedal Free Play Adjustment 1/4–7/16". If play not correct after brake adjustment, loosen lock nut on the eccentric bolt attaching brake pedal to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder· Located on engine side of firewall.

Checking Fluid–Maintain fluid level to within ¼' of top of reservoir.

Removal–Disconnect brake line from master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to firewall.

Power Brakes· Bendix Vacuum Power Unit (combination vacuum power unit and master cylinder). Unit mounted on engine side of firewall and replaces regular master cylinder.

See "Bendix Power Unit" in Brake Section.

Checking Fluid Level–Same as for regular master cylinder.

Removal of Power Unit–Disconnect valve pushrod from brake pedal assembly in drivers compartment. Remove master cylinder outlet fitting bolt from master cylinder. *(NOTE*–It is not necessary to remove stop light switch, wires or hose assembly from outlet fitting. Do not disturb outlet fitting in master cylinder). Loosen clamp securing manifold vacuum hose to check valve on power unit. Remove hose from valve. Loosen clamp securing vacuum reserve tank hose to fitting on check valve. Remove four capscrews securing power brake assembly to bracket on dash panel and remove power brake assembly.

MISC. MECHANICAL

Windshield Wipers: Vacuum, Link & Crank Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Electric Reversible motor in each window Controlled by door switch and master control switch. *See "Window Regulators" in Miscellaneous Section.*

Power Top Control: Reversible type motor (mounted under seat) drives two screw type jacks (one on each side) through flexible cables. Controlled by relay and two-way switch. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters· Electric type. Individual motor for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

Air Conditioning *See "Lincoln & Mercury" Air Conditioning in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs. (Dry Thds.)
Spark Plugs	30
Cylinder Head Nuts	45
Main Bearing Cap Nuts	77-80
Con. Rod Bearing Capscrews	35
Flywheel Stud Nuts	32

ENGINE

►*ENGINE REMOVAL NOTE:* Engine assembly (with clutch and transmission) can be removed from below, or engine only (less transmission) can be removed from above. This latter method is recommended for engine replacement.

ENGINE ASSEMBLY REMOVAL (From below): Drain engine oil pan, transmission case, and radiator and block. Then proceed as follows:

(1) Remove hood top, radiator, air cleaner and cylinder head cover.

(2) Disconnect all lines, hoses, and electrical connections at engine, and cables and controls at transmission.

(3) Disconnect exhaust pipe at engine and muffler, remove pipe, wire muffler to left side of underbody.

(4) Disconnect and remove propeller shaft (disconnect shaft at rear universal companion flange, pull shaft out and off transmission shaft splines).

(5) Attach Engine Lifting Fixture (see Note below), support engine weight, remove all Front and Rear Cross-member attaching bolts at body side sills.

(6) Lower engine assembly and remove from beneath car.

ENGINE REMOVAL (From above): Drain engine oil pan, radiator, and block. Then proceed as follows:

(1) Remove top hood, radiator, air cleaner, and cylinder head cover.

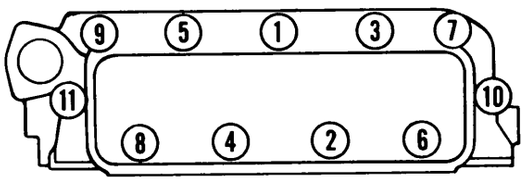
(2) Disconnect all lines, hoses, and electrical connections at engine, disconnect exhaust pipe at exhaust manifold.

(3) Remove starter from right side of engine.

(4) Attach Engine Lifting Fixture (see Note below), remove engine support bracket-to-front cross-member bolts (4 on each side), support engine weight with lifting fixture.

(5) Remove all clutch housing-to-engine rear plate attaching bolts. Move engine forward to disengage transmission drive shaft from pilot bearing, then lift engine up and maneuver it out of engine compartment.

► **Engine Lifting Fixture Note**—Fixture can be made up from two pieces of channel with hole in each end of each piece to fit the end cylinder head studs on each side of head. Lifting holes in channel should be centered between the cylinder head stud holes (for engine removal only), 3 3/8" to rear of center point (for engine and transmission assembly removal).



CYLINDER HEAD & MANIFOLD

REMOVAL: Remove head as complete assembly with rocker arms and shaft after loosening tappet adjusting screws and removing pushrods. *See Pushrod Removal under VALVES below.* Inspect cylinder head studs for tightness in block. If studs removed, use sealing compound on studs when replacing.

INSTALLATION: Install head (see Gasket Note below), tighten all stud nuts finger-tight, install Pushrods, tighten cylinder head nuts, adjust valve clearance. *NOTE*—Recheck cylinder head nut torque and recheck valve tappet clearance after approximately 100 miles of operation.

Tightening Cylinder Head Nuts—Tighten nuts in order as shown in cylinder head diagram to recommended torque of 40 ft. lbs. with dry threads.

Cylinder Head Gasket Note—Use non-hardening gasket paste and install gasket with "Top" mark upward.

CYLINDER HEAD

CRANKSHAFT & MAIN BEARINGS

FRONT & REAR MAIN BEARING CAPS: Removal—Remove front and rear end plates, then use tool J-5559 to pull bearing caps from recesses in block. *NOTE*—This tool is combination Main Bearing Cap and Pinion Bearing Remover.

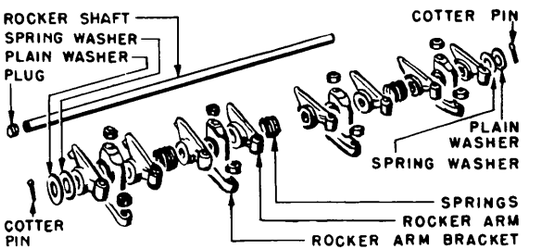
Installation—Install caps with punchmark toward camshaft side of engine. Transverse groove for oil seal should be on outer edge of bearing cap.

Oil Seal Installation: Install cork strip in transverse groove in front and rear main bearing caps.

FLYWHEEL

FLYWHEEL REPLACEMENT: With engine removed, flywheel can be removed by taking off nuts on flywheel mounting studs. When installing flywheel, tighten mounting stud nuts to 32 ft. lbs. torque.

CAMSHAFT & BEARINGS



CAMSHAFT REMOVAL: With engine removed from car, remove pushrods, remove valve side covers, remove all valve lifters through side openings. Pull crankshaft pulley, remove timing cover and oil shedder, remove camshaft sprocket capscrews, pull both sprockets and timing chain as a unit. Remove camshaft retaining and thrust plate (*CAUTION*—note location of oil hole for timing chain lubrication). Remove oil pump and distributor drive gear shaft. Slide camshaft out through front of engine.

CAMSHAFT BEARING REPLACEMENT: Punch old bearings out, tap new bearings into position (*CAUTION*—line up oil holes in bearings and block). Line-ream new bearings for correct clearance of .001-.002".

VALVE SYSTEM

PUSHROD REMOVAL: Loosen tappet clearance adjusting screws in rocker arms completely, depress valve spring until pushrod socket end is free from ball end of adjusting screw, push rocker arm to one side. Remove pushrod (*CAUTION*—maintain side pressure on pushrod to insure lower end snapping out of lifter without pulling lifter up and out of its bore in the block). When removing end pushrods (front and rear), take out cotter pin in end of rocker shaft and slide rocker arm off shaft.

ROCKER ARM ASSEMBLY: Removal—Remove nuts from all rocker arm support brackets (left hand nuts are on cylinder head studs), lift entire unit off as an assembly. To disassemble unit, remove cotter pins from ends of shaft, slide rocker arms, spacing springs, and support brackets off shaft. *NOTE*—Remove plug from end of rocker arm shaft and clean sludge accumulations from hollow shaft.

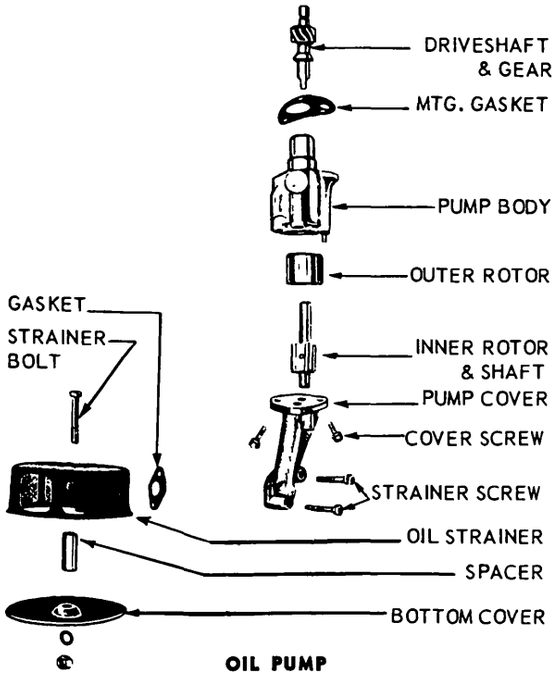
ROCKER ARM ASSEMBLY

Rocker Arm Specifications

Rocker Arm Shaft Diameter	.624-.625"
Rocker Arm Bushing Inside Diameter	.6255-.626"
Shaft Clearance	.0005-.004"

Installation—All rocker arms are the same. Install arm on each side of each support bracket with spacing spring between adjacent rocker arms (no spring for end rocker arms which are assembled on each end of shaft and retained by cotter pin). When installing assembly, make certain that oil lead in FRONT support bracket lines up with oil lead in cylinder head at support bracket mounting pad. *CAUTION*—This oil lead in front bracket supplies oil for rocker arm assembly (feeds into hollow rocker arm shaft through front support bracket).

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

OIL PUMP

OIL PUMP REMOVAL & INSTALLATION: With oil pan off, remove nuts from oil pump mounting studs, slide pump down off mounting studs (*CAUTION*–Pump drive shaft and gear assembly may remain in engine and can be removed by pulling it down to disengage drive gear). Install pump by reversing this procedure. Make certain that holes in pump mounting gasket line up with holes in block (*CAUTION*–Pump delivery is through oil channel in pump body and block), and that drive gear tang engages slot in upper end of pump shaft.

PUMP OVERHAUL: Disassembly–Remove oil strainer assembly from side of pump lower cover. Take out two pump cover attaching screws, lift off cover, remove inner and outer pump rotors and pump shaft. Inner rotor is pinned to shaft.

Reassembly–Reverse disassembly procedure above. After assembly completed and with lower cover tight, make certain that shaft can be turned freely by hand without binding.

OIL PUMP

IGNITION NOTES

DRIVESHAFT NOTE: This shaft and gear assembly is installed in the cylinder block and has a slot in the flanged upper end for distributor shaft drive. The assembly need not be disturbed unless replacement is required or camshaft is being removed. *CAUTION–Remove and install assembly exactly as detailed below to insure correct ignition timing.*

Removal–Use a tool made up from a piece of rod with threaded end (5/16" - 24 N.F. THD.) as a remover and installer tool. With distributor and drive bushing removed, insert threaded end of rod into upper end of the driveshaft and remove the shaft with a turning motion which will prevent the shaft disengaging from the rod and dropping into the crankcase while it is being removed.

Installation–Turn crankshaft until #1 piston is on TDC. of compression stroke. Install driveshaft in engine (using threaded rod in upper end of shaft) so that offset slot is slightly off the vertical (approximately equal to 12:30 - 6:30 of a clock face) and large portion of offset is toward REAR of engine with drive gear fully meshed with camshaft gear and driveshaft assembly fully seated in cylinder block.

MODEL IDENTIFICATION

NOTE - Electrical Syst m is 12 volt typ .

Convertible ... .561 Hardtop Model 562

SERIAL NUMBER: Stamped on plate on right side of dash panel in engine compartment and on upper flange of right dash-to-front wheelhouse panel brace near top corner of brace (below serial number plate).
First Serial Number – E-21008.

ENGINE NUMBER: Stamped on plate on upper edge of cylinder block on right side at center.
First Engin Number – IH-14001.

TUNE-UP

COMPRESSION PRESSURE: 120-135 lbs. at cranking speed of 300-350 RPM.

VALVE TAPPET CLEARANCE: .015" All Valves Cold.

MANIFOLD HEAT CONTROL: "Hot Spot" plate located between intake manifold and exhaust manifold with baffle to direct exhaust gas to center of plate. No moving parts or external controls.

IGNITION

FIRING ORDER: 1-3-4-2.

SPARK PLUG GAP: .023-.025".
Spark Plug – Champion N-8-B or Auto-Lite No. AG-5. Tighten plugs to 30 ft. lbs. torque.

COIL: Lucas LA-12. *12 Volt.* On generator.
Igniti n Curr nt – .9 amps. (Idling), 2.7 amps. (Stopped).

DISTRIBUTOR: Lucas DM-2. *12 Volt.* Distributor has "micrometer" adjuster for fine timing adjustments.
Cond ns r – Lucas. Metropolitan No. 8112147.
Capacity – .2 microfarad.
C ntact Point Set – Metropolitan No. 8112145.
Break r Gap – .014-.016".
Cam Angl – 60° ± 3° (closed).
Br aker Arm Spring T nsi n – 20-24 ozs. (at contacts).
R tati n – Counter-clockwise viewed from above.

Aut matic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		600	0		1200
7		1700	14		3400

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	6
12	24	16

Distribut r R m val & Installation: Distributor assembly (including mounting clamp) can be lifted out after hold-down screw removed from drive bushing flange (under mounting clamp plate). Drive tang in lower end of shaft is offset and distributor can only be installed in correct position.
Distribut r Driv Shaft & Gear Removal & Installation– *See "Ignition Not s" in Metropolitan Special Data.*

IGNITION TIMING

Setting–11° BTDC.
Timing Mark–Crankshaft pulley marked at TDC point.
*TIMING ADJUSTMENT NOTE–*Timing should be set by loosening mounting clamp bolt and rotating distributor within mounting clamp. The "micrometer" adjuster nut (knurled nut on opposite side of distributor housing from vacuum spark control mounting stud) can be used for fine timing adjustments to compensate for operating conditions and fuel.

CARBURETOR

Zenith 30 VIG-10. Single barrel downdraft type with manual choke control.
Idle Setting–0-1 turn open. Turn screw in for richer mixture. Adjusting screw controls idle air bleed.
Idle Speed–500 RPM. at normal operating temperature.
Float Level–No adjustment (float is free in bowl and bears directly against intake needle in cover).

Accelerating Pump–Two holes in throttle lever. Upper Hole–long stroke. Lower Hole–short stroke.
Fast Idle–1/32" throttle valve opening with choke valve closed. Adjust by loosening setscrew and changing connector rod position in choke shaft swivel.
Choke Control: Manual (cable) control.

►*OTHER DATA: See "Zenith VIG-10" in Carburetor Section.*

Fuel Pump Pressure: 1.5-2.5 lbs. at carburetor inlet.
*NOTE–*Fuel pump has priming handle at side of sediment bowl for manual operation.

CARB. EQUIPMENT

Fuel Pump: AC. Type T. Pump has "Priming Handle" at side of sediment bowl for manual operation.
Replacement Pump – Metropolitan No. 8111797.
Pressure–1.5-2.5 lbs. at carburetor inlet.
See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: Electric.
Dash Unit–Metropolitan No. 8110706.
Tank Unit–Metropolitan No. 8110398.
See "Gasoline Gauges" in Carburetion Equipment Section.

BATTERY

Lucas GTW-9A. *12 Volt.* 9 plate, 58 ampere hour (20 hour rate). Local battery may be installed. (Delco or Auto-Lite)
Grounded Terminal–Positive (+) terminal.
Engine Ground–Cable from flywheel housing to frame on right side.
Location–Under rear seat on right side (lift seat pad for access to battery box cover).

STARTER

Lucas M-35-G-1. *12 Volt.*
Armature–Metropolitan No. 8111090.
Drive–Bendix Barrel Type.
Brush Spring Tension–15-25 ozs.
Rotation–Counter-clockwise at commutator end.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	5800	12.0	45
4.9 "	1000	8.9-9.3.	250-270
9.3 "	Lock .	7.3-7.7 .	370-390

Starting Switch: ST-19/1. On dash in engine compartment with cable actuation by button on instrument panel.

GENERATOR

Lucas C-39-PV-2. *12 Volt.* Two brush type.
Armature–Metropolitan No. 8111074.

Performance Data

Amperes	Volts	RPM.
0	13.0	1050-1200
19	13.5	2000-2150

Brush Spring Tension–22-25 ozs. (new brushes).
Field Current–Field resistance 6.2 ohms.
Rotation–Counter-clockwise at commutator end.
Belt Adjustment: 1" deflection with light finger pressure midway between generator and crankshaft pulleys.

REGULATOR

Lucas RB-106-2. *12 Volt.* Two unit type with combined voltage-current regulator. Compensated.

Cutout Relay

Cuts In – 12.7-13.3 volts (1050-1200 Gen. RPM).
Cuts Out– 8.5-11 volts with 3.5 amps. discharge current.
Contact Gap – .018".
Air Gap – .025-.030".

Voltage & Current Regulator

Voltage Setting – 15.6-16.2 volts at 68° F. (Generator RPM 1000 minimum).
Air Gap – .015".

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Direction Signal: *See Electrical Equip. Section*
Lighting & Ignition Switch: Combination switch (ignition lock cylinder located in light switch knob).
Removal–Remove spring clamp screw and clamp behind instrument panel, pull switch assembly out. *NOTE–*Ignition lock cylinder can be removed by rotating light switch knob until cylinder retaining pin lines up with access hole in side of switch case, insert key, use rod to depress retaining pin, withdraw lock cylinder.
Stop Light Switch: In front brake line fitting on inside of left front wheelhouse panel.
FUSES: Two fuses on fuse block on firewall adjacent to Regulator. Spare fuse provided for each circuit.
Lighting-Ignition-Gauges – 30 or 35 ampere.
HORNS: *12 Volt.* As follows:
Low Note – Metropolitan No. 8112149.
High Note – Metropolitan No. 8112150.

ENGINE

ENGINE SPECIFICATIONS: Austin A-50. 4 Cylinder, valve in head.
Bore – 2 7/8". **Stroke –** 3 1/2".
Displacement – 90.89 cu. ins. **Rated HP –** 13.22.
Compression Ratio – 7.2-1
Compression & Vacuum Reading – *See TUNE-UP.*

OIL PAN REMOVAL: No obstructions.

ENGINE REMOVAL: *See "Engine" in Metropolitan Special Data*

CYLINDER HEAD: *See "Cylind r H ad & Manifold" in M tropolitan Special Data.*

TIGHTENING TORQUES: *See "Tight ning Specifications" in Metropolitan Special Data.*

CONTINUED FROM PRECEDING PAGE

PISTONS

Aluminum alloy, cam ground, split skirt, 4-ring.
Removal—Pistons and rods removed from above.
Fitting New Pistons: Clearance .0009-.0015" measured at bottom of skirt at right angles to piston pin. Check fit by inverting piston in clean dry bore. Piston should just support its own weight.
R placement Pistons: Furnished with pins in Standard size and .010", .020" Oversize.

PISTON PINS

Pin is locked in rod by a clampscrew.
Diameter – .6869". Length – 2.568-2.578".
Clearance in Piston – .0003" maximum. Fit pin palm push fit in piston bosses at 70° F.
R placement Pins: Standard & .001", .003" Oversize.

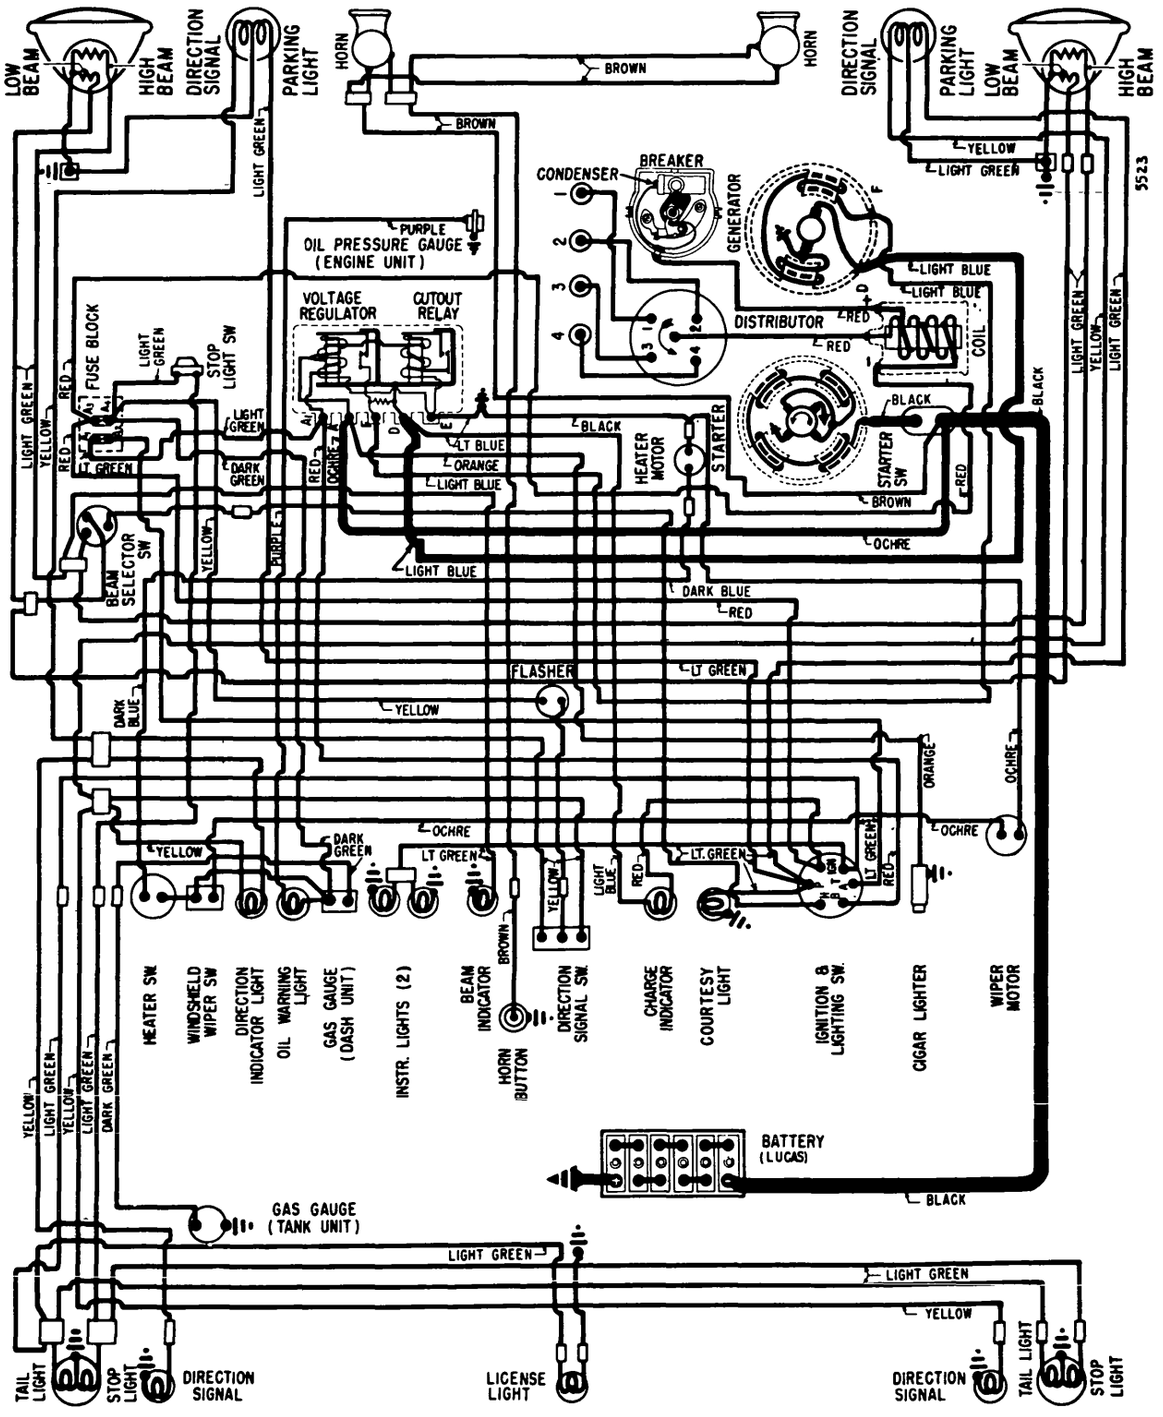
PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1, 2, 3)	.077-.078"	.013"	.001-.003"
Oil (4)	.1552-.1562"	.013"	.0025-.003"

Replacement Rings: Standard & .020" Oversize.
Installing Rings: Plain compression ring in top groove, taper-faced rings in No. 2 & 3 grooves, oil ring in bottom groove. All rings are oxidized-coated.

CONNECTING RODS

Rods have lower end split at an angle (to permit removal through cylinder bore), lower bearing is offset toward camshaft side of engine, and bearing has "narrow side" toward main bearing journal.



Crankpin Journal Diameter—1.8759-1.8764".
Bearings—Steel-backed, babbitt-lined, precision type inserts.
Clearance – .001-.0016".
Side Play – .008-.012".
Replacement Bearings: Standard & .002", .010" Undersize.
Installing Rods: Rods are stamped for cylinder location. Install rods in numbered cylinder with bearing offset and shorter side of rod toward left or camshaft side (oil spray hole in lower end of rod will be toward right side of engine). *NOTE*—"Narrow" side of lower bearing must toward nearest main bearing (#1 & #3 forward, #2 & #4 toward rear).

CRANKSHAFT

Journal Diameter—2.0005-2.001". Three bearings.
Bearings—Steel-backed, babbitt precision type.
BEARING NOTE—Upper bearing halves can be rotated out and in by using a pin type tool (made up from cotter pin) inserted in oil hole in journal.
Clearance—.00075-.002".
R placement Bearings: Standard & .002", .010" Undersize.
End Thrust: Taken by split thrustwashers at center main bearing (upper washers retained in recesses in bearing support in crankcase, lower washers retained by tabs fitting in recesses in bearing cap).
End Play – .002-.003".
Front & Rear Bearing Caps & Oil Seal Installation: *See Metropolitan Special Data.*

►*MAIN BEARING REMOVAL NOTE:* Engine assembly, engine end plates, oil pump and strainer assembly must be removed to remove main bearing caps.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FLYWHEEL REPLACEMENT: *See "Flywheel" in Metropolitan Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.78875-1.78925", (2) 1.72875-1.72925", (3) 1.62875-1.62325".

Bearings—Steel-backed, babbitt bushings.

Clearance—.001-.002".

End Thrust: Taken by thrust plate on front end plate behind camshaft sprocket. **Endplay**—.002-.008".

Camshaft Removal & Bearing Replacement: *See "Camshaft" in Metropolitan Special Data.*

Timing Chain—Double Roller. Metropolitan No. 8110131.

NOTE—Camshaft sprocket has rubber Tensioner Ring (installed in groove in outer rim) for quiet operation.

Camshaft Setting: Mesh sprockets in chain (on the bench) with marks on sprockets adjacent and line with a straightedge across shaft centers. Turn crankshaft until #1 & #4 pistons are at TDC., turn camshaft so that #1 & #2 valves are in overlap position (exhaust valve closing, intake valve opening), install chain and sprockets as an assembly.

VALVES

Tappet Clearance: .015" All Valves Cold.

Valv	Head Diameter	Stem Diameter
Intake	1 3/8"	.34175-.34225"
Exhaust	1 3/16"	.34175-.34225"

Valv	Seat Angl	Lift	Stem Clearance
Intake	45°	.325"	.0015-.0025"
Exhaust	45°	.325"	.0010-.0020"

Valv Seat Width - 1/16" (3/32" maximum).

Valv Stem Seals: Used on all valves. Seal washer installed between Seal Retainer and Spring Retainer on upper end of valve stem. Use NEW seals when installing valves.

Valv Springs: Free length 2 1/64".

Valve Spring Specifications

	Lbs. Pressure	Length
Valve closed	75.5-79.5	1 17/32"
Valve open	128-132	1.206"

►*VALVE LOCK INSTALLATION CAUTION*—Safety pin (hairpin spring) must be installed in groove in locks.

Valv Guides: Drive old guides out from top of head. Use Driver J-5564 to install new guides from combustion chamber side, drive guides in until they extend 11/16" beyond machined spring seat surface on head.

Valv Lifters: Two-piece barrel type (pushrod cup is pressed in main body). Remove from above (through side opening of block) after side covers and pushrods removed. *CAUTION*—Re-install lifters in same bore.

Rock r Arm Assembly: *See "Valve System" in Metropolitan Special Data for removal and assembly.*

Rock r Arm Clearanc —.0005-.004"

VALVE TIMING

See CAMSHAFT SETTING above.

Intake Valves—Open 5° BTDC. Close 45° ALDC.

Exhaust Valves—Open 40° BLDC. Close 10° ATDC.

NOTE—These specifications apply with .020" tappet clearance.

Valv Timing Check—Turn crankshaft so that #1 & #4 piston on top dead center with #4 piston entering power stroke. At this point, #1 & #2 valves should be in "overlap" position (exhaust valve closing and intake valve opening).

OILING SYSTEM

Crankcase Capacity: 4 quarts (refill).

Normal Oil Pressure: 55-60 PSI at 30 MPH.

Pressure Regulator Valve—Located under plug on left side at the rear of engine.

Oil Pressure Indicator—Warning light on lower left face of speedometer controlled by Pressure Switch on right side of engine block. Lamp should light when ignition turned on and should go out when engine oil pressure exceeds 7 lbs.

Oil Pressure Switch —Metropolitan No. 3134704.

Oil Pump: Rotor type. In crankcase on left side.

Pump Removal & Installation—*See "Oil Pump" in in Metropolitan Special Data.*

Oil Filter: Accessory.

Replacement Filter Element— Metropolitan No. 8990183.

Crankcase Ventilation: Air intake in rocker arm cover (hose connection to air cleaner), outlet pipe on left side of engine at rear.

COOLING

Water Capacity: 8 qts. (with heater).

Pressure Valve: Metropolitan No. 8111524 Radiator Filler Cap 3.5-4.5 lbs.

Thermostat: In water outlet elbow on cylinder head. **(Std.)** Metropolitan No. 8110247. Opens at 158-167°F. **(Permanent Anti-freeze)** Metropolitan No. 8111202. Opens at 180°F.

Water Pump: Packless. *NOTE*—Pump has oil plug on top of body (lubricate with light engine oil at 10,000 mile intervals).

See "Metropolitan" in Water Pump Section.

Pump Removal—Remove radiator core first, then remove pump from block.

CLUTCH

Borg & Beck Type A—Single plate.

See "Borg & Beck Type A" in Clutch Section.

Clutch Disc—Metropolitan No. 8111732. Facing Set (Including rivets) No. 8111739.

Pedal Adjustment: Freeplay ½-¾". Adjust length of rod between clutch pedal and clutch master cylinder.

Hydraulic Clutch Control: Consists of standard master cylinder located adjacent to brake master cylinder, attached to clutch cover. Adjusting link between clutch pedal and master cylinder, connecting rod only between clutch operating cylinder and clutch throwout lever.

Filling Master Cylinder: Filler cap accessible through hole in floor pan. Maintain level to mark on cylinder. Bleed hole in clutch operating cylinder permits bleeding procedure the same as for brake system.

►*MASTER CYLINDER VENT CAUTION:* Floor pan hole cover gasket may block off air vent hole. Cut 2" diameter holes in gasket directly over both clutch and brake master cylinder.

Removal: Remove transmission and integral bell housing (see below), mark clutch cover, pressure plate, and flywheel (to insure re-installation in same position), relieve spring pressure by turning out all cover screws evenly.

SYNCHRO-MESH TRANSMISSION

Own. Three-speed, helical gear, constant mesh gears. *See Transmission Section for complete data.*

Transmission Control: See "Transmission Controls" in *Transmission Section.*

Removal: Remove four top transmission to engine mounting bolts (from engine compartment). Raise & support car securely. Drain transmission. Install engine support fixture Tool J-5565. Disconnect propellor shaft at the rear axle companion flange and pull the shaft from the transmission main shaft splines. Remove rear crossmember from rear transmission supports and side sill members. Disconnect speedometer cable and shift rods from transmission levers. Disconnect clutch operating cylinder rod from clutch throwout lever, remove two capscrews holding cylinder to transmission but DO NOT disturb hydraulic lines. Remove four remaining lower transmission to engine bolts and remove starter. Lower the engine support fixture approximately 1¼" and lift transmission toward the rear, while supporting weight to eliminate possible damage to clutch drive plate.

UNIVERSALS

Cross type. Two used.

REAR AXLE

Own. 3/4-Floating, Hypoid Gear, Hotchkiss Drive, with separate differential gear carrier.

See "Rear Axle Section" for Complete Data.

Ratio – 4.2-1 (9-38).

Axle Shaft Removal: Remove rear wheel, drain axle housing. Remove drum locating screw, tap brake drum off hub. Remove axle shaft retaining screw (in shaft flange—exposed when drum removed), pull axle shaft straight out (if flange tight, pry flange loose from studs).

►*INSTALLATION CAUTION—Always use NEW gasket between axle shaft flange and hub when installing shaft.*

Rear Axle Removal: *Carrier Assembly can be removed separately, or complete Axle Assembly can be removed as follows:*

Carrier Removal—Raise rear end of car, drain axle housing, remove axle shafts (see above). Disconnect propeller shaft at rear universal companion flange and remove shaft. Remove nuts on differential carrier studs and lift assembly out of housing.

Axle Assembly Removal— Disconnect brake cable at balance lever and brake hose at "Tee" fitting. Disconnect propeller shaft at rear universal companion flange and remove shaft. Disconnect rear springs by removing "U" bolts at spring seats. Remove axle assembly from beneath car.

Wheel Bearing Adjustment: None. Bearing nuts on outer end of axle housing should be kept tight.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SHOCK ABSORBERS

Direct acting, hydraulic (front & rear). Service by replacement.
Front–Metropolitan No. 8111425.
Rear–Metropolitan No. 8111426.

FRONT SUSPENSION

Independent. Parallelogram type with coil springs mounted above knuckle pin and independent direct acting shock absorbers.
See Front Suspension Section for complete data.

Kingpin Inclination–6½° crosswise.
Caster–Pos. 2° to Pos. 3°. No adjustment.
Camber–Pos. ½° to Pos. 1½°. No adjustment.
Toe-In–0-1/16". Adjust center tie-rod (between steering gear pitman arm and idler arm).
Toe-Out on Turns–With outer wheel turned 20°, inner wheel should be 24½°+½°-0°.

STEERING

R ss. Cam-and-Lever type.
See "Ross Cam-and-Lever" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam-and-Lever" in Steering Section.*

Steering Gear Removal: *See "Ross Cam-and-Lever" in Steering Section.*

BRAKES

Girling Hydraulic. Front Wheels–Twin Cylinder, floating shoes (single acting cylinder actuating one shoe and serving as anchor for other shoe). Rear Wheels - Single cylinder, floating, non-servo lever (shoes anchored at adjuster bracket, piston actuates one shoe, lateral movement of cylinder actuates opposite shoe). Parking lever applies rear wheel service brakes.

See "Girling Hydraulic" in Brake Section.

►*MASTER CYLINDER VENT CAUTION:* Floor pan hole cover gasket may block off air vent hole. Cut 2" diameter holes in gasket directly over both clutch and brake master cylinder.

Drums–Diameter 8".
Wh l Cylind rs–¾" diameter (all whls.).
Replacement Lined Shoes–Shoes with bonded or riveted lining furnished for replacement as follows:

Metropolitan No.	Front Wh l	R ar Wh el
Shoe & Lining Set	8112228	8112265

Lining Width–1.25". **Length**–7.68".

Clearance–Shoes just free of drag (eccentric adjuster for each front wheel shoe, single wedge adjuster on backing plate for both rear wheel shoes).

Master Cylinder: Under front compartment floor on left side.

Checking Fluid–Filler access hole in front floor pan on left side. Check fluid level at 1000 mile intervals.
Removal–Remove from beneath car after disconnecting brake line fitting, pedal pushrod, and return spring.

MISC. MECHANICAL

Windshield Wiper: Lucas. Electric.
See "Lucas Electric Windshield Wiper" in Misc. S ct.

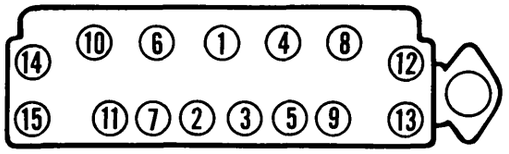
CYLINDER HEAD & MANIFOLD

STATESMAN

CYLINDER HEAD INSTALLATION: Use torque indicating wrench to tighten cylinder head studs in sequence shown in cylinder head diagram. Torque specifications are for engine at operating temperature.

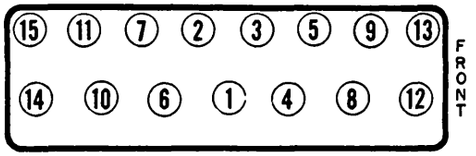
Cylind r H ad Gask t - Always use new gasket. Coat gasket with non-hardening gasket paste to insure tight seal between cylinder head and block.

AMBASSADOR 6



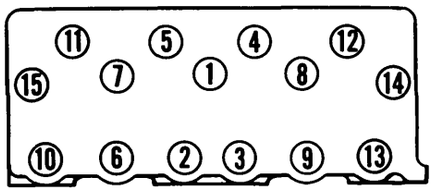
INSTALLING CYLINDER HEAD: Use torque indicating wrench to tighten cylinder head stud nuts in sequence shown in cylinder head diagram

Cast Iron H ads—Torque to specifications with engine at normal operating temperature



Aluminum H ads—Torque to specifications with engine cold or at room temperature

Cylinder H ad Gasket—Always use new gasket Coat gasket with non-hardening gasket paste



Tightening T rqu —See Tightening (Torque Wrench) Specifications above

STATESMAN CYLINDER HEAD

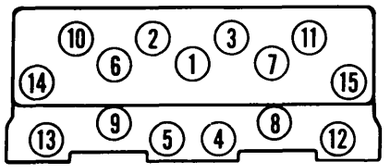
AMBASSADOR 6 CYLINDER HEAD

HUDSON HORNET & NASH AMB. SPECIAL V8 CYLINDER HEAD

HORNET & AMBASSADOR SPECIAL V8

CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up cylinder head and gasket during installation. Coat gasket with non-hardening gasket paste, install gasket with marks "AM" and "TOP" upward. Install cylinder head, pushrods, and rocker arm assembly *(CAUTION* - Special drilled capscrew must be installed in rear rocker arm support bracket to provide lubrication for rocker arms). Tighten head bolts in sequence shown in diagram to correct torque. See Tightening Specifications.

HORNET & AMBASSADOR V8
AMBASSADOR V8



CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up and holding position of cylinder head and gasket during installation Coat gasket with a non-hardening gasket compound Install Cylinder Head Lifter J-4159 in the front and rear spark plug holes and install head over dowels (dowels are drilled for oil return from rocker arm chamber) Install pushrods, rocker arm assembly, and the cylinder head capscrews Tighten all head bolts in the sequence indicated in diagram to correct torque. See Tightening Specifications.

STATESMAN

►*INTAKE MANIFOLD COVER CORRECTION (For exhaust leak into Intake Manifold):* To correct exhaust leakage due to excessive corrosion, causing rough engine operation, remove intake manifold cover and tap and install Two Nash Part No. 3125657 Allen Head pipe plugs in lower side of cover blocking off heat passages. These plugs should be flush with intake manifold gasket surface.

HORNET & AMBASSADOR V8

►*INTAKE MANIFOLD GAS PASSAGE CORRECTION* Poor automatic choke operation can be traced to either a stuck manifold heat control valve or restrictions in the exhaust gas passages of intake manifold Free up or replace stuck manifold heat control valve. Remove any casting fins that extend into exhaust passages of intake manifold If found they can be removed or broken out with a small rod. When intake manifold is not discolored, in center section, from passage of exhaust gases it indicates that restrictions or fins are blocking the passage of exhaust gases.

HUDSON HORNET & NASH AMBASSADOR V8 CYLINDER HEAD

ORIGINAL BORE & PISTONS

STATESMAN & AMBASSADOR 6

ORIGINAL BORE LETTER CODE· A three letter code stamped adjacent to engine number indicates as follows

Letter Sequence Code	
First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code	
Letter "A"	Standard
Letter "B"	010 Undersize
Letter "C"	010 Oversize
Letter "D"	001 Undersize

ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD.

PISTON PINS

STATESMAN & AMBASSADOR 6
HORNET & AMBASSADOR SPECIAL V8

PISTON PIN: Pin is press fit in connecting rod and no clamp bolt or locking rings are used to retain the pin. Piston pin must be removed and installed as detailed below to prevent distortion or damage to piston.

Removal - Remove pins with special Piston Pin Remover J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

Installation - Place piston pin pilot in support, insert piston and connecting rod. This aligns piston and connecting rod piston pin bores. Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support which will properly center rod on pin

►*CAUTION* Pin must be tight press fit in connecting rod

HORNET & AMBASSADOR V8

PISTON PIN BUSHING (IN CONNECTING ROD) INSTALLATION· After pressing old bushing out with an arbor press, install new bushing so that it is flush with both sides of rod Position Burnisher Tool J-6055 in bushing, then applying plate of tool under rod, push

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

burnisher through bushing with an arbor press Make sure oil hole in bushing lines up with oil hole in rod *NOTE*–If bushing not drilled for an oil hole, drill a 3/16" hole before reaming bushing

First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code

Letter "A"	Standard
Letter "B"	010 ' Undersize
Letter "C"	010 Oversize
Letter "D"	001 Undersize

ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD

CRANKSHAFT & MAIN BEARINGS

STATESMAN

CRANKSHAFT END THRUST PLATE: Crankshaft end thrust taken by flanged edges of front bearing A steel thrust plate is assembled between rear face of timing chain sprocket and flanged face of front bearing Plate keyed to shaft by Woodruff key which also secures sprocket on shaft When plate installed, chamfered edge on inner diameter should face toward the rear for tight fit against bearing journal

STATESMAN

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Packing in groove in block and cap behind oil slinger on crankshaft Cap sealed with rubber plugs in groove on each side where cap fitted in recess in block Use Tool J-1610 to install packing in groove in block and cap Place packing in groove (with bearing shell removed), place small diameter of tool over packing, hit end of tool with lead hammer to seat packing, cut ends of packing flush with bearing cap seat, remove tool Repeat operation for groove in block Install rubber seal plugs on each side of bearing cap (where angle seal used, make certain that seal also seated in horizontal groove in block)

AMBASSADOR 6

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Steel backed synthetic rubber seal Install upper half in block, lower half in bearing cap, make certain that seal fits snugly over edge of rear bearing oil return groove See that surface on crankshaft to rear of oil slinger (on which seal rides) is rough **NOTE**–Manufacturer now recommends roughing seal position on crankshaft with No 240 grit emery cloth **DO NOT** create spiral scratches which may conduct oil against and under seal lip Check depth of bearing cap seal groove (.050-.055") Insufficient depth will prevent crankshaft seal from contacting crankshaft Install rubber seal strips on either side of bearing cap (three strips overlap bearing cap and seal sides and end surfaces of bearing cap in crankcase)

HORNET & AMBASSADOR SPECIAL V8

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Install hemp packing in block and in bearing cap using tool J-3048-A to seat packing in groove. Trim excess packing off flush with face of cap.

HORNET & AMBASSADOR V8

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Apply Lubriplate to groove in bearing cap and install oil seal, using Oil Seal Installer J-3048-A and a hammer, drive seal into place With seal installed and tool still in place, trim ends of seal flush with surface of cap To install upper half of seal in crankcase, remove crankshaft and install seal in same manner as for bearing cap **NOTE**–At time of pan installation, place a generous bead of non-hardening Permatex along edge of bearing cap and crankcase to insure a perfect seal

VIBRATION DAMPENER

STATESMAN & AMBASSADOR 6

INSTALLATION: Non-adjustable, rubber cushioned type To install hub assembly install large lockwasher with notches on inner edge, cork seal ring, rubber seal ring and hub retainer in recess in hub, install hex head lock screw with helical lockwasher under it, in screw hole in end of crankshaft and tighten screw securely On Ambassador 6 models, dampener hub retained by a special nut shake-proof lockwasher (no seal installed behind hub) On both models, rubber block retaining bolt nuts on front face of dampener hub must be drawn up tight *CAUTION*–When installing vibration dampener on hub, timing marks must be aligned with hub key-way and on same side

HORNET & AMBASSADOR V8

VIBRATION DAMPENER: Removal–Drain cooling system Remove radiator core and fan assembly Remove vibration dampener retainer screw and lockwasher and if car is equipped with Power Steering or Air Conditioning, remove the drive pulleys by prying them-off dampener assembly Install center adapter J-5992-2. in threads of crankshaft Install screw assembly J-5992-3 in remover body J-5992-1 and removedampener

Installation: Lubricate oil seal in engine front cover and position dampener over crankshaft and tap it into place with a rawhide hammer Assemble Vibration Dampener Installer J-5992 by placing the ¾" nut on screw assembly J-5992-3 and slide spacer J-5992-4 over screw assembly Start screw in end of crankshaft and tighten until it bottoms in the threads With one end of spacer against dampener, turn nut on screw until dampener hub bottoms the crankshaft oil slinger against a shoulder on crankshaft Install Power Steering and/or Air Conditioning pulleys, retainer washer, and screw. Tighten retainer screw to 130-150 ft lbs

ENGINE FRONT COVER

STATESMAN & AMBASSADOR 6

CRANKSHAFT FRONT OIL SEAL: A felt oil seal is fitted in the timing chain cover which bears against vibration dampener hub Seal seat in hub has inner edge turned up to form a shedder on inside of cover An oil slinger is assembled behind vibration dampener hub which extends over outer edge of oil shedder Use Tool J-1430 installed on end of crankshaft when tightening timing chain cover screws to align seal properly **NOTE**–On Statesman a cork seal and rubber seal is assembled behind vibration dampener to seal front end of crankshaft See Vibration Dampener above

HORNET & AMBASSADOR SPECIAL V8

CRANKSHAFT FRONT OIL SEAL: Oil seal is installed in timing chain cover at vibration dampener hub. To replace seal, remove water pump, fuel pump assembly, vibration dampener, and timing chain cover. Remove old seal from cover Install new seal in cover. *NOTE* - When installing timing chain cover, place cover on locating dowels but leave cover-to-block screws loose until vibration dampener is installed, then tighten cover screws.

HORNET & AMBASSADOR V8

ENGINE FRONT COVER: Removal–Remove vibration dampener (see above), and water pump manifold assembly Disconnect and remove fuel pump Remove screws attaching front cover to block and remove cover

Installation: Using a new gasket, install engine front cover in place and start capscrews in threads, **but do not tighten.** Lubricate oil seal in cover and install vibration dampener assembly, using hub on dampener as a pilot to align front cover Complete installation by reversing removal procedure

HORNET & AMBASSADOR V8

ENGINE FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION· Remove engine front cover (see above), drive out old seal with a hammer and punch, being careful not to damage cover Install a new seal using tool J-5983, pressing seal into place with an arbor press

►*FRONT OIL SEAL LEAK CORRECTION:* Caused by seal assembly rotating with crankshaft. To correct, remove front cover, pry out old seal assembly. Before installing new seal, drill two 11/64" holes through seal opening flange on inside of cover locating the holes approximately 35° on each side of upper end of vertical line through seal opening. When new seal installed, upset seal material into these holes with a blunt punch so that seal is secured in place.

FLYWHEEL

STATESMAN & AMBASSADOR 6

►*FLYWHEEL REPLACEMENT CAUTION (Std. & Ov r-drive Trans.):* Flywheel on which starter ring gear is installed is balanced as an assembly with crankshaft and vibration dampener. When flywheel is replaced, it is important that balance holes be duplicated as to size, depth, and angular location After replacing flywheel, tighten crankshaft to flywheel stud nuts with torque wrench

CAMSHAFT & BEARINGS

STATESMAN

CAMSHAFT REMOVAL NOTE: Special valve tappet retaining clips supplied in sets of 16(Tool No J-1612) Clips should be installed on upper ends of valve lifters to hold lifters up out of the way while the camshaft is being removed

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

AMBASSADOR 6

CAMSHAFT REMOVAL: Remove pushrods Remove valve cover on side of engine, lift up each valve lifter and use rubber bands to hold lifters up out of the way while camshaft is being withdrawn

HORNET & AMBASSADOR SPECIAL V8

CAMSHAFT REMOVAL: Remove spark plug wires, cylinder head covers, and rocker arm assemblies. Remove intake manifold and carburetor. Remove all pushrods and hydraulic valve lifters *(CAUTION* - Keep these parts in order so they can be installed in same relative positions). Remove fuel pump. Remove vibration dampener and timing chain cover. Remove water pump and cylinder head water distribution manifold. Crank engine until timing marks on chain sprockets line up on vertical line through shaft centers. Remove fuel pump eccentric, remove both sprockets and timing chain as an assembly. Remove camshaft retainer thrust plate and thrust spacer. Carefully withdraw camshaft through front of engine.

HORNET & AMBASSADOR V8

CAMSHAFT: Rem val—Remove cylinder head covers, ignition wires, rocker arm assemblies, intake manifold, and carburetor Remove water pump and manifold assembly Remove upper oil breather and tappet assembly cover Remove inner oil baffle cover Remove pushrods, keeping them in their relative operational positions Remove hydraulic tappets and keep in their relative operational positions Remove fuel pump, vibration dampener, and engine front cover Crank engine until timing marks on camshaft and crankshaft sprockets line up with shaft centers Remove oil shedder from crankshaft and fuel pump eccentric from camshaft Timing chain, camshaft, and crankshaft sprockets can be pried off Remove camshaft retainer and thrust plate and end plate thrust spacer Remove camshaft

Installati n: Reverse removal procedure and note the following· Install camshaft gear about 1/16" beyond a position flush with camshaft end to allow mounting of fuel pump eccentric

TIMING CHAIN

AMBASSADOR V8

TIMING CHAIN: R moval—Remove engine front cover (see above). Pry off oil slinger from end of crankshaft and remove fuel pump eccentric Rotate engine to line up marks on sprockets with marks adjacent and in line across shaft centers Remove sprockets by alternately prying on them and slide chain and sprocket assembly off the shafts

Installati n: Install camshaft and crankshaft sprocket keys being sure that they are properly seated in keyways Rotate engine or crankshaft to bring No 1 cylinder to firing position Slide crankshaft sprocket part way on the crankshaft and assemble camshaft sprocket in chain, locating and lining up the "O" marks on the sprockets in line with camshaft and crankshaft centers. Position chain on crankshaft sprocket and start camshaft sprocket on camshaft. Using a rawhide hammer, alternately tap both sprockets into proper position Camshaft gear must be installed about 1/16" beyond a position flush with end of camshaft for installation of fuel pump eccentric Complete installation by reversing removal procedure

VALVE SYSTEM

HORNET & AMBASSADOR V8

VALVE SPRING BAFFLE INSTALLATION (For Improved Oil Control): Beginning at Engine No. P-25889, valve spring baffles, Nash No. 6480914, were installed in production. Baffles are installed under springs with flange extending upward on high side of spring. *These baffles can be installed on earlier engines if valve system disassembled (for Valve Grinding etc.) or special type baffles can be installed WITHOUT disassembling valve system as follows*

Service Installation of Special Baffles (Without disassembling Valves) - Install Baffle Kit, Nash No. 6484-396 (Four No. 6489127 Valve Spring Baffles, Eight No. 6489048 Lockwashers) as follows Remove cylinder head covers, loosen rocker arm shaft bolts and lift off rocker arm shaft assemblies. Place baffles in position on rocker arm assemblies using two baffles on each cylinder head assembly (baffle should circle springs on rocker arm shaft side and mounting lugs should rest on top of shaft brackets). Install rocker arm shaft assembly on cylinder head, replace original lockwashers with new type square lockwashers, tighten bolts to correct torque *(CAUTION* - See that lockwashers do not turn with bolts and distort baffles).

VALVE TAPPET ADJUSTMENT

AMBASSADOR V8

VALVE TAPPET ADJUSTMENT: *(NOTE—Checking must be done with no oil in compression chamber of tappet and plunger completely bottomed, with tappet on base circle of cam).* With piston on compression stroke and both valves closed, press downward on the pushrod end of rocker arm to compress plunger spring and force plunger to bottom position While still holding down on rocker arm, measure the lash The clearance between valve stem end and rocker arm tip should be 050" to 210"

VALVE STEM SEALS

STATESMAN

HORNET & AMBASSADOR SPECIAL V8

VALVE STEM OIL SEAL: Consists of a rubber deflector installed on valve stem of all valves. Install deflector on valve stem with cupped side down over upper end of valve guide before installing valve spring and locks. Use new deflector whenever valves ground or replaced.

AMBASSADOR 6

VALVE STEM OIL SEAL: Consists of a neoprene valve stem seal and a felt seal under metal retainer, which is mounted over top of valve guide The neoprene seal prevents excessive oil passage past valve stem while felt seal provides initial starting lubrication An upper neoprene rubber seal is also installed in groove on valve stem below valve locks on all valves. Install these seals as follows After installing valve spring and spring retainer, compress spring, so that lower groove of valve stem exposed, install neoprene seal in this groove, install valve locks in upper groove, relieve spring tension

HORNET & AMBASSADOR V8

VALVE STEM OIL SEAL: Rubber oil deflectors used on all valves Same as Statesman and other V8 models (above).

VALVE GUIDES

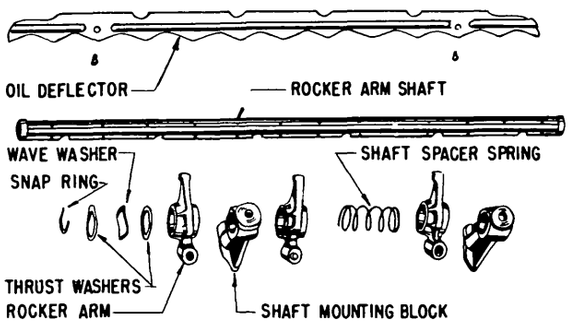
HORNET & AMBASSADOR V8

VALVE GUIDE REAMING & INSTALLATION OF VALVES WITH OVERSIZE STEMS: Valve guides are integral with head and whenever stem clearance is excessive (see Checking Valve Stem Clearance below), guides should be reamed out to next oversize and valves with oversize stems installed.

Checking Valve Stem Clearance - After valves have been removed from head, and with valve stems and guides clean, install valve in respective guide bore and measure side-to-side play crosswise to the cylinder head using a dial indicator or thin strips of feeler gauge material placed between stem and guide bore If clearance is excessive, guides should be reamed and valves with oversize stems installed

Valve Guide Reaming - Four oversize reamers (.003", .010", .020", .030" Oversize) are furnished in Valve Guide Set J-6042 which will provide correct stem clearance for installation of same oversize valve (.001- 002" Intake, .002- 003" Exhaust). After checking clearance (above), select proper oversize reamer and pilot for the oversize valve to be installed.

ROCKER ARMS



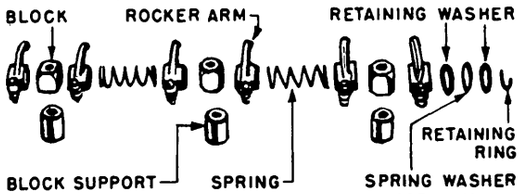
STATESMAN

ROCKER ARM ASSEMBLY: Rocker arm shaft is one piece type and entire rocker arm assembly can be removed after taking out mounting bolts in shaft brackets.

Disassembly & Inspection: Remove snap ring on end of shaft, slide thrustwashers, wave washer, rocker arms, mounting brackets, and springs off shaft. Inspect all parts for wear, see that end plugs are tight in shaft.

Reassembly & Installation: Install all parts in same relative positions *(CAUTION* - Rocker arms are "Right" and "Left" and must not be interchanged). Install assembly with rocker arm lubricating holes in shaft down or toward cylinder head. Make certain that baffle installed on rocker shaft supports does not interfere with rocker arm.

CONTINUED ON NEXT PAGE



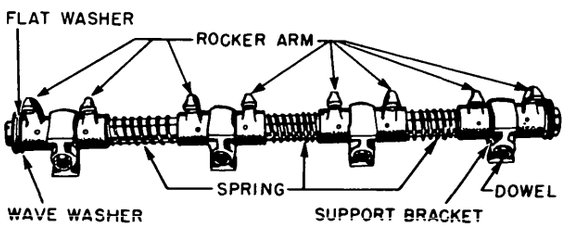
STATESMAN ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

AMBASSADOR 6

ROCKER ARM ASSEMBLY: See illustration for sequence of assembly.

►*ROCKER ARM & LUBRICATION CAUTION:* Hollow bolt must be in front mounting bolt hole of rocker arm assembly for proper lubrication.



AMBASSADOR 6 ROCKER ARM ASSEMBLY

HORNET & AMBASSADOR SPECIAL V8

ROCKER ARM ASSEMBLY: Complete assembly mounted on cylinder head by four long cylinder head retaining capscrews *(CAUTION* - Rear bolt is special hollowtype for rocker arm lubrication). Assembly can be removed by taking out the retaining screws.

Disassembly & Inspection: Remove snap ring on end of shaft and slide all parts off shaft. Keep all parts in order so they can be reassembled in same relative positions. Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem end for wear and replace worn rocker arms. Make certain that plugs are tight in ends of shaft.

R assembly & Installation: Install all parts in same relative positions *(CAUTION* - Rocker arms are "Right" and "Left" and will not contact valve stem properly if interchanged). When installing assembly, make certain that special hollow bolt installed in rear support bracket (necessary for correct rocker arm lubrication).

ROCKER ARM ASSEMBLY
HUDSON HORNET & NASH AMB. SPECIAL V8
HUDSON HORNET & NASH AMBASSADOR V8

HORNET & AMBASSADOR V8

ROCKER ARM AND SHAFT DISASSEMBLY: Remove rocker arm and shaft assembly from cylinder head. Remove pins and wave washers from end of shaft. Remove rocker arms, springs and supports, keeping all parts in order so they can be reassembled in original position.

Inspecti n: Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem ends, and if worn replace the rocker arm. Inspect plugs at each end of shaft for tightness.

R ass mbly: Reverse disassembly procedure and note the following: Rocker arm shaft must be assembled with the grooved oil hole in the downward position, or facing the cylinder head.

►*CAUTION: There is a right and left rocker arm and if reversed in assembly they will not contact the valve stem properly.*

HYDRAULIC LIFTERS

HORNET & AMBASSADOR (ALL) V8

HYDRAULIC VALVE LIFTERS: Removal—Remove valve rocker covers and rocker arm shaft mounting bracket bolts and lift off rocker arm assembly. Remove upper valve tappet cover and breather tube and then remove lower tappet cover. Remove pushrods and hydraulic valve lifters keeping pushrods and lifters in sequence so they can be replaced in same relative position.

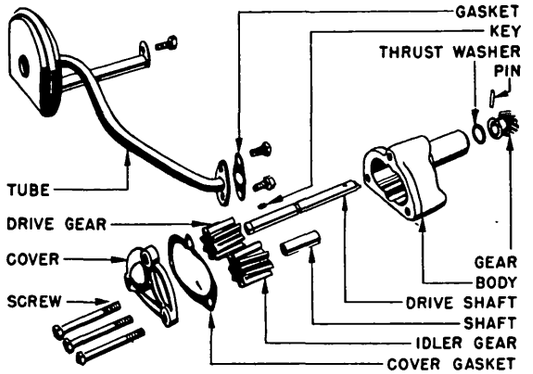
Disassembly: Press down on valve pushrod socket and use a pair of needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger being careful not to lose the small flat valve and coil spring. *(CAUTION—Disassemble one lifter at a time to avoid mixing plungers and bodies. These parts are selectively fitted and must not be interchanged).* Use clean solvent and thoroughly wash all parts. Remove all varnish and gum deposits.

Inspection: Inspect the plunger and wall of body for scratches (if plunger or body is scratched, replace complete unit). Try the plunger for fit in body. If check valve removed from plunger, inspect flat disc valve, spring and seat.

Reassembly: Reverse disassembly procedure. See illustration for correct sequence.

Testing: Use a clean container deep enough to cover the lifter assembly (in an upright position). Fill container with clean kerosene. Remove the pushrod socket and place lifter in kerosene in an upright position, allowing it to fill up. Remove lifter and replace pushrod socket. Place lifter assembly between jaws of checking tool J-5978-A. Check leak-down by depressing tool. A decided resistance should be felt. If plunger collapses immediately, the lifter should be checked again. Replace if no resistance felt.

Tool Note - To alter tool J-5978 for use with late type V8 lifter, Nash No. 6476060, grind bottom face of lower jaw on tool back 5/8" to reduce thickness of jaw to .150-.160".



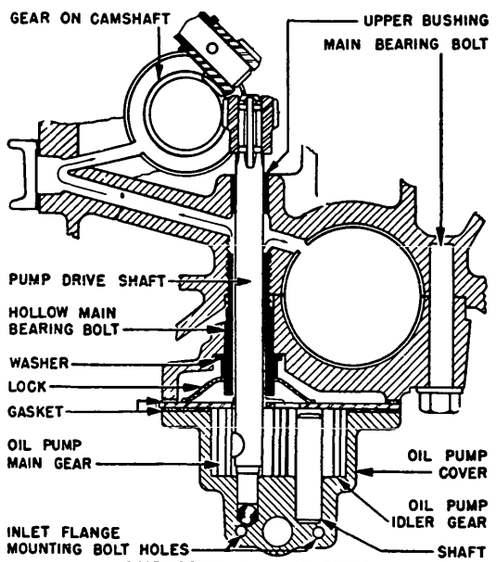
OILING SYSTEM

OIL PUMP

STATESMAN

OIL PUMP: Removal - Pump mounted externally on right side of engine. Remove pump by taking out three capscrews in pump cover.

Overhaul: Remove pump cover and gasket. Lift out pump drive gear, idler gear, and idler gear shaft. Remove key from keyway in shaft. Remove shaft and driving gear assembly through upper end of pump body *(NOTE* - Driving gear is held on shaft by a pin). Remove thrustwasher from shaft. Reassemble pump by reversing this disassembly procedure.



STATESMAN OIL PUMP

AMBASSADOR 6

OIL PUMP: Removal—Pump is mounted on center main bearing cap and must be dismantled for removal as follows: Take out pump mounting screws, withdraw pump body and idler gear assembly (shaft will remain in engine). Withdraw shaft from below disengaging drive gear from splines on upper end of shaft as shaft is withdrawn. Gear is free fit on shaft splines and can be lifted out after it is freed from the shaft. Pump shaft operates in thin wall bushing pressed in block (upper), in pump body (lower). Remove and replace bushing from beneath with pump and shaft out of engine. Ream bushing to diameter of .500" after installation.

CONTINUED ON NEXT PAGE

AMBASSAD R 6 IL PUMP

CONTINUED FROM PRECEDING PAGE

►*CAUTION: Excessive clearance of shaft in bushing will result in low oil pressure (pump oil delivery is up along shaft to oil channel in block–upper bushing prevents oil leakage from channel).*

Installati n: Make certain that loose thrust ball is installed in pump body at lower end of pump shaft. Install pump in reverse order of disassembly and removal above.

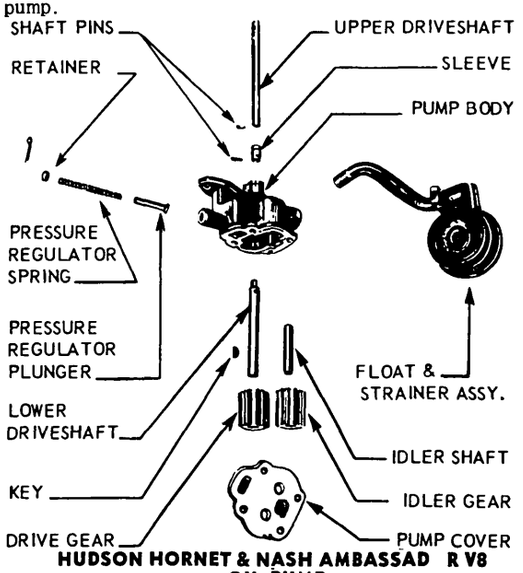
CAUTION–Maintain a tight connection between inlet flange and pump body.

HORNET & AMBASSADOR SPECIAL V8

OIL PUMP: R m val - Remove oil pan and screws retaining oil pump to rear main bearing cap, remove oil pump.

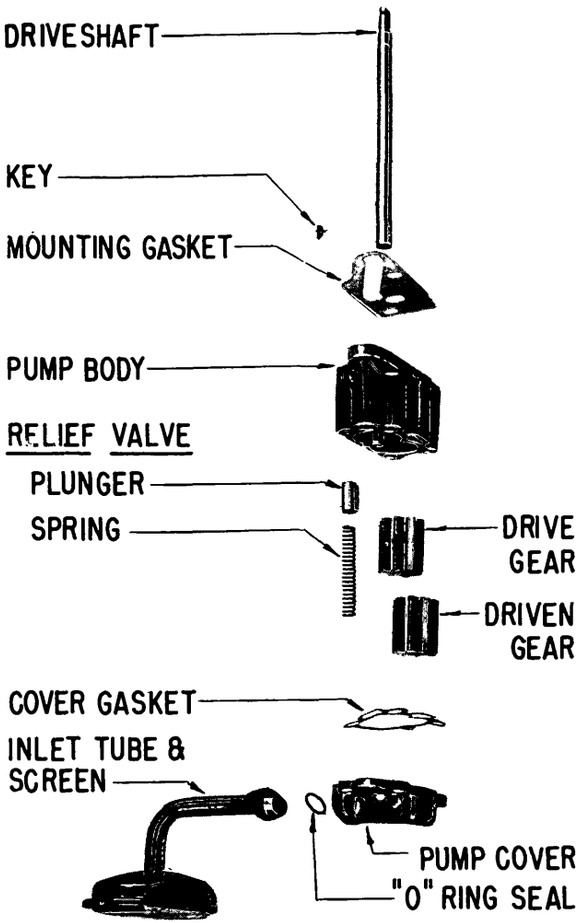
NOTE - Oil pump is driven by distributor drive shaft so removal of oil pump does not affect ignition timing.

Disass mbly - Remove inlet tube and screen assembly from pump cover. Remove cover retaining screws, cover, pump gears, relief valve spring and plunger.



Insp cti n - Check gear to cover clearance by placing straight edge across pump body with gears in operational cavity. Clearance should not exceed .004". A clearance of .008" maximum should exist between gears and walls of gear cavity opposite point of gear mesh.

R ass mbly & Installati n - Reverse disassembly procedure. Before installing pump on engine, check for free operation.



HORNET & AMBASSADOR V8

OIL PUMP: R moval–Remove engine oil pan and remove the two screws attaching oil pump to rear main bearing cap and remove oil pump and strainer assembly.

Disassembly: Remove screws attaching pump cover to pump and remove the cover. Remove idler gear. Remove pin from shaft and drive off sleeve. Remove upper and lower oil pump driving shafts and gear. If necessary, press shaft out of gear. If necessary to remove the float assembly, the tube can be unscrewed from pump.

HUDSON HORNET & NASH AMBASSAD R V8 OIL PUMP

HUDSON HORNET & NASH AMB. SPECIAL V8 OIL PUMP

Inspection: Wash all parts in clean solvent and blow dry with air. Inspect float for leaks. Inspect strainer. Inspect pump shaft for wear, scores or pits. Check clearance between pump housing and gears (opposite point of gear mesh). This clearance should not be greater than .008". Check gear endplay using a straight-edge across gears and housing. Endplay should not exceed .004". Inspect relief valve piston for scores.

Reassembly & Installation: Reverse disassembly and removal procedure indicated above.

CLUTCH NOTES

STATESMAN & AMBASSADOR 6

CLUTCH LINKAGE: Linkage consists of a beam lever, with a support mounted at one end in a hook plate on engine (later models use a flexible link) and the other end held in position by a fulcrum plate and guide fastened to a steering gear housing boss bolt which also bolts steering gear to frame. The outer end of the beam lever connects to the clutch pedal with a rod, and the inner end connected by rod to the release bearing fork arm. Both rods are adjustable. Only the latter rod must be used when making clutch pedal free play adjustments. The fulcrum plate guide centers the beam support. If the beam support is not centered it will climb out of the hook and cause chattering. The beam is held in position by the beam anchor spring, and the pedal return spring.

►*CAUTION: Do not disturb the length of the pedal to beam rod (All Models).*

Clutch Linkage Adjustment: Pedal free play adjustment is made by lengthening or shortening the beam to release bearing fork arm rod. Do not disturb the pedal to beam rod setting. In the event it is necessary to adjust the pedal to beam rod the adjustment is made so that the outer end of the beam lever projects (½" on "Statesman" and 5/16" on "Ambassador") from the beam, toward the rear, with the clutch pedal against the floorboard.

MISC. ELECTRICAL

ALL MODELS

►*BACK-UP LIGHT WIRING CORRECTION (First Cars):* If Backing Light comes on when shift lever placed in Reverse position, with Ignition Switch "Off", back-up light circuit should be checked and the following changes made:

Synchro-mesh & Overdrive Cars - If Back-up Light feed wire is attached to red wires of center terminal on Body Junction Block (behind battery), proceed as follows:

1) Disconnect this back-up light feed wire from the Body Junction Block, remove eye terminal from wire and replace with Douglas terminal.

2) Locate Back-up Light Switch Wire Extension (No. 18 red wire in harness) attached to "AUX" terminal of Circuit Breaker and extending through main wiring harness grommet in dash. This wire has Douglas terminal on engine side of dash. *NOTE* - If this wire missing, install the wire, Nash No. 4382421, and connect the eye terminal end to the "AUX" terminal of the circuit breaker.

3) Connect Douglas terminal of above wire (2) to the Douglas terminal installed on back-up light switch feed wire (1).

Automatic Transmission Cars - If Back-up Light feed wire is attached to right hand terminal of Body Junction Block (green wires), disconnect this wire and proceed in accordance with (1), (2), (3) above.

BRAKE NOTES

►*SPONGY BRAKE PEDAL CORRECTION (EXCEPT POWER BRAKES):* The small hole of the keyhole slot in master cylinder-to-pedal shaft brace may not fully engage groove at outer end of pedal shaft allowing the pedal shaft to flex within the keyhole. Correct as follows: Remove master cylinder-to-pedal shaft brace and elongate the master cylinder attaching hole as necessary to provide a full engagement of small hole of keyhole slot to groove in outer end of pedal shaft. Replace brace using two "bite" washers in place of the regular lockwashers on the master cylinder attaching screws.

►*AIR CONDITIONED CAR SERVICE CAUTION: Us xtr me care wh n disc nnecting any part f air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.
Starting Serial Number–K-649201 (Domestic), 4KD-5701 (Unassembled Export), KT-11101 (Canada).

ENGINE NUMBER: Stamped on machined surface at upper left front corner of cylinder block.
Starting Engine Number–DB-1001.

TUNE-UP

►*BURNED BREAKER POINTS OR HIGH SPEED MISS CORRECTION:* **May be caused by use of incorrect ignition primary resistor. Use only resistor with Delco-Remy trademark. See Resistor data below.**

COMPRESSION PRESSURE: 120 lbs. at cranking speed.

VACUUM READING: 18-21" at idling speed.

VALVE TAPPET CLEARANCE: .012" Int., .016" Exh. hot & running.

MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: 030".
Spark Plug–Auto-Lite AL-7. Torque to 30 ft. lbs

COIL: Delco-Remy 1115393. *12 Volt.*
Ignition Current – 1.7 amperes idling, 3.75 stopped.
Resistor–Delco-Remy No 1927809. 1 40-1.62 ohm.

►*COIL RESISTOR NOTE:* Connected in series between battery and coil. Resistor is by-passed during cranking by solenoid or magnetic starter switch, making direct lead from battery to coil.

DISTRIBUTOR: Delco-Remy No. 1110242. *12 Volt.*
Condenser–Delco-Remy 1869704. **Capacity** .18-.23 mfd.
Contact Point Set – Delco-Remy No. 1918148.
Breaker Gap–.016".
Cam Angle–28°-35°.
Breaker Arm Spring Tension–19-23 ozs.
Rotation–Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	350	0-4.	700
6.5-8.5	550	13-17	1100
11-13	1100	22-26	2200
15-17	1600	30-34	3200

Vacuum Spark Control: Delco-Remy No. 1116099.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum ("of Hg.)
Start	0	6-8
5	10	11-12

IGNITION TIMING

S tting–TDC. (Supersedes original specification of 4° ATDC)

►*IGNITION TIMING CHANGE:* Starting with engine number DB-1598 ignition timing was changed from 4° ATDC to TDC. On engines prior to above number, paint mark vibration dampers and set ignition to new specification "TDC".

Timing Mark–Vibration Damper.

CARBURETOR

►*ROUGH ENGINE CORRECTION (Exhaust gas leakage into Intake Manifold):* **May be caused by corrosion of intake manifold cover. For corrective procedure, see** *"Cylinder Head & Manifold" in Nash Special Data.*

Carter WCD No. 2350S. Dual type with automatic choke.

►*MANIFOLD FUEL DISTRIBUTION: Both barrels feed all cylinders*
Idle Setting–½-1½ turns open. Turn screws out for richer mixture.
Idle Speed–550 RPM (Standard & Overdrive Trans.), **475 RPM** (Hydra-Matic in Neutral), **500 RPM** (Hydra-Matic in Neutral with Air Conditioning turned on)
Float Level–5/32" (Gauge T109-196). Distance from top of each float to gasket seat on cover (cover inverted)
Accelerating Pump–No seasonal adjustment
Fast Idle: 020" between throttle valve and bore (side opposite idle port) with choke fully closed
Automatic Choke: Centered (At Index)

Throttle Linkage Adjustment (Hydra-Matic Cars): Adjust engine idle speed to 450 RPM (with air conditioning 500 RPM, compressor running), with engine temper-150-160°F, transmission warm and selector lever in neutral. Disconnect throttle rod at throttle lever at side of transmission Clean back of transmission case, place checking Gauge J-2545-D flush against machined surface with edge of gauge against transmission side cover. Throttle lever stud should fit freely in notch of gauge. Use bending Tool J-3310 to correct throttle lever position. Gauge notch must be in alignment with pin through hole in T.V. lever with lever held against its stop to the rear. When properly adjusted, connect throttle rod to T.V. lever. Remove upper end of throttle rod at bellcrank. Disconnect carburetor to bellcrank rod at carburetor throttle rod. Insert an aligning pin in holes of the bell crank and bracket. Adjust carburetor to bellcrank rod. Fasten rod in place with clip fasteners. Adjust T.V. rod at bellcrank to fit freely with the hole in lever. Then shorten T V. rod **three full turns.** Connect T.V. rod at bellcrank; remove **aligning pin.**
NOTE–Gauge 2545-C can be reworked by adding another notch behind original notch so that distance from center of notch to rear inside surface of gauge is 6½ .

►*OTHER DATA: See "Carter Dual WCD" in Carburetion Section.*
Fuel Pump Pressure: 3½-5¼ lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter. Fuel and vacuum.
Replacement Pump – Carter No. M-2379S.
Pressure – 3½ - 5¼ lbs. at 500 RPM.
See " Fu l Pumps" in Carbur ti nS cti n.
Gasolin Gaug : Auto-Lite Electric type.
Dash Unit – Auto-Lite 14159A.
Tank Unit – Auto-Lite 14165A.
See "Fuel Gaug s" in Carbureti n S cti n.

BATTERY

Standard – Auto-Lite 11-HS-50. *12 V lt.* 11 plate, 50 Ampere Hour Capacity (20 Hr. rate).
Air Conditioned Cars ∠ Auto-Lit 11-HS-60. *12 Volt.* 11 plate, 60 Ampere Hour Capacity (20 Hr. rate).
Battery Ground – Negative.
►*CAUTION: This is reversed from previous models.*
Engine Ground – Battery to engine with body ground from transmission to engine rear crossmember.

STARTER

Delco-Remy 1107647. *12 Volt.* **Armatur - 1926626.**
Drive–Overrunning clutch (solenoid pinion shift).
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–35 ozs

Performance Data

Torque	RPM	Volts	Amperes
0 ft lbs.	6900	10 3	75
10.5 ft. lbs	Lock	11.3	435

Starter Switch: Delco-Remy No. 1119793 solenoid switch located on starter, actuated by combination ignition and starter switch (Std. and Overdrive cars), by Delco-Remy No. 1996084 switch operated by raising shift lever upward (Hydra-Matic).

GENERATOR

Delco-Remy. *12 Volt.* **Used as follows:**

Application	Gen rat r	.Armatur
Without Air Cond.	1100323	1933352
With Air Cond.	1102049	1934326

►*GENERATOR ARMATURE SHAFT PRODUCTION CHANGE:* Generators with tag code stamped 5K-20 or later have heavier brazing of water pump drive extension on armature shaft to prevent breaking. Brazing should withstand 25 ft lb. torque applied to generator pulley (belt released) with pump shaft coupling held stationary.

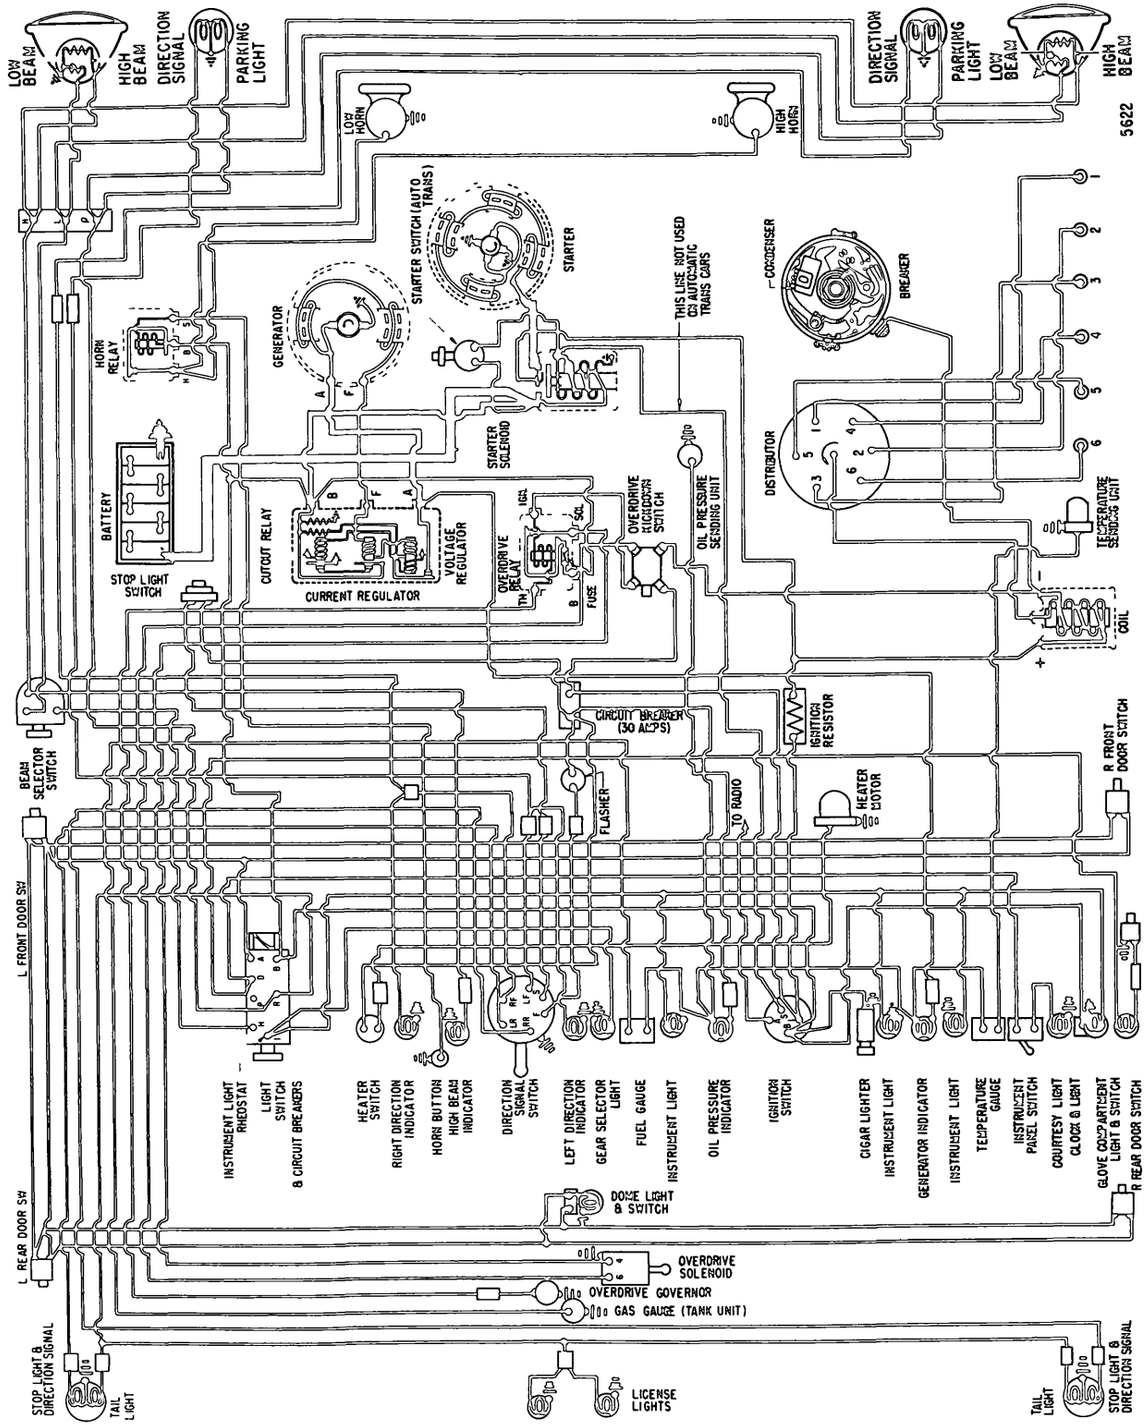
Performanc Data

	Amperes	Volts	RPM
Standard	25	14 0	2780
Air Cond.	30	14.0	2150

Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–28 ozs.
Field Current–1.50-1.62 amperes (1100323), 1.48-1.62 amperes (1102049), 12 volts at 80°F
Belt Adjustment: ½" deflection with 25 lbs pressure applied midway between fan and generator pulleys.

REGULATOR

Delco-Remy 1119122 (1100323 G n.), 1119003 (1102049 Gen.). *12 Volt. NOTE*–**Specifications are "Normal" Settings.**



Cut-Out R lay

Cuts-In–11.8-13.5 volts
Contact Gap–.020".
Air Gap– 020" with contacts just closed

Voltage Regulat r

S tting–13.8-14.8 Volts (hot).
Air Gap–.075" with armature pressed down to point where contacts just touching
Checking & Adjusting–*See "Delco-Remy 1119000*

CONTINUED FROM PRECEDING PAGE

Series Regulators" in Electrical Section.

Current Regulator

Setting (1119122)–23-27 amperes (hot).
Setting (1119003)–27-33 amperes (hot).
Air Gap–.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting–See *"Delco-Remy 1119000 Series Regulators" in Electrical Section.*

MISC. ELECTRICAL

▷*BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars):* Incorrect assembly of wire to back-up light switch and circuit breaker causes back-up light to operate incorrectly. *See "Electrical Notes" in Rambler Special Data.*

Headlamps: Sealed Beam. *See Electrical Section.*

Directional Signals: *See Electrical Section.*

Light Switch Removal: Disconnect battery. With switch in "OFF" position, press button release on top of light switch assembly, and pull knob and shaft clear of switch. Remove slotted nut, pull switch to rear of instrument panel.

Stop Light Switch: Located at tee fitting in line to left front brake.

FUSES: 7.5 Ampere. On lighting switch for Courtesy and Glove Box Light.
15 Ampere. Located on overdrive relay.
5 Ampere. Located in Radio wire back of instrument panel.

CIRCUIT BREAKERS: Three used as follows:
12 Ampere. On light switch for Instrument, Tail and Dome Lights.
12 Ampere. On light switch for Head and Parking Lights.
30 Ampere. For Stop Light, Instruments and Indicators, Heater and Directional Signals. Located back of Instrument panel.

HORNS: Auto-Lite HAD-4737 (Low Pitch), HAD-4738 (High Pitch). 12 Volt.
Horn Relay – Nash No. 3145684.

ENGINE

▷*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning system or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Sect.*

▷*ENGINE NOISE (Similar to bearing noise) CORRECTION:* A noise usually diagnosed as a bearing noise may come from improperly assembled Vibration Damper. Reassemble Cushions, Disc and Rubber correctly on engines built prior to Engine No. DB-2567.

▷*WATER PUMP LUBRICATION CHANGE:* Lubrication fitting now included. Use hand pressure lubrication gun to lubricate at 5,000 mile intervals.

ENGINE SPECIFICATIONS: 6 Cyl. valve-in-head.

Bore	Stroke	Displacement
3 1/8"	4¼"	195.6 cu. ins.
Compr Ratio	**Rated HP**	**Dev l p d HP**
7 47-1	23.44	130 at 4500 RPM

Compression & Vacuum Reading–See *TUNE-UP.*

OIL PAN REMOVAL: Remove steering linkage cross

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tie-rod before removing pan.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Nash Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Nash Special Data.*

PISTONS

Cam ground, aluminum alloy, tin plated, with steel strut and solid skirt.

Original Bore & Piston Sizes—*See "Original Bore & Pistons" in Nash Special Data.*

Weight—13.59 ozs.

Removal—Remove from above.

Fitting New Pistons: Clearance .0006-.0012". Pistons should just support own weight at any point in cylinder bore (piston and bore dry and clean).

Replacement Pistons: Standard, .002", .005", .010", .020", .030", .040" Oversize.

Installing Pistons: Piston pin is offset in piston. Piston is marked with notch that should face front of engine when installed. *See Rod Installation.*

PISTON PINS

Press fit in connecting rod. No locking device.

Diameter – .8597". Length – 2¾".

Clearance in Piston – .0002" maximum. Thumb push fit at 70°.

Pin Removal & Installation – *See "Piston Pins" in Nash Special Data.*

Replacement Pins: Standard, .003", .005" Oversize.

NOTE – Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.	.0930-.0935"	.010-.020"	.002-.004"
Oil #3	.1545-.1550"	.010-.020"	.002-.004"
Oil #4	.1545-.1550"	"U Flex"	.002-.004"

Replacement Rings: Standard & .020" Oversize in sets.

Installing Rings: Stepped inner edges of both compression rings must be up.

CONNECTING RODS

Length—6.625" center-to-center. **Weight**—25 ozs.

Crankpin Journal Diameter—2.0948-2.0955".

Original Bearing Sizes—*See "Original Bearing Sizes" in Nash Special Data.*

Bearings—Steel-backed babbitt. No shims.

Clearance—.0010-.0015". **Sideplay**—.005-.015".

Replacement Bearings: Std. & .001", .002", .010" and .012" Undersize.

Installing Rods: Identification marks (raised section on center of rod and bearing cap) toward front of engine.

CRANKSHAFT

Journal Diameter—2.4791-2.4798". Four bearing.

Original Bearing Sizes—*See "Original Bearing Sizes" in Nash Special Data.*

Bearings—Steel-backed babbitt. No shims.

Clearance—.001-.0015".

Replacement Bearings: Std. & .002", .010", .012" Undersize.

End Thrust: Taken by front main bearing. *See "Crankshaft & Main Bearings" in Nash Special Data.*

Endplay—.003-.008".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Nash Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Nash Special Data.*

FLYWHEEL REPLACEMENT: *See "Flywheel" in Nash Special Data.*

VIBRATION DAMPENER REMOVAL: *See "Vibration Dampener" in Nash Special Data.*

CAMSHAFT

Bearings—Steel backed babbitt bushings.

Clearance—.002".

End Thrust: Thrust plate on front of engine between No. 1 bearing and camshaft sprocket. End play controlled by position of sprocket on shaft (press fit on shaft).

Endplay—.004-.006".

Timing Chain: Morse. **Width** 1". **Pitch** 3/8". **Length** 22-1/2" or 60 links.

Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across center line of sprockets.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Nash Special Data.*

VALVES

Tappet Clearance: Intake .012", Exhaust .016" (Running Hot).

Valve	Head Diam.	Stem Diam.	Length
Intake	1.594"	.3412-.3417"	4.759"
Exhaust	1.343"	.3407-.3412"	4.759"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45° ①	.383"	.0015-.0035"
Exhaust	45° ①	.385"	.002-.004"

① Valve face angle 44°.

►*VALVE GRINDING CAUTION:* Replace valves when refacing reduces distance from top of valve face to top of valve to less than 1/32".

Valve Seat Width – 5/64-3/32".

Valve Stem Oil Seal – Rubber deflectors mounted on all valve stems at upper end of guide.

Valve Springs: Valve springs may be removed without removing cylinder head by maintaining 90 lb. air pressure in combustion chamber to hold valve against valve seat.

Free Length – 2 3/8".

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	65-70	1.13/16"
Open	115-125	1 7/16"

Valve Guides: Use Tool J-1429-A to remove and replace guides. Guides should extend ¾" above cylinder head.

Rocker Arm Assembly: *See "Valve System" in Rambler Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valve – Open 12°30' BTDC, Close 51°30' ALDC

Exhaust Valve – Open 53°30' BLDC, Close 10°30' ATDC

Valve Timing Check – Set valves on No. 1 cylinder at .003" lash. With No. 6 piston at TDC in firing position, timing will be correct if exhaust valve opens the same amount before DC on vibration dampener as intake valve opens after DC as engine is rocked back and forth over DC.

OILING SYSTEM

Crankcase Capacity: 4 qts. refill.

Normal Oil Pressure: 30 lbs. at 20 MPH. 12 lbs. minimum at 600 RPM.

Pressure Regulator Valve – Non-adjustable spring loaded valve located in cylinder block where oil enters oil distribution channel.

Oil Pressure Indicator: Light goes on when Ignition switch is turned on, goes out as oil pressure reaches 6½ lbs. ± 1½ lbs. Sending unit Rambler No. 3142826 located on right rear side of engine block.

Oil Pump: Gear type. Mounted on right side of engine. *See "Oiling System" in Rambler Special Data.*

Oil Filter – Partial Flow type. Replace element every 5000 miles or less as needed.

Replacement Filter Unit – Rambler No. 8990068.

Crankcase Ventilation: Filter in crankcase filler cap, and vent in rocker arm cover.

COOLING

Water Capacity: 11 quarts.

Pressure Valve: 7 lb. Radiator Filler Cap Rambler No. 3142965 (less Air Conditioning), 14 lb. No. 3141371 (with Air Conditioning).

Thermostat: Choke type. (Std.) 170° type Rambler No. 3131817, (Optl.) 180° type Rambler No. 3131985 for use with permanent anti-freeze.

Water Pump: Sealed packing and bushing type. *See "Rambler" in Water Pump Section.*

Pump Removal – Drain cooling system, disconnect coupling, hoses, and pump mounting screws.

Temperature Gauge: King-Seeley Electric Constant-Voltage ("CV") type with gauge voltage regulator, King-Seeley No. 46439.

Dash Unit – King-Seeley 49476.

Engine Unit – King-Seeley 44200.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 8.5A7. Assy. No. 1391. Single plate. *See "Borg & Beck" in Clutch Section.*

Clutch Disc No.	Borg & Beck	Nash No.
Standard	382394	3144937
Overdrive	382490	3147133

Pedal Adjustment: Pedal free play 1/2-3/4". Adjust by loosening locknut and turning adjusting nut on connector link at clutch fork.

►*CAUTION: The pedal to beam rod should never be disturbed in service.* With pedal against floor board, outer end of beam lever should project 1/2" from beam toward the rear.

Clutch Linkage – *See "Clutch Notes" in Nash Special Data.*

Removal: Remove transmission (see below), disconnect

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

clutch pedal linkage, remove clutch housing and pan, punch mark flywheel, clutch cover and pressure plate. (Reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Own. 3 Speed, All helical gear type.
See "Nash Transmission" in Transmission Section.

►*TRANSMISSION REAR BEARING SNAP RING BREAKAGE CORRECTION:* **Caused by heavy duty operation or maladjustment of torque tube trunnion. For installation of sleeve or adjustment of trunnion, *See "Nash Transmission" in Transmission Section.***

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect brake tube bracket at body, and torque tube at rear of transmission. Disconnect brake cable at bell crank and cable housing at bell crank bracket. Move rear axle assembly to rear off transmission main shaft splines. Disconnect speedometer cable and shifter rods, (if overdrive equipped, disconnect wires at solenoid and overdrive cable at lever) Use guide pins, Tool J-1434, in two upper cap screw positions and slide transmission free of pilot bearing and clutch disc

OVERDRIVE

Warn r R10. Used with Nash transmission.
See "Warner R10 Overdrive" in Transmission Section.

Overdriv C ntrol: *Se "Warner R10 Transmission Control" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Rang . Four speed automatic transmission with fluid coupling.
See "Hydra-Matic Drive" in Transmission Section.

►*HYDRA-MATIC REVERSE GEAR SLIP-OUT CORRECTION:* **To check and correct this condition, first disconnect back-up light switch at manual control lever on side of transmission, and operate transmission in reverse. If condition not corrected, adjust manual control linkage. If condition corrected adjust back-up light switch to proper tension by placing control lever in reverse, and adjusting switch cable just enough to allow spring to pull switch to the contact position.**

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid every 1,000 miles, drain and refill at 25,000 mile intervals.

Capacity—8-1/2 qts. (9-1/2 qts. after overhaul).

Ch cking Fluid Lev l—Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of 2 minutes after transmission has reached normal operating temperature. With selector lever in "N" position, remove dipstick and check fluid level (dipstick located in engine compartment on right side). Add fluid to bring level up to "F" mark.

▲*CAUTION:* Do not check oil level when transmission is excessively hot and do not fill above the "F" mark on dipstick.

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit—Cross type. One used at forward end of propeller shaft.

REAR AXLE

Own. Semi-floating, hypoid gear type with torque tube drive.
See "Nash Rear Axles" in Rear Axle Section.

Axle Ratios	Standard	Optional
Synchro-mesh	4.4-1 (9-40)	4.4-1 (9-40)
Overdrive	4.9-1 (8-39)	
Hydra-Matic	3.6-1 (12-43)	

Rear Suspension: *See "Nash" in Suspensions & Wheel Alignment Section.*

Backlash— 002-.006". Shim adjustment.

Axle Shaft Removal: Remove wheel, pull drum (use hub puller J-1644). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer. backing plate, and wheel bearing adjusting shims. Withdraw axle shaft using puller J-2498. Do not drag shaft on inner oil seal.

Rear Axle Assembly Removal: Jack up and support rear end of body. Disconnect rear brake cable at equalizer, torque tube at rear of transmission, brake hose and shock absorbers at rear axle end (allow shocks and brake hose to hang from body). Roll axle assembly out from under car.

Wheel Bearing Adjustment: Shims behind brake backing plate.

SHOCK ABSORBERS

Delco or Monroe. Direct acting type. Serviced by replacement.

Front — Nash No. 3140879. **Rear** — Nash No. 3140406.

►*REAR SHOCK ABSORBER NOISE CORRECTION (Cars before Serial No. K-651528):* **Before replacing a rear shock absorber for being noisy, check for damaged shock absorber grommet spacer or limit sleeve, (caused by incorrect retainer with oversize hole). If grommet spacer damaged discard it. When reassembling without grommet spacer, do not use retainer Nash No. 3136432, however, do not compress shock absorber grommets excessively.**

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper ends of steering knuckle pin and seat in outer wheel house panel.
See "Nash" in Suspensions & Wheel Alignment Section.

King Pin Inclination—6-1/2°.

Caster (Manual Steering)—Pos. 1/2° desired (limits 0° to Pos. 1/2°). **(Power Steering)** Pos. 1° desired (limits Pos. 1/2° to Pos. 1°).

Camber—0° desired (limits Neg. 1/4° to Pos. 1/4°).

Toe-In—1/16"-3/16".

►*TOE-IN ADJUSTMENT (POWER STEERING) CAUTION:* **Operate engine so that power steering pump will supply oil pressure to center spool in power cylinder valve.**

Toe-Out on Turns—Outer wheel 20-3/4°, Inner wheel 25°.

►*FRONT CROSSMEMBER INSTALLATION CAUTION:* When installing front crossmember, distance between centers of either front or rear mounting bracket bolt holes must be 19-1/2" to insure maintaining front wheel alignment.

STEERING

Manual: Gemmer. Worm & Roller with "push-pull" adjustments.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering: Monroe "Power Guide". Linkage type.
See "Monroe Power Guide" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor. Hand lever applies rear wheel service brakes.
See "Bendix Hydraulic, Single Anchor" in Brake S ct.

Drums — Diameter 10" (Front and Rear).

Wheel Cylinder Diameter — 1 1/8" (Front), 7/8" (Rear).

►*REAR WHEEL BRAKE CYLINDER PRODUCTION CHANGE:* **Beginning with Car Serial Number K-652321 the diameter of the rear wheel brake cylinder was decreased to 7/8" from 15/16" to improve brake distribution.**

Replacement Lining & Shoes — Linings and shoes with linings furnished standard size only.

Lining Width & Length	Front Wheel	Rear Wh l
Primary Shoes	2" x 8 7/8"	1¾" x 8 7/16"
Secondary Shoes	2½" x 10 31/32"	1¾" x 10 25/32"

Clearance - .015" heel & toe of secondary shoe with primary out against drum, or adjusting screw backed off 14 notches or clicks from point where wheel can just be turned by hand.

Standard Master Cylinder: Mounted on support under floor pan.

Checking Fluid — Roll back floor mat, remove access hole cover, maintain fluid level ½-1" below filler opening.

Removal — Remove from below without disturbing other units.

Power Brakes: Bendix Power Unit. Replaces standard master cylinder.
See "Bendix Power Unit" in Brake Section.

Checking Fluid—Same as for standard master cylinder.

Removal—Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Miscellaneous Section.

Wind w R gulat rs: Electric with reversible motor. *See "Nash Window Regulators" in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Us xtrem care wh n disc nn cting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.
Starting Serial Number–R-757901 (Domestic), 6KD-4601 (Unassembled Export)

ENGINE NUMBER: Stamped on machined surface at upper right hand, front corner of cylinder block.
Starting Engine No.–A-279001 (Super Jet Fire–one carburetor), LMA-277001 (LeMans–two carburetors)

TUNE-UP

COMPRESSION PRESSURE: 120 lbs. at cranking speed
VACUUM READING: 18-21" at idling speed.
VALVE TAPPET CLEARANCE: 012" (Intake), .016" (Exhaust) Running Hot.
MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .030".
Spark Plug–Auto-Lite A-7. Torque to 30 ft. lbs.
COIL: Auto-Lite CAF-4003. *12 Volt.*
NOTE - **No resistor used in primary circuit.**
DISTRIBUTOR: Auto-Lite IAT-4301. *12 Volt.*
Condenser–Auto-Lite IAT-2015R **Capacity** 21-.25 mfd.
Contact Point Set–Auto-Lite IGW-3028BS
Breaker Gap–.020"±.002".
Cam Angle–36-42°.
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
3	450	6	900
7	650	14	1300
10	950	20	1900
14	1350	28	2700

Vacuum Spark Control: Integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	5
1	2	6½
3	6	9½
5	10	12½
6	12	14

IGNITION TIMING

Setting–4° ATDC.
Timing Mark–Vibration damper.

CARBURETOR

►*CARBURETOR APPLICATION NOTE:* One carburetor (Carter YH 2368S) used on Super Jet Fire Engine two carburetors (Carter YH 2369S) used on LeMans Engine.

►*WARM-UP & ACCELERATION STUMBLE CORRECTION (Carter YH-2368S):* Improved body castings used on carburetors bearing Code "L-5" or higher (Nov. 1955) on brass tag. Porous main body castings and imperfect sealing between bowl cover and main body near accelerating pump passage (early carburetors) resulted in too lean mixture causing poor warm-up and acceleration. Install carburetor with date tag "L-5" or later

Throttle Linkage Adjustment: Adjust engine idle speed to 450 RPM (with air conditioning 500 RPM, with compressor running), with engine temperature at 150-160°F, transmission warm and selector lever in Neutral. Disconnect throttle rod at throttle lever at side of transmission. Clean back of transmission case, place checking Gauge J-2545-D flush against machined surface with edge of gauge against transmission side cover. Throttle lever stud should fit freely in notch of gauge. Use bending Tool J-3310 to correct throttle lever position. Gauge notch must be in alignment with pin through hole in T.V. lever, with lever held against its stop to the rear. When properly adjusted, connect throttle rod to T.V. lever. After checking adjustment of T.V. lever at transmission disconnect T.V. rod at Carburetor throttle shaft lever. Adjust T.V. rod to fit freely in hole of throttle shaft lever. Then shorten T.V. rod three full turns. *NOTE*– Gauge 2545-C can be reworked by adding another notch behind the original notch so that distance from center of notch to rear inside surface of Gauge is 6½".

CARTER YH-2368S

Idle Setting– ½-1½ turns open. Turn screw out for richer mixture
Idle Speed–550 RPM (Standard & Overdrive), 475 RPM (Hydra-Matic in Neutral), 500 RPM (Hydra-Matic in Neutral with Air Conditioning turned on).
Float Level–5/16" (T-109-107). Distance from bowl cover to top of float with cover inverted and gasket removed.
Fast Idle: .030" between throttle valve and bore (side opposite idle port) with choke fully closed.
Automatic Choke: 1 point rich.
Throttle Linkage Adjustment: See *CARBURETOR* above.
►*OTHER DATA: See "Carter YH" in Carburetion Sect.*
Fuel Pump Pressure: 3½ - 5¼ lbs. at 500 RPM.

CARTER YH-2369S (Two Used)

Idle Setting–½-1½ turns open. Turn screws out for richer mixture.
Idle Speed–**550 RPM** (Standard & Overdrive Trans.), **475 RPM** (Hydra-Matic in Neutral), **500 RPM** (Hydra-Matic in Neutral with Air Conditioning turned on).
Idle Adjustment–*To insure proper synchronization make idle adjustments in following sequence:*
1) Remove air cleaner boots and "Tee" from carburetor airhorns.
2) Adjust throttle stop screw on rear carburetor as follows. Hold choke valve open, back off throttle stop screw until throttle valve is just closed, then turn screw in approximately 2 turns to crack throttle valve slightly Adjust front carburetor similarly
3) Start engine and allow it to idle until normal temperature reached. Attach Tachometer.
4) Adjust rear carburetor stop screw for minimum idle speed (See above).
5) While noting idle speed, synchronize front carburetor by adjusting connecting throttle linkage between carburetors, opening front carburetor throttle just to the point where further opening begins to increase engine speed. At this point, air suction noise in both carburetors should be identical.
6) Replace air cleaner boots and "Tee" connections.
7) Adjust idle mixture on rear carburetor by turning adjusting screw in (to lean mixture) until engine begins to be rough, then turn screw out ¼ turn. Adjust idle mixture for front carburetor similarly.
8) Recheck idle speed. If not within limits (see above) repeat synchronization (1 thru 5).
Float Level–7/16". Distance from bowl cover (gasket removed) and top of float at free end. Gauge T-109-81.
Accelerating Pump–No seasonal adjustment.
East Idle: .018" between throttle valve and bore (side opposite idle port) with choke fully closed.
Automatic Choke Setting: 2 points lean.
►*OTHER DATA: See "Carter YH" in Carburetion Sect.*
Fuel Pump Pressure: 3½ - 5¼ lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: AC. Fuel and vacuum pump.
Replacement Pump – AC No. 4309.
Pressure – 3½ to 5¼ lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: Auto-Lite. Electric type.
Dash Unit – Auto-Lite 14159A.
Tank Unit – Auto-Lite 14165A.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Standard – Auto-Lite 11-HS-50. *12 Volt.* 11 plate, 50 Ampere hour capacity (20 hour rate).
Air Conditioned Cars – Auto-Lite 11-HS-60. *12 Volt.* 11 plate, 60 Ampere hour capacity (20 Hr. rate).
Grounded Terminal – Negative.
►*CAUTION: This is reversed from previous models.*
Engine Ground – Battery to engine with body ground from transmission to rear crossmember.

STARTER

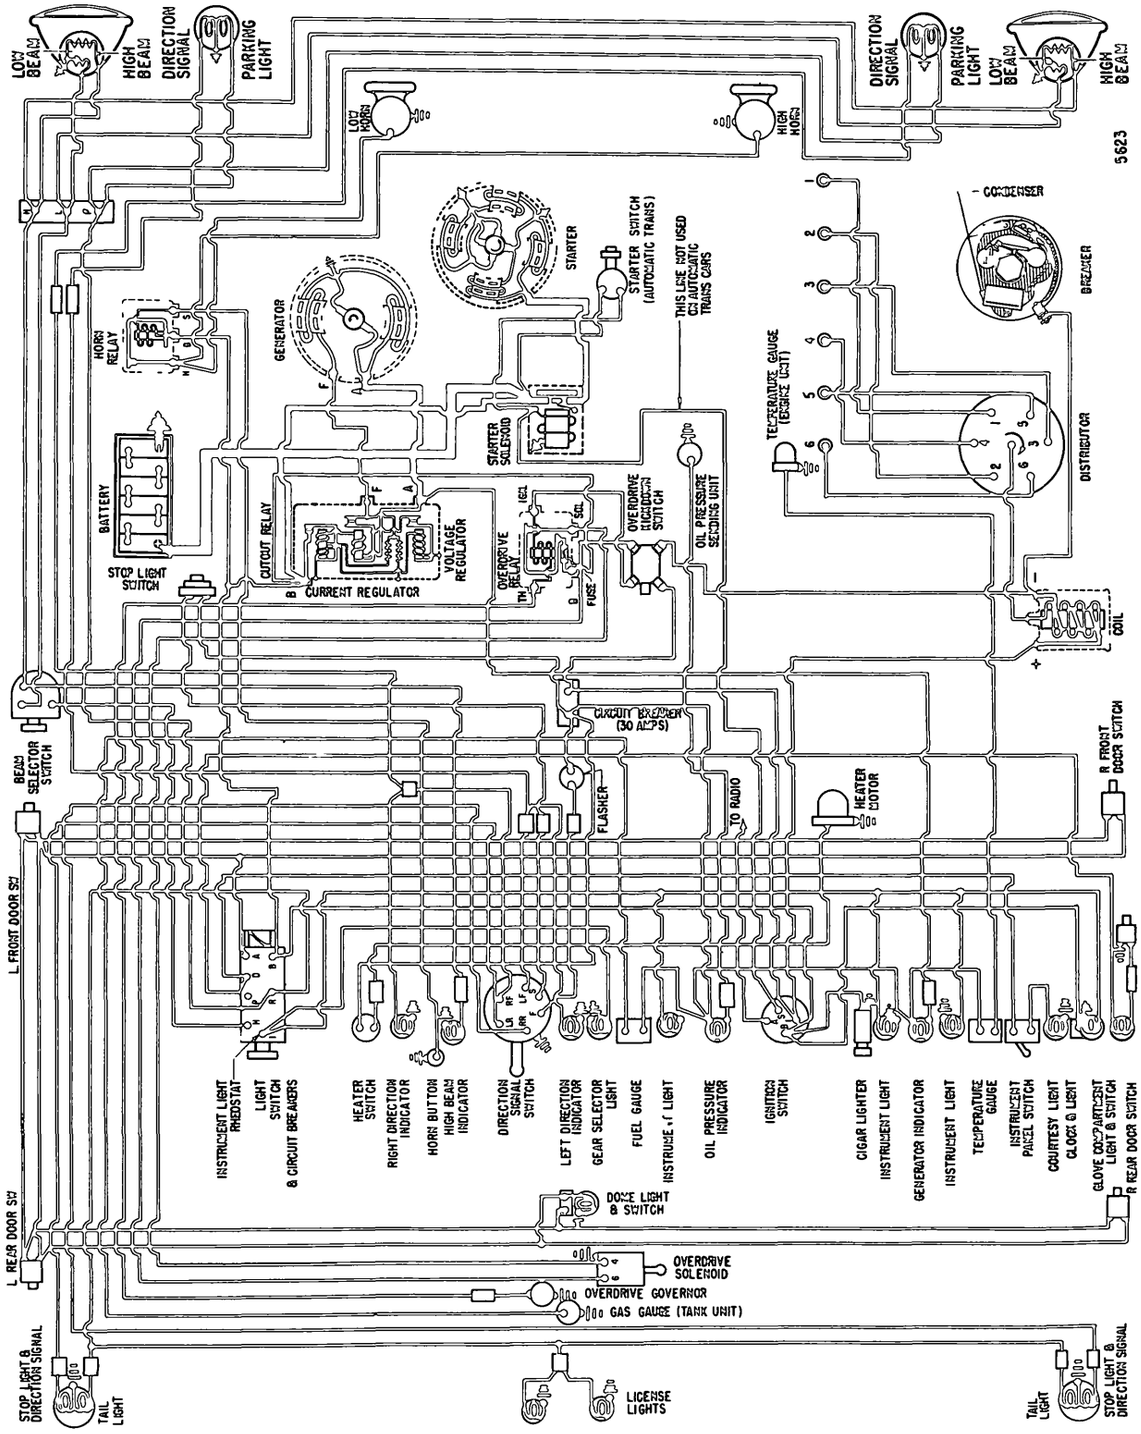
Auto-Lite. *12 Volt.* Used as follows:

Auto-Lite No.	Starter	Armature
Std. & O.D. Trans.	MDF-6010	MDF-2037
Hydra-Matic	MDF-6009	MDF-2088

Drive–Bendix A2033 (Std. Trans.), A3281 (Hydra-Matic).
Rotation – Counter-clockwise from commutator end.
Brush Spring Tension – 42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60 Max.
6.5 ft. lbs.	Lock	4.0	240 Max.



Starter Switch: Nash No. 3146189 magnetic switch located on starter, actuated by combination Ignition and Starter Switch (Standard and Overdrive), by Delco-Remy 1996085 Switch (Hydra-Matic), by raising shift lever while in Neutral position.

GENERATOR

Auto-Lite. *12 Volt.* Used as follows:

Auto-Lite No.	Generator	Armature
Standard	GJC-7007A	GJC-2052F
Air Cond.	GJC-7007B	GJC-2052F

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data—Cold

Amperes	Volts	RPM
20	15.0	1750
30	15.0	2250

NOTE—Do not operate at high output without ventilating fan for any length of time as to do so may result in burned armature or fields.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-36 ozs.

Field Current—1.23-1.32 amperes at 10 volts at 70°F.

Belt Adjustment: ½" deflection upon application of 25 lb. pressure applied midway between fan and Generator pulleys.

REGULATOR

Cutout Relay

Cuts In—13.0-13.7 volts

Cuts Out—8 2-9.3 volts at approx. 3-5 amperes discharge.

Contact Gap—.015" min.

Air Gap—031-034", with contact open (check at hinge end of core).

Auto-Lite VRX-6008A. *12 Volt.*

Checking & Adjusting — *See Electrical Section.*

Voltage Regulator

Setting—14.5 volts (80°F), charging at 10 amperes or with .25 ohm resistor between regulator and battery.

Air Gap—.048-.052" with contacts just opening.

Current Regulator

▷*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
36 max.		30 (28-32)

Test A—After 15 minutes operation at 10 amperes.

Test B—After an additional 15 minutes operation on current regulator (with load to give 13.6-13.8 volts).

Air Gap—.048-.052" with contact just opening.

Checking & Adjusting — *See Electrical Section.*

MISC. ELECTRICAL

▷*BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars):* Incorrect assembly of wire to back-up light switch and circuit breaker causes back-up light to operate incorrectly. *See "Electrical Notes" in Nash Special Data.*

Headlamps: Sealed Beam. *See Electrical Section.*

Directional Signals: *See Electrical Section.*

Light Switch Removal: Disconnect battery. With switch in "OFF" position, press button release on top of light switch assembly, pull knob and shaft clear of switch. Remove slotted nut, pull switch out to rear of instrument panel.

Stop Light Switch: Located at tee fitting in line to left front brake.

FUSES: 7.5 Ampere on lighting switch for Courtesy and Glove Box Light.

15 Ampere. Located on overdrive relay.

5 Ampere. Located in radio wire back of instrument panel.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CIRCUIT BREAKERS: Three used as follows:
12 Ampere – On light switch for Instrument, Tail and Dome lights.
12 Ampere – On light switch for Head and Parking lights.
30 Ampere – For Stop Light, Instruments and Indicators, Heater and Directional Signals. Located back of Instrument panel.

HORNS: **Auto-Lite HAD-4737** (Low Pitch), **HAD-4738** (High Pitch).
Horn Relay – Nash No. 3145684.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTIONS: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Sect.*

►*ENGINE NOISE (Similar to Bearing Noise) CORRECTION:* A noise usually diagnosed as a bearing noise may be caused by improperly assembled Vibration Damper, Reassemble cushions, Disc, and Rubber correctly on cars built prior to Engine No. A-280018.

►*WATER PUMP LUBRICATION CHANGE:* Lubrication fitting now used on pump. Lubricate at 5000 mile intervals using hand pressure gun.

ENGINE SPECIFICATIONS: 6 Cyl. Valve in head. **Super Jet Fire** (1 carburetor) & **LeMans** (2 carburetors).

	Bore	Stroke	Displacement
All Engines	3½"	4 3/8"	252.6 cu. ins.

	Compr. Ratio	Rated HP	Developed HP
Super Jet Fire	7.6-1	29.4	135 at 3700 RPM
LeMans	7.6-1	29.4	145 at 4000 RPM

Compression & Vacuum Reading–*See TUNE-UP.*

OIL PAN REMOVAL: Remove steering linkage cross tie-rod before removing pan.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Nash Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Nash Special Data.*

PISTONS

Cam ground, aluminum alloy, tin plated, with steel strut and solid skirt.
Original Bore & Piston Sizes–*See "Original Bore & Pistons" in Nash Special Data.*
Weight–19.57 ozs.
Removal–Remove from above.

Fitting New Pistons: Clearance .0009-.0015". Fit piston so that it will support itself in any part of cylinder bore (dry piston & bore).

Replacement Pistons: Std., .002", .005", .010", .020", .030" & .040" Oversize.

Installing Pistons: Notch on front edge of piston must be toward front of engine. *See Rod Installation.*

PISTON PINS

Press fit in connecting rod. No locking device.
Diameter – .9308". Length – 3 3/16".
Clearance in Piston – .0002" maximum. Thumb push fit at 70°
Pin Removal & Installation – *See "Piston Pins" in Nash Special Data.*
Replacement Pins: Standard & .003", .005" Oversize.
NOTE – Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.	.0930-.0935"	.007"	.002-.004"
Oil #3	.1545-.1550"	.007"	.002-.004"
Oil #4	.1545-.1550"	②	.002-.004"

② No end gap with U-flex ring.

Replacement Rings: Std. & .020" Oversize. In sets.
Installing Rings: Stepped inner edges of both compression rings must be up.

CONNECTING RODS

Length–8.750" center to center. **Weight**–29 ozs.
Crankpin Journal Diameter–2.0010-2.0003".
Original Bearing Sizes–*See "Original Bearing Sizes" in Nash Special Data.*
Bearings–Steel backed babbitt. No shims.
Clearance–.001-.015". **Side Play**–.005-.015".
Replacement Bearings: Std., .001", .002", .010", .012" Undersize.
Installing Rods: The identification boss on center of rod is installed to front of engine.

CRANKSHAFT

Journal Diameter–2.4791-2.4798". Seven main bearings.
Original Bearing Sizes–*See "Original Bearing Sizes" in Nash Special Data.*
Bearings–Steel backed babbitt.
Clearance–.001-.0015".
Replacement Bearings: Std., .002", .010", .012" Undersize.
End Thrust: Taken on center No. 4 main bearing.
End Play–.003-.008".
Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Nash Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Nash Special Data.*

FLYWHEEL REPLACEMENT: *See "Flywheel" in Nash Special Data.*

VIBRATION DAMPENER REMOVAL & INSTALLATION: *See "Vibration Dampener" in Nash Special Data.*

CAMSHAFT

Bearings–Steel-backed babbitt bushings (except #1 Cast Iron with babbitt lining).
Clearance–.002".
Camshaft Removal: *See "Camshaft & Bearings" in Nash Special Data.*
End Thrust: Controlled by position of chain sprocket & No. 1 bearing.
End Play–.004-.006".
Timing Chain: Morse. **Width**–1". **Pitch**–3/8". **Length**–22-1/2" or 60 links.

Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across center line of sprockets.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Nash Special Data.*

VALVES

Tappet Clearance: Intake .012" Hot. Exhaust .016" Hot.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.787"	.3720-.3730"	5-31/64"
Exhaust	1.468"	.3725-.3735"	5-31/64"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30° ①	.393"	.002-.004"
Exhaust	45° ②	.3945"	.002-.004"

① –Valve face 29°. ② –Valve face 44°.

►*VALVE GRINDING CAUTION:* Replace valve when refacing reduces distance from top of valve face to top of valve to 1/32".
Valve Stem Oil Seal: *See "Valve System" in Nash Special Data.*
Valve Springs: Install springs with closed-coil end toward valve seat. **Free Length**–2-1/16".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	53-58	1-13/16"
Open	144-154	1-7/16"

Valve Guides: Pressed in. Use Tool J-4687 to replace guides. *NOTE*–Before removing guides, check height of guide and install guide to same height.
Rocker Arm Assembly: *See "Valve System" in Nash Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves–Open 12-1/2° BLDC. Close 51-1/2° ALDC.
Exhaust Valves–Open 53-1/2° BLDC. Close 10-1/2° ATDC.
Valve Timing Check–With No. 6 piston on TDC in firing position, set tappet clearance on No. 1 Intake & Exhaust at .003". Rock engine back and forth over TDC. Timing is correct if the Exhaust valve opens before TDC same amount that the Intake opens after the TDC mark.

OILING SYSTEM

Crankcase Capacity: 6 qts.
Normal Oil Pressure: 30 lbs. at 20 MPH, 12 lbs. minimum at 600 RPM.
Pressure Regulator Valve–Non adjustable, located in pump body. Opens at 50-58 lbs.
Oil Pressure Indicator–Light goes on when Ignition Switch is turned on, goes out as oil pressure reaches **5-8 lbs. Pressure Switch, Nash No. 3142826, located on right side of crankcase.**
Oil Pump: Gear type, driven off camshaft, mounted on center main bearing cap.
Pump Overhaul – *See "Oiling System" in Nash Special Data.*
Oil Filter: Partial flow type. Replace element every 8000 miles or less as needed.
Replacement Filter Element – Nash No. 3137443.
Crankcase Ventilation: Breather pipe in valve cover and filter in crankcase filler cap.

COOLING

Water Capacity: 17 qts. Add 1 qt. for heater.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Pressur Valve: 7 lb. Radiator Filler Cap Nash No. 3142965 (less Air Conditioning), 14 lb. No. 3141371 (with Air Conditioning).

Th rm stat: Choke type, Nash No. 3131817 (167-173°), Use 3131985 (177-182°) for permanent anti-freeze.

Wat r Pump: Sealed packing and bushing type.
S e "Nash" in Water Pump Section.

Pump R moval—Drain cooling system, disconnect pump drive coupling (remove rear bolt), disconnect inlet hose, remove pump mounting screws.

Temperatur Gauge: Auto-Lite. Electric type.
Dash Unit – Auto-Lite 14158A.
Engin Unit – Auto-Lite 13550A.
See "T mperatur Gauges" in Miscellaneous Section.

CLUTCH

B rg & B ck 10A7 Assy. No. 950. Single plate.
See "Borg & Beck" in Clutch Section.

Clutch Disc No.—Borg & Beck CD 752. Nash No. 3125822.

P dal Adjustment: Pedal free travel 1/2-3/4". Adjust by loosening locknut and turning adjusting nut on control link at clutch fork.

►*CAUTION: The pedal to beam rod should never be disturbed in service.* With pedal against floor board, outer end of beam lever should project 5/16" from beam toward the rear, to provide proper leverage.

Clutch Linkag –*See "Clutch Notes" in Nash Special Data.*

R moval: Remove transmission (see below), disconnect clutch pedal linkage, remove clutch housing and pan. Punch mark flywheel clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Warner AS25-T86E (Standard), AS46-T86E (With Overdrive). Three speed, helical gear type.
See "Warner Transmissions" in Transmission Section.

Transmissi n Contr ls: *See "Transmission Controls" in Transmission Section.*

R m val: Move rear axle back (see Universals for procedure) to slip front universal joint off transmission. Disconnect shift levers and speedometer cable, remove two upper transmission to bell housing bolts, and install special guide bolts in their place. Remove lower bolts slide transmission out.

OVERDRIVE

Warn r R10. *See "Warner R10 Overdrive" in Transmission Section.*

Ov rdriv Control: ***See "Warner R10 Overdrive Controls" in Transmission S ction.***

HYDRA-MATIC DRIVE

Dual Range. Four speed automatic transmission with with fluid coupling.
See "Hydra-Matic Driv " in Transmission Section.

►*HYDRA-MATIC REVERSE GEAR SLIP-OUT CORRECTION: See "Hydra-Matic Driv " in Trans. S ction.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid every 1,000 miles, drain and refill at 25,000 mile intervals.

Capacity—11 qts. 12 qts. after disassembly.

Checking Fluid Level—Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of 2 minutes after transmission has reached normal operating temperature. With selector lever in "N" position remove dipstick and check fluid level (dipstick located in engine compartment on right side). Add fluid to bring level up to "F" mark.

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit—Cross type. One used at rear of transmission

REAR AXLE

Own. Semi-floating, hypoid gear type with torque tube drive. *See "Nash Hypoid" in Transmission Section.*

Axle Ratio—4.1-1 (10-41) Std., 4.4-1 (9-40) with Overdrive, 3.2-1 (13-41) with Hydra-Matic.

Backlash—.002-.006" shim adjusted.

Axle Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims, and replace same amount when reassembling). Withdraw shaft using puller J-2498, do not drag on inner seal.

Rear Axle Assembly Removal: Raise and support rear end of car. Disconnect rear brake cables at center equalizer. Disconnect torque tube at rear of transmission. Disconnect brake hose and shock absorbers at axle end (let hang from body). Roll axle free.

Wheel Bearing Adjustment: Shims behind brake backing plate.

Rear Suspension: ***See "Nash" in Suspensions & Wheel Alignment Section.***

SHOCK ABSORBERS

Delco or Monroe. Direct acting type. Serviced by replacement.
Front – Nash No. 3140879. Rear – Nash No. 3140406.

►***REAR SHOCK ABSORBER NOISE CORRECTION (Cars before Serial No. R-759717):*** **Before replacing a rear shock absorber for being noisy, check for damaged shock absorber grommet spacer or limit sleeve, (caused by incorrect retainer with oversize hole). If grommet spacer damaged, discard it. When reassembling without grommet spacer, do not use a retainer (Nash No. 3136432), however, do not compress shock absorber grommets excessively.**

FRONT SUSPENSION

Independent. With coil springs located between upper ends of steering knuckle pin and seat in outer wheelhouse panel.
See "Nash" in Susp nsions & Whe l Alignment S ction.

►***FRONT TIRE WEAR CORRECTION (Early Cars):*** **Wear due to tire contact with brake hose bracket can be corrected as follows: Set stopscrews on pitman arm to limit turning radius to 36°. If tire still contacts bracket, trim rear corner of bracket approximately 1/8" Cars built after April 11, 1956 have reworked brackets.**

King Pin Inclination—6-1/2°.

Caster—**(Std.)** Pos ½° desired (limits 0° to Pos. ½°). **(Power Steering)** Pos. 1° desired (limits Pos. ½° to Pos 1°)

Camber—0° desired with 1/4° Neg. to 1/4° Pos. Limit.

Toe-In – 1/16" to 3/16". *CAUTION* – When adjusting toe-in on power steering cars, operate engine so that pump will supply oil pressure to center spool in power cylinder valve.

Toe-Out on Turns – Outer wheel 20¼°. inner wheel 25°.

STEERING

Manual: Gemmer Model 305. Worm & Roller with "push-pull" adjustments.
See "Gemmer Steering Gears" in Steering Section.

Power Steering: Bendix Linkage type.
See "Bendix Linkage Type" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix Hydraulic Single Anchor. Hand lever applies rear wheel service brakes.
See "Bendix Hydraulic, Single Anchor" in Brake Section.

Drums—11" front & rear.

Wheel Cylinder Diameter – Front 1 1/8". Rear 7/8".

►***REAR WHEEL BRAKE CYLINDER PRODUCTION CHANGE:*** **Rear brake cylinder reduced to 7/8" (was 15/16") beginning with Serial No. R-760903 to improve brake distribution.**

Lining Width & Length

Shoe	Front	Rear
Primary	2-1/2" x 9-3/8	2" x 9 5/16"
Secondary	2-1/2" x 12"	2" x 12"

Clearance—.015" heel & toe of secondary shoe with primary out against drum, or adjusting screw backed off 14 notches or clicks from point where wheel can just be turned by hand.

Standard Master Cylinder: Mounted on support under floor pan to left of transmission.

Checking Fluid—Roll back floor mat, remove access hole cover, maintain fluid 1/2-1" below filler opening.

Removal—Remove from below without disturbing other parts.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Miscellaneous Section.

P w r Window R gulat rs: Electric with reversible motor. *See "Nash Window Regulators" in Misc l-laneous Section.*

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Hudson Hornet Special V8 ..... Model 35650
Nash Ambassador Special V8 ..... Model 5650

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.

Starting Serial Number – (Hudson) Z-1001 (Domestic), ZKD-1001 (Unassembled Export).

(Nash) U-1001 (Domestic), UKD-1001 (Unassembled Export).

ENGINE NUMBER: Stamped vertically on lower right front corner of cylinder block above oil pan flange. *NOTE* – Number also stamped on plate on valve compartment cover.

Starting Engine Number – G-1001.

TUNE-UP

► *BURNED BREAKER POINTS OR HIGH SPEED MISS CORRECTION:* Caused by use of incorrect ignition primary circuit resistor. Use only resistor with Delco-Remy trademark. *See Resistor data below.*

COMPRESSION PRESSURE: 140 lbs. at cranking speed of 315 RPM (throttle wide open).

VACUUM READING: 18-21" at idling speed.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located between left bank exhaust manifold and exhaust cross-over pipe (exhaust gases diverted through heat passages in manifold when valve closed).

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders – RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plug – Auto-Lite AL-7. Torque to 30 ft. lbs.

COIL: Delco-Remy 1115084. *12 Volt.*

Resistor – Delco-Remy 1927809. 1.40-1.62 ohms.

► *COIL RESISTOR NOTE:* Connected in series between battery and coil. Resistor is by-passed during cranking by solenoid or magnetic starter switch, making direct lead from battery to coil.

DISTRIBUTOR: Delco-Remy 1110863. *12 Volt.*

Condenser – Delco-Remy 1869704. **Capacity** .18-.23 mfd.

Contact Point Set – Delco-Remy 1918148.

Breaker Gap – .016".

Cam Angle – 26°-33°.

Breaker Arm Spring Tension – 19-23 ozs.

Rotation – Counter-clockwise viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
.5-2.5		350	1-5		700
2-4		400	4-8		800
7-9		800	14-18		1600
11-13		1125	22-26		2250

Vacuum Spark Control: Delco-Remy 1116095.

Vacuum Advanc

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5-7
10	20	11.5-13.5

Plunger Travel – 7/32-15/64".

IGNITION TIMING

Setting – 5° BTDC, at idling speed.

Timing Mark – Timing indicator on front cover and 5° mark on vibration damper.

► *DISTRIBUTOR INSTALLATION CAUTION:* When distributor installed and correctly timed (5° BTDC), upper distributur oil cap must be in center toward front of engine or few degrees to right side. If oil cap is to left of center, oil supply to right bank hydraulic lifter oil gallery may by-pass back to pan and cause noisy lifter operation.

CARBURETOR

► *THROTTLE VALVE LINKAGE ROD MEASUREMENT CHANGE:* The lower rod measurement has been changed to 16 1/8" plus .000", minus 1/32" (from 15¼") to improve shift patterns. *See complete adjustment below.*

THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC CARS): Make adjustments in the following order:

1) – Disconnect throttle valve rod from throttle valve lever on transmission case, disconnect vent pipe at lower left of case. Hold throttle lever to rear against stop. Distance from machined surface on rear of case to center of pin on throttle lever should be 5 9/16". Bend lever to correct position.

2) – Measure length of lower throttle valve rod from center of lower hole to outer surface of upper end. Length should be 16 1/8" (plus 0", minus 1/32"). Adjust by bending rod. *See Rod Change above.*

3) – Set carburetor throttle at slow idle (closed throttle). Adjust upper throttle rod at carburetor throttle rod bracket so that rod enters hole in bracket freely; then lengthen rod by turning adjusting end one full turn to left, tighten locknut and connect rod.

CARTER WGD 2352S

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

Idle Setting – ½-1½ turns open. Turn screws out for richer mixture.

Idle Speed – (Std. & O.D.) 550 RPM, (Hydra-Matic) 425 RPM in Neutral, (Hydra-Matic & Air Cond.) 450 RPM in Neutral with Air Conditioning turned on.

Float Level – 7/32" (Gauge T109-106) between top of float and bowl cover, gasket removed, cover inverted and needle seated. Adjust by bending float arm.

Fast Idle: .023" between throttle valve and bore (side opposite idle port), with choke valve fully closed. Gauge T109-189. Adjust by bending choke connector rod at lower angle. *NOTE* – This fast idle setting will provide 1700-1800 RPM engine fast idle speed.

Automatic Choke: Centered (At Index).

Hydra-Matic Throttle Linkage Adjustment: *See Carburetor above.*

► *OTHER DATA: See "Carter Dual WGD" in Carb.Sect.*

Fuel Pump Pressure: 4-5½ lbs. Max.

CARB. EQUIPMENT

Fuel Pump: Carter M-2433S, Nash No. 3145119 (before Serial No. Z-1227), Nash No. 3149268 (Starting with Serial No. Z-1227.)

Pr ssure – 4-5½ lbs. maximum.

S e "Fuel Pumps" in Carburetion S ction.

Gasoline Gauge: Stewart Warner (Hudson) or Auto-Lite (Nash). Electric type.

Dash Unit – Hudson 3119655 (Stewart Warner 441168), Nash 3119503 (Auto-Lite 14159A).

Tank Unit – Hudson & Nash 3146814 (Auto-Lite 14165A).

See "Fuel Gauges" in Carburetion Section.

BATTERY

(Std.) – Auto-Lite 11-HS-50. *12 Volt,* 11 plate, 50 ampere hour capacity (20 hour rate).

(Air Cond. Cars) – Auto-Lite 11-HS-60. *12 Volt,* 11 plate, 60 ampere hour capacity (20 hr. rate).

Battery Ground – Negative.

Engine Ground – Battery to engine with body ground from transmission to engine rear cross member.

STARTER

Delco-Remy 1107648. *12 Volt.* **Armature 1926626.**

Drive – Overrunning clutch (solenoid pinion shift).

Rotation – Counter-clockwise at commutator end.

Brush Spring Tension – 35 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft.lbs.	Lock	11.3	435

Starter Switch: Delco-Remy No. 1119760 solenoid switch located on starter, actuated by combination ignition and starter switch (Std. and Overdrive cars), by Delco-Remy No. 1996084 Switch operated by raising shift lever upward (Hydra-Matic).

GENERATOR

Delco-Remy. *12 Volt.* Used as follows:

Delco-Remy No.	G nerator	Armatur
Without Air Cond.	1100324	1928952
With Air Cond.	1103011	1923535

Performance Data

Generator	Amperes	Volts	RPM
1100324	25	14.0	2780
1103011	30	14.0	2150

Rotation – Counter-clockwise at commutator end.

Brush Spring Tension – 28 ozs.

Field Current – 1.50-1.62 amperes (1100324), 1.48-1.62 amperes (1103011), 12 volts at 80° F.

Belt Adjustment: ½" deflection with 25 lbs. pressure applied midway between fan and generator pulleys.

REGULATOR

Delco-Remy 1119122 (1100324 Gen.), 1119003 (1103011 Gen.). *12 Volt. NOTE – Specifications are "Normal" Settings.*

Cut-Out Relay

Cuts-In – 11.8-13.5 volts.

Contact Gap – .020".

Air Gap – .020" with contacts just closed.

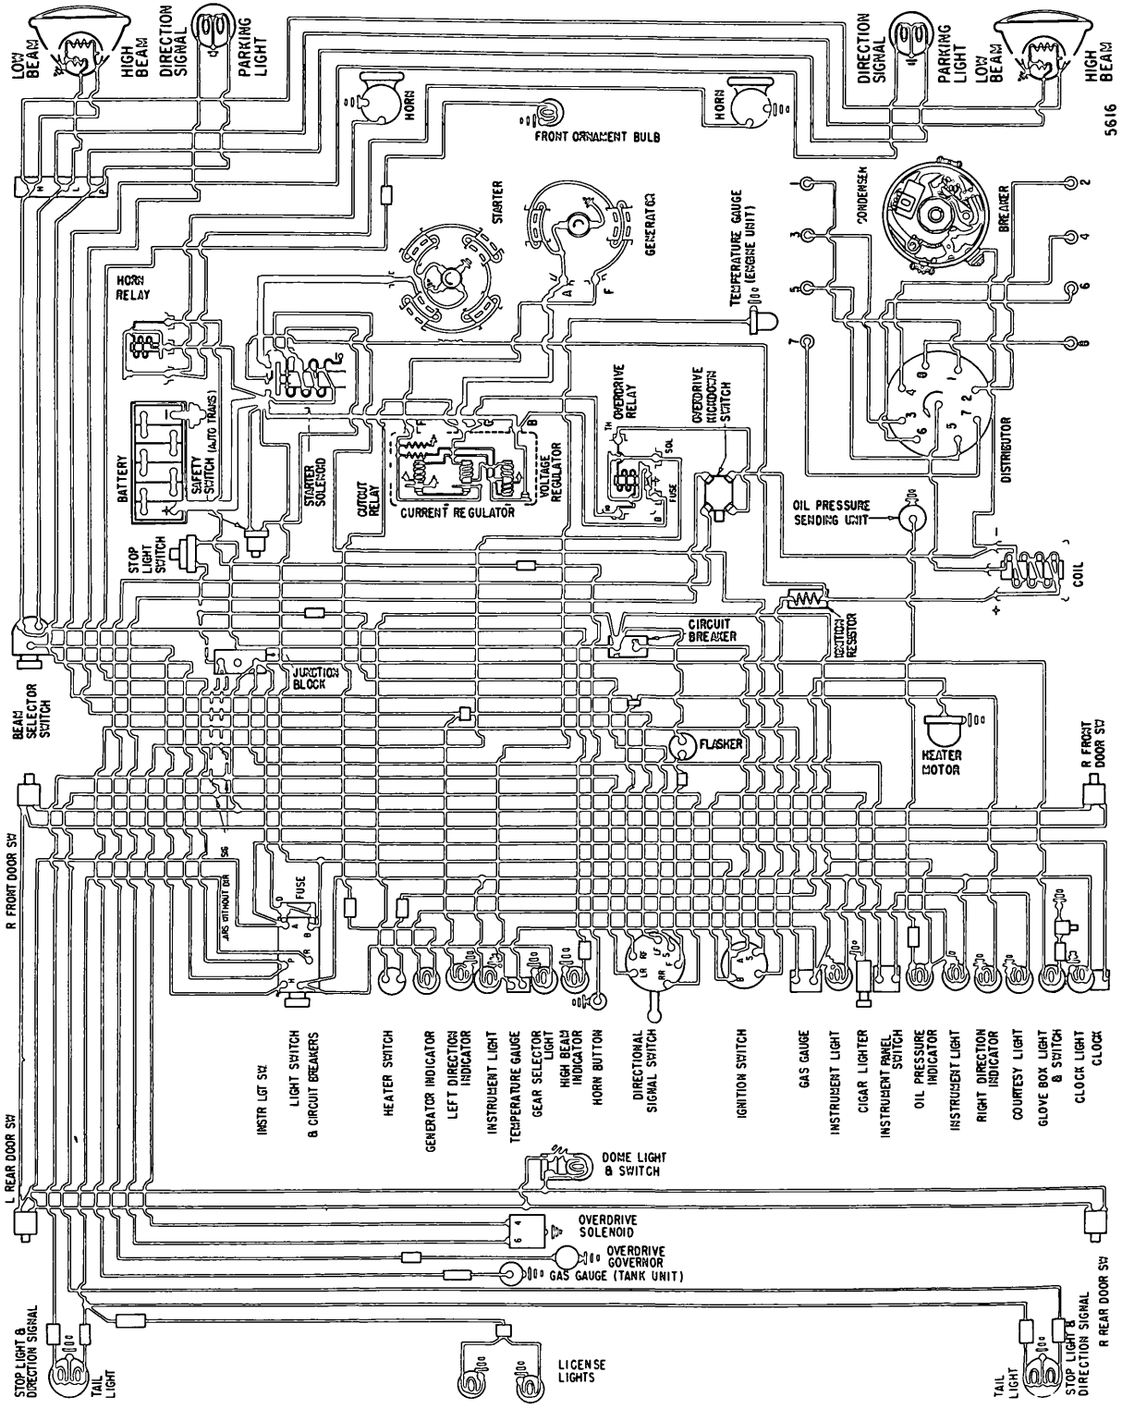
Voltage Regulator

Setting – 13.8-14.8 volts (Hot).

Air Gap – .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting – *See "Delco-Remy 1119000 Series Regulators" in Electrical Section.*

Current Regulator



Setting (1119122)-23-27 amperes (Hot).

Setting 1119003)-27-33 amperes (Hot).

Air Gap – .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting – *See "Delco-Remy 1119000 Series Regulators" in Electrical Section.*

CONTINUED ON NEXT PAGE

HUDSON HORNET SPECIAL V8 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

▷ *BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars):* Incorrect assembly of wire to back-up light switch and circuit breaker causes back-up light to operate incorrectly. *See "Electrical Notes" in Nash Special Data.*

Headlamps: Sealed Beam. *See Electrical Section.*

Directional Signals: *See Electrical Section.*

Light Switch Removal: Disconnect battery. With switch in "OFF" position, press release on top of light switch assembly, and pull knob and shaft clear of switch. Remove slotted nut, pull switch out to rear of instrument panel.

Stop Light Switch: Located in tee fitting in line to left front brake.

FUSES: 7.5 Ampere. On lighting switch for Courtesy and Glove Box lights.
15 Ampere. Located on overdrive relay.
5 Ampere. Located in Radio wire back of instrument panel.

CIRCUIT BREAKERS: Three used as follows:
12 Ampere. On light switch for Instrument, Tail and Dome lights.
12 Ampere. On light switch for Head and Parking lights.
30 Ampere. For Stop Light, Instruments and Indicators, Heater and Directional Signals. Located back of Instrument panel.

HORNS: Auto-Lite HAD-4737 (Low Pitch), HAD-4738 (High Pitch). 12 Volt.
Horn Relay – Nash No. 3145684.

ENGINE

▷ *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Sect.*

▷ *NOISY VALVE LIFTER OPERATION (Right Cylinder Bank Only):* May be caused by incorrect distributor installation allowing oil to by-pass back to pan. *See Distributor Installation Caution under Ignition Timing.*

▷ *REAR MAIN BEARING CAP TORQUE CHANGE:* Rear bearing cap screws should be tightened to 50-55 ft.lbs. to avoid possibility of distorting cap (changed from 80-85 ft. lbs.). All other main bearing caps should be tightened to 80-85 ft. lbs.

ENGINE SPECIFICATIONS: Own V8. Valve in head.

Bore	Stroke	Displacement
3½"	3¼"	250 Cu. Ins.
Compression Ratio	**Rated HP**	**Developed HP**
8.0-1	39.2	190 at 4900 RPM

Compression & Vacuum Reading – See TUNE-UP.

CYLINDER HEAD INSTALLATION: *See "Cylinder Head & Manifolds" in Nash Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Nash Special Data.*

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset toward thrust side of piston.
Removal – Piston & Rods removed from above.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Clearanc – .001-.0015" (Top of skirt), .0009-.0015" (Bottom of skirt).

R placement of Pistons: Std., .002", .005", .010", .020", .030", .040" Oversize.

Installing Pistons: Install with "F" cast in piston strut and notch in piston head toward front of engine.

PISTON PINS

Press fit in connecting rod. No locking device.

Pin Fit in Piston – Palm press fit at room temperature.

Pin Removal & Installation – *See "Piston Pins" in Nash Special Data.*

R placement Pins: Std., .003", .005" Oversize.

PISTON RINGS

Three rings (two compression & one oil) used. Upper ring is chrome plated. Oil control ring is three piece type (two oil control wiper rails with a segmented steel spacer between them).

Ring	Width	End Gap	Side Clearance
Compr. #1	.0775-.0780"	.010-.020"	.002-.0035"
Compr. #2	.0775-.0780"	.010-.020"	.002-.004"
Oil(Steel Rail)	.015-.055"		.001-.0079"

CONNECTING RODS

Crankpin Journal Diameter – 2.2483-2.2490".

Lower Bearing – Precision, steel-backed, babbitt.

Clearance – .0007-.0028". **Side Clearance** –.004-.012".

Replacement Bearings: Std., .001", .002", .010", .012" Oversize.

Installing Rods: Assemble connecting rod with notch in piston and connecting rod identification mark to front of engine. Cylinder numbers on connecting rod should be toward outside of bank in which they are installed.

CRANKSHAFT

Journal Diameter – 2.4983" - 2.4990". Five bearings.

Bearings – Precision, steel-backed, babbitt.

Clearance – .0006"-.0032".

R placement Bearings: Std., .001", .002", .010", .012" Oversize.

End Thrust: Taken by No. 1 flanged bearing.

Endplay – .003-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Nash Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Nash Special Data.*

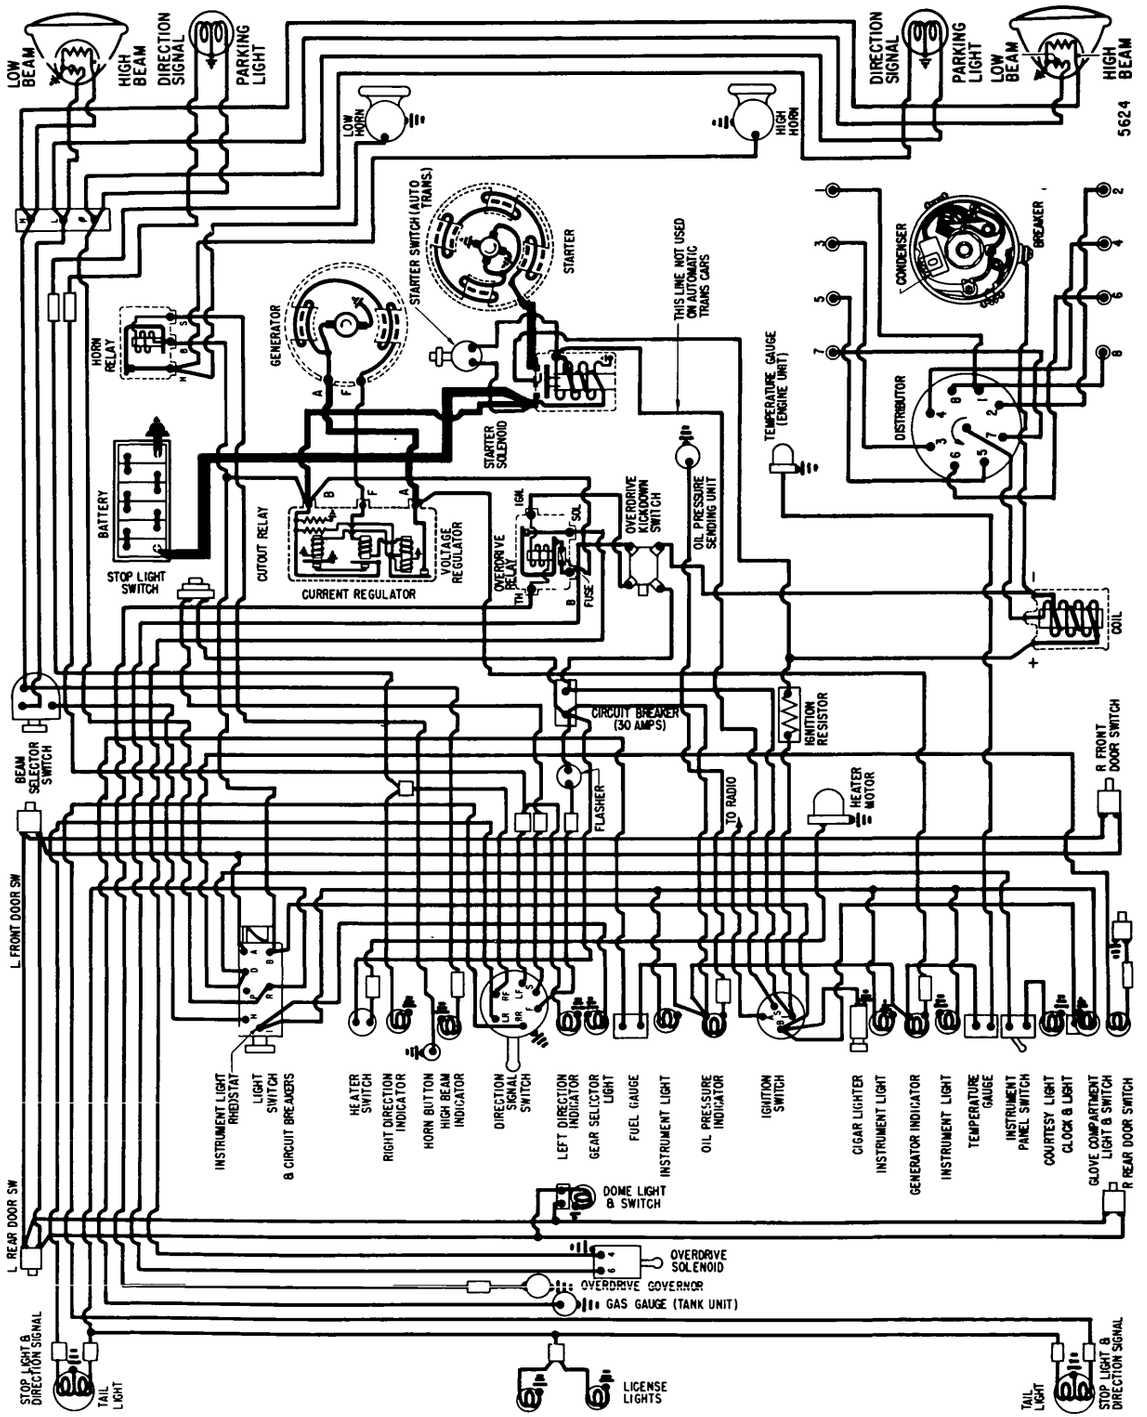
CAMSHAFT

Bearings – Five, steel-backed, babbitt lined bushings pressed in block and line reamed.

Clearance – .001-.003".

End Thrust: Taken by thrust plate behind camshaft sprocket.

End Play – .003-.006".



Camshaft Removal & Installation: *See "Camshaft & Bearings" in Nash Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Nash Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Nash Special Data.*

Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers. To check assembly – Rotate crankshaft until timing mark on camshaft sprocket is on horizontal line at either

CONTINUED ON NEXT PAGE

NASH AMBASSAD R SPECIAL V8 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

3 or 9 o'clock position. There should be 10 links or 20 pins between timing marks.

VALVES

Tappet Clearance – None in service (Hydraulic).

Valv	H ad Diameter	Stem Diameter
Intake	1.787"	.3412-.3417"
Exhaust	1.406"	.3407-.3412"

Valv	Seat Angle	Lift	Stem Clearance
Intake	30° ①	.375"	.0013-.0028"
Exhaust	45° ②	.375"	.0018-.0033"

Valv Seat Width – .078-.093" (Intake), .093-.104" (Exhaust).

Valv Stem Seals – Rubber deflector installed on valve stem and over top of guide on all valves.

Valve Springs: Install springs with closed coil end against cylinder head. **Free Length** - 2.20".

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	85 - 91 lbs.	1 13/16"
Open	150 -160 lbs.	1 7/16"

Valve Guides: Drive old guides out, drive new guides in to height of ¾" ± 1/64" above cylinder head (measure from top of guide to flat machined surface of lower spring retainer on head). Ream all guides to I.D. of .3430-.3440" after installation.

Valve Lifters: Hydraulic type.

Hydraulic Valve Lifter Removal, Overhaul & Testing – *See "Valve Syst m" in Nash Special Data.*

Rocker Arm Assembly: *See "Valve System" in Nash Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 12°30' BTDC. Close 51°30' ALDC.

Exhaust Valves– Open 53°30' BLDC. Close 10°30' ATDC.

Valve Timing Check: Remove valve compartment cover and spark plugs. Crank engine until #6 piston in right bank is on TDC of compression stroke (#1 piston will be on TDC of exhaust stroke in overlap position). Rotate crankshaft 90° counter-clockwise. Install dial indicator on #1 intake rocker arm pushrod end. Crank engine in a clockwise direction until dial indicator dicates pushrod movement, (hydraulic lifter should be fully charged for this check). At time indicator moves, ignition timing pointer on front cover should align with a point approximately 25/32" before TDC position on vibration damper. *NOTE* – If more than ½" variance in either direction, remove timing chain cover and inspect installation. Replace if deflection exceeds 1/2".

OILING SYSTEM

Crankcase Capacity – 5 quarts.

Normal Oil Pr ssur : 10 lbs. minimum at 600 RPM.

Pr ssure R gulat r – In oil pump. Opens at 55-60 lbs. Not adjustable.

Oil Pr ssur Indicat r – Light on instrument panel controlled by pressure switch, Nash No. 3142826, located on left side at rear of engine. Light goes on when Ignition Switch turned on, goes out when oil oil pressure reaches 6½ lbs. ± 1½ lbs.

Oil Pump: Gear type. Mounted on rear main bearing cap and driven by distributor drive shaft. *NOTE* – Removal of oil pump does not disturb ignition timing.

Oil Pump Rem val, Overhaul and Installation – *See "Oiling System" in Nash Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air inlet) and outlet pipe in valve tappet cover.

COOLING

Water Capacity: 21 quarts, add 1 quart for heater.

Pressure Valve: Radiator filler cap. 7 lbs. (Std.), 14 lbs. (Air Cond.).

Thermostat: Choke type, Nash No. 3132708 (150°), No. 3131817 (167 - 173°), No. 3131985 (177 - 182°) for use with permanent anti-freeze.

Water Pump: Packless type with sealed ball bearing. *See "Hudson & Nash V8 Special" in Water Pump Sect.*

Temperature Gauge: Stewart Warner (Hudson) or Auto-Lite (Nash). Electric type.

Dash Unit – Hudson 3119681, Nash 3119504 (Auto-Lite 14158A).

Engine Unit – Hudson & Nash 3144585 (Auto-Lite 13550A).

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 10A7 Assy. No. 950 or 1436. Single plate. *See "Borg & Beck" in Clutch Section.*

Clutch Disc No.–Borg & Beck CD 752. Nash No. 3125822.

Pedal Adjustment: Pedal free travel ½ - ¾". Adjust by loosening locknut and turning adjusting nut on control link at clutch fork.

► *CAUTION: The pedal to beam rod should never be disturbed in service.* With pedal against floor board, outer end of beam lever should project 3/8" forward of the rear edge of beam bracket, to provide proper leverage.

Removal: Remove transmission (see below), disconnect clutch pedal linkage, remove clutch housing and pan. Punch mark flywheel clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Warner. Three speed, helical gear type.

See "Warner Transmissions" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Move rear axle back to slip front universal joint off transmission. Disconnect shift levers and speedometer cable, remove two upper transmission to bell housing bolts, and install special guide bolts in their place. Remove lower bolts, slide transmission out.

OVERDRIVE

Warner R10. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

HYDRA-MATIC DRIVE

"Flashaway" Hydra-Matic. New four speed, hydraulically controlled transmission with two fluid couplings. *See "Dual Coupling Hydra-Matic Driv " in Transmission S ction.*

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual C upling Hydra-Matic Driv " in Transmission S ction.*

► *TESTING & TROUBLE SHOOTING: S "Dual C upling Hydra-Matic Drive" in Transmission Section.*

Lubrication – Check fluid every 1,000 miles. Drain and refill every 25,000 miles (remove oil pan and clean oil screen). Use Automatic Transmission Fluid type "A" ("AQ-ATF").

Checking Fluid Level – Bring transmission to normal operating temperature. Idle engine to 425 RPM, with selector lever in "P" (Park) position, with car on level floor. Remove fluid level indicator, wipe clean, reinsert it, then remove it again and note reading.

► *OTHER HYDRA-MATIC SERVICE DATA: See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit or Mechanics. One universal used at front end of propeller shaft.

REAR AXLE

Spicer. Semi-floating, hypoid gear with torque tube drive.

See "Spicer Hypoid" in Rear Axle Section.

Axle Ratios – Std., 4.1-1 (11-45), **Overdrive** 4.5-1 (11-50), **Hydra-Matic** 3.5-1 (13-46).

Backlash – .002-.006".

Axle Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims, and replace same amount when reassembling). Withdraw shaft using Puller J-2498; do not drag on inner seal.

Rear Axle Assembly Removal: Raise and support rear end of car. Disconnect rear brake cables at center equalizer. Disconnect torque tube at rear of transmission. Disconnect brake hose and shock absorbers at axle end (let hang from body). Roll axle free.

Wheel Bearing Adjustment: Shims behind brake backing plate. *NOTE* – Adjust axle shaft end play on **Right Hand Side Only.**

Rear Suspension: *See "Nash" in Suspensions & Wh l Alignment Section.*

SHOCK ABSORBERS

Delco or Monroe. Direct acting type. Service by replacement.

Front – Nash No. 3140879. **Rear** – Nash No. 3140406.

FRONT SUSPENSION

Independent. With coil springs located between upper ends of steering knuckle pin and seat in outer wheelhouse panel.

See "Nash" in Suspensions & Wheel Alignment Secti n.

King Pin Inclination – 3°36' (Hudson), 6½° (Nash).

Caster – (Std.) ½° Pos. desired. Limits 0-½° Pos.

(Power Steering) 1° desired. Limits ½° - 1° Pos.

Camber – 0° desired. Limits ¼° Neg. to ¼° Pos.

Toe-In – 1/16" to 3/16". *CAUTION* – When adjusting toe-in on Power Steering Cars, operate engine so that pump will supply oil pressure to center spool in power cylinder valve.

T e-Out n Turns – (Hudson) Outer wheel 20°, inner wheel 24°. (Nash) Outer wheel 20¾°, inner wheel 25°.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STEERING

Manual: Gemmer Model 305. Worm & Roller with "push-pull" adjustment.
See "Gemmer Steering Gears" in Steering Section.

Power Steering: Monroe Power Guide. Linkage type.
See "Monroe Power Guide" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor. Hand lever applies rear wheel service brakes.

See "Bendix Hydraulic, Single Anchor" in Brake Sect.

Drums – Diameter 10". (Front and Rear).

Wheel Cylinder Diameter – 1 1/8"(Front), 7/8" (Rear).

Replacement Lining & Shoes: Linings and shoes with linings furnished standard size only.

Lining Width & Length

	Front Wheel	Rear Wheel
Primary Shoes	2" x 8 7/8"	1¾" x 8 7/16"
Secondary Shoes	2½" x 10 31/32"	1¾" x 10 25/32"

Clearance – .015" heel and toe of secondary shoe with primary shoe out against drum, or adjusting screw backed off 14 notches from point where wheel can just be turned by hand.

Standard Master Cylinder: Mounted on support under floor pan.

Checking Fluid – Roll back floor mat, remove access cover. Maintain fluid level ½ - 1" below top of filler opening.

Removal – Remove from below without disturbing other units.

Power Brakes: Bendix Power Unit. Replaces standard master cylinder.
See "Bendix Power Unit" in Brake Section.

Checking Fluid – Same as for standard master cylinder.

Removal – Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Misc. Sect.

Window Regulators: Electric with reversible motor. *See "Nash Window Regulators" in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extr me car wh n disconnecting any part of air conditioning equipm nt or lin s. See "Air Conditioning Service Cautions" in Misc llaneous Section.*

MODEL IDENTIFICATION

Hudson Hornet V8 ..... Model 35680
Nash Ambassador V8 ..... Model 5680

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.
Starting Serial Numb r (Hudson): Y-7201 (Domestic), YKD-1001 (Unassembled Export).
Starting Serial Numb r (Nash): V-11501 (Domestic), 8KD-1001 (Unassembled Export).

ENGINE NUMBER: Stamped on machined surface on top of cylinder block.
Starting Engine Number – P-21001.

TUNE-UP

►*DETONATION OR PRE-IGNITION CORRECTION: See Distributor Conversion Data below.*

►*SLOW COLD STARTING & POOR WARM-UP CHANGE & CORRECTION: See CARBURETOR below.*

►*POOR ENGINE PERFORMANCE (Automatic Choke) CORRECTION:* Restrictions in exhaust gas passages of intake manifold affects automatic choke operation. *S "Cylind r H ad & Manifold" in Nash Special Data.*

COMPRESSION PRESSURE: 140 lbs. Min. at 150 RPM with wide open throttle.

VACUUM READING: 18-21" at idling speed.

VALVE TAPPET CLEARANCE: None in service (Hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic type. Located at left manifold outlet.

IGNITION

►*BURNED BREAKER POINTS OR HIGH SPEED MISS CORRECTION:* May be caused by incorrect ignition primary resistor. Use only resistor with Auto-Lite trade mark. *S Resistor Data below.*

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylind rs–RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033"-.037".
NOTE – Champion N-8 used up to Eng. No. P-21543 with .035-.037" gap. Use Champion N-18 for replacement.

COIL: Auto-Lit CAD-4004. *12 Volt.*
Igniti n Curr nt – 2.2 amperes (Idling, Hot).
Resist r – Auto-Lite PU-4001 (.665-.735 ohms).

DISTRIBUTOR: Auto-Lit IBK-4001B (Through Eng. No. P-25305), IBJ-4001D (Eng. No. P-25306 to P-28608), IBJ-4001C (Eng. N . P-28609 & Later), IBJ-4001E (R pl. & C nv rsi n f IBJ-4001D & C - see below). Double Breaker type (IBK-4001B), Single Breaker type (All others).

►*DISTRIBUTOR CONVERSION TO CORRECT PRE-IGNITION (IBJ-4001D & IBJ-4001C):* If pre-ignition occurs when using premium fuel, and this cannot be corrected by retarding ignition, removing carbon, or other corrective procedures, distributors can be converted as detailed below. Install new IBJ-4001E nameplate (in kit) after conversion. *NOTE* - Complete IBJ-4001E furnished for replacement.

IBJ-4001D C nversion – Install all parts furnished in Conversion Kit Nash No. 6484607 (Vacuum Advance Chamber, Vacuum Spring, Governor Weight Spring, and small parts). Automatic and Vacuum advance will be the same as IBJ-4001E below.

IBJ-4001C Conversion – Install all parts furnished in Conversion Kit Nash No. 6484609 (Distributor Stop & Cam plate, Governor Weight Spring, Vacuum Spring, and small parts). Automatic & Vacuum advance will be the same as IBJ-4001E below.

Condenser–Auto-Lite IBB-2015L (IBK & IBJ Distributors). **Capacity** .25-.28 mfd.
Contact Point Set–Auto-Lite IGW-3028JS (IBK Distributor), IGW-3028 HS (IBJ Distributor).
Breaker Gap–.017" ± .002".
Cam Angle–38° ±3° (IBK Distr.-both sets of contacts operating together), 31° ±3° (IBJ Distr.).
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Counter-clockwise viewed from above.

Automatic Advance–IBK-4001B

IGNITION TIMING

Setting–5° BTDC.
Timing Mark–Timing indicator on chain case cover marked 0-5-10-15. Align groove in vibration dampener with "5" mark on indicator.

CARBURETOR

►*POOR WARM-UP PRODUCTION CHANGE & CORRECTION: See "Carter WGD" in Carburetion Section f r installation of parts furnished in Unitized Packag as follows:*

1) Vacuum Piston Spring Change – Install on carburetors tag-dated before "M-5" (later carburetors have new spring installed).

2) Metering Rod Change – Install on cars before Eng. No. P-24900 (later engines have new rods).

►*SLOW COLD STARTING CORRECTION:* To correct, check spark plugs, ignition points, engine timing, and electrical connections. Choke valve must have .005" clearance in all positions, choke valve and shaft must operate freely, choke piston must be free in cylinder, and operate freely with no bind between unloader arm on choke lever and fast idle link. *NOTE*–Climatic control may be set one notch either rich or lean from standard setting.

THROTTLE LINKAGE ADJUSTMENT (1955-56): The carburetor throttle rod from carburetor to lever at the vertical rod must be 15½" from center of ball pivot at carburetor to "L" bend at rear end of rod. The adjuster rod that is connected to carburetor throttle rod and to the lever of the cross-shaft must be 6 9/16" from center-to-center of ends of rod. To change dimension, bend rod at present bend to obtain 6 9/16". The TV rod from cross shaft lever to the TV lever at the transmission must be 26 1/8" from center of pins. Bend rod to correct measurement. The TV lever must be adjusted so that taper on end of lever should contact a straight edge held against the machined surface at rear of transmission case. If necessary to adjust, loosen lever clamp screw nut and turn shaft counterclockwise until valve has reached its stop. Hold shaft in this position and rotate lever on shaft so that taper on lever lines up with milled surface on rear of case. After measurements have been corrected, warm up engine, set carburetor idle to 400 RPM. Stop engine and loosen two locknuts at front and rear end of adjuster on rod. PLACE REAR END OF ROD IN CENTER HOLE OF THE CROSS SHAFT LEVER. Tighten two locknuts so that adjuster rod fits freely in lever. *NOTE*–Early production 1956 cars had adjuster rod in bottom hole of cross shaft lever. Relocate to center hole to improve shift characteristics.

CARTER WGD 2231S, SA

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idle Setting—½-1½ turns open. Turn screws out for richer mixture.

Idle Speed—425 RPM with transmission in "N" (Air Conditioning turned on).

Float Level—¼" from underside of bowl cover to top of float at center with needle valve seated. Measure with bowl cover and float assembly inverted.

Fast Idle: .030" throttle opening or clearance between valve and wall on side opposite idle ports with choke valve tightly closed. Adjust by bending choke rod at lower angle.

Automatic Choke: 1 point rich.

Ultramatic Throttle Linkage Adjustment: *See "Carburetor" above.*

►*OTHER DATA: See "Carter WGD" in Carburetion Sect.*

Fu l Pump Pressure: 3½-5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter M2256S (Fuel & Vacuum).
Pressure – 3½-5 lbs. Max. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: Stewart Warner (Hudson) or Auto-Lite (Nash). Electric type.
Dash Unit—Hudson 3119655 (Stewart Warner 441168), Nash 3119503 (Auto-Lite 14159A).
Tank Unit—Hudson & Nash 3146814 (Auto-Lite 14165A).
See "Fuel Gauges" in Carburetion Section.

BATTERY

(Std.) Auto-Lite 11-HS-50. *12 Volt.* 11 plate, 50 ampere hour capacity (20 hr. rate).
(Air-Cond. Cars) Auto-Lite 11-HS-60. *12 Volt.* 11 plate, 60 ampere hour capacity (20 hr. rate).
Battery Ground – Negative.
NOTE – This is reversed from previous models.
Engine Ground – Battery to engine with body ground from transmission to rear crossmember.

STARTER

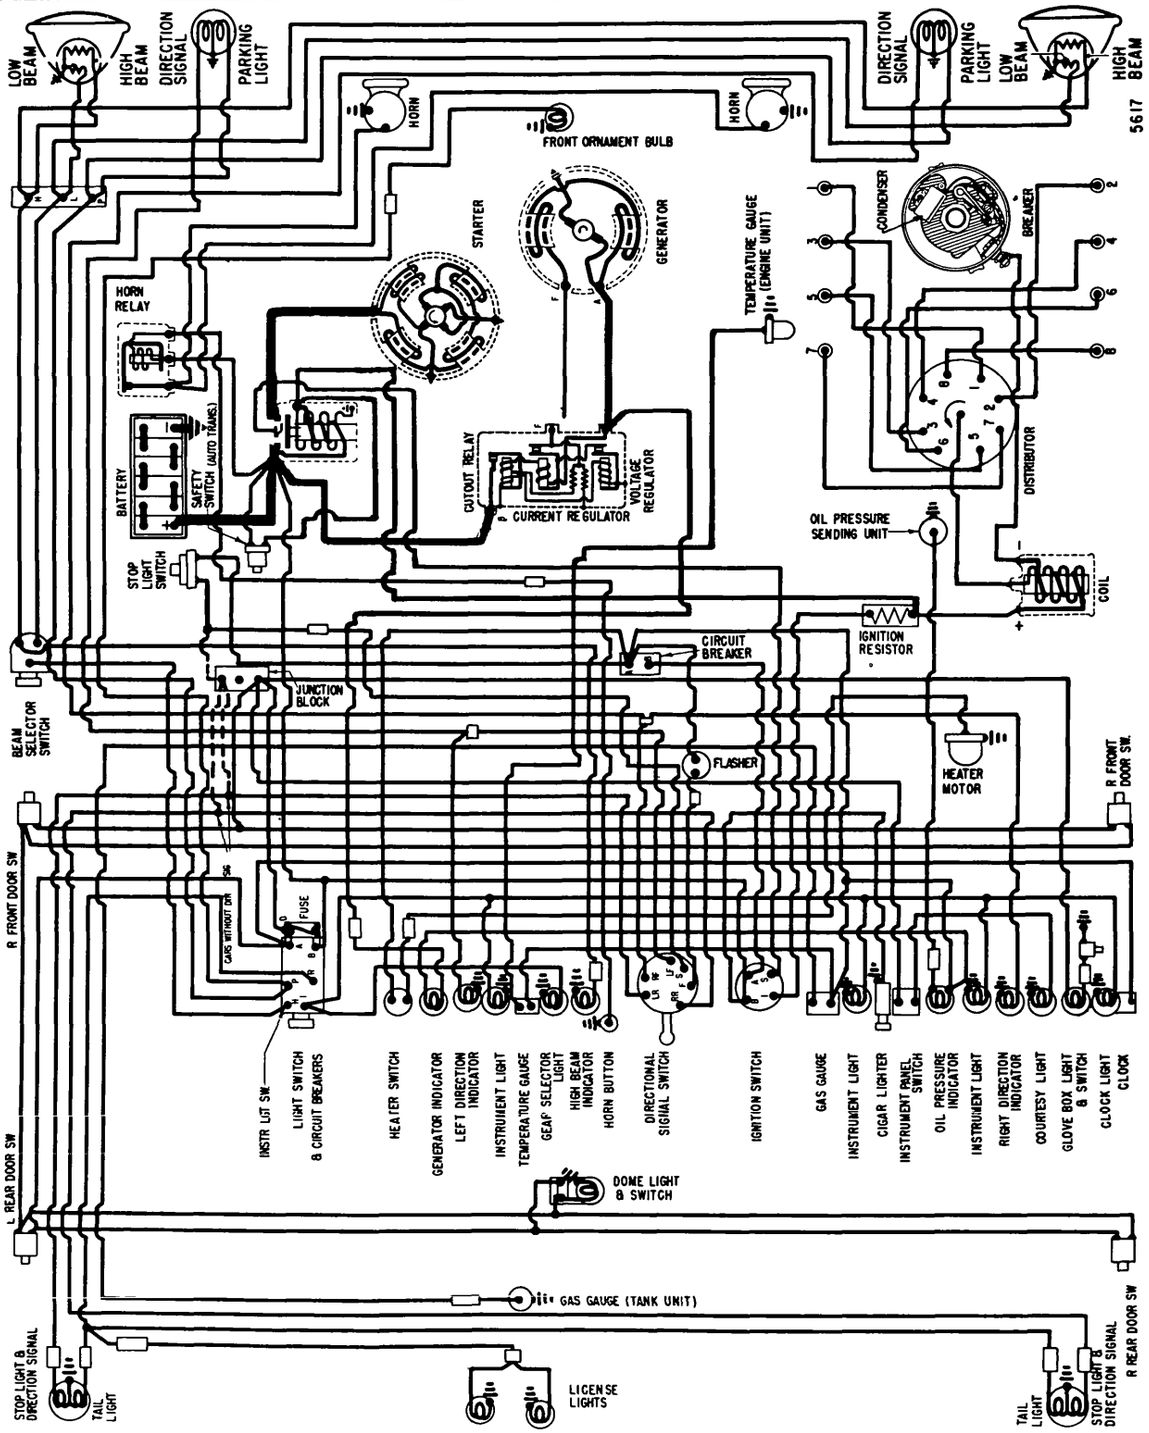
Auto-Lite MDF-6008. *12 Volt.* **Armature** MDF-2122.
Drive – Overrunning Clutch (solenoid pinion shift).
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60
6.5 ft. lbs.	Lock	4.0	240

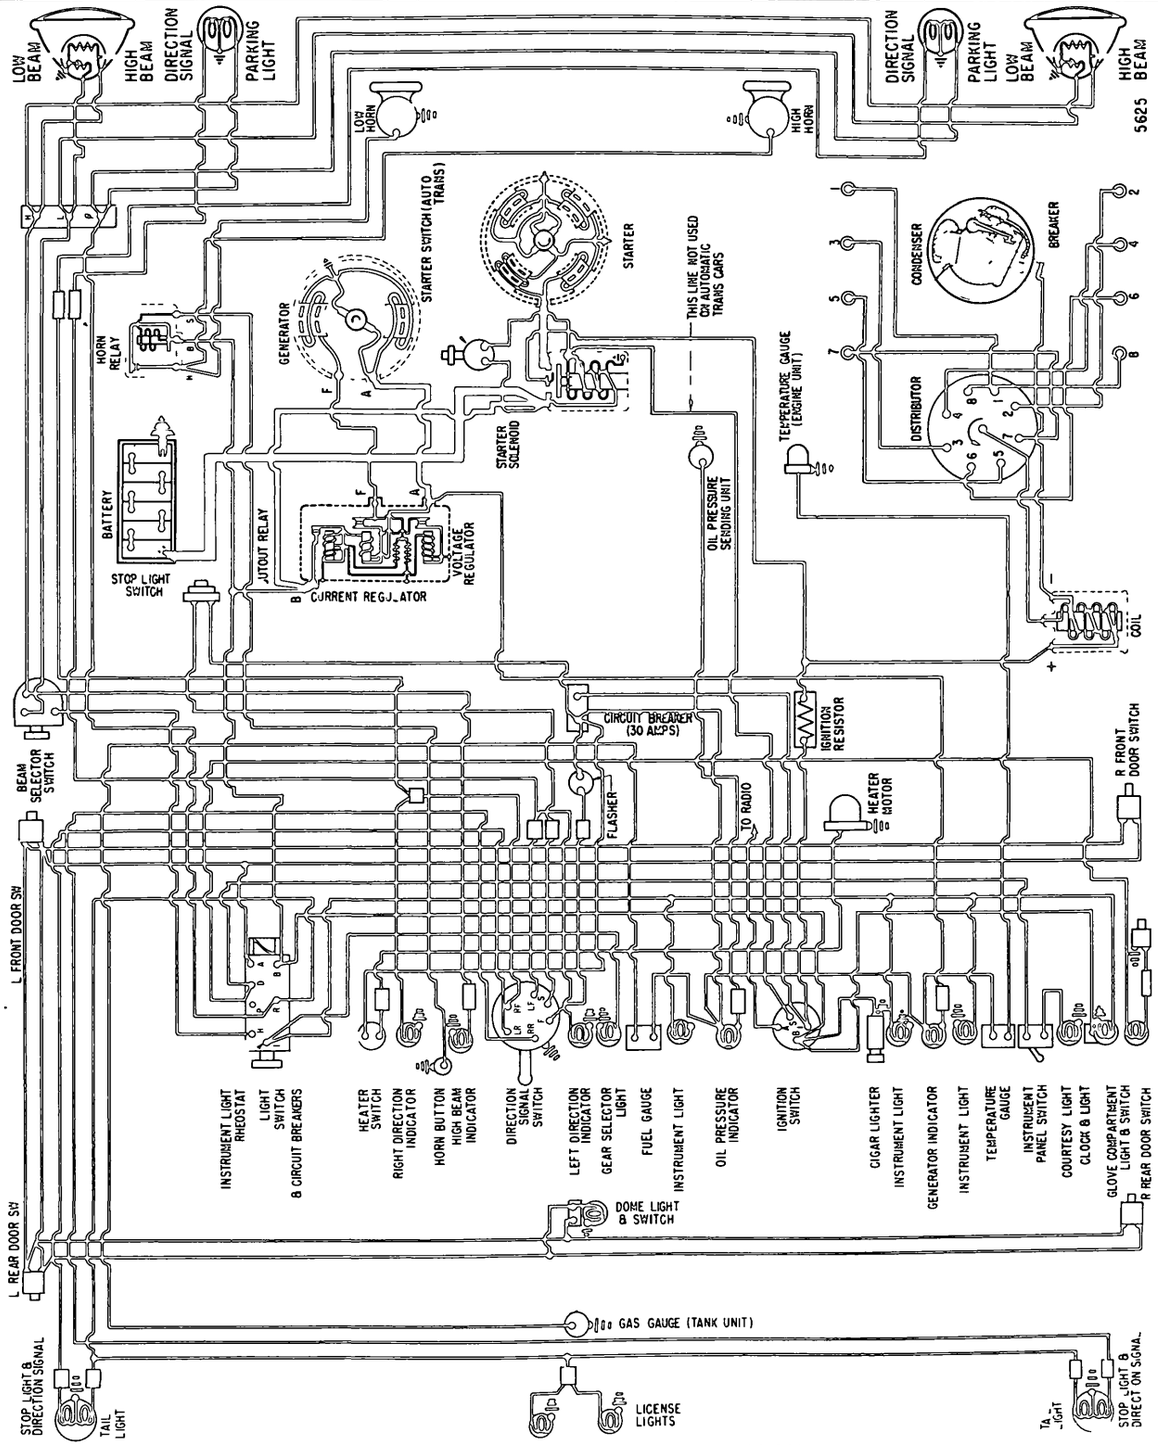
Starting Switch: Auto-Lite Solenoid SAD-4101 on starter and control switch, Hudson & Nash No. 3146490, on steering column. Operated by lifting selector lever in "P" or "N" position.

GENERATOR



Auto-Lite GJC-7002F. *12 Volt.*
Armature—Auto-Lite GJC-2030J.
Maximum Charging Rate—*See Voltage Regulator.*

Performance Data—Cold



Amperes	Volts	RPM
20	15.0	1750
30	15.0	2250

NOTE—Do not operate at high output without ventilating fan for any length of time as to do so may result in burned armature or fields.

CONTINUED ON NEXT PAGE

HUDSON HORNET V8 WIRING DIAGRAM

NASH AMBASSADOR V8 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-36 ozs.
Field Current—1.2-1.3 amperes at 10.0 volts (70°F).
Belt Adjustment: ½" deflection midway between water pump and generator pulleys.

REGULATOR

Auto-Lite VRX-6008A. *12 Volt.*

Cutout Relay

Cuts In—13.0-13.7 volts.
Cuts Out—8.2-9.3 volts at approx. 3-5 ampere discharge.
Contact Gap—.015" min.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—14.5 volts (80°F), charging at 10 amperes or with .25 ohm resistor between regulator and battery.
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Section.*

Current Regulator

▷*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
36		30 (28-32)

Test A—After 15 minutes operation at 10 amperes.
Test B—After an additional 15 minutes operation on current regulator (with load to give 13.6-13.8 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Section.*

MISC. ELECTRICAL

▷*BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars):* Incorrect assembly of wire to back-up light switch and circuit breaker, causes back-up light to operate incorrectly. *See "Electrical Notes" in Nash Special Data.*
Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Light Switch Removal: Disconnect battery. With switch in "OFF" position, press button release on top of light switch assembly, pull knob and shaft clear of switch. Remove slotted nut, pull switch out to rear of instrument panel.
Stop Light Switch: Located at tee fitting in line to left front brake.
FUSES: Lighting—7.5 ampere. On lighting switch. Protects Courtesy Light and Glove Box Light.
Overdrive—15 ampere. On overdrive relay.
CIRCUIT BREAKER: Three used as follows:
12 Ampere—On light switch. Protects instrument lights, tail lights, and dome light.
12 Ampere—On light switch. Protects head lights and parking lights.
30 Ampere—On dash behind instrument panel. Protects Stop Light, Directional Signals, Instrument Gauges and Indicators, and Heater.
HORNS: Auto-Lite HAD-4737 (Low Pitch), HAD-4738 (High Pitch), *12 Volt.*
Horn Relay—Nash No. 3145684.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►***IMPROVED OIL CONSUMPTION CHANGE (1955-56 Cars before Eng. No. 0-25589):*** **Valve spring baffles (as used on later engines) can be installed (Two types available for field installation). *See "Valve System" in Nash Special Data.***

►*ENGINE FRONT COVER OIL SEAL LEAK CORRECTION: See "Engine Front Cover" in Nash Special Data.*

ENGINE SPECIFICATIONS: V8 Valve-in-head type.

Bore	Stroke	Displacement
4"	3½"	352 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
9.55-1	51.2	220 at 4600 RPM

Compression & Vacuum Reading: *See TUNE-UP.*

OIL PAN REMOVAL: Remove steering idler arm attaching bolts and drop steering linkage. Remove exhaust crossover pipe

CYLINDER HEAD INSTALLATION: *See "Cylinder Head & Manifolds" in Nash Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Nash Special Data.*

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset toward thrust side of piston

Removal—Pistons and rods removed from above

Clearance—.001-.0015" (top of skirt), 000-0015" (bottom of skirt)

Fitting New Pistons; Use .0015" x ½" feeler gauge between piston and cylinder wall (insert inverted piston in bore with pin hole parallel to crankshaft, push piston down until bottom of skirt slightly below top of block). Pull to withdraw feeler should be 6-11 lbs.

Replacement Pistons: Furnished Std. size, .010", .020". .030" oversize

Installing Pistons: Install with "F" cast in piston strut and notch in piston head toward front of engine

PISTON PINS

Full floating type. Retained in piston by lock rings at each end. **Diameter**—.9803"

Pin Fit in Piston—Palm press fit with piston heated

Pin Fit in Connecting Rod—Palm press fit at room temperature

Replacement Pins: Std. size, .003", .006" oversize

Piston Pin Bushing (In Connecting Rod) Installation: *See "Piston Pins" in Nash Special Data.*

PISTON RINGS

Three rings (two compression & one oil) used. Upper compression ring is chrome plated.

Ring	Width	End Gap	Side Clearance
Compr.	.078"	.010-.018"	.0015-.005"
Oil	.186"	.010-.018"	.0015-.005"

Installing Rings: Install upper compression ring and oil ring with gap toward camshaft side of engine. Install lower compression ring with gap toward opposite side from camshaft. All gaps should be midway between piston pin bosses

CONNECTING RODS

Length—6 25/32" (center-to-center)

Crankpin Journal Diameter—2.250"

Lower Bearing—Replaceable precision type

Clearance—.0005-.0025" **Sideplay** .003-.011"

Replacement Bearings: Std. size, .001", 002", .020" undersize

Installing Rods: Install odd numbered rods in left bank and even numbered rods in right bank, with numbers on rods facing down and away from block and milled oil groove in connecting rod cap upward and toward crankshaft

CRANKSHAFT

Journal Diameter—2.500" Five bearings

Bearings—Precision type. The four front crankshaft bearings are interchangeable.

Clearance—.0005-.0025"

Replacement Bearings: Std. size, .001", .002", .020" undersize

End Thrust: Taken by No. 5 (rear) main bearing.

Endplay—.0035-.0085"

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Nash Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Nash Special Data.*

Vibration Dampener: *See "Vibration Dampener" in Nash Special Data.*

CAMSHAFT

Bearings—Five, steel-backed babbitt lined precision bearings.

Clearance—.0005-.0045"

End Thrust: Taken by thrust plate behind camshaft sprocket.

Endplay—.004-.006"

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Nash Special Data.*

Timing Chain: Morse. **Width**—1" **Pitch**—.375". **Length**—64 links.

Timing Chain & Sprocket Removal—*See "Timing Chain" in Nash Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Nash Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Nash Special Data*

Camshaft Setting: Both sprockets marked "0". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers. ***NOTE*** **— Install camshaft sprocket 1/16" beyond position flush with end of camshaft to permit installation of fuel pump drive eccentric.**

VALVES

►***VALVE SPRING BAFFLE INSTALLATION (Cars before Eng. No. P-25589): Will improve oil consumption. See "Valve System" in Nash Special Data.***

Tappet Clearance: Hydraulic lifters. **Adjustment not required unless cylinder head removed or valve lifters replaced. *See "Valve Tappet Adjustment" in Nash Special Data.***

Valve	Head Diam.	Stem Diam.	Length
Intake	2.000"	.3725"	5.712"
Exhaust	1.687"	.3715"	5.690"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.398"	.001-.002"
Exhaust	45°	.388"	.002-.004"

Valve Seat Width — 3/64" (Intake), 5/64" (Exhaust).

Valve Stem Seals (Intake Valves) — Consist of a rubber deflector installed on intake valve stems and over top of valve guides.

Valve Springs: Single springs used Install springs with two closely wound coils against cylinder head

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	78-86 lbs.	1¾"
Open	158-172 lbs.	1 3/8"

►***SPECIAL VALVE SPRING SEAT (For High Speed):*** **Special hardened Upper Valve Spring Seat, Nash No. 6492077 (identified by daub of red paint), is furnished for use where valve spring retainer (split lock) has pulled through upper spring seat. Recommended for replacement on cars operated at extreme high speeds.**

Valve Guides: Integral with cylinder head Ream valve guide holes for oversize valves if valve stem clearance excessive. Valves are furnished with 003", 010", .020", .030" oversize stems.

Checking Valve Stem Clearance and Reaming Guides for Oversize Valve Stems — *See "Valve System" in Nash Special Data.*

Valve Lifters: Hydraulic type.

►***LIFTER PRODUCTION CHANGE:*** **Hydraulic Lifter, Nash No. 6476060, has been changed for slower leakdown and improved noise level on initial start.**

Hydraulic Lifter Removal, Overhaul & Testing — *See "Valve System" in Nash Special Data.*

Rocker Arm Assembly: ***See "Valve System" in Nash Special Data.***

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves — Open 14° BTDC. Close 62° ALDC.

Exhaust Valves — Open 54° BLDC. Close 18° ATDC.

Valve Timing Check — Remove left bank rocker arm cover. Turn engine until No. 1 cylinder intake valve is open. Let engine stand for several minutes, until hydraulic lifter has leaked down completely. Then hold pressure against the top of the pushrod to keep lifter arm from refilling, and turn engine until valve closes. Insert tip of a screwdriver between end of valve stem and rocker arm to keep plunger in lifter bottomed, and turn engine until just before mark on timing gear reaches the 15° mark on the timing chain case cover as No. 6 cylinder comes up on compression stroke. Attach a dial indicator to the flange on cylinder head so that it will read any movement of the No. 1 intake valve rocker arm at the pushrod end of the arm. Turn engine very slowly until rocker arm just starts to move. At this point, mark on damper should be just 14° BTDC. *NOTE*— Maximum deflection of timing chain should be ½". If deflection is greater, it will cause a variation in the valve timing.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill).
Normal Oil Pressure: 45 lbs. at 40 MPH. 10 lbs. at idle speed.

Pr ssur R gulat r—In oil pump. Not adjustable.
Oil Pr ssure Indicator: Red light on instrument panel. Lighted when engine oil pressure low.
Oil Pressur Switch—King-Seeley 47195.
Oil Pump: Gear type. On rear main bearing cap, driven through distributor drive and camshaft gear.
Oil Pump R moval, Ov rhaul and Installation—*See "Oiling System" in Nash Special Data.*
Crankcas Ventilation: Filter element in oil filler cap (air intake). Outlet pipe in valve tappet cover.

COOLING

Wat r Capacity: 28 qts. (with heater), 27 qts. (without heater).

Pr ssur Valve Radiator filler cap. 7 lbs. (Std.), 14 lbs. (with Air Cond.).
Th rm stat: (Std.) 170°. (Optl.) 150° for alcohol anti-freeze, 180° for permanent anti-freeze.
Wat r Pump: Packless type with sealed ball bearing. *See "Nash V8" in Water Pump Section.*
Temp ratur Gaug : Stewart Warner (Hudson) or Auto-Lite (Nash). Electric type.
Dash Unit—Hudson 3119681, Nash 3119504 (Auto-Lite 14158A).
Engin Unit — Hudson & Nash 3144585 (Auto-Lite 13550A).
S e "T mperatur Gaug s" in Miscellaneous Section.

ULTRAMATIC DRIVE

Packard "Twin-Ultramatic". Torque converter (with hydraulic operated direct speed clutch) and hydraulic operated planetary unit.

►*TESTING & TROUBLE SHOOTING:* See *"Twin-Ultramatic Transmission" in Transmission Section.*

Lubricati n: Check fluid level every 1000 miles, drain and refill every 25,000 miles.
Ch cking Fluid Lev l—*(CAUTION—Fluid level must be checked at normal operating temperature and after engine has been idling at 800 RPM for at least one minute to compl tely fill system).* Run engine at low idle speed while fluid level is being checked, using dipstick located in engine compartment. Add fluid as required to bring level to "Full" mark on dipstick.
Capacity—22 pints. Use only Automatic Transmission Fluid Type A having an AQ-ATF number on can.

►*OTHER TWIN-ULTRAMATIC DATA:* See *"Twin-Ultramatic" in Transmission Section.*

UNIVERSALS

Mechanics: One universal joint used at front end of propeller shaft.

REAR AXLE

Own. Semi-floating, Hypoid Gear with Torque Tube drive. *See "Nash Hypoid" in Rear Axle Secti n.*
Axl Rati — 3.2-1 (13-41).
Backlash — .002-.006". Shim adjustment.
R ar Axl Ass mbly R moval: Raise rear of body. Disconnect hand brake cable at bellcrank and the housing at bracket. Disconnect torque tube from transmission, rear brake hose at bracket on body floor pan, rear springs, shock absorbers and rear axle stabilizer bar at axle tube. Roll axle from under car and remove truss rods, torque tube and propeller shaft from rear axle.
Axle Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644-B). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims and replace same amount when reassembling). Withdraw shaft using Puller J-2498, do not drag on inner seal.
Wheel Bearing Adjustment: Shims behind brake backing plate.
Rear Suspension: *See "Nash" in Suspensions & Wheel Alignment Section.*

SHOCK ABSORBERS

Delco or Monroe. Direct acting type. Serviced by replacement.
Front — Nash No. 3140879. **Rear** — Nash No. 3140406.

►*REAR SHOCK ABSORBER NOISE CORRECTION (Cars before Serial No. V-13160):* Before replacing a rear shock absorber for being noisy, check for damaged shock absorber grommet spacer or limit sleeve (caused by incorrect retainer with oversize hole). If grommet spacer damaged, discard it. When reassembling without grommet spacer, do not use retainer (Nash No. 3136432), however, do not compress shock absorber grommets excessively.

FRONT SUSPENSION

Independent. Coil springs located between upper ends of steering knuckle pin and seat in upper wheelhouse panel.
See "Hudson & Nash" in Suspension & Wheel Alignment Section.

►*FRONT TIRE WEAR CORRECTION (Early Cars):* Wear due to tire contact with brake hose bracket can be corrected as follows: Set stopscrews on pitman arm to limit turning radius to 36°. If tire still contacts bracket, trim rear corner of bracket approximately 1/8". Cars built after April 11, 1956 have reworked brackets.
Kingpin Inclination — 3° 36' (Hudson), 6½° (Nash).
Caster —**(Std.)** ½° Pos. desired. Limits 0-½° Pos.
(Power Steering) 1° Pos. desired. Limits ½ - 1° Pos.
Camber — 0° desired. Limits ¼° Neg. to ¼° Pos.
Toe-In — 1/16" to 3/16". *CAUTION* — When setting toe-in on Power Steering Cars, operate engine so that pump oil pressure will center spool in power cylinder valve.
Toe-Out on Turns — **(Hudson)** Outer wheel 20°, Inner wheel 26°. **(Nash)** Outer wheel 20¼° (Std.), 21¾° (Power Steering), Inner wheel 25° (All).

STEERING

Manual: G mmer Mod l 305. Worm & Roller with "push-pull" adjustments.
See *"Gemmer Steering Gears" in Steering Section*
Pow r St ring: Monroe "Linkag Type". *See "Monroe Power Steering" in St ering Section.*
St ring Linkage: *See "Steering Linkage" in Steering S ction.*
Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*
Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix. Hydraulic duo-servo single anchor type without eceentric adjustment. Hand lever applies rear wheel service brakes.
See "Bendix Hydraulic" in Brake Section.
Wheel Cyl. Diameter — 1 1/8" (Front), 7/8" (Rear).

►*REAR WHEEL BRAKE CYLINDER PRODUCTION CHANGE:* Beginning with car Serial Number Y-9019 (Hudson), V-13514 (Nash), diameter of rear wheel brake cylinder was decreased to 7/8" from 15/16" to improve brake distribution.

Lining Width & Length

	Front	Rear
Primary	2½" x 9 3/8"	2" x 9 5/16"
Secondary	2½" x 12"	2" x 12"

Clearance—Back off adjusting screw 14 notches from point where wheel can just be turned by hand.
Standard Master Cylinder: Mounted on support under floor pan to left of transmission.
Checking Fluid—Remove access cover under floor mat on left side. Maintain level ½-1" below filler top.
Removal—Remove from below without disturbing other parts.

Power Brakes: Bendix Power Unit. Replaces standard cylinder.
See "Bendix Power Unit" in Brake Section.

Removal of Power Unit—Remove vacuum and air cleaner hoses at inlet tubes. Remove hydraulic line. Disconnect pushrod from brake pedal linkage. Remove unit from mounting brackets.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Own. Compressor clutch controlled magnetically. Inoperative unless control knob turned "ON". *See "Nash Air Conditioning" in Miscellaneous Section.*

Pow r Window R gulat rs: Electric. Individual motors in each window. *See "Power Window Regulators" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	60-70
Intake Manifold (Bolts & Nuts)	22-26
Exhaust Manifold (Bolts & Nuts)	22-26
Oil Pan	9-11
Main Bearing Caps (except Rear)	100
Main Bearing Caps (Rear)	140
Flywheel	85-95
Crankshaft Pulley	45-50
Con Rod Caps	40-50
Camshaft Sprocket & Pump Eccentric	14-17
Rocker Arm Support Brackets	14-17
Engine Front Cover (3/8 & 7/16" Bolts)	30-35
Water Manifold	22-26
Oil Pump Mounting	11-14
Oil Filter to Cylinder Block	30-35
Oil Filter Housing to Base	40-45
Oil Filter Pad Cover	30-35
Flywheel Lower Housing	50-55
Transmission Mounting	60-70

ENGINE MOUNTINGS

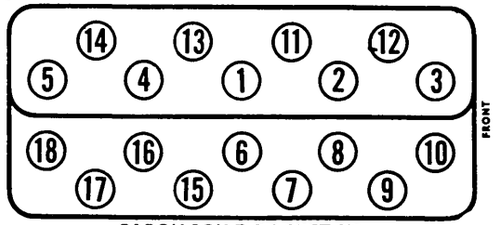
FRONT ENGINE MOUNT INSTALLATION: Cap screws fastening mounting to frame or bracket should first be screwed finger tight, then tightened alternately, one turn at a time DO NOT TIGHTEN ONE CAP SCREW IN POSITION INDEPENDENTLY OF THE OTHER, since lower portion of assembly would not seat evenly in upper portion. Front mounting must be properly positioned and tightened, otherwise mounting will not function properly as an insulator.

OIL PAN

OIL PAN REMOVAL: Remove starter and exhaust cross-over pipe. Disconnect idler arm from frame and drop steering relay rod. Remove oil pan capscrews and withdraw pan.

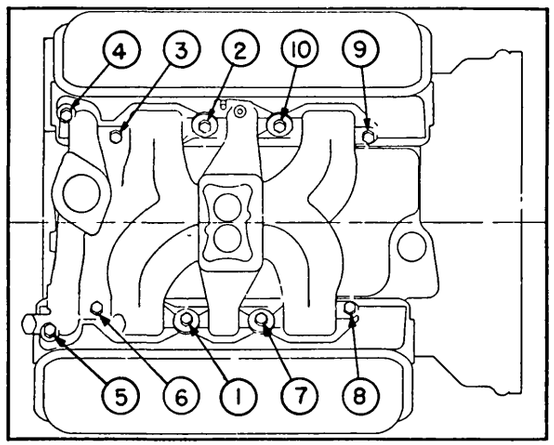
Installation: Cement new cork gaskets to pan, assemble front and rear synthetic seals to pan. Place coat of graphite grease on exposed surface of seals to insure that seal maintain their proper position in pan and do not hang up on front cover and main bearing sealing surfaces during oil pan installation.

CYLINDER HEAD & MANIFOLD



CYLINDER HEAD REMOVAL: Drain radiator and cylinder block. Remove intake manifold and generator, disconnect exhaust pipes. Remove valve cover and rocker arm shaft assembly. Rock rods to break oil seal between rod and lifter seat to avoid pulling lifter from bore, remove pushrods, then remove remaining cylinder head bolts. Remove cylinder head with exhaust manifold attached.

CYLINDER HEAD INSTALLATION: Reverse removal procedures given above and note the following:



Gaskets - Use all new gaskets. Use P. O. B. No. 4 sealer on both sides of head gasket. Cement new gasket to valve cover.

Cylinder Head Bolts - 7/16" bolts used as follows. Four 6" bolts at rocker arm supports. Ten 4 7/16" bolts through center of head. Four 2 3/8" bolts at bottom. Use a torque wrench (see Tightening Specifications) and tighten in sequence shown in head diagram.

INTAKE MANIFOLD INSTALLATION: Apply Permatex No. 3 sealer around gasket water holes. Dip threads of intake manifold bolts in C. P. No. 9 sealer. Use large flatwashers under manifold nuts, small flatwashers on bolts. Use a torque wrench (see Tightening Specifications) and tighten in sequence shown in manifold diagram.

OLDSMOBILE ROCKET V8

ROCKET V8 INTAKE MANIFOLD

PISTONS

FITTING STANDARD SIZE PISTONS: *CAUTION* - When fitting standard size pistons **do not** select a piston which has same coding as marked on cylinder block. Instead, fit piston according to revised pounds pull specification of 5-12 lbs. Standard size pistons (Part No. 564503) are furnished in four sizes ranging from DD (smallest) through D, EE, to E (largest).

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL: Asbestos covered wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove).

Oil Seal Installation - With crankshaft out of engine and bearing cap off, use new seal coated with graphite grease, crowd seal by hand into rear groove in cap and block. Using Tool BT-12, drive seal into place. With tool resting on seal, cut ends flush with parting line between upper and lower bearing. Ends of seal must be cut clean so no frayed ends will be clamped between block and cap. Seal must entirely fill the groove.

ENGINE FRONT COVER

ENGINE FRONT COVER (Removal): Disconnect lower radiator hose and heater hose from front cover and disconnect generator link at generator. Remove oil pan and remove the two bolts attaching front engine mount to frame. Support engine with Special Tool BT-29 (engine must clear front cross member). Remove radiator assembly, fan blades and pulley and crankshaft pulley. Remove fuel and vacuum pump assembly. Remove front cover attaching bolts and front cover Reverse removal sequence to install cover, using a new gasket coated on one side with gasket cement. Lubricate sealing surface of front oil seal and fuel pump operating arm. Dip attaching cover bolts in POB No. 3 sealer

Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement: ***(NOTE—Front cover oil seal can be replaced without removing front cover by using Tool J-4176).*** Remove crankshaft pulley and replace large capscrew in crankshaft end. Place fingers of Tool J-4176 over end of crankshaft and turn tool fingers so that hooks will pass through clearance between crankshaft end and inner diameter of front oil seal, (some light taps on tool center screw will force fingers behind rubber ring of oil seal) Use an end wrench on fixed nuts below puller plate and rotate each finger outward 90° to engage the finger hooks with ring of oil seal, then tighten nuts on upper plate for puller to hold fingers in position. Rotate puller center screw against crankshaft screw and remove seal.

Installation—Use Tool J-4177 to replace seal in cover by first placing seal in cover and then assembling adapter ring and driver so slot in driver will clear crankshaft key. Drive seal into place until adapter bottoms on cover face.

FLYWHEEL HOUSING

SYNCHRO-MESH & "DUAL RANGE" HYDRA-MATIC

LOWER FLYWHEEL HOUSING ALIGNMENT: *(NOTE* - Misalignment is evident as a "step" between block and lower housing resulting from location of housing too far forward or rearward on block). To correct misalignment, elongate dowel pin holes so as to allow lower housing to move to rear or front as required. Do not remove dowel pins or enlarge dowel pin holes with an oversize drill, as correct side-wise location of lower housing must be maintained for proper engagement of starter pinion and ring gear.

REAR FLYWHEEL HOUSING ALIGNMENT: Loosen capscrews slightly. Remove dowel pins, then shift housing with a lead hammer to bring within limits. *(NOTE* - On Synchro-mesh cars it will be necessary to remove rear housing and saw off dowel pins close to block before driving pins through). After aligning housing, again tighten housing attaching bolts and recheck radial runout. Using Reamer J-4832-3 and ratchet wrench J-808-6, ream two engine block-to-rear housing dowel pin holes. Finish ream with reamer J-4832-4 and install oversize dowel pins, Part No. 557754, with large chamfer end out. *(NOTE* - Above reamers must be shortened to 4" over-all length if operation is to be performed with housing in car).

REAR FLYWHEEL HOUSING ALIGNMENT CHECK: *NOTE* - It is not necessary to have lower housing in place during this check.

1) Install pilot mounting strap J-2548 on flywheel. Install rear housing and tighten bolts. Install pilot shaft and mount dial indicator. Tap crankshaft to rear of engine.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

2) Using large button on dial indicator, install indicator assembly so button contacts face of housing with approximately .015" compression. With dial indicator positioned against rear face of housing (2 3/4" radius on Hydra-Matic & 2 3/8" radius on Synchro-mesh, from centerline of crankshaft) revolve flywheel 360° and note indicator reading. Limits for this reading are not to exceed .003" on indicator within 360°. If reading exceeds limit, shim as necessary between housing and engine block to bring within limits.

3) Assemble dial indicator to pilot shaft using attachments 8-50 and 8-51, then check radial runout of housing bore as follows. Mark flywheel housing with pencil or chalk to indicate horizontal and vertical positions. With indicator positioned at zero at either horizontal mark, rotate flywheel 180°. Indicator reading at this opposite point must not exceed .004" plus or minus. With indicator positioned at zero at top mark, rotate flywheel 180°. Indicator reading at bottom must be between .000" and minus .008".

4) If not within above limits, proceed with Rear Flywheel Housing Alignment above.

CAMSHAFT & BEARINGS

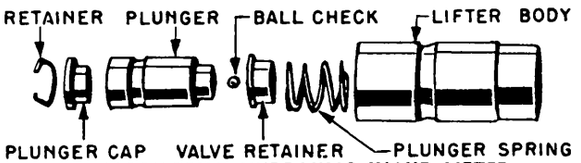
CAMSHAFT REMOVAL & INSTALLATION: Remove valve lifters, distributor, engine front cover, fuel pump eccentric, camshaft sprocket and timing chain. Remove camshaft CAREFULLY by sliding out from front of engine. To install, reverse removal procedures.

VALVE SYSTEM

ROCKER ARMS

ROCKER ARM SHAFT ASSEMBLIES: Identical hollow steel tube shafts (ends plugged) are used. Four removable supports for each shaft, one support doweled to shaft for oil feed (at oil line from #2 camshaft bearing on left side, from #4 camshaft bearing on right side) Three springs used to position center rocker arms against supports. End rocker arms retained by wave washer, flat washer, and cotter key.

Rocker Arm Shaft Disassembly: With assembly off engine, remove cotter key and washers from end of shaft. Remove rocker arms, supports (except doweled support which should not be removed from shaft), and springs.



►*CAUTION—Rocker arms should be stored so that they can be reassembled in their original position.*

Rocker Arm Shaft Reassembly: Assemble supports in proper position as to doweled support (oil supply). Push rod end of rocker arms must be on same side as large cylinder head bolt hole in each support.

HYDRAULIC LIFTERS

VALVE LIFTERS: Hydraulic, Barrel Type. Consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet body (See illustration) Oil is introduced to this unit from main oil gallery through hole in side of lifter plunger and body

Removal: Remove intake manifold, cylinder block cover, valve covers, rocker arm shaft assemblies, push rods and valve lifters

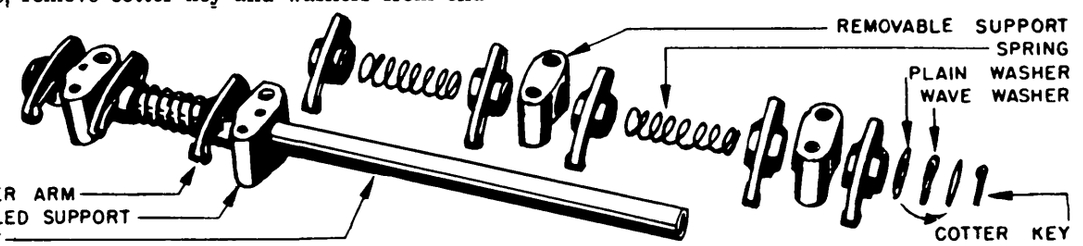
OLDSMOBILE HYDRAULIC VALVE LIFTER

►*CAUTION*—Valve lifters must be installed in same bores from which they were removed

Disassembly: Remove plunger retainer with Lock Spring Tool, BT-31 Remove push rod seat, plunger, ball check valve, ball retainer and spring If plunger is stuck in lifter body, remove plunger by engaging Remover Tool BT-38, in plunger oil hole, and while holding tool lug in vise, turn "T" handle counterclockwise until plunger in drawn from lifter body NOTE—Soak heavily varnished lifters in solvent before disassembling

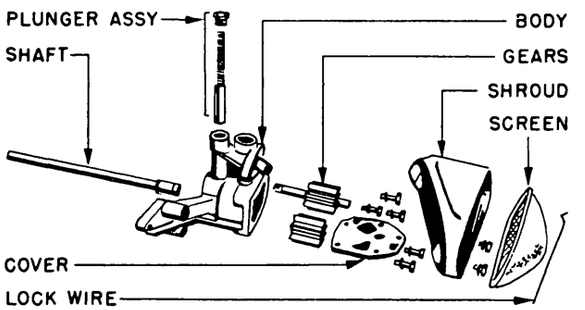
Cleaning & Inspection: Wash all parts in a suitable cargon solvent and remove all trace of carbon and varnish Inspect plunger and lifter body for scoring or other damage that would prevent free movement Inspect lower end of lifter body for nicks or indentations If any exist, replace complete lifter assembly Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement Plunger should drop of own weight into body bore

Reassembly: *(NOTE—Body and plunger are selectively fit and must not be interchanged, or replaced individually)* Place plunger over push rod seat and then turn plunger over holding push rod seat in place, and install ball on its seat in plunger Place ball check valve retainer over ball and then place valve retainer spring over retainer Carefully assemble valve lifter body over complete assembly Turn assembly over and while holding push rod seat down, install retaining lock spring, using Tool BT-31



Identification Note—It is important when replacing lifters that the correct oversize lifter be used An identification number is etched on all lifter bodies except standard Lifters are furnished in Std size and the following oversizes .001", .002", .003", .005" The cylinder block is marked 1, 2, 3, or 5 for lifter size on rail under engine top cover

OILING SYSTEM



OIL PUMP

OIL PUMP: Removal & Disassembly—Remove oil pan, then remove pump Remove oil screen lock wire and screen, and oil screen shroud Remove extension shaft and coupling by removing lower snap ring from coupling Remove oil pump cover, oil pump gears and pressure regulator nut, spring and valve

Reassembly & Installation: Reverse removal & disassembly procedures outlined above

OLDSMOBILE ROCKER ARM ASSEMBLY

OLDSMOBILE OIL PUMP

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconn cting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBERS: On left body pillar post.
Starting Serial Number — 1001.

►*SERIAL NUMBER NOTE: Complete serial number (example 567M 1001) includes following identification data in sequence.*

Year	Series①	Assy. Plant②	Serial No.
56	7	M	1001

① — Series Designation: 7 — (88 Series). 8 — (Super 88 Series). 9 — (98 Series).

② — See Assembly Plant Designation following.

Assembly Plant Designation

M — Lansing	L — Linden
A — Atlanta	C — South Gate
B — Framingham	W — Wilmington
K — Kansas City	T — Arlington

ENGINE NUMBER: Stamped on machined pad located on top of left hand cylinder bank of block. The number can be observed between the front and center exhaust manifold ports.
Starting Engine Number—V1,000,001.

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. minimum at cranking speed. Reading on low cylinders should not be less than 80% of high cylinder.

VACUUM READING: Steady 17" minimum at idling speed.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic coil type located on left side between exhaust manifold and exhaust pipe. Stop spring should strike stop before counter-weight touches pin to prevent valve rattle when cold.

►*DUAL EXHAUST NOTE:* When heat control valve closed, most exhaust gases are discharged through right exhaust pipe.

►*DUAL EXHAUST INSTALLATION CAUTION (To prevent Excessive Exhaust Noises From Being Transmitted Into Car):* It is important that intermediate bracket clamp be tightened AFTER other clamps and supports are tightened. If tightened first, vibrations will be transmitted to car.

IGNITION

FIRING ORDER: 1—8—7—3—6—5—4—2.
Cylinders—RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .030".
Spark Plugs—AC No. 44.14mm. Torque to 23-28 ft. lbs.

COIL: D lco-R my 1115087. *12 V lt.*
Igniti n Current—2.0 amperes idling. 4.5 stopped.
R sistor—D lc -R my 1928016. On bracket adjacent to ignition coil.

►*COIL RESISTOR NOTE: R sistor is connect d in lead from ignition switch-to-coil. This resistor is by-pass d during cranking by a lead from starter solenoid-to-coil.*

DISTRIBUTOR: Delco-Remy 1110857. *12 Volt.* New external adjustment "Window" type. *See "Delco-Remy (Window Type) Distributor" in Electrical Section.*
Condenser—Delco-Remy 1932004. **Capacity** .18-.23 mfd.
Contact Point Set — Delco-Remy 1931988.
Breaker Gap — .016"
Cam Angle — 26-33°
Breaker Arm Spring Tension — 19-23 ozs.
Rotation — Counter-clockwise viewed from above.

Automatic Advance

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	400	0-4	800
7¾-9¾	1000	15½-19½	2000
9-11	1200	18-22	2400
11-13	2000	22-26	4000

Vacuum Spark Control: Delco-Remy 1116096.
Plunger Travel — 7/32—15/64".

Vacuum Advance

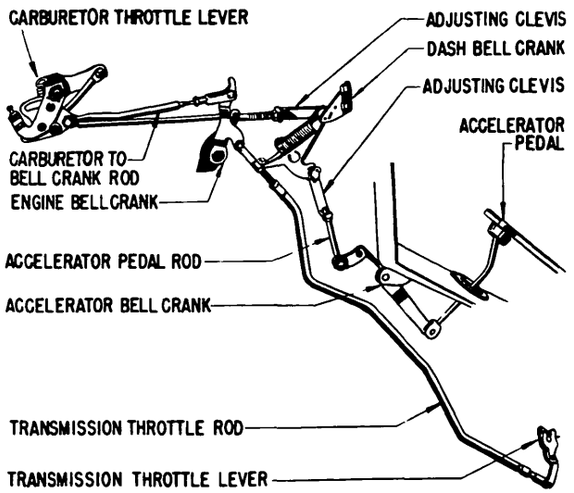
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4.5—6.5
10.75	21.50	15.25—16.0

IGNITION TIMING

Setting—5° BTDC, with engine idling at 850 RPM and vacuum line to distributor disconnected and carburetor opening taped closed.

►*DETONATION CAUTION: If engine detonates (due to low octane fuel or carbon build-up) set timing to 2½° BTDC. For high altitude operation, timing can be adjusted to 7½° BTDC, if detonation does not occur.*
Timing Mark— Slot in rim of crankshaft pulley and pointer on front cover. Leading edge of slot is 5° BTDC. Trailing edge is TDC. Midway between these points is 2½° BTDC.

CARBURETOR



►*CARBURETOR APPLICATION: Rochester 2GC 2-Barrel used on 88 Series, Rochester 4GC 4-Barrel used on Super 88 & 98 Series.*

►*IDLE ADJUSTMENT NOTE: A "Split" throttle lever permits idle speed adjustment after Hydra-Matic Throttle Linkage adjustment made (without affecting that adjustment).*

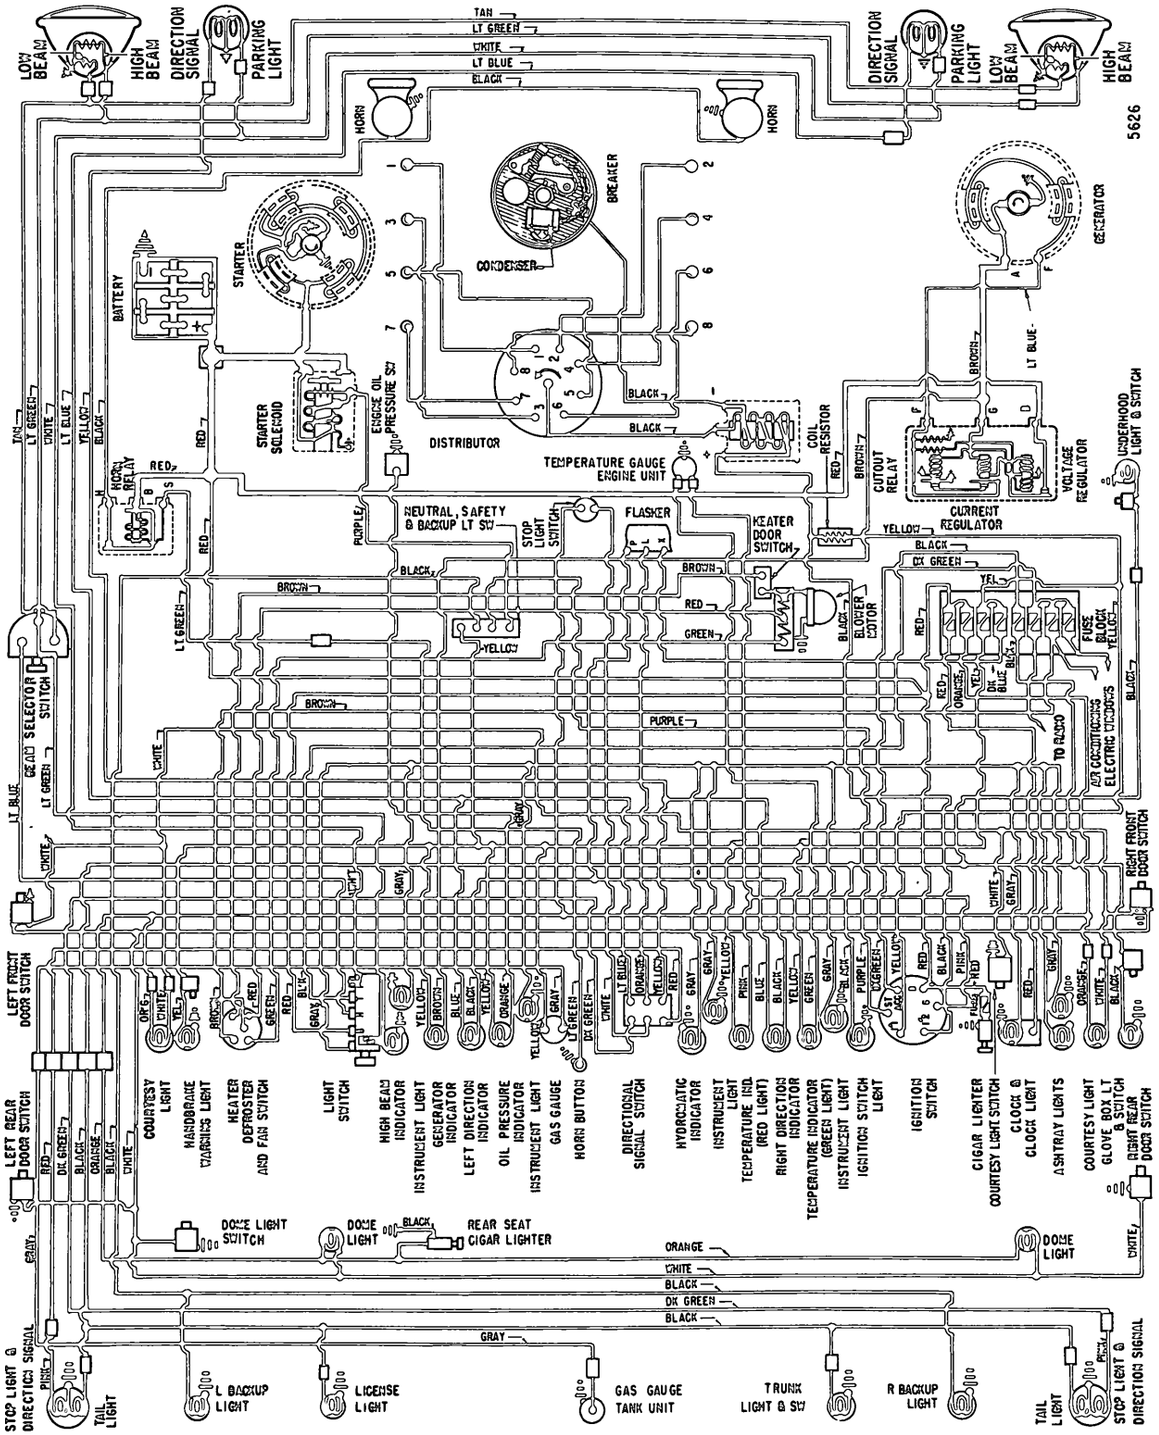
Throttle Return Check Adjustment (Cars with "Jetaway" Hydra-Matic): With transmission in "N" (Neutral) and engine at normal operating temperature, set carburetor on fast idle and adjust to 1500 RPM. Flash throttle and allow to return to slow idle, then turn off the ignition switch. Set carburetor on fast idle and check clearance between throttle return check plunger and throttle lever. Adjust to .020" using two wrenches so that diaphragm is not permitted to turn.

THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC DRIVE CARS): Install Throttle Return Check Holding Tool J-6342 to hold plunger away from throttle lever. Proceed as follows:

1) Remove throttle rod from transmission throttle lever and move throttle lever to rear against its stop, and with Throttle Lever Gauge J-5605 (88 Series with Std. Hydra-Matic); Gauge J-6344 (All Series with "Jetaway" Hydra-Matic), placed flat against rear face of transmission case, rod on gauge should just enter hole in throttle lever. Adjust throttle lever by bending with tool J-2029. Attach throttle rod to lever.

HYDRA-MATIC THROTTLE LINKA E

2) With carburetor on slow idle adjust rod between throttle lever on carburetor and bellcrank on dash so a clearance of 11/32" to 13/32" exists between bellcrank lever and dash *(NOTE — Op n sid of cl vis should face away from engin with 4-Barr l carbur tor, and toward engine with 2-Barr l carbur tor).*



3) Loosen jam nuts and remove both clevis pins and rods from bellcrank on rear of cylinder head. With bellcrank held against the stop and bellcrank-to-transmission throttle lever rod pushed back against the stop, adjust clevis so pin will enter freely into holes in clevis and bellcrank. Install cotter pin and tighten jam nut (bellcrank should be against the stop. If it is away from the stop, transmission throttle lever rod is too long). Adjust short rod rrom carburetor -to -bellcrank so that clevis pin just touches gauge point (gauge point is forward face of elongated section of lever directly above upper hole in lever) on bellcrank, or is one-half turn short.

NOTE — Throttle rod should be pulled lightly toward rear of engine to remove slack and bellcrank should be against the stop when adjustments made.

4) Install clevis pin and cotter pin and tighten jam nut.

5) Hold choke wide open and pull forward on bellcrank on dash until throttle is wide open. Then go beyond to the point of maximum transmission lever travel (this point is a matter of feel and care must be taken not to bend or stretch linkage beyond the actual point of maximum transmission lever travel). With throttle held in this position adjust stopscrew on carburetor throttle lever to just touch the tang on the downshift lever

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

(carburetor-to-bellcrank rods are attached to downshift lever). *NOTE* – This adjustment will prevent linkage from bending when a detent downshift is made.

6) Adjust accelerator pedal as follows: Place a wood block 3 7/8" long on the top center of the floor mat retainer and bring bottom of accelerator pedal down to rest on block. With carburetor in the slow idle position (choke completely off), pedal should just touch gauge block. If necessary to adjust, disconnect rod assembly between bellcrank on dash and accelerator pedal bell and adjust rod so that clevis just slides over pin with wood block in position and carburetor in slow idle position. Reassemble rod between dash bellcrank and accelerator bellcrank, making sure that open side of rod is facing away from engine, then remove wood block.

ROCHESTER 2GC (CONCENTRIC BOWL) No. 7007223

The new 2GC (Concentric Bowl) Rochester Carburetor is similar in design to the 2GC (Side Bowl) carburetor used on previous models, the principal difference being the concentric bowl design and the relocation of the metering jets toward the center of the carburetor.

▷*ENGINE STALLING WHEN COLD CORRECTION (First Cars)*: Caused by carburetor dropping down to slow idle before engine fully warmed up. Correct by drilling 3/64" hole in end of choke piston to reduce vacuum behind piston. *NOTE–Carburetors tag-dated "B" and later incorporate changes in piston and choke housing DO NOT require this modification.*

▷*CARBURETOR PRODUCTION CHANGES (To Correct Cold Drive-away & Low Speed Acceleration Difficulties): See "Rochester 2GC Carburetor" in Carburetion Section.*

Service Replacement Carburetor – Rochester No. 7009300 (Service Package), furnished less Throttle Return Check Assembly.

▷*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1–4–6–7, LEFT barrel 2–3–5–8.*

Idle Setting – 1 1/2 turns open (initial setting). With engine at normal operating temperature, turn each idle adjusting screw in or out for smoothest possible idle (highest vacuum and RPM), then turn each screw out (rich) 1/4 turn. *NOTE* – If engine rolls from richness when throttle snapped closed, turn each screw in 1/8 turn.

Idle Speed – 425 RPM (Synchro-mesh); 400 RPM (Hydra-Matic – With selector lever in "Dr" range).

Float Level – *NOTE – Double floats used in this carburetor.* With air horn inverted and gasket in place, distance from gasket surface to top of floats should be 1 7/16". Use Float Setting Gauge J-6337 (Oldsmobile), BT-125 (Rochester) and position gauge over both floats so that gauge rests against curvature of air horn. Bend float arm tang until floats just touch the gauge. Align floats vertically in gauge slots.

Float Drop – With air horn held upright, distance from bottom of float to gasket surface should be 2". Bend the float tang toward needle seat to lessen drop and away from seat to increase drop.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fast Idle· 1700 RPM with fast idle screw on high step of fast idle cam. Adjust screw as necessary to obtain the correct engine RPM.

Unloader: Index the throttle levers by backing out the idle stop screw, then turn it **in one turn** beyond the point where the outside lever begins to move. With the throttle valves wide open, the large end of Gauge J-6338 (Oldsmobile), BT-127 (Rochester), should just fit between the upper edge of the choke valve and the air horn wall (this distance is .155"). To adjust, bend the throttle lever tang with Tool BT-69.

Automatic Choke Setting: One notch rich. *NOTE*–Supersedes previous "Centered (at index)" specification.

►*OTHER DATA*· *See "Rochester 2GC Carburetor" in Carburetion Section.*

Throttle Return Check Adjustment (Hydra-Matic Drive Cars): *See CARBURETOR above.*

Hydra-Matic Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4 – 5 1/4 lbs. at 450-1000 RPM.

ROCHESTER 4GC

Rochester No. 7007221 (Hydra-Matic), 7007222 (Synchro-mesh).

►*MANIFOLD FUEL DISTRIBUTION. Carburetor RIGHT barrels feed Cyls. 1–4–6–7, LEFT barrels 2–3–5–8.*

Idle Setting – With engine at operating temperature, set the idle speed (see below), turn each screw in or out for smoothest possible idle (highest vacuum and RPM), then turn each screw out (rich) 1/4 turn. NOTE – If engine rolls from richness when throttle snapped closed, turn each screw in (lean) 1/8 turn.

Idle Speed – 425 RPM (Synchro-mesh), 400 RPM (Hydra-Matic – With selector lever in "Dr" range).

►*OTHER DATA: See "Rochester 4GC Carburetor" in Carburetion Section.*

Throttle Return Check Adjustment (Hydra-Matic Drive Cars)· *See CARBURETOR above.*

Hydra-Matic Throttle Linkage Adjustment: *See CARBURETOR above.*

Fuel Pump Pressure: 4-5¼ lbs. at 450-1000 RPM.

CARB. EQUIPMENT

Fuel Pump: AC Replacement No. 4317. Fuel & Vacuum.
Pressure – 4-5¼ lbs. at 450-1000 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: AC Electric type.
Dash Unit – AC No. 1518430.
Tank Unit – AC No. 1518409.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Delco 3KMR62. *12 Volt,* 9 plate, 62 ampere hour capacity (20 hour rate).
Battery Ground – Negative
Engine Ground–Connected between engine and forward side of firewall.

STARTER

Delco-Remy 1107638. *12 Volt.* **Armature** 1927343.
Drive – Overrunning clutch (solenoid pinion shift).
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3500	10.1	95 max.
10.5 ft. lbs.	Lock	5.4	470 max.

Starting Switch: Solenoid switch, Delco-Remy 1119780, mounted on starter and controlled by combination Starter & Ignition Switch, Delco-Remy 1116521, and Neutral Safety Switch (see below). *NOTE* - Neutral Safety Switch used on all models with automatic transmission.

Hydra-Matic Neutral Safety Switch: Delco-Remy 1998135 (88 Series with Std. Hydra-Matic – 5 - position switch). **Delco-Remy 1998125** - All Series with "Jetaway" Hydra-Matic - 6-position). Combination Neutral Safety and Back-up Light Switch.
Adjustment – *See "Dual Range" or "Dual Coupling" Hydra-Matic in Transmission Section.*

GENERATOR

Delco-Remy 1102003 (Std.), 1102021 (Air Conditioned Cars). *12 Volt. NOTE* – Above listed generators are with pulley. Generator without pulley is Delco-Remy 1102005.

►*GENERATOR WARNING LIGHT NOTE:* Warning light lights when ignition turned on. As generator speed increases, light will go out.

Armature – Delco-Remy 1923535 (All Models).
Maximum Charging Rate – *See Voltage Regulator.*

Performance Data

Amperes	Volts	RPM
30 Ⓒ	14	2150

Ⓒ – Not maximum. See Regulator.
Brush Spring Tension – 28 ozs.
Field Current – 1.48-1.62 amperes at 12 volts.
Rotation – Counter-clockwise at commutator end.

Belt Adjustment: Loosen generator attaching bolt and place Tool J-4170-B against generator between bracket and generator housing. Attach torque wrench to tool to apply torque of 16 ft. lbs. (Std.), 20 ft. lbs. (Air Conditioning). Tighten generator attaching bolts while holding tension on wrench.

REGULATOR

Delco-Remy 1119001. *12 Volt. NOTE - Regulator is "1119000 Series" Specifications below are "Normal" settings.*

Cutout Relay
Cuts In – 11.8-13.5 volts (hot).
Contact Gap – .020".
Air Gap – .020" (with contacts just closed).

Voltage Regulator
Setting – 13.8-14.8 volts (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting–*See "1119000 Series Regulator" in Electrical Section.*

Current Regulator
Setting – 27-33 amperes (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting – *See "1119000 Series Regulator" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signal: *See Electrical Section.*
Autronic Eye: *See Electrical Section.*

Lighting Switch Removal Disconnect battery cable and disconnect wires from lighting switch Pull switch knob out to last notch then depress spring loaded latch button on switch body while pulling rod and knob assembly out of switch Remove switch mounting nut and remove switch and escutcheon from instrument panel

Stop Light Switch Location (Std. Brakes): Mechanical type on toe board near brake pedal

Stop Light Switch Location (Power Brakes)· Directly above brake pedal on firewall Adjust so lights come on within free travel of brake pedal

FUSES: All fuses (exc. Instrument Panel fuses) are located on a combination fuse and junction block under the instrument panel A color code is used on the fuse panel corresponding to the color code of circuits protected by each fuse. The following fuses will be found on this panel·

(1) Clock (Std. on 98 Series only) 1 ampere.
(2) Courtesy Lights, Dome & Stop Lights, and Rear Cigar Lighter. 25 amperes.
(3) Fuel & Temp. Gauges, Hand Brake Signal Light, Hydra-Matic Shift Indicator, and Back-up Lights. 9 amperes
(4) Turn Signal. 9 amperes
(5) Glove Box, Underhood, Key Ill, Tail, Trunk, & Spot Lights. 9 amperes
(6) Radio. 7.5 amperes.
(7) Heater & Air Conditioner. 20 amperes (without Air Conditioner), 25 amperes (with Air Conditioner)
(8) Electric Windows & Antenna. 20 amperes
Instrument Panel Lights–2 amperes located on headlight switch
Cigar Lighter–20 amperes located behind lighter

CIRCUIT BREAKER: 22 amps. Located in headlamp switch

HORNS: Delco-Remy 1999753 (Low Note) **1999754** (High Note) *12 Volt*

Optional (Trumpet Type) – **Delco-Remy 1999586.** *12 Volt.*

Horn Relay: Delco-Remy 1116781. *12 Volt.*
Contacts Close – 5-9 Volts. Set to 6.5 if outside limits.
Contact Gap – .027". **Air Gap** – .014" (closed).

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8 with overhead valve.

Bore	Stroke	Displacement	Rated HP
3 7/8"	3 7/16"	324 cu. ins.	48

Engine	Compr. Ratio	Developed HP
88	9.25-1	230 at 4400 RPM
Super 88 & 98	9.25-1	240 at 4400 RPM

Compression & Vacuum Reading – *See TUNE-UP.*

CYLINDER HEAD: *See Oldsmobile Special Data.*

INTAKE MANIFOLD INSTALLATION: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*

TIGHTENING TORQUES: *See Oldsmobile Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OIL PAN REMOVAL: *See Oldsmobile Special Data.*

ENGINE FRONT MOUNT INSTALLATION: *See Oldsmobile Special Data.*

PISTONS

Aluminum alloy, three ring, autothermic, steel strut, slipper skirt, cam ground, tin plated.

Length – 4.05". **Weight** – 22.07 ozs. (less rings & pin).

►*CAUTION:* Mark piston, rods, and bearing caps with cylinder number before removal to insure correct reinstallation.

Fitting New Pistons: .0005-.0010" clearance at thrust surface (Selective fit). With piston inverted and pin removed, insert piston into bore. Pull required to withdraw a .0015" x 1/2" x 12" feeler placed at 90° to normal position of pin and piston at center of normal travel, should be 5-12 lbs. *See "Pistons" in Oldsmobile Special Data.*

►*CAUTION: Allow rebored cylinders to cool to normal room temperature before fitting pistons.*

Replacement Pistons: Std. & .020", .030" Oversize. Pistons furnished only with fitted pins.

Installing Pistons: Install pistons 1, 3, 5, 7 in left bank, and 2, 4, 6, 8 in right bank with letter "F" cast on each side of piston pin hole, and notch in piston head, toward front of engine.

PISTON PINS

Floating type with rock rings at each end.

►*CAUTION: Discard old lock rings and install new service type lock rings when installing pins.*

Diameter – .9803-.9807". **Length** – 3.126".

Pin Fit in Piston – Pin should not fall through piston of own weight when using the low limit (.0000" fit). Piston can be tapped into place using brass drift.

Pin Fit in Rod Bushing – .0003-.0005" loose.

Replacement Pins: Std. size & .001", .003" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compression	.077-.078"	①	.001-.003"
Oil	.180-.186"	②	.0023-.0039"

① – Perfect Circle .010-.020". Sealed Power .008-.016".
② – Perfect Circle & Sealed Power .013-.033".

Replacement Rings: Furnished Std. & .010" Oversize (not in sets), Std. & .030" Oversize (in sets).

Installing Rings: Install upper chrome and lower black compression rings with side marked "TOP" up. Install oil ring (either side up) with gap on same side of piston as rod spit hole. Install oil ring expander with gap on side opposite rod spit hole.

CONNECTING RODS

Length—6 5/8" (Center to center). **Weight**—29.54 ozs.

Crankpin Journal Diameter—2.2488-2.2498".

Out of Round Limit—.0015".

Bearings—Durex 100A, steel backed, full precision type. Both halves interchangeable. No shims.

Clearance – .0009-.0029" (vertical), .0019-.0039" (horizontal).

Side play—.002-.011" (total for both rods).

Replacement Bearings: Standard size, .002", .010", .020" Undersize.

Installing Rods: *CAUTION*—Rods have plain side and boss side (two machined bosses at lower end). Install rods **1, 3, 5, 7 with plain side to front, and 2, 4, 6, 8 with boss side to front** (*NOTE*—Pistons marked "F" on front side). Caps offset and cannot be installed incorrectly. Groove on rod and cap, and pads for numbering caps and rods are on same side.

►*CAUTION—Use Guide tool BT-22 over rod bolts to prevent damaging crankpin journals when removing and installing piston and rod assemblies.*

NOTE—Oil spit hole for lubrication of opposite cylinder wall provided in rod above cap joint.

CRANKSHAFT

Journal Diameter—#1, 2, 3, 4 2.498-2.499", #5 2.623-2.624".

Bearings—Durex 100A, steel backed, full precision type. Rear bearing flanged.

Clearance—.0005-.002" (Front—See Note below), .002-.0035" (Rear - See Note below), .0005-.003" (Others).

►*FRONT MAIN BEARING NOTE: Selective fit bearing used.* **On cars with Power Steering or Air Conditioning it is very important that front bearing fit be held as close as possible because of the increased pump drive and compressor drive belt load.** Bearing Part No. 565770 (Marked "M" on tang) will reduce bearing clearance .0005" Bearing Part No. 564771 (marked "H" on tang) will reduce bearing clearance 001". These bearings are in addition to regular replacement bearings

►*REAR BEARING NOTE* Rear bearings are selective fit during manufacture, 3 sizes used: "M" Medium, "T" Thin, "H" heavy. **Use same size bearing (indicated by letter on tang) when replacing bearing.**

Replacement Bearings: Standard size, .002", .010", .020" Undersize. In addition to lettered bearings used at front and rear. *See Front & Rear Bearing Notes above.*

End Thrust: Taken by rear (#5) flanged bearing.

Endplay—.004-.008"

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data*

Flywheel & Clutch Housing Alignment: *See "Flywheel Housing" in Oldsmobile Special Data.*

CAMSHAFT

Journal Diameters – 1.9970-1.9975".

Bearings – Steel backed babbitt.

Clearance – .0018-.0038".

End Thrust: Forward thrust taken by plunger and spring on front of engine, rear thrust at front of cylinder block.

►*CAUTION:* Two main oil gallery holes in block sealed by hex head bolt. A small hole in bolt for right hand gallery provides lubrication to timing chain, fuel pump eccentric and lever.

Camshaft Removal & Installation: *See "Camshaft" in Oldsmobile Special Data.*

Timing Chain:	Link-Belt	Morse
Width	11/16"	13/16"
Pitch	.500"	.375"
Length (Links)	48	64

►*NOTE—Morse and Link-Belt chains not interchangeable unless sprockets also changed*

Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Oldsmobile Special Data*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Oldsmobile Special Data*

Camshaft Setting: Mesh chain with sprocket marks adjacent and in line with a straight edge across shaft centers (or use Tool BT-11).

►*NOTE—Fuel pump eccentric bolted to front of camshaft ahead of sprocket. Assemble with "0" mark to front, machined step against sprocket*

VALVES

Valves	Head Diam.	Stem Diam.	Length
Intake	1.745-1.755"	.3417-.3425"	4.989-5.009"
Exhaust	1.557-1.567"	.3930-.3938"	4.989-5.009"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.418"	.0017-.0040"
Exhaust	45°	.418"	.0022-.0045"

Valve Seat - .042-.071" (Intake & Exhaust).

Intake & Exhaust Valve Stem Oil Seals – A "Top Hat" type oil seal (deflector) is installed on valve stem below valve spring retainer.

Valve Springs: Intake and exhaust valve springs are alike. Dampers are used on lower end of all valve springs.

Valve Spring Specifications

Valve	Pressure	Length
Closed	95-105 lbs.	1.880"
Open	183-197 lbs.	1.480"

Spring Free Length – 2.38" approximately.

►*CAUTION:* Lower end of damper and spring must seat in recess in head. Install closely wound spring coils toward cylinder head.

Valve Guides: Press guide in head until top of guide is .787" above top of head. Ream inside diameter of guide, after installation, to .3442-.3457" (Intake), .3960-.3975" (Exhaust).

Hydraulic Valve Lifters: Barrel type.

►*HYDRAULIC LIFTER INSTALLATION CAUTION.* FIVE different sizes used in production as follows (marked as indicated) Standard (unmarked), 001 O S (marked "1"), 002 O S (marked "2"), 003 O.S (marked "3"), 005 O S (marked "5") **Lifters** marked by etched number on lifter body, **Cylinder Block** marked by number on rail under engine top cover *Reinstall lifter in same hole or replace with proper size.*

Diameter—.8424-.8427". **Length**—2" (Overall).

Clearance in Block—.0005-.0018" (Selective).

Replacement Lifters: Standard size, .001", .002", .003", .005" Oversize.

Hydraulic Lifter Overhaul & Testing—*See "Valve System" in Oldsmobile Special Data*

Rocker Arm Assembly: *See "Valve System" in Oldsmobile Special Data*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves – Open 11½° BTDC. Close 52½° ALDC.

Exhaust Valves – Open 51° BLDC. Close 13° ATDC.

Valve Timing Check–Remove left hand cylinder head rocker arm assembly and rotate engine so that #1 piston is on top dead center (firing stroke). Trailing edge of notch in vibration dampener will be aligned with pointer on timing chain cover. Install tool J-5374 in place of rear rocker shaft bracket with step plunger over #7 cylinder exhaust push rod. The 7/10" diameter pilot at bottom of tool will fit into cylinder head bolt hole. Screw main body of gauge down so step plunger contacts push rod and small diameter of step plunger is flush with top of main body Tighten clamp bolt. Rotate engine one complete revolution so that #1 piston is again at TDC (intake stroke). Distributor rotor should now be pointing toward rear of engine. If timing chain is installed properly, top of tool plunger will rise so the top of main body of tool is flush with the third step. If camshaft is retarded one tooth, the third step will rise above top of main body, and if advanced one tooth, second step will be below main body

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). 6 qts. (dry).
NOTE– 1 qt. additional for dry filter.

Normal Oil Pressure: 35-45 lbs. at 50 MPH.
Pressure Regulator Valve–In pump body Not adjustable.
Oil Pressure Indicator – Oil pressure warning light on instrument panel and oil pressure switch in engine block or oil filter. Lights when pressure below 3 lbs.
Engine Unit – AC No. 1508319.
See "Oil Pressure Indicators" in Miscellaneous Section.

Oil Pump Gear type. In crankcase at rear end.
Pump Overhaul–*See "Oil Pump" in Oldsmobile Special Data.*

Oil Filter: AC No. PM-90-3 full flow type (optional). On lower right side of crankcase at rear.
Replacement Filter Element–AC No PF-122

►*CAUTION*–If filter (or pad cover if filter not used) is replaced, used a new gasket (coat both sides with POB No. 5 Sealer) and tighten bolts to 30-35 ft. lbs. Oil filter or pad mounted externally on lower right side of crankcase at rear. Oil filter is full flow type (all oil from pump delivered to oil filter) requires pad when filter not used to return oil to main oil gallery.

Crankcase Ventilation. Air intake in oil filler cap has oil-wetted cleaner, AC No. 1552233 (Std.) No. 1551509 (Heavy Duty). Outlet is connected to ventilating baffle at rear of block above right bank. Outlet pipe is push fit at ventilator and extends down below right rear corner of engine.

►*NOTE* Air cleaner also used in lower section of ventilator outlet tube on cars with heavy duty inlet breather in filler cap and oil bath air cleaner

COOLING

Water Capacity: 20½ qts. (without heater), 21½ qts. (with heater).
Pressure Valve: AC Type RC-1, No. 850795. Radiator filler cap. 7 lb. type.
Thermostat: Dole or Harrison.

Oldsmobile No.	Dole Type	Harrison Type
160° ①	563219	3126289
180° ②	563311	3126290

① – Use with alcohol anti-freeze.
② – Use with permanent type anti-freeze.

Water Pump Packless, sealed ball bearing type.
See "Oldsmobile" in Water Pump Section.
Pump Removal–Remove fan and fan pulley. Remove six mounting bolts (4 to engine cover, 2 to engine block). Remove pump. *NOTE*–When installing pump, coat one side of pump housing gasket with gasket cement, dip bolts in CP No. 9 Sealer.

Temperature Indicator: New TWO light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes off when engine temperature reaches 111-115° F. RED light remains off during normal engine operation but comes on when engine temperature reaches 218-222° F. *NOTE*- Red light will come on when ignition key turned to "Start" position but should go out when key returned to running position (this tests bulb and circuit each time engine started).
Engine Unit – AC No. 1998140.
See "Temperature Indicators" in Miscellaneous Section.

CLUTCH

Long 11CF Type. Single plate, semi-centrifugal type.
See "Long" Clutches in Clutch Section.

Part	Long No.	Oldsmobile No.
Cover Assy. (Std.)	262832	562619
Disc (Std.)	282687	565059

Pedal Adjustment- Pedal free travel 1 1/8-1 3/8". Adjust by turning adjusting nut on clutch connector link at throw-out yoke

Removal: Remove transmission (see Transmission), remove right and left splash pans, engine breather pipe, and right and left lower flywheel housing bolts. Install Engine Rear Support Tool BT-28, entering pilot supports into lower housing bolt holes. Remove engine rear mount bolts at clutch housing, and remove frame cross member by removing three bolts at each end. Remove clutch housing by removing eight bolts holding housing to flywheel housing Remove clutch assembly from flywheel.

Clutch Housing Alignment- *See "Flywheel Housing" in Oldsmobile Special Data.*

SYNCHRO-MESH TRANSMISSION

Own. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse) all helical gear type
See "Oldsmobile Synchro-mesh" in Transmission Section

Transmission Control *See "Transmission Controls" in Transmission Section.*

Removal: Drain transmission and disconnect manual control rods and speedometer cable at transmission. Remove propeller shaft. Remove bolts holding transmission to clutch housing, and remove transmission by moving rearward until main drive gear clears clutch assembly.

HYDRA-MATIC DRIVE

"Dual Range" or "Dual Coupling". Four speed automatic transmission and fluid coupling.

►*APPLICATION NOTE- Early Series 88 used "Dual Range" Hydra-Matic (same as 1955 Mod Is). Later Series 88, Super 88 & 98 use the new "Jetaway (Dual Coupling)" type.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION. See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Trans. Sect.*

Lubrication – Check fluid level every 1000 miles. Drain and refill every 25,000 miles. Use GM Hydra-Matic Drive Fluid Type "A" (can marked AQ-ATF).

Checking Fluid Level – Check with engine at normal operating temperature, idling, and selector lever in "N" (Neutral) on Series 88 Dual Range type, and selector lever in "P" (Park) position on later Series 88, Super 88 and 98 "Dual Coupling" type. Add Hydra-Matic Fluid Type "A" (can marked AQ-ATF) to bring level to "FULL" mark on dipstick.

►*CAUTION: Do not fill above "FULL" mark (will cause foaming and improper operation of the transmission).*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Dual Range" or "Dual Coupling" Hydra-Matic in Trans. Sect.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

UNIVERSALS

Mechanics. Roller bearing type.

►*PROPELLER SHAFT YOKE LUBRICATION CAUTION* Remove plug, install fitting and lubricate with hand pressure gun using high melting point, low viscosity lubricant, Oldsmobile Part No 567196 Remove fitting and replace plug **Do not use chassis grease at this point.**

►*CAUTION*—Rear universal companion flange nut controls rear axle pinion bearing pre-load (must be adjusted whenever nut loosened) *See "Oldsmobile Hypoid" in Rear Axle Section*

REAR AXLE

Own. Hypoid gear, semi-floating type with Hotchkiss drive.
See "Oldsmobile Hypoid" in Rear Axle Section.

Ratio	Axle Ratios	① Code
3.08-1 (40:13)		0
3.64-1 (40:11)		6
3.42-1 (41.12)		8
3.23-1 (42:13)		9

① — Rear axle ratio code number stamped on lower locating boss on forward side of carrier.
Backlash — .004-.008". (*NOTE* - As much as .012" may be necessary in some cases to correct tooth contact for noise).

Axle Shaft Removal: Remove wheel and take off brake drum by removing two Tinnerman nuts from wheel studs (if nuts removed by turning off threads they can be reused, if nuts damaged, new nuts must be used). Remove backing plate mounting nuts and static collector. Loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft and bearing with Puller J-942 (do not allow shaft to drag on oil seal), replace one nut to hold backing plate in position.

Differential Carrier Assembly Removal: Remove axle shafts (see above). Clean differential carrier and axle housing around carrier to prevent dirt entering housing. Disconnect propeller shaft at rear universal joint after having wired trunnion blocks together to avoid loss of rollers. Mark universal joint so it can be replaced in the same position. Drain oil by removing nuts from carrier mounting studs and moving carrier away from housing.

CAUTION—Do not wash exterior of carrier until differential has been disassembled

Wheel Bearing Adjustment: None required. Bearings are built with .012-.015" endplay between balls. Check endplay before removing axle shaft and if endplay greater than .020", replace bearings. *CAUTION*— If bearings removed from shaft, they cannot be reused.

SHOCK ABSORBERS

Delco. Direct acting front and rear. Service by replacement.

Shock Absorbers

Model	Front	Delco No.	Rear
88, Super 88	5352644		5352648
98	5352645		5352649

FRONT SUSPENSION

Independent. Direct acting shock absorbers are mounted within front coil springs.
See "Oldsmobile" in Suspensions & Wheel Alignment Section.

Kingpin Inclination—5° 51' 10" crosswise.
Caster— 0° to Neg. ¾°. Variation between both sides should not exceed ½°.
Camber—Neg. ¾° to Pos. ¾°. Variation between both sides should not exceed ½°
Toe-In—1/16" to 1/8".
Toe-Out on Turns—23°±½° on inner wheel with outer wheel turned 20°.

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm & nut.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Saginaw (In Line). *See "Saginaw (In Line)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Bendix Hydraulic (Single Anchor). Conventional two shoe with short molded lining front (Primary), and long molded lining rear (Secondary). Parking brake applies rear wheel service brakes.
See "Bendix Hydraulic" in Brake Section

Drums—Diameter 11" Rebore limits .060 .

Wheel Cylinder Diameter—Front 1 1/32". Rear 31/32".
Lining—Molded. **Width**—2½" (front wheels), 2" (rear wheels). **Thickness**—7/32".

Length—(Primary) 9 3/8', (Secondary) 12 1/32'

Clearance—Adjusting screw backed off 16 notches from point where wheels can just be turned by hand

Braking Power—56% Front. 44% Rear.

Standard Master Cylinder: On left chassis frame front extension under hood

Checking Fluid—Fluid reservoir is part of master cylinder. Maintain fluid level to within ½" of top of master cylinder gasket surface.

Removal—Remove from above. Not necessary to disturb other parts.

Power Brakes: Bendix or Moraine Power Unit (combination vacuum power unit and hydraulic master cylinder) Unit is mounted on under side of toe board and replaces regular master cylinder *See "Bendix Power Unit" or "Moraine Power Unit" in Brake Section.*

Checking Fluid—Same as for standard master cylinder.

Removal of Power Unit — Disconnect positive battery cable at junction block on right fender filler plate, disconnect purple solenoid lead wire from wiring harness, then pull cable through sleeve on power brake. Disconnect hydraulic line at master cylinder and secure hose so end is above level of junction assembly. Disconnect vacuum hoses at power cylinder, and remove dipstick. Disconnect leads from stop light switch and fold back floor mat. Remove three brake pedal bracket attaching bolts and remove pedal and bracket. Remove mast jacket grommet retainer and slide grommet up mast jacket. Remove mast jacket cover plate attaching screws, cover plate and power cylinder assembly. Remove two cover plate-to-power cylinder bolts and remove cover plate. Remove power unit through toe pan opening.

MISC. MECHANICAL

Windshield Wipers: Cable operated, vacuum type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type with individual motors in each window

See "Power Window Regulators" in Miscellaneous Section

Power Top Control: Hydro-Lectric *See "Power Top Controls" in Miscellaneous Section*

Power Seat Adjuster (Two-way): Electric type with single reversible type motor for horizontal adjustment.
See "GM Two-way Seat Regulators" in Misc. Section.

Power Seat Adjuster (Six-way): Electric type with single reversible motor.
See "GM Six-way Seat Regulators" in Misc. Section.

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	55-60
Intake Manifold	25-30
Exhaust Manifold	25-30
Oil Pan	15-18
Main Bearing Caps	90-95
Flywheel	55-60
Vibration Dampener	130-150
Con Rod Caps	40-45
Camshaft Sprocket ①	25-30
Rocker Arm Support Bracket	55-60
Valve Lifter Cover Screws ②	12-15
Rocker Arm Cover ②	15-18
Engine Front Cover	15-18
Water Pump Manifold	25-30
Water Pump Mounting	15-18
Oil Pump Mounting	25-30

① —Fuel Pump eccentric retaining screw.
②—To obtain proper seal, tighten these screws to required torque three successive times.

ENGINE

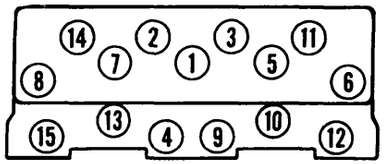
ENGINE REMOVAL: *(NOTE—On Synchro-mesh cars, Engine and transmission can be removed as an assembly providing front fenders and grille are first removed).*

1) Drain engine oil pan. Remove hood assembly and drain cooling system. Remove radiator core. Disconnect heater hose at cylinder head and remove water pump and manifold assembly. Remove battery and carburetor air cleaner.

2) Remove coil, bracket, distributor cap and ignition wiring as an assembly. Remove carburetor assembly. Disconnect power brake vacuum line at power cylinder (if car so equipped). Disconnect vacuum hose at windshield wiper motor. Disconnect flexible fuel pump line.

3) Remove generator assembly. Disconnect wire leads to water temperature and oil pressure indicator sending units. Disconnect engine ground wire at dash. If car equipped with Power Steering, remove screws at pump bracket and place pump pressure lines and hose assembly out of way.

4) Remove valve tappet cover vent tube. Remove starting motor and flywheel housing lower cover. Disconnect exhaust pipe from exhaust manifold. Drain transmission oil pan and remove transmission filler tube assembly. Disconnect oil cooler lines at transmission. Loosen transmission rear support bracket, *but do not remove bolts.* Support transmission using a block of wood and a jack. Disconnect throttle control valve linkage at transmission.



5) Remove converter clutch housing to flywheel retaining nuts, and bell housing to flywheel housing cap-screws Disconnect front motor supports at frame. Install a flexible lifting cable or rope around intake manifold and attach a chain fall or hoist. Clamp or wire converter to transmission case to keep converter from sliding out of transmission. Raise engine and slide forward to clear transmission and slide out of chassis.

OIL PAN

OIL PAN REMOVAL: Drain engine oil and remove screws attaching steering idler lever to frame and lower steering linkage. Remove engine oil level indicator. On cars not equipped with the dual exhaust system the crossover pipe from left to right banks must be removed, on cars with dual exhaust, remove left exhaust pipe. Remove starting motor and flywheel lower housing. Remove attaching screws and washers and remove oil pan.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD: Removal—Drain cooling system. Remove generator (if removing right bank head), or fan belt (if removing left bank head). Remove fan, water pump, and manifold assembly. Remove air cleaner. Remove ignition coil and bracket, disconnect ignition cables and place the coil and wiring out of way. Remove carburetor and intake manifold assembly. Remove valve cover and remove bolts attaching rocker lever shaft to cylinder head, and lift off the rocker lever shaft assembly. Disconnect exhaust manifold from exhaust pipe. Remove cylinder head bolts. Install Cylinder Head Lifter J-4159 in the front and rear spark plug holes and lift off cylinder head. *NOTE*—To remove right bank head it will be necessary to remove heater and oil level indicator. On cars equipped with Twin Ultramatic Transmission the filler tube assembly will have to be removed. On removing the left bank head, the oil filter and bracket will have to be loosened from cylinder head, On cars equipped with Power Steering the bracket bolts will have to be removed and pump and hose assembly will have to be moved out of way

V8 CYLINDER HEAD

Installation: Clean gasket surfaces of cylinder head and engine block. Coat gasket with Perfect Seal No. 5 and install on block. Install cylinder head over dowels (dowels are drilled for oil return from rocker arm chamber). Install flat washers on head bolts and start the five medium length bolts in center holes of head Install valve pushrods making sure they engage in sockets in valve lifters, and carefully install rocker shaft lever assembly. The two end rocker shaft mounting brackets are doweled to line up with bosses on cylinder head *(NOTE* - Left Front and Right Rear brackets provide oil lead to hollow rocker arm shafts for rocker arm lubrication). Install four longest bolts in rocker arm brackets, engage pushrods in rocker arm sockets and tighten bolts evenly. Install short cylinder head bolts along lower edge of cylinder head. Tighten all bolts in sequence shown in diagram to correct torque (see Tightening Specifications).

PISTON PINS

PISTON PIN BUSHING (IN CONNECTING ROD) INSTALLATION: After pressing old bushing out with an arbor press, install new bushing so that it is flush with both sides of rod. Position Burnisher Tool J-6055 in bushing, then applying plate of the tool under the rod, push burnisher through bushing with an arbor press. After bushing has been burnished, and before reaming bushing, the oil hole in bushing should be drilled using a 3/16" drill.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT: Removal (With Engin in Car)—Remove transmission. Drain cooling system and remove radiator core. Drain and remove engine oil pan Remove water pump and manifold assembly. Remove fuel pump. Remove engine vibration dampener, engine front cover, timing chain and sprockets. Remove oil and vacuum pump assembly. Remove spark plugs. Disconnect connecting rods and push piston assemblies up into cylinder bores so that crankshaft can be removed without interfering with connecting rods. Remove front and rear main bearing caps Support crankshaft at front and rear journals and remove the three intermediate bearing caps Carefully lower crankshaft and flywheel assembly.

Installation: Install new rear main bearing seals in upper crankcase and in bearing cap (See Rear Main Bearing Oil Seal Installation below). Install new front crankshaft seal in engine front cover. Reverse removal procedure indicated above.

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Apply Lubriplate to groove in bearing cap and install oil seal. Using Oil Seal Installer J-3048-A and a hammer, drive seal into place With seal still in place, trim ends of seal flush with surface of cap. To install upper half of seal in crankcase, remove crankshaft and install in same manner as for bearing cap

VIBRATION DAMPENER

VIBRATION DAMPENER: Removal—Drain cooling system, remove radiator core and top splasher Remove fan assembly. Remove vibration dampener retainer screw and washer and if car is equipped with Power Steering or Air Conditioning, remove the drive pulleys by prying them off dampener assembly. Install center adapter J-5992-2 in threads of crankshaft Install screw assembly J-5995-3 in remover body J-5992-1 and remove dampener.

Installation: Lubricate oil seal in engine front cover, and position dampener over crankshaft and tap it into place by tapping it with a rawhide hammer. Assemble Vibration Dampener Installer J-5992 by placing the 3/4" nut on screw assembly J-5992-3 and slide spacer J-5992-4 over screw assembly Start screw in end of crankshaft and tighten until it bottoms in the threads. With one end of the spacer against dampener, turn

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

nut on screw until dampener hub bottoms the crankshaft oil slinger against a shoulder on the crankshaft. Install Power Steering and/or Air Conditioning Pulleys, retainer washer and screw Tighten retainer screw to 130-150 ft. lbs.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal—Remove vibration dampener (see above), and water pump manifold assembly. Disconnect and remove fuel pump. Remove screws attaching front cover to block, loosen engine oil pan, remove cover.

Installati n: Using a new gasket, install engine front cover in place and start capscrews in threads, *but do not tighten.* Lubricate oil seal in cover, and install vibration dampener assembly, using hub on dampener as a pilot to align front cover Complete installation by reversing removal procedure. Use new gasket on oil pan.

ENGINE FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Remove engine front cover (see above), drive out old seal with a hammer and punch, being careful not to damage cover Install a new seal using tool J-5983, pressing seal into place with an arbor press

CAMSHAFT & BEARINGS

CAMSHAFT: R moval (With Engine in Car)—Drain and remove radiator. Remove fan, water pump and manifold assembly. Remove air cleaner, ignition coil, carburetor and intake manifold. Remove vacuum line to distributor, disconnect ignition cables and place out of way. Remove distributor. Remove valve rocker covers, the four rocker lever shaft capscrews (both banks), and lift off shaft assemblies Remove upper valve tappet cover and breather tube, and remove the lower cover. Remove pushrods and hydraulic lifters (keeping them in sequence so they will be installed in the same location). Remove vibration dampener (see above). Drain engine oil and remove oil pan. Remove engine front cover (see above). Pry off oil slinger from end of crankshaft. Remove fuel pump drive eccentric. Rotate engine to line up marks on camshaft and crankshaft sprockets so marks are adjacent and in line across shaft centers. Remove the sprockets by alternately prying on them and slide chain and sprocket assembly off the shafts. Remove the three camshaft retainer plate screws and remove plate and camshaft spacer. Carefully pull camshaft forward into the radiator grille far enough to clear engine block, taking care not to damage camshaft or bearings.

Installati n: Reverse removal procedure and note the following: Install camshaft gear about 1/16" beyond a position flush with camshaft end, to allow mounting of fuel pump eccentric.

TIMING CHAIN

TIMING CHAIN: Removal—Remove engine front cover (see above). Pry off oil slinger from end of crankshaft and remove fuel pump eccentric. Rotate engine to line up marks on sprockets so marks are adjacent and in line across shaft centers. Remove sprockets by alternately prying on them and slide chain and sprocket assembly off the shafts

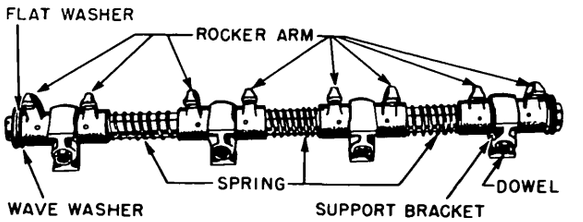
Installation: Install camshaft and crankshaft sprocket keys being sure they are properly seated in keyways. Rotate engine crankshaft to bring No. 1 cylinder to firing position. Slide crankshaft sprocket part way on the crankshaft and assemble camshaft sprocket in chain, locating and lining up the "O" marks on the sprockets in line with camshaft and crankshaft centers. Position chain on crankshaft sprocket and start camshaft sprocket on camshaft. Using a rawhide hammer, alternately tap both sprockets into proper position. Camshaft gear must be installed about 1/16" beyond a position flush with end of camshaft for installation of fuel pump eccentric. Complete installation by reversing removal procedure

VALVE SYSTEM

VALVE TAPPET ADJUSTMENT

VALVE TAPPET ADJUSTMENT: *NOTE—Checking must be done with no oil in compression chamber of tappet and the plunger completely bottomed, with tappet on base circle of cam* With piston on compression stroke and both valves closed, press downward on the pushrod end of rocker arm to compress plunger spring and force plunger to its bottom position. While still holding down on rocker arm, measure the lash. The clearance between valve stem end and rocker arm tip should be .050" to 210".

VALVE GUIDES



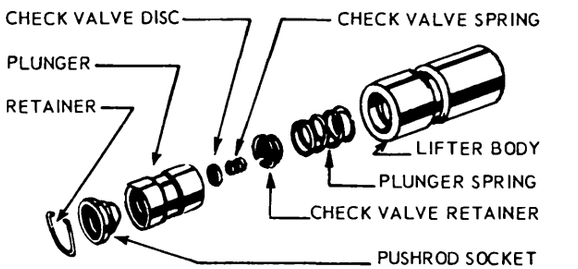
CHECKING VALVE STEM CLEARANCE: After valves have been removed from head, and with valve stems and guides clean, install valve in respective guide bore and measure side-to-side play crosswise to the cylinder head using a dial indicator or thin strips of feeler gauge material placed between stem and guide bore. If clearance is greater than .004" (intake), or .005" (exhaust) guides should be reamed and oversize valves installed.

VALVE GUIDE REAMING: Four oversize reamers are available in Valve Guide Set J-6042 which will provide the desired clearance of .001-.002" (Intake), and .002-.003" (Exhaust) between stem and guide. After checking clearance, select the proper oversize reamer and pilot for the oversize valve to be installed.

ROCKER ARMS

ROCKER ARM AND SHAFT: Disassembly—Remove rocker arm and shaft assembly from cylinder head. Remove cotter pins, and flat and wave washers from end of shaft. Remove rocker arms, springs and supports, keeping all parts in order so they can be replaced in original position.

Insp cti n: Clean and inspect all parts, making sure that all oil holes are open. Inspect shaft and arms for wear. Inspect rocker arm radius at valve stem end, and if worn replace the rocker arm. Inspect plugs at each end of shaft for tightness.



ROCKER ARM ASSEMBLY

Reassembly: Reverse disassembly procedure and note the following: Rocker arm shaft must be assembled with the grooved oil hole in the downward position, or facing the cylinder head.

►*CAUTION: There is a right and left rocker arm and if reversed in assembly they will not properly contact the valve stem.*

HYDRAULIC VALVE LIFTER

HYDRAULIC VALVE LIFTERS: Removal—Remove valve rocker covers and rocker arm shaft mounting bracket bolts and lift off rocker arm shaft assembly. Remove

HYDRAULIC VALVE LIFTER

upper valve tappet cover and breather tube and then remove lower valve tappet cover. Remove pushrods and hydraulic valve lifters keeping pushrods and lifters in sequence so they can be replaced in the same relative position. *NOTE*—Lifters can be removed from block with Valve Lifter Remover J-5962 or a wire hook.

Disassembly: Press down on valve pushrod socket and use a pair of needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger being careful not to lose the small flat valve and coil spring. *(CAUTION—Disassemble one lifter at a time to avoid mixing plungers and bodies. These parts are selectively fitted and must not be interchanged).* Use clean solvent and thoroughly wash all parts. Remove any varnish or gum deposits.

Inspection: Inspect plunger and walls of body for scratches (if plunger or body are scratched, replace complete unit). Try the plunger for fit in body. If check valve assembly removed from plunger, inspect flat disc valve, spring and seat.

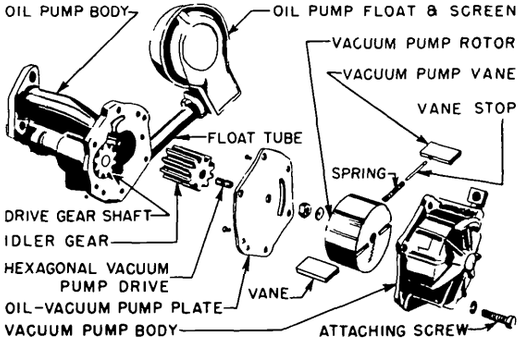
R ass mbly: Reverse disassembly procedure. See illustration for correct sequence.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Testing: Use a clean container deep enough to cover the lifter assembly (in an upright position) Fill container with clean kerosene Remove the pushrod socket and place lifter in kerosene in an upright position, allowing it to fill up. Remove lifter and replace pushrod socket Place lifter assembly between jaws of checking tool (see J-5978 & J-5978-A Tool Note below) Check leakdown by depressing the tool. A decided resistance should be felt. If plunger collapses immediately, the lifter should be checked again. Replace if no resistance felt.

► *TOOL J-5978 & J-5978-A TOOL NOTE* Two types of lifters used. Tool J-5978 can be used with early type lifter. Tool J-5978-A must be used with later type lifter and can be used with early type. New valve lifters have narrower oil groove in body and groove is raised slightly. If Tool J-5978-A not available, Tool J-5978 can be reworked as follows for use with later type lifter Grind two ears of lower jaw down to a 5/32' thickness (grind away lower surface of jaw) and back 5/8". Use Adapter J-5978-6 with modified tool.



OILING SYSTEM

OIL PUMP

OIL PUMP: Removal—Remove engine oil pan Disconnect vacuum pump line to crankcase. Remove the two screws attaching oil pump to rear main bearing cap and remove oil pump, vacuum pump and strainer assembly.

Disassembly: Remove screws attaching vacuum pump to oil pump body and remove vacuum pump Do not lose the small hexagonal drive. Remove idler gear. Remove pin from shaft and drive off sleeve. Remove upper and lower oil pump driving shaft and gear. If necessary, press shaft out of gear If necessary to to remove the float assembly, the tube can be unscrewed from pump.

Inspection: Wash all parts in clean solvent and blow dry with air . Inspect float for leaks Inspect strainer. Inspect pump shaft and gears for wear, scores or pits. Check clearance between gears and pump housing using a feeler gauge. This clearance should not exceed 005" Check gear endplay using a straightedge across gears and housing Endplay should not exceed 003" Check clearance between shaft and body. Clearance should not exceed .003". Inspect pressure relief valve piston for scores. Inspect relief valve

V8 OIL & VACUUM PUMP ASSEMBLY

spring Free length of spring should be approximately 3-19/64" When compressed to 1-3/8", pressure should be 9–9-1/2 lbs Inspect pump cover for wear. Dress down on a surface plate if necessary.

Reassembly: If float and suction tube removed from pump body, special care should be taken when installing to see that suction tube is tight in threads of pump body, and that float is properly positioned. To position float and tube (vacuum pump must be removed), measure the distance between machined face of pump housing and top edge of float. This distance must be 3/4" *(CAUTION—When positioning float, do not unscrew tube to position float, but continue one more turn).* Install key in pump shaft keyway and press driving gear on shaft until flush with bottom of gear. Install upper and lower shafts and gear in pump body. Install sleeve on shaft Install pin in sleeve and stake both ends of pin Install idler gear and hexagonal drive in end of gear. Position vacuum pump on oil pump body to line up with dowel pins and install attaching screws.

Installation: Start oil pump driving shaft in hole in rear main bearing cap and turn shaft to engage mating end on distributor shaft Start the two screws and lockwashers and tighten screws to 25-30 ft. lbs. Connect vacuum pump line to crankcase. Install engine oil pan.

IGNITION NOTES

DISTRIBUTOR REMOVAL: Mark position of rotor with respect to housing so that rotor may be placed in same position when distributor is reinstalled. If crankshaft is rotated while distributor is removed, it will be necessary to follow procedure outlined under "Installation" below.

DISTRIBUTOR INSTALLATION (If Crankshaft Rotated with Distributor Removed): Rotate crankshaft until No 1 cylinder (front left bank) is on TDC firing stroke Place gasket on distributor shaft, and with distributor cap removed, insert distributor to engage oil pump drive shaft by turning distributor rotor. Select proper tooth so that when distributor gear is in full mesh with camshaft gear the position of rotor will be on No. 1 terminal. After distributor is in bottom position, install retainer clamp, washer and screw. Connect distributor vacuum and wire connections and cap. Set ignition timing (see Car Model pages).

►*TORSION LEVEL SUSPENSION CAR SERVICING CAUTION:* Do not jack car up in rear with jack placed under rear load arms or any part of torsion level suspension assembly. Rear load arm link may become disengaged from arm.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines, see "Air Conditioning Service Cautions in Miscellaneous Section.*

►*ELECTRICAL EQUIPMENT NOTE: Both Auto-Lite and Delco-Remy electrical equipment used.*

MODEL IDENTIFICATION

Model	Model Designation	Series
Clipper Deluxe	5622	5640
Clipper Super	5642, 5647	5640
Clipper Custom	5662, 5667	5660
Packard (290 HP)	5682, 5687	5680
Packard (310 HP)	5697, 5699	5688
Packard Executive	5672A, 5677A	5670

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post

ENGINE NUMBER: Stamped on front end of engine block between cylinder banks, directly behind water pump

►*DETONATION CORRECTION (First Cars in Low Octane Areas):* If detonation not eliminated by correcting other engine conditions (carbon deposits etc.), early Distributors can be converted to later type with different advance performance. *See Auto-Lite & Delco-Remy Distributors below.*

TUNE-UP

COMPRESSION PRESSURE: 120 lbs minimum at 150 RPM Variation between cylinders should not exceed 10 lbs.

VACUUM READING: 18-21" at idling speed.

VALVE TAPPET CLEARANCE: None required in service (hydraulic)

MANIFOLD HEAT CONTROL: Thermostatic spring type mounted between right bank exhaust manifold and exhaust pipe With heater valve in closed position, hook in end of coil should assume a position approximately 90° clockwise from coil anchor pin at normal room temperatures. Valve should operate freely

►*NOTE:* When valve is closed, most exhaust gases are discharged through left exhaust pipe

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2
Cylinders—RIGHT BANK 2-4-6-8 LEFT BANK 1-3-5-7

SPARK PLUG GAP: 033-.037".
Spark Plugs—Champion N-18. 14mm. Torque to 26-30 ft lbs

AUTO-LITE

COIL: Auto-Lite CAD-4004. *12 Volt.*
Ignition Current—2.2 amps. idling HOT.
Resistor—Auto-Lite PU-4001.

►*COIL RESISTOR NOTE:* Resistor is connected in series with primary circuit between battery and coil Resistor is by-passed during cranking by lead from starter solenoid to coil

DISTRIBUTOR: Auto-Lite IBJ-4001-D (5640 Early), IBJ-4001C (5660 Early), IBJ-4001E (5640, 60, 70 Later). *12 Volt. NOTE* - Delco-Remy Distributor 1110865 also used on later 5640, 60, 70.

►*DISTRIBUTOR CONVERSION TO CORRECT DETONATION (IBJ-4001C & IBJ-4001D):* Install all parts furnished in conversion kit for each distributor as listed below. Install new IBJ-4001E nameplate (furnished in kit) and check advance performance which should agree with IBJ-4001E data below.

IBJ-4001C Conversion – Install all parts furnished in Conversion Kit No. 6484609 as follows: Distributor Stop & Cam Plate, Governor Weight Springs (Weak & Heavy Spring), Vacuum Advance Unit Spring, and small parts.

IBJ-4001D Conversion – Install all parts furnished in Conversion Kit No. 6484607 as follows: Vacuum Advance Unit, Vacuum Spring, Governor Weight Springs (Weak & Heavy Spring), and small parts.

Condenser – Auto-Lite IBB-2015L. **Capacity** .25-.28 mfd.
Contact Point Set – Auto-Lite IGW-2038HS.
Breaker Gap—.017".
Cam Angle—31°±3°.
Breaker Arm Spring Tension—17-20 ozs.

IGNITION TIMING

Model	℄ Ignition Setting
5640, 60, 70 (A-L Distr.)	5° BTDC
5680, 88 to Eng. No. D-1834 (D-R Distr.)	5° BTDC
5680, 88 Eng. No. D-1834 Up (D-R Distr.)	10° BTDC
5640, 60, 70, (D-R Dist.)	10° BTDC

℄—See Timing procedure following.

Timing - When setting timing, disconnect vacuum advance line at carburetor, place selector button or lever in "H" (Ultramatic), idle engine at 450-500 RPM (Synchro-mesh & Overdrive Cars), 450 RPM (Ultramatic Cars).

► *TIMING NOTE* - 10° setting should be altered, as necessary, in areas where octane rating of fuel is lower than average.

Timing Mark—Timing indicator on chain cover marked "0", "5", "10", "15", Align index mark (groove) on vibration damper with correct mark on indicator

CARBURETOR

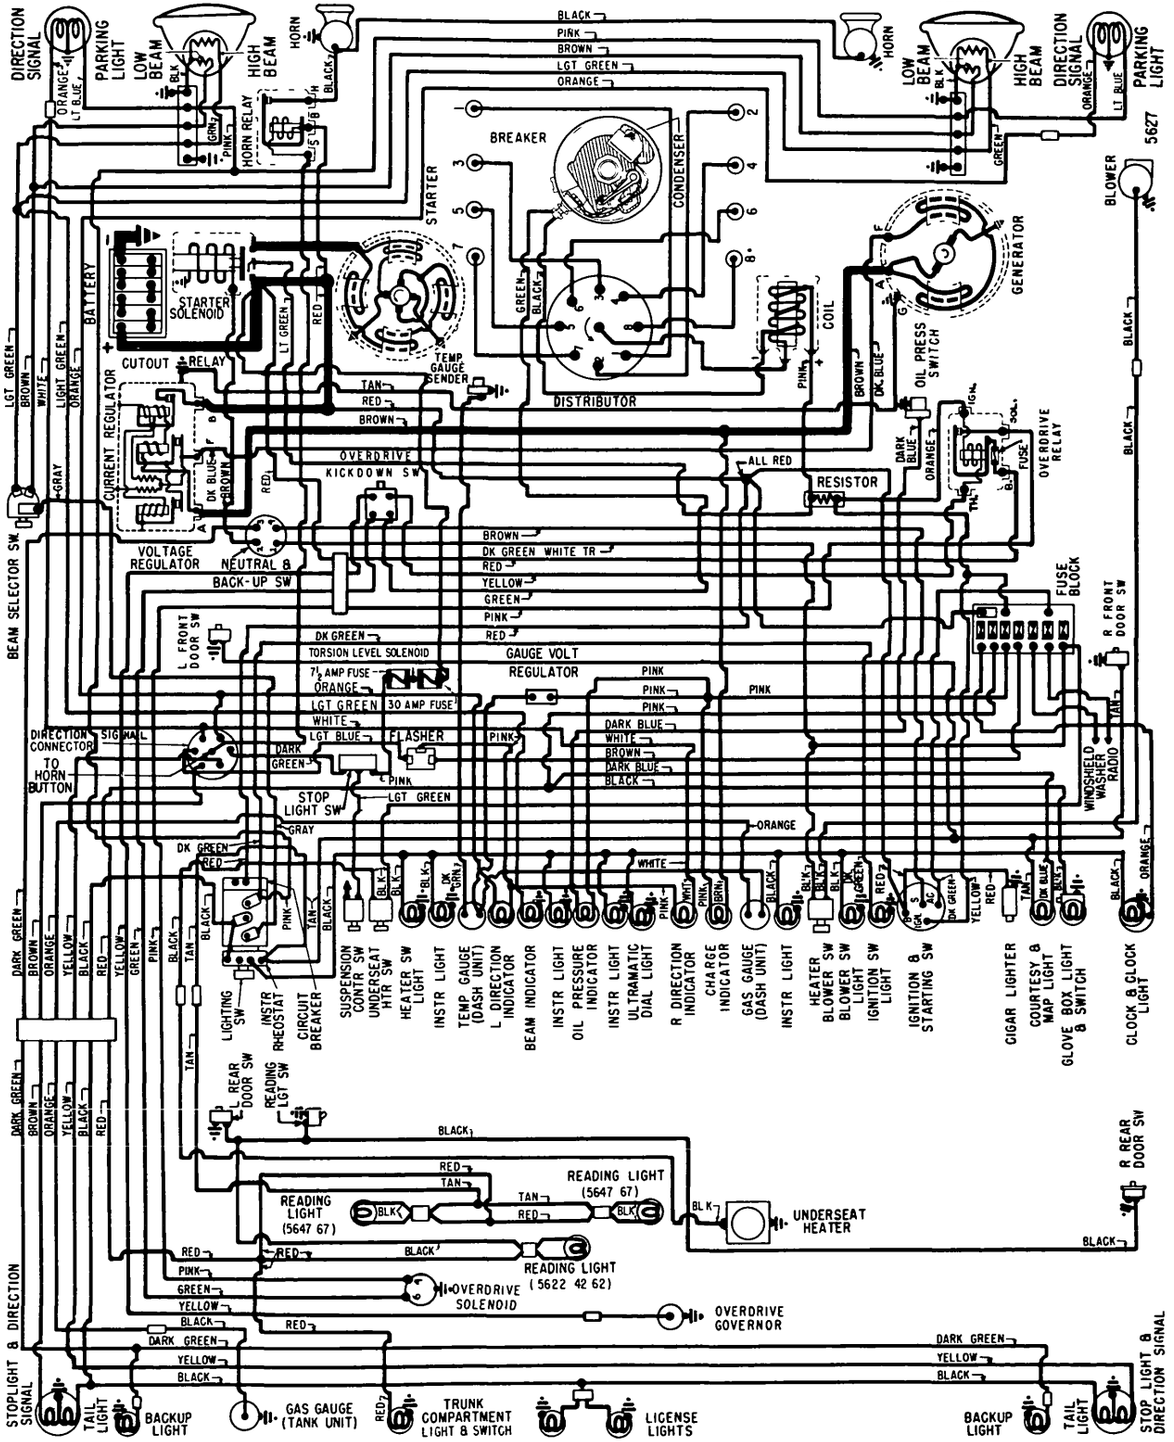
► *CARBURETOR APPLICATION: Carter & Rochester Two and Four Barrel Carburetors used as follows:*

Car Model	Carburetor
5640	Carter WGD 2393S
5660, 5670	Carter WCFB 2394S
5680	Rochester 4GC 7008610
5688	Rochester 4GC 7009600 & 7009601

THROTTLE LINKAGE ADJUSTMENT (Ultramatic Drive Cars): With engine at normal operating temperature, choke valve fully open and throttle in the slow idle position, adjust engine idle speed to 450 RPM (see "Carburetor" below for idle adjustment and Carburetor Synchronizing). Loosen the two locknuts (4 or 5 turns) that position the transmission throttle control rod cross shaft adjuster on accelerator-to-carburetor rod Make sure that adjuster is free to move back and forth Move transmission throttle shaft outer lever on right side of transmission so that it is at its rearward position. With carburetor throttle adjusting screw against its stop, adjust the throttle operating rod turnbuckle so that accelerator pedal rod lever just touches underside of the floorboard (this point is where rod from accelerator pedal extends through the floorboard), **then lengthen turnbuckle one full turn** to provide clearance. Tighten locknut on turnbuckle. Apply a slight forward pressure on transmission throttle rod adjuster and move rear locknut up to the adjuster. Move the front locknut up to the adjuster and tighten securely. Make sure that the alignment of the adjuster does not cause lever to bind.

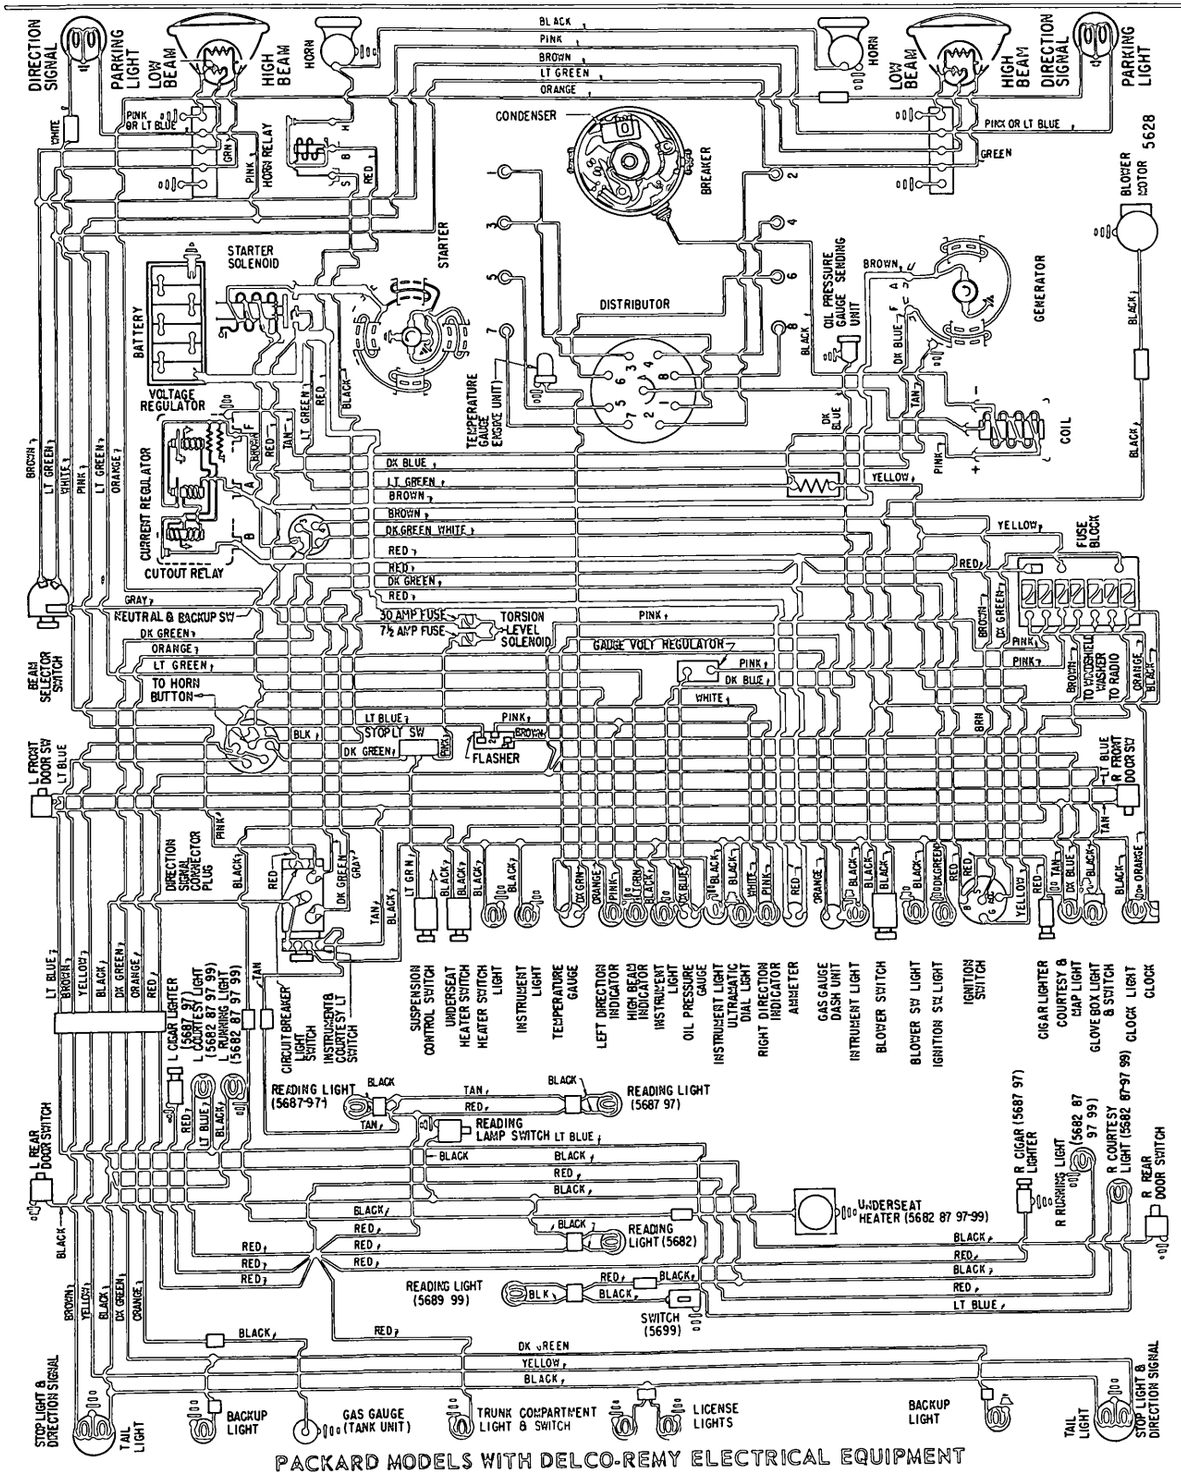
CARTER WGD 2-BARREL
No. 2393S

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*



Idle Setting—¾ to 1¾ turns open Turn screws out for richer mixture.

Idle Speed (Synchro-mesh & O.D.)—450-500 RPM.



Idle Speed (Ultramatic Trans.)—450 RPM with selector lever or button in "H" range.

Float Level: With bowl cover gasket removed, bowl cover inverted and needle seated, distance between

CONTINUED ON NEXT PAGE

CLIPPER MODELS WITH AUTO-LITE ELECTRICAL EQUIPMENT

PACKARD MODELS WITH DELCO-REMY ELECTRICAL EQUIPMENT

CONTINUED FROM PRECEDING PAGE

top of float and bowl cover should be 3/16" Adjust by bending float lever

Accelerating Pump—No seasonal adjustment

Fast Idle Setting: 024" clearance (Gauge T109-189) between throttle valve and bore of carburetor (side opposite idle port) with choke valve tightly closed Adjust by bending choke connector rod at lower angle (Use bending tool T109-213)

Automatic Choke Setting Two points rich

Throttle Linkage Adjustment (Ultramatic) *See CARBURETOR above*

▷ *OTHER DATA See "Carter WGD" Carburetors in Carburetion Section*

Fuel Pump Pressure: 3½-5 lbs at 500 RPM

CARTER WCFB 4-BARREL
No. 2394S

▷ *ROUGH IDLE CORRECTION (Cars before Engine No B-1792 with Carter 4-Barrel Carburetor)* Rough engine idle on these cars may be caused by slight opening of secondary throttle valves and can be corrected by increasing wind-up on secondary throttle valve return springs from ½ to 1½ turns *NCTE* - On cars after Eng No B-1792, the return spring has this additional wind-up

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*

Idle Setting—¾ to 1¾ turns open Turn screws out for richer mixture

Idle Speed (Synchro-mesh & O D)—450-500 RPM

Idle Speed (Ultramatic Trans)—450 RPM with selector lever or button in "H" range

Throttle Linkage Adjustment (Ultramatic) *See CARBURETOR above*

▷ *OTHER DATA See "Carter WCFB 4-Barrel" in Carburetion Section.*

Fuel Pump Pressure: 3½-5 lbs. at 500 RPM.

ROCHESTER 4GC 4-BARREL
No. 7008610

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT Barrels Feed Cyl. 2-3-5-8, LEFT Barrels 1-4-6-7.*

Idle Setting – 1 - 1½ turns open. Turn screws out for richer mixture.

Idle Speed – 450 RPM with selector lever or pushbutton in "H" range.

Throttle Linkage Adjustment (Ultramatic): *See CARBURETOR above.*

▷ *OTHER DATA See "Rochester 4GC 4-Barrel" in Carburetion Section.*

Fuel Pump Pressure: 3½-5 lbs. at 500 RPM

ROCHESTER 4GC (CARIBBEAN)
No. 7009600 (Front), 7009601 (Rear)

▷ *CARBURETOR ADJUSTMENT CAUTION Carburetor linkage must be adjusted to synchronize carburetion as directed below.*

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl. 2-3-5-8. LEFT barrels 1-4-6-7*

Idle Setting—1-1-1/2 turns out Turn screws out for richer mixture

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idl Sp d – 450 RPM with selector lever or pushbutton in "H" range.

Synchronizing Carburetors: 1) Loosen both jam nuts on throttle rod at front carburetor throttle valve lever and both jam nuts at forward end of transmission throttle rod (where it connects with accelerator pedal rod), several turns.

2) Back out front and rear carburetor idle speed adjusting screws until throttle valves are closed. While holding the front carburetor throttle valves tightly closed, adjust jam nuts on throttle rod at front carburetor throttle lever so that pin fits freely in lever, then tighten jam nuts.

3) Turn in the idle speed screw on **front** carburetor until it makes contact and then turn it in **one additional turn.** Turn the four idle mixture screws (two each carburetor) all the way in and then **back them ut one full turn.**

4) After engine is warmed up, adjust the **front carburetor** idle speed screw to obtain 450 RPM (selector lever in "D" or pushbutton in "H" position).

NOTE–The rear carburetor idle speed screw is not used and should therefore remain in the "backed out" position.

5) Adjust the idle mixture screws to obtain a smooth idle in the following recommended manner. Turn each idle mixture screw in until the lean "drop-off" point (as noticed by a drop in the tachometer and vacuum gauge readings), counting the turns while turning the needle out to its rich "drop-off" point, then returning the screw to a position midway between the two "drop-off" points. Repeat with each idle mixture screw in the following sequence right rear, right front, left front, left rear. Adjust for the highest possible RPM and vacuum reading. Readjust front carburetor idle speed screw to 450 RPM if necessary.

6) Raise the **rear** carburetor fast idle cam so that the idle speed adjusting screw rests on the high step of the cam. Adjust fast idle screw to obtain 2300-2350 engine RPM and then drop cam away from the screw. Repeat this procedure with the **front** carburetor, adjusting the screw to obtain 1850 RPM, drop cam away from the screw. *NOTE–Because of the inaccessibility of the fast idle screws on both carburetors at low idle position, it will be necessary to shut the engine off and partially open the throttle to adjust the fast idle screws.*

Throttle Linkage Adjustment (Ultramatic): *See CARBURETOR above.*

► *OTHER DATA· See "Rochester 4GC" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 3½-5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter (Fuel only). Vacuum pump is part of engine oil pump assembly.

Replacement Fuel Pump - Carter No. M-2198S.

Fu l Pump Pr ssur - 3½-5 lbs. at 500 RPM

See "Fuel Pumps" in Carburetion Section.

Gas lin Gaug : King-Seeley Electric "CV" type (Constant Voltage) type with voltage regulator.

Dash Unit - K-S No. 49546 (5640, 60, 70), 49506 (5680, 88).

Tank Unit - K-S No. 44519.

See "Fuel Gauges" in Carburetion Section.

BATTERY

Auto-Lite 3EA-60 or Willard HDW-3KM-60. *12 Volt,* 9 plate, 60 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

► *CAUTION This is reversed from previous models.*

Engine Ground - Cylinder head to dash panel.

STARTER

AUTO–LITE

Auto-Lite MDF-6008. *12 Volt.* **Armature** MDF-2122.

Drive - Solenoid pinion shift (over-running clutch).

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200 min.	10.0	60 max.
6.5 ft. lbs. min.	Lock	4.0	240 max.

Starting Switch: Auto-Lite SAD-4101. Solenoid switch, with key starting. *See "Starter Controls" in Electrical Section.*

Ultramatic Neutral Safety & Back-up Light Switch: *See "Delco-Remy Starter" data below.*

DELCO–REMY

Delco-Remy 1107656. *12 Volt.* **Armature** 1926626.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 35 ozs. min.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3240	10.6	91
	Lock	3.5	395

Starting Switch: Delco-Remy 1119760 solenoid switch, mounted on starter and controlled by Ignition & Starter Switch. Turn key full RIGHT to start. *See "Starter Controls" in Electrical Section.*

Ultramatic Neutral Safety & Back-up Light Switch: Delco-Remy 1998118. Located on lower end of steering column. Connected in starter control circuit so that starter operative in "N" or "P" only.

GENERATOR

AUTO–LITE

Auto-Lite GJC-6001A (Early), GJC-7002F(Later). *12 Volt.*

Armature - Auto-Lite GJC-2006F (GJC-6001A Gen.), GJC-2030F (GJC-7002F Gen.).

Maximum Charging Rate - *See Voltage Regulator.*

Performance Data

Amperes	Volts	RPM
20 Ⓒ	15.0	1750 max.
30 Ⓒ	15 0	2050-2250

Ⓒ - Do not operate at high output without ventilating fan for any length of time. To do so may result in burned armature and fields.

Brush Spring Tension - 35-53 ozs. (GJC-6001A), 18-36 ozs. (GJC-7002F), with new brushes.

Field Current - 1 2-1.3 amps. at 10.0 volts (70°F.).

M toring Curr nt - 3.4-3.9 amps. at 10.0 volts (70°F.).

Rotati n - Counter-clockwise at commutator end.

B lt Adjustm nt: Loosen generator-to-mounting bracket bolts and adjusting arm screw. Place Fan Belt Adjusting Tool J-4672 over head of front mounting bolt and rotate tool until arm of tool contacts edge of generator end plate. Then using torque wrench, turn tool counter-clockwise until a 20-25 ft. lbs. torque is indicated on wrench scale. While holding wrench at proper torque, tighten adjusting arm screw securely. Remove tool and tighten the generator-to-mounting bracket bolts.

DELCO–REMY

Delco-Remy 1102003. *12 Volt.* **Armatur** 1923535.

Maximum Charging Rate - *See Voltage Regulator.*

Performance Data–Cold

Amperes	Volts	RPM
30	14.0	2150

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.48-1.62 amps. at 12.0 volts (80°F.).

Belt Adjustment: Same as for Auto-Lite above.

REGULATOR

AUTO–LITE

Auto-Lite VRX-6009A. *12 Volt.*

Cutout R lay

Cuts In - 13.0-13 7 volts.

Cuts Out - 8 2-9.3 volts.

Contact Gap - .015" minimum.

Air Gap - .031-.034".

Voltage R gulator

Setting - 14.2-14.8 volts at 80°F., *unit operating normally while charging at 10 amps. or with a .25 hm resistor between regulator and battery.*

Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

Checking & Adjusting - *See Electrical Section.*

Current R gulat r

► *SETTING CAUTION. "Temperature Compensated" type, Set to following specifications at 70°F.*

Test A	Operating Amp r s	Test B
36 amps.		30 (28-32)

Test A - After 15 minutes operation charging at 10 amps.

Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).

Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

Checking & Adjusting - *See Electrical Section.*

DELCO–REMY

Delco-Remy 1119123. *12 Volt. NOTE - Regulator is "1119000 Series". Specifications below are "Normal" settings.*

Cutout R lay

Cuts In - 11.8-13.5 volts (Hot).

Contact Gap - .020".

Air Gap - .020" (with contacts just closed).

Voltage Regulator

Setting - 13.8-14.8 volts (Hot).

Air Gap - .075" with armature pressed down to point where contacts just touching.

Checking & Adjusting - *See "1119000 S ries" Regulator in Electrical Section.*

Curr nt R gulat r

Setting - 27-33 amps. (Hot).

Air Gap - .075" with armature pressed down to point where contacts just touching.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Checking & Adjusting - *See "1119000 Series" Regulator in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signal: *See Electrical Section.*
Lighting Switch Removal: Remove knob, then remove nut on instrument panel with special wrench. Remove switch.
Stop Light Switch Location: On brake master cylinder outlet tee.
FUSES: All fuses, except as noted are located on a fuse block under instrument panel.
Stop Light - AGW-7½ amps. (SFE-20 amps. fuse with Spring Suspension on Clipper Deluxe 4-Dr. Sedan).
Body Wiring - SFE-20 amps.
Dome Light - SFE-20 amps.
Direction Signal - SFE-9 amps.
Courtesy Light - SFE-20 amps.
Clock - AGA-2 amps.
Overdrive - AGC-15 amps., on relay on dash panel.
Instruments - AGW-7½ amps.
Windshield Washer - SFE-9 amps.
Heater - AGC-15 amps.
Radio - AGW-7½ amps.
Antenna (Electric) - SFE-20 amps.
Torsion Level Motor - AGC-30 amps., in container near starter.
Torsion Level Control - AGW-7½ amps., in container near starter.
CIRCUIT BREAKERS: Lighting - 20 ampere circuit breaker on headlight switch protects head, tail, and parking lights.
HORNS: Sparton. Dual horns with relay.
Horn Relay: Delco-Remy 1116781.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own 90° V8 (All Models).

Model	Bore	Stroke	Displmnt.
5640, 60, 70	4"	3½"	352 cu. ins.
5680, 5688	4 1/8"	3½"	374 cu. ins.

Model	Rated HP	Compr. Ratio	Developed HP
5640	51.2	9.5-1	240 at 4600 RPM
5660, 70	51.2	9.5-1	275 at 4600 RPM
5680	54.45	10.0-1	290 at 4600 RPM
5688	54 45	10.0-1	310 at 4600 RPM

Compression & Vacuum Reading–*See TUNE-UP.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Packard Special Data.*
ENGINE REMOVAL: *See "Engine" in Packard Special Data.*
OIL PAN REMOVAL: *See "Oiling System in Packard Special Data*
CYLINDER HEAD REMOVAL & INSTALLATION: *See "Cylinder Head & Manifolds" in Packard Special Data.*

PISTONS

Aluminum alloy, cam ground, Autothermic flat head, slipper skirt, tin plated.
Weight - 24.762 ozs. (5640, 60, 70), 26.067 ozs. (5680, 88).
Removal - Pistons and rods removed from above.
Clearance - .000-.0015" at bottom of skirt.
Fitting New Pistons: Using a .0015 x 1/2" feeler gauge placed against side of cylinder wall, insert piston without rings, in an inverted position in cylinder bore. Push piston down until bottom of skirt is slightly below top of cylinder block and piston pin bore is parallel to crankshaft Pull to withdraw feeler should be 6-11 lbs
Installing Pistons: Install with "F" cast in piston strut, and notch in piston head, toward front of engine. *See Rod Installation below.*
Replacement Pistons: Std size, 010", 020", 030" oversize

PISTON PINS

Floating type retained by lock ring at each end Split type bushing used at upper end of rod Pin is offset 0625" toward thrust side
► *PISTON PIN LOCK CAUTION* 5640 60, 70 (4" bore) engines prior to Engine Plant Nos. A-1347 and B-1196 use piston pin locks, Part. No. 440847 (.080" wire size). All 5680 & 5688 engines and 5640, 60, 70 engines beginning at above Engine Plant Nos. use piston pin locks, Part No. 440995 (.063" wire size).
Pin Fit in Piston–(Clearance) 0000" - 0002" Hand push fit with piston heated to 160°F
Pin Fit in Connecting Rod–(Clearance) .0000" -.0004". With pin held in a vise and connecting rod horizontal, rod should fall slowly of its own weight
Replacement Pins: Std size, 003", 006" oversize.
Piston Pin Bushing (In Connecting Rod) Installation: *See "Piston Pins" in Packard Special Data.*

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.078"	Ⓒ	.0015-.005"
Oil	.186"	.015"	.0015-.005"

Ⓒ - .019"(5640, 60, 70),.018" (5680, 5688).
Replacement Rings. Std size, 010", 020", 030" oversize
Installing Rings: Install upper compression ring and oil ring with gap toward camshaft side of engine Install lower compression ring with gap toward opposite side from camshaft All gaps should be midway between pin bosses Grooves on inner diameter of compression rings should be toward top of engine

CONNECTING RODS

Length–6-25/32", (center-to-center). **Weight**–26.688 ozs.
Crankpin Journal Diameter–2.250".
Lower Bearing–Replaceable precision type.
Clearance–.0005-.0025". **Sideplay**–.003-.011".
Replacement Bearings: Std. size, .001", .002", .020" Undersize.
Installing Rods: Install odd numbered rods in left bank and even numbered rods in right bank, with numbers on rods facing down and away from block and milled oil groove in connecting rod cap upward and toward crankshaft.

CRANKSHAFT

Journal Diameter–2.4990". Five bearings.
Bearings–Precision type. The four front crankshaft bearings are interchangeable.
Clearance - .003-.0023".
Replacement Bearings: Std. size, .001", .002", .020" undersize.
End Thrust: Taken by No. 5 (rear) main bearing.
Endplay–.0035-.0085"
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Packard Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Packard Special Data.*
Crankshaft Removal & Installation (With Engine in Car): *See "Crankshaft & Main Bearings" in Packard Special Data.*
Vibration Dampener. *See "Vibration Dampener" in Packard Special Data.*

CAMSHAFT

Bearings–Five, steel-backed babbitt lined precision bearings.
Clearance–.0005-.0045".
End Thrust: Taken by thrust plate behind camshaft sprocket. **Endplay** - .0035-.0065".
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Packard Special Data.*
Timing Chain: Morse. **Width**–1". **Pitch**–.375". **Length**–64 links.
Engine Front Cover Removal: *See "Engine Front Cover" in Packard Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal). *See "Engine Front Cover" in Packard Special Data.*
Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers.
Timing Chain & Sprocket Removal: *See "Timing Chain" in Packard Special Data.*

VALVES

Tappet Clearance: Hydraulic lifters. Adjustment not required unless cylinder head removed or valve lifters replaced. *See "Valve Tappet Adjustment" in Packard Special Data.*

Valve	Head Diam.	Stem Diam.	Length
Intake	.2"	.3725"	5.712"
Exhaust	1.687"	.3715"	5.690"

Valve	Seat Angle	Lift	Stem Clearanc
Intake	30°	398"	.001-.002"
Exhaust	45°	.388"	.002-.003"

Valve Seat Width - 3/64" (Intake), 5/64" (Exhaust).
Valve Springs: Single springs used. Install springs with the two closely wound coils against cylinder head.

Valve Spring Specifications

Valve	Spring Pressure	Length
Closed	87-97 lbs.	1 3/4"
Open	173-187 lbs.	1 3/8"

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance excessive. Valves are furnished with .003", .010", .020", .030" oversize stems.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Ch cking Valve St m Clearance and R aming Guid s f r Oversize Valve Stems: *See "Valve System" in Packard Special Data.*

Valve Lifters· Hydraulic type.

Hydraulic Lifter Removal, Overhaul & Testing—*See "Valve System" in Packard Special Data.*

R cker Arm Assembly: *See "Valve System" in Packard Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves - Open 14° BTDC, Close 62° ALDC.

Exhaust Valves - Open 54° BLDC, Close 18° ATDC.

Valve Timing Check - Remove left bank rocker arm cover. Turn engine until No. 1 cylinder intake valve is open. Let engine stand for several minutes, until hydraulic lifter has leaked down completely. Then hold pressure against the top of the pushrod to keep lifter from refilling, and turn engine until valve closes. Insert tip of a screwdriver between end of valve stem and rocker arm to keep plunger in lifter bottomed, and turn engine until just before mark on timing gear reaches the 15° mark on the timing chain case cover as No. 6 cylinder comes up on compression stroke. Attach a dial indicator to the flange on cylinder head so that it will read any movement of the No. 1 intake valve rocker arm at the pushrod end of the arm. Turn engine very slowly until rocker arm just starts to move. At this point, mark on damper should be just 14° BTDC. *NOTE* - Maximum deflection of timing chain should be ½". If deflection is greater, it will cause a variation in the valve timing.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill).

Normal Oil Pressure: 45 lbs. at 2800 RPM.

Pressure Regulator Valve—In pump body. Not adjustable.

Pressure Relief Valve Spring—3-19/64" (free length). Compressed to 1-3/8", pressure should be 9—9-1/2 lbs.

Oil Pressure Indicator (Clipper Series)—Red light on instrument panel. Lighted when oil pressure low.

Oil Pressure Switch Engine Unit: King-Seeley No. 47195.

Oil Pressure Gauge (Packard Series): King-Seeley "CV" (Constant Voltage) electric type with Gauge Voltage Regulator.

Dash Unit - K-S No. 49512.

Engine Unit - K-S No 44000.

See "Oil Pressure Gauges" in Miscellaneous Section.

Oil Pump: Gear type. Located on rear main bearing cap and driven through distributor drive and camshaft gears. A vacuum pump is attached to oil pump cover plate and is driven by oil pump idler gear.

Oil Pump Removal, Overhaul & Installation—*See "Oiling System" in Packard Special Data.*

Vacuum Pump: Attached to engine oil pump. Serviced only as an assembly. Remove and install in same manner as oil pump. *See "Oiling System" in Packard Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe in valve tappet cover.

COOLING

Wat r Capacity: 26 qts. Additional pint for each heater.

Pressure Valve: Radiator filler cap. 12 lbs. type.

Thermostat: Capsule type. Starts to open 167-173°F (Std.), 177-182°F (High Std.).

Water Pump: Packless type with sealed ball bearing. *See "Packard" in Water Pump Section.*

Temperature Gauge: King-Seeley "CV" (Constant Voltage) electric type with Gauge Voltage Regulator.

Dash Unit-K-S No. 49516 (5680, 88), 49550 (5640, 60, 70).

Engine Unit - K-S No. 44235.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long 11CF, Assy. No. 268349 (5640, 60, 70 with Synchro-mesh Trans.).

See "Long" Clutches in Clutch Section.

Clutch Disc - Long No. 284340 (11").

Pedal Adjustment: 1-1/4—1-1/2" free travel.

Removal: Remove transmission (see below). Remove flywheel lower housing, and clutch release bearing. Mark flywheel and clutch cover. Remove clutch cover to flywheel bolts evenly to relieve tension.

SYNCHRO-MESH TRANSMISSION

Own. *See "Packard Synchro-mesh" in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect speedometer cable, gear shift rods from levers on transmission case, and propeller shaft at rear universal joint. Remove propeller shaft completely by slipping front universal joint flange off the transmission main shaft. *(CAUTION*—Wire or tape the two bearings of the universal joint together to prevent them from falling off). Support rear of engine with a jack. Remove rear engine support mounting and support crossmember. Remove capscrews attaching transmission to flywheel housing. Using two pilots in bolt holes, slip transmission to rear so that clutch release bearing pull back spring may be unhooked. Remove transmission.

OVERDRIVE

Warner R11 Type. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down. Overdrive lockout switch not used.

See "Warner R11" Overdrive in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting overdrive control cable from lever on right side of overdrive case, electric leads at governor and solenoid. Remove governor, then remove solenoid.

ULTRAMATIC DRIVE

Own. "Twin Ultramatic", Torque converter (with hydraulically operated direct speed clutch) and hydraulically operated planetary unit with manual control.

See "Twin Ultramatic Transmission" in Transmission Section.

►*TESTING & TROUBLE SHOOTING: See "Twin Ultramatic Transmission" in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level—*(CAUTION—Fluid level must be checked at normal operating temperatures and after engine has been idling at 800 RPM. for at least one minute to completely fill the transmission).* Run engine at low idle speed while fluid level is being checked, using the dipstick located in engine compartment. Add fluid through dipstick tube as required to bring level to "Full" mark on dipstick.

NOTE—If fluid level doubtful due to bent or distorted dipstick tube, check actual fluid level in transmission as follows: Place car on level floor and allow engine to run at idle speed for five minutes in "N" (neutral). Place a pan under rear of transmission and remove plug in rear of transmission case. If no oil runs out of opening, add oil until it begins to run out, install plug, then ADD ONE QT. If oil does run out when plug removed at rear of transmission, allow to drain to level of hole, then ADD ONE QT.

Capacity—Approximately 11 qts. Use only Packard Ultramatic Drive or any Type "A" Automatic Transmission Fluid which has an AQ-ATF number embossed on container.

►*OTHER TWIN ULTRAMATIC SERVICE DATA: See "Twin Ultramatic Transmission" in Transmission Section.*

UNIVERSALS

Spicer (Std. & Overdrive Cars), Universal Products (Ultramatic Drive Cars).

►*CAUTION:* Rear universal joint flange nut controls rear axle pinion bearing preload which **must b adjusted** whenever nut is loosened. *See "Packard Hypoid" in Rear Axle Section.*

REAR AXLE

Spicer. Semi-floating, hypoid gear, with Hotchkiss drive. *See "Spicer Hypoid" in Rear Axle Section.*

Axle Ratios - Optional ratios available as follows·

Synchro-mesh - 3.54-1, 4.09-1.

Overdrive - 3.54-1, 4.09-1.

Ultramatic - 2.87-1, 3.07-1, 3.31-1, 3.54-1, 4.09-1.

Backlash - .003- 006"

Carrier Removal: Remove axle shafts (see Axle Shaft Removal below). Disconnect rear universal (wire trunnions), wire or prop propeller shaft up against floor pan with a 2 x 4" inserted inside frame crossmember Drain differential, replace drain plug. Clean off housing, take off carrier mounting nuts, lift carrier assembly out.

Axle Shaft Removal: Remove wheel and brake drum (use screw type puller J-4153 (do not use knock-out type puller or thrust block may be damaged). Disconnect brake line at wheel cylinder. Remove nuts at oil seal guard and take off seal guard, gasket, retainer, oil seal, brake support plate, and bearing shims. Remove axle shaft and bearing using Puller J-2552 (do not drag shaft on inner seal). Use Tool J-943-B to remove inner seal.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Wh l B aring Adjustm nt: Endplay controlled by shims between flange end of housing and brake backing plate. Add or remove shims (furnished .005", .007", .020" thick) at one wheel if .050" or under, at both wheels if over .050" to secure .004-.007" endplay. Normally adjust by tightening nut to 20 ft. lbs. and back off one hex and lock.

Endplay - .004-.007".

SHOCK ABSORBERS

D lc r M nroe. Direct acting hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Ind p nd nt. Coil springs (5640), "Torsion Level Suspension" (others).

See "Packard" & "Packard Torsion Level Suspension" in Susp nsions & Wheel Alignment Section.

Kingpin Inclinati n– 5° 50'.

Caster–Neg. 1° ± 1/2°.

Camber–0° (Pos. 3/4° to Neg. 1/4° range).

T e-In–0" (plus 1/16", minus 0").

STEERING

Manual: Gemmer. Worm and three tooth roller.

See "Gemmer Worm & Roller" in Steering Section.

P w r St ring: Bendix or Monroe Linkage Types.

NOTE - Gemmer Worm & 2-Tooth Roller Steering Gear used with both types.

See "Bendix Linkage Type" or "Monroe Linkage Type" Pow r Steering in Steering Section.

St ering Linkag : *S e "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Bendix Hydraulic. Single Anchor (without eccentric) Hand lever applies rear wheel service brakes rear wheel service brakes.

See "Bendix Hydraulic" in Brake Section.

Drum Diameter - 11"(5640, 60, 70),12" (5680, 5688).

Lining Width	Front	Rear
5640, 5660, 5670	2½"	2"
5680, 5688	2¼"	2"

Lining Thickness - 3/16" (All Series).

Lining Length	① Primary	① Secondary
5640, 5660, 5670	9 5/16"	12"
5680, 5688	11 1/2"	13"

① - Front & Rear wheels.

Clearance - Turn brake adjusting screw until wheel can just be turned by hand, then back off shoe until wheel turns free.

Standard Master Cylinder: On bracket on left side of frame near transmission support.

Checking Fluid–Access hole in front floor pan at left corner of drivers seat.

Removal–Remove brake lines from master cylinder. Disconnect pushrod at pedal. Remove gearshift selector linkage bellcrank from mounting bolt stud. Remove mounting bolts and master cylinder.

P w r Brak s: Bendix. Combination power cylinder and hydraulic master cylinder.

See "Bendix Power Unit" in Brake Section.

Checking Fluid–Check level every 1000 miles Add fluid to bring level to full mark.

Removal of Power Unit–Disconnect hose line and electrical wiring from power unit (raise hydraulic line above level of junction assembly to prevent fluid leakage). Disconnect and remove brake and accelerator pedal. Remove steering column grommet retainers, slide grommet out of way. Remove carpet retainers and fold carpet back. Remove cover plate screws, then remove power brake and cover as an assembly, take out mounting screws and remove power brake from cover.

MISC. MECHANICAL

Windshield Wipers: Vacuum type, cable operated. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Harrison. *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type with individual motors in each window. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Seat Controls: Individual electric motors for horizontal and vertical seat adjustment. *See "Electric Seat Controls" in Miscellaneous Section.*

Power Top Controls: Hydro-Lectric type. *See "Hydro-Lectric Top Controls" in Miscellaneous Section.*

6 CYL. ENGINES

V8 ENGINES

ENGINE

6 CYL. ENGINES

ENGINE ASSEMBLY REMOVAL: Engine, clutch, and transmission assembly can be removed from car as an assembly, as follows: Remove hood and radiator core. Disconnect propeller shaft at transmission. Disconnect transmission controls at transmission (wires to overdrive controls), and speedometer cable. Disconnect clutch linkage at clutch housing. Disconnect fuel pump flexible line at pump, throttle and choke controls at carburetor, heat indicator tube at head. Disconnect wires from generator and starter, coil and distributor. Disconnect exhaust pipe at manifold. Disconnect oil gauge tube at flexible line. Remove crankcase breather pipe, and the front and rear engine support bolts. Disconnect hand brake linkage. Remove carburetor air cleaner. Connect hoist to engine and lift assembly out of chassis.

V8 MODELS

ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery. Remove fan shroud, radiator, and hood. *(NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission. Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. *(NOTE* - Place a roll-away jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support. Lower car to convenient working height, then remove engine front support mounting bolts. With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender.

ENGINE MOUNTINGS

ENGINE MOUNTINGS: On some models, a rubber insulating washer 3/32" thick is provided for left mount only, and should be installed between frame and lower flat washer. This washer eliminates transfer of noise on rapid acceleration. Washer must not be compressed between frame and flat washer. *CAUTION*—Do not over-tighten rear engine mounting bolts. Over-tightening these bolts may collapse insulator spacer.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.

Tightening Torque—See Tightening (Torque Wrench) Specifications above.

6 CYL. ENGINES

CYLINDER HEAD INSTALLATION: When installing cylinder head, use new gasket. Coat threads of capscrews with sealer except the three screws that lead into intake manifold ports. If sealer used on these capscrews, there is a possibility that it will be drawn into carburetor or valves. Use torque indicating wrench to tighten cylinder head bolt nuts and capscrews. Tighten in sequence shown in diagram.

INTAKE & EXHAUST MANIFOLD INSTALLATION: Install the new gasket between intake and exhaust manifold (make sure that heat valve is free and operates freely), and insert the four bolts through exhaust manifold and into intake manifold. Draw bolts down snug but DO NOT TIGHTEN. Install thermostatic coil spring and counter-weight. Install manifold-to-engine block gaskets and install assembled manifolds. While holding manifold and gaskets evenly against engine block, install long center bolts and draw down snugly. (If bolts show signs of water leakage, coat threads with suitable sealer). Install remaining washer and nuts. *(CAUTION*—Be sure to install the four conical, brass washers and nuts on the extreme ends of exhaust manifold). Tighten manifold nuts and bolts, starting from center and working out towards ends, to 15-20 ft. lbs. torque. Tighten the four bolts holding exhaust manifold to intake manifold.

V8 ENGINES

CYLINDER HEAD INSTALLATION (Single Rocker Shaft): Before cylinder head removed, remove rocker shaft assembly. Slide out push rods and place them in sequence in a suitable rack in order that each push rod can be reinstalled in its original position. When installing cylinder head, use new gaskets. Make sure all holes are punched out. Be certain cylinder head enters both dowel guide pins in cylinder block. Tighten cylinder head bolts in sequence shown in diagram. Slide push rods in position. Lower rocker shaft assembly down on two locating studs. Install all washers, nuts and bolts. *CAUTION*—Extreme caution must be exercised when tightening rocker shaft bolts and nuts so that hydraulic tappets have time to bleed down to their operating length. If tappets are forced down too rapidly, damage to push rods, tappet bodies or rocker arms will result.

CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINES

REAR MAIN BEARING SEAL: Neoprene type seal. When replacing seal, both upper and lower halves should be replaced. Remove oil pan, clutch housing pan, and rear main bearing cap. Remove seal from cap, and then remove upper seal by pushing one corner of seal until opposite end protrudes about 3/8" from block. Pull out with long-nosed pliers. Install new seal in lower half by carefully inserting lower half of seal into bearing cap. Before installing upper seal, coat seal contacting lip with grease. Insert one end of seal into block and push it into place with a rolling motion. Install main bearing cap, making certain that tabs of cap gasket fit in cap seal channel.

V8 ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos. With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap. Tap seal down in position with Tool C-3511 until tool is

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

seated in bore. Hold tool down and cut off protruding ends flush with cap. Install bearing insert and both cap seals. The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine.

ENGINE FRONT COVER

6 CYL. ENGINES

FRONT OIL SEAL: To replace, drive old seal out with suitable drift. When installing seal, make sure seal is driven into place evenly to insure a tight fit. Use a new gasket and position cover in place.

FRONT COVER INSTALLATION: Use new gasket and position cover in place. Install screws but do not tighten. Install pulley and hub on crankshaft far enough so that seal can be evenly positioned on crankshaft. Tighten two screws on right side lightly. Then tighten remainder of screws in like manner. Repeat tightening procedure and torque screws to 15 ft. lbs.

V8 ENGINES

ENGINE FRONT COVER (Single Rocker Shaft Engines): Proceed as follows:

Removal: Drain and remove radiator. Disengage fan belt and remove generator. Install Tool C-3033 over pulley and force pulley off end of crankshaft. Support engine with suitable chain hoist fastened to intake manifold. Remove motor support "U" bolts and nuts. Remove fan blades and hub, then remove bolts that hold water pump housing to cylinder block and heads. Lift water pump housing, water pump, front motor support and insulator up and away from front of engine. Discard gaskets. Loosen bolts that hold oil pan to cylinder block. Drop pan slightly to clear chain case cover. Disconnect inlet and outlet fuel lines at fuel pump. Remove bolts that hold pump to chain case cover. Slide pump out and away from engine. Discard gasket. Remove bolts and washers from cover. Disengage cover from locating dowels, remove from engine. Discard gasket.

Installation: Be sure mating surfaces of cover and cylinder block are clean and free of burrs. Install new gasket and position cover locating dowels. Coat screws with suitable sealer and tighten to 15 ft. lbs. *NOTE*—Coat four center screws with sealer suitable for water. Coat other screws (upper and lower) with sealer suitable for oil.

FRONT OIL SEAL: Remove crankshaft pulley and water pump housing. Loosen oil pan bolts sufficiently until pan clears chain case cover. Install Tool C-3506 and remove seal. Discard seal and retainer. Position new seal and retainer assembly in housing and press into place using Tool C-3503. Seal must be tight against seat surface. *CAUTION* - Always have thin shoulder away from front of cover with stamped case cover, thick shoulder away from front of cover with cast iron cover.

CAMSHAFT & BEARINGS

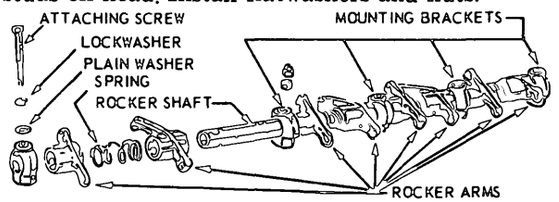
6 CYL. ENGINES

CAMSHAFT REMOVAL: Remove Front End Assembly as a unit. Remove cylinder head, fuel pump, oil pump, valve tappet cover plates, crankshaft pulley, front motor support (with front of engine jacked up), timing chain cover, camshaft sprocket and timing chain. If valves and valve springs are not to be removed, prop valves up by inserting wooden wedges at opposite sides under valve head. Raise tappets and hold in this position (use spring type clothes pins or similar tool to hold tappets up). Withdraw camshaft (rotate shaft to clear any obstructions).

V8 ENGINES

CAMSHAFT REMOVAL: Drain radiator, remove radiator and crankshaft pulley. Support engine with chain hoist attached to intake manifold. Remove engine support U-bolts. Remove fan, water pump, and water pump housing assembly. Loosen oil pan bolts sufficiently in order that oil pan clears chain case cover, camshaft gear hub nut, fuel pump eccentric and dowel. Then remove camshaft gear and timing chain. Support engine at front of oil pan. Then remove intake manifold, distributor, distributor drive gear, tappet chamber cover, rocker cover, rocker shaft assemblies and push rods. Use Tool C-3158 to pull out hydraulic tappets. If varnish build-up is excessive, use puller part of Tool C-3158 and work tappet out of bore. Remove four camshaft thrust bolts, then remove camshaft.

VALVE SYSTEM



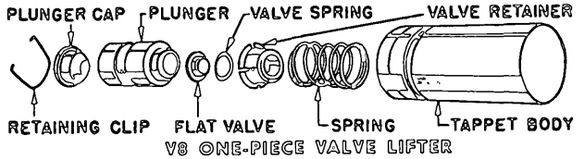
6 CYL. ENGINES

EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished .010" oversize. Use Tool C-732 to remove inserts. After inserts have been removed from engine, smooth any roughness of seat with a blunt drift. Valve seat inserts should be from .002-.004" larger than counterbore to insure correct fit. If inserts are found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert. Place inserts in dry ice for approximately 10 minutes. Clean counterbore thoroughly and install a chilled insert with valve side up, and drive it into place with Installing Tool C-767.

ROCKER ARMS

V8 ENGINES

ROCKER ARM ASSEMBLY (Single Rocker Arm Shaft): Hold rocker arm shaft and end bracket in a horizontal position with oil grooves facing down. Slide an intake rocker arm over shaft and down against bracket, with diagonal slant of arm close to bracket. Then slide a spacer spring over shaft and down against intake rocker arm. Next, slide an exhaust rocker arm over shaft and down against spacer spring, followed by a shaft bracket. Continue to slide first an intake rocker arm, then a spacer spring followed by an exhaust rocker arm and bracket, over shaft until last bracket has been installed. Slide push rods into push rod holes. Be sure that rocker arms are in a horizontal position, then lower rocker shaft assembly down on two locating studs on head. Install flatwashers and nuts.



V8 ROCKER ARM ASSEMBLY

HYDRAULIC VALVE LIFTER

V8 ENGINES

HYDRAULIC VALVE LIFTERS (One-Piece Integral Type) Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.

Removal (Single Rocker Arm Shaft Engine): Remove rocker covers, then remove bolts, nuts and flatwashers holding shaft to heads. Lift rocker shaft and arms straight up and away from heads. Drain cooling system to point below level of intake manifold. Remove carburetor air cleaner, disconnect fuel and vacuum lines, overdrive kick-down switch wires and accelerator linkage at carburetor. Disconnect coil wires and disconnect heat indicator wire at intake manifold. Disconnect heater hose and automatic integral choke heat tube at carburetor. Remove intake manifold bolts, then lift intake manifold, coil and carburetor straight up and away from engine. Discard gaskets (*CAUTION* - Cover intake ports in cylinder head to avoid entry of dirt). Remove crankcase ventilator pipe and gasket. Remove tappet chamber cover bolts. Lift cover up and away from engine. Discard gaskets. Insert hooked portion of Tool C-3158 into hole in tappet body (this portion of tool can be used to remove tappets without a varnish build-up at lower part of tappet body). Lift tappet out of bore. If lifter

V8 ONE-PIECE VALVE LIFTER

sticks in bore, slide puller portion of Tool C-3158 through cylinder head (pushrod) openings and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and slowly pull tappet out of bore with sharp twisting motion. As tappet clears bore, withdraw puller pin and puller tool, then lift tappet out of chamber.

Disassembly: (*CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.*) Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body. Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting. Check to see that valve exerts a slight pressure on valve spring to insure valve seating. Clean lifter assembly in clean solvent and remove all traces of varnish and carbon. Blow parts dry with air. DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY.

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene. (*CAUTION*—Container and kerosene must be absolutely clean). Allow lifter to fill with kerosene, then remove and replace the plunger cap. Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill

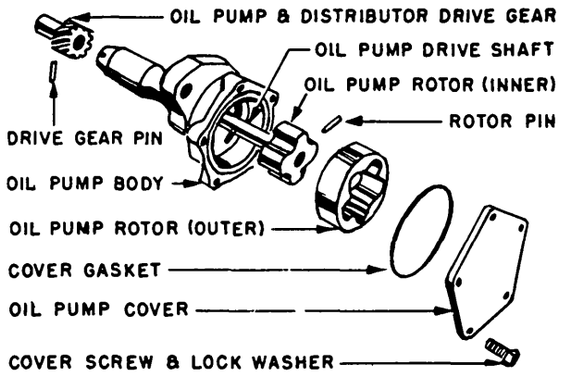
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

lifter body. Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again. If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter. When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing. This will prevent possible scoring of lifter plunger when engine is first started.

Reassembly: Reverse disassembly procedure as noted above.

LOW POINT OF CAMSHAFT LOBE: Remove distributor cap, noting position of rotor for Nos. 1 and 6 cylinders. Set timing mark "DC" located on crankshaft pulley to pointer. With rotor at No. 1 firing position, the following lifters will be on the low side of the cam lobe: No. 2 intake and exhaust, No. 4 exhaust, No. 7 intake, No. 8 intake and exhaust (*NOTE*—To remove No. 1 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed). With rotor at No. 6 position, following lifters will be on low side of cam lobe: No. 3 intake and exhaust, No. 4 intake, No. 5 intake and exhaust, No. 7 exhaust (*NOTE*—To remove No. 6 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed).



OILING SYSTEM

OIL PUMP

6 CYL. ENGINES

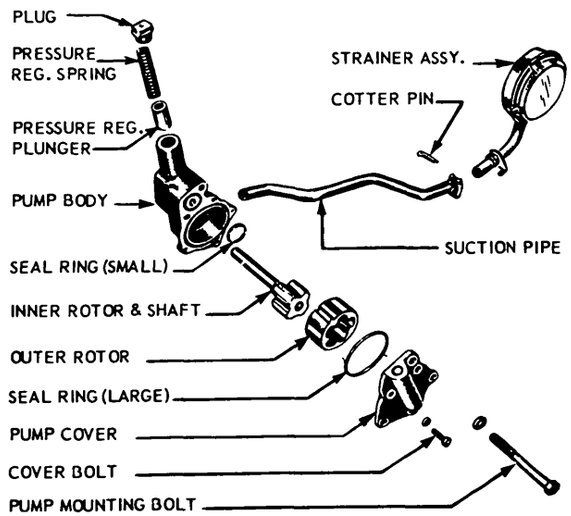
ROTOR TYPE OIL PUMP: Removal—Before removing oil pump, rotate crankshaft and make sure "DC" mark on crankshaft pulley lines up with pointer on timing chain case cover Do not rotate engine with oil pump removed Remove the attaching screws and remove pump from engine *NOTE*—On some models it will be necessary to remove the two upper cover capscrews to obtain sufficient clearance to remove oil pump

Disassembly & Inspection: Remove the oil pump cover and gasket Hold hand over cover opening and with pump upside down, turn drive shaft until outer rotor slips out. Drive out the straight pin holding pump drive gear to shaft Press the shaft out of drive gear and slide shaft and inner rotor assembly out of pump body Wash all parts and dry with air. Inspect all parts and replace as necessary, then measure clearance between opposite lobe of inner rotor and outer rotor. Clearance should be .010" or less. If clearance is greater, replace both rotors Measure thickness and diameter of outer rotor. If thickness is .748" or more and diameter is 2.245" or more, rotor is satisfactory Thickness of inner rotor should be .748" or more If either rotor is less than these dimensions, replace BOTH rotors. Insert both rotors into pump body and place a straight edge across pump body between bolt holes Clearance between straight-edge and rotor should be 004" maximum If greater, replace pump body. Press outer rotor to one side against pump body and measure clearance between rotor and body on opposite side Maximum clearance should be 008". If greater, replace pump body. Cover should be smooth and flat. If it is scratched or grooved, replace cover. Check flatness by placing a straight-edge across inner surface of cover If it is possible to insert a .001" feeler between cover and straight-edge, replace cover.

6 CYL. OIL PUMP

Reassembly: Slide the drive shaft and rotor assembly into pump body Press drive gear on shaft until end play of shaft is from 003" to 010". Press rotor down in body with hand and measure clearance with feeler gauge. Install pin and peen over both ends. If pin holes do not line up, drill a new pin hole through gear and shaft, using a 5/32" drill. Slide outer rotor into place in pump body Install new cover gasket and install cover and tighten screws evenly.

V8 ENGINES



ROTOR TYPE OIL PUMP: Removal—Drain engine oil, remove oil pan. Remove oil pump mounting bolts and lower pump straight down.

Disassembly & Inspection: Remove cotter pin holding oil strainer to oil pump suction pipe, then remove pipe. Remove cover bolts and cover. Discard oil seal ring. Remove pump rotor shaft and lift out pump outer rotor. Remove oil pressure relief valve plug and lift out spring and plunger. Wash all parts in a suitable solvent and inspect for damage or excessive wear. Check all pump parts as follows:

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers. If diameter less than 2.244" or thickness less than .998", replace both inner and outer rotors.

Inner Rotor—Measure thickness of inner rotor with micro-calipers. If thickness measures less than .998", replace both inner and outer rotors.

Rotor Depth—Slide rotors in pump body. Place a straightedge across pump body. Use a feeler gauge and measure clearance between top of rotors and straightedge. If clearance in excess of .004", replace pump body.

V8 OIL PUMP

Outer Rotor to Pump Body Clearance—To check rotors for excessive wear, measure clearance between lobes of inner and outer rotors. If clearance in excess of .010", replace both inner and outer rotors.

Reassembly: Use new oil seal ring between cover and body. Tighten cover bolts to 10-15 ft. lbs. Prime pump and then install new oil seal ring in pump mounting face.

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

IGNITION NOTES
V8 ENGINES

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows: Rotate crankshaft until No. 1 cylinder is at TDC (or firing position). When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener. Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear. Coat shaft of drive gear with engine oil. Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase).

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing. Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block.

Installation: Slide new bushing over burnishing end of Tool C-3053. Insert tool and bushing into bore of block. Drive bushing and tool down into position, using a soft hammer. As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size. ***DO NOT REAM THE BUSHING.***

COOLING SYSTEM
6 CYL. ENGINES

WATER DISTRIBUTION TUBE: Replace whenever engine completely overhauled. If tube becomes rusted or corroded, overheating of engine may occur due to failure of water to circulate properly through cylinder block. To replace tube, remove radiator core and water pump. Pull tube out of block with stiff hooked rod. Install tube with slots up and be sure tube is inserted far enough into block so that water pump will seat properly against block.

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Place transmission shifting lever in neutral and be sure the hand brake is released. Disconnect front end of propeller shaft and remove adjusting screw cover plate. Loosen brake cable guide clamping screw and back off cable adjusting nut. Turn brake shoe adjusting nut to decrease shoe-to-drum clearance until a slight drag is felt on drum. Back off adjusting nut one full notch (using spanner wrench C-3014) to give approx. .010" clearance. (NOTE—be sure the two raised shoulders on the adjusting nut are seated in the grooves on adjusting sleeve). The cable length adjusting nut should be positioned against cable housing so there is at least .005" (but not more than .010") clearance between operating lever and brake shoe cable. To lock the adjustment, tighten cable housing clamp securely and then tighten cable adjusting nut against housing. Test hand brake lever for travel. When properly adjusted, 4 to 6 clicks of ratchet should be obtained to hold car. Install adjusting screw cover plate and connect propeller shaft.

HAND BRAKE ADJUSTMENT (External Type): The hand brake adjustments can be made from beneath car as follows: Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for .015-.020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw. Loosen guide bolt locknut and adjust guide bolt adjusting nut for .015-.020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut. Turn large adjusting bolt nut (on lower end of bolt below springs) for .015-.020" band to drum clearance for upper half of band. Groove in upper end of this nut must contact ridge on band operating lever spacer above nut.

NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed .005" (if clearance excessive band may be distorted when brake applied). To correct, compress saddle in vise or place on block and tap lightly with a hammer.

►*"FURY" NOTE:* This model has a special High Compression Engine with different valve timing (adjustable tappet clearance), ignition setting, spark plugs and carburetor (Carter 4-Barrel). See data below.

►*V8 AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

6 CYL. MODELS

Series	Model Identification
Plaza	P-28-1
Savoy	P-28-2
Belvedere	P-28-3

V8 MODELS

Series	Model Identification
Plaza	P-29-1
Savoy	P-29-2
Belvedere	P-29-3
Fury	P-29-3

SERIAL NUMBER: On plate attached to left front hinge pillar post.

Serial Nos.	Detroit	Evansville	Los Angeles
6 Cyl. (All)	14,720,001	20,820,001	25,202,001
V8 (All)	15,873,001	22,247,001	26,552,001

ENGINE NUMBER: 6 Cylinder - Stamped on boss at left front side of cylinder block.

V8 - Located on left front face of cylinder block.

Starting Engine Numbers - 6 Cylinder - 1001 and up.

V8 - In blocks of numbers as follows:

270 Cu. In. Engine - 41,001 through 80,000 & 250,001 through 274,009.

277 Cu. In. Engine - 1,001 through 40,000, 80,001 through 250,000, 274,001 & Up.

330 Cu. In. (Fury) Engine - Engine No. preceded by prefix letter "F".

►*ENGINE NUMBER LETTERS & MARKS (Following engine number): Indicate as follows:*

"A" - All cylinders .020" oversize.

"B" - All Main & Connecting Rod Journals .010" undersize.

"AB" - Both above conditions exist.

"DIAMOND" (3/8" high) - .008" oversize tappets used.

TUNE-UP

COMPRESSION PRESSURE: 6 Cyl. - 120-150 lbs. at cranking speed of 150 RPM. Maximum allowable variation between cylinders 10 lbs.

V8 - 125-165 lbs. at cranking speed of 150 RPM. Maximum variation between cylinders 15 lbs.

VACUUM READING: Steady 18-21" at idling speed.

VALVE TAPPET CLEARANCE: 6 Cyl. - .010" Intake & Exhaust, with engine hot and idling.

V8(270 Cu.In.Eng.) - None in service (hydraulic lifters).

V8(277 Cu.In.Eng.) - .008" Intake, .018" Exhaust, with engine hot and idling.

V8 (Fury 303 Cu.In.Eng.) - .010" Intake, .018" Exhaust with engine hot and idling.

MANIFOLD HEAT CONTROL: 6 Cyl. - Thermostatic coil type. Valve should operate freely. When installing coil, spring should be installed so that about one full turn (355° of wrap) is required to hook outer end of spring around stop stud.

V8 (270 & 277 Cu.In.Std.) - Single Exhaust with Crossover pipe. Located in right exhaust manifold (277 Cu. In. Eng.), between right exhaust manifold and exhaust pipe (270 Cu. In. Eng.).

V8 (303 Cu. In. (Fury) Std. 277 Cu. In. Optl. with Power Package). Dual Exhaust. Heat control valve in right exhaust pipe.

Coil Spring Installation - Position valve shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end tongue of spring in upper left hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end tongue of spring around and hook under pin (left pin when facing coil end of valve on 270 Cu. In. Single Exhaust and all Dual Exhaust systems).

Counterweight Installation - Place counterweight over shaft (shield upward) and insert lock in shaft slot. Center counterweight on shaft and turn weight on shaft until seated. Install stop, and tighten nut securely.

►*DUAL EXHAUST NOTE:* When valve is closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

6 CYL. IGNITION WIRING

CONTINUED FROM PRECEDING PAGE

Distributor Basic Timing & Drive Shaft Bushing: *See "Ignition Notes" in Plymouth Special Data.*

IGNITION TIMING

Setting - 2° BTDC (6 Cyl.), 4° BTDC (Others Exc. 277" Eng. with Power Package), TDC (277" Eng. with Power Package). *NOTE* - It is recommended that only premium grade gasoline be used in "Fury" engines and V8 engines with Power Package.

Timing Mark - Fan Drive Pulley or Vibration Damper.

CARBURETOR
6 CYLINDER ENG.

▷*CARBURETOR APPLICATION: Carter single barr l is standard equipment on Powerflow 6 engines. Stromberg dual barrel carburetor with special larger air cleaner, intake manifold, and gear ratio of 3.9–1 on Power Package engines.*

THROTTLE LINKAGE ADJUSTMENT (PowerFlite): Loosen vertical clamp rod and adjust the carburetor throttle lever rod to provide a 5 7/16" distance between the anchor points of the throttle return spring. Then with engine idling (off fast idle), take up slack at the vertical rod and tighten the clamp nut.

THROTTLE PRESSURE ADJUSTMENT: *See "PowerFlite" Transmission in Transmission Section.*

CARTER BBS

Model	Carburetor Model
Synchro-mesh	2063SA ℂ, 2293S
Overdrive	2062SA ℂ, 2294S
PowerFlite	2116SA ℂ, 2295S
City Traffic	② 2403S
Taxicab	2410S

ℂ - Temporary production. ② - With Throttle Restrictor.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idle Setting - ½-1½ turns open (2062SA, 63SA, 2116SA), ½-1¾ turns open (2293S, 94S, 95S; 2403S), 1-2 turns open (2410S). Turn screw out for richer mixture.

Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive), 475-500 RPM (PowerFlite - In Neutral).

Float Level - 7/32" (Except 2403S, 10S), 9/32" (2403S, 10S) from top of each float to top surface of body casting with float pin retainer removed and float pin at bottom of guide slots.

Accelerating Pump - Install connector rod in center hole of throttle lever (medium stroke).

Fast Idle: .022-.026" (2062SA, 63SA, 2116SA), .016-.020" (All Others) clearance between lower edge of throttle valve and carburetor bore with fast idle cam in fast idle position. Adjust by bending connector rod at lower angle (Tool T109-213).

Automatic Choke: Centered - At Index (All Models).

Slow Closing Throttle (Dashpot): Maximum dashpot action is obtained by loosening locknut and adjusting dashpot unit so that dashpot plunger shaft can be moved inward approximately 3/32" with throttle valve fully closed.

Overdrive Kickdown Switch: With throttle valve in wide open position, adjust hex nuts on switch to have 1/64-3/64" clearance between kickdown lever and switch stem guide.

Throttle Linkage Adjustment (PowerFlite): *See CARBURETOR above.*

►*OTHER DATA: See "Carter BBS" Carburetor in Carburetion Section.*

Fuel Pump Pressure: 4-5½ lbs.

STROMBERG WW (DUAL)

Transmission	Stromberg Code No.
Synchro-mesh	3-124
Overdrive	3-125
PowerFlite	3-126

►***MANIFOLD FUEL DISTRIBUTION: Each barrel feeds all cylinders.***

Idle Setting - ¾-1¾ turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed - 450-500 RPM Synchro-mesh & Overdrive, 475-500 RPM PowerFlite in neutral.

Float Level - 3/16" from top of main body to top of float, measured at center of float, with float lip held firmly against needle valve. Use depth gauge or Tool T-25569 to measure float level. To reset float level, bend float lever next to float with Tool T-24733.

Accelerating Pump - Normal setting, center hole: for less fuel install rod in inner hole; for more fuel install rod in outer hole.

Fast Idle: With throttle valves in fully closed position turn throttle stop screw in until it just contacts throttle lever, then turn stop screw in 5 1/8 turns. When properly adjusted a No. 59 drill gauge should just pass between throttle valve and wall of carburetor body. With choke valve closed and throttle lever held against throttle stop screw, a No. 48 drill gauge should just fit clearance between ear on contact lever and first step of fast idle cam. To adjust bend cam contact ear.

Automatic Choke: Centered at Index.

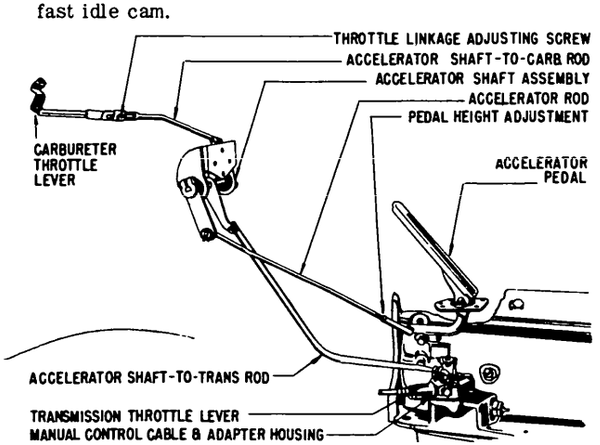
Kickdown Switch Adjustment: With throttle valves in wide open position, there should be 1/64"-1/32" clearance between ear on throttle lever and threaded section of switch housing. To adjust, loosen adjusting nuts and adjust to correct position.

Slow Closing Throttle (Dashpot) Adjustment: With throttle stop screw set for normal idle speed, there should be a 1/16"-1/32" clearance between end of dashpot plunger and ear of throttle lever when dashpot plunger is pushed into end of its stroke.

Throttle Linkage Adjustment (PowerFlite): *See CARBURETOR above.*

►*OTHER DATA: See "Stromberg WW (Dodge & Plymouth)" Carburetor in Carburetion Section.*

CARBURETOR



►*CARBURETOR APPLICATION NOTE: Carter Dual Carburetors standard on all engines. Carter Four Barrel Carburetors used on 277 cu. in. engine with Power Package and 303 cu.in. "Fury" Model.*

►*EXCESSIVE FAST IDLE OR CONTINUOUS FAST IDLE AFTER WARM-UP CORRECTION:* When above condition exists on early production (277 Cu. In. Eng.) cars, check for installation of late type fast idle cam, identified by yellow coating over plating or 1/8" circle on inside face near trademark. Check fast idle adjustment. *See "Fast Idle Adjustment" below.*

►***"FURY" IMPROPER CHOKE ACTION CORRECTION (Due to Interference Between Carburetor Throttle Lever & Dashpot):*** **Install three regular gaskets, Part No. 1731516. Place spacer on intake manifold first, then regular gaskets. Three regular gaskets can be used if spacer not available. Correction has been made on later cars.**

►*CARBURETOR PRODUCTION CHANGE:* **Dashpots were eliminated on all V8 cars with PowerFlite about the middle of 1956.**

THROTTLE LINKAGE ADJUSTMENT (PowerFlite): Loosen locknut on throttle control rod and slide the rear part of rod toward the rear of car to take up all slack. Tighten locknut. Be sure carburetor is "OFF" fast idle cam.

POWERFLITE THROTTLE LINKAGE 6 CYL. & V8

Throttle Pressure Adjustment (PowerFlite): *See "PowerFlite" Transmission in Transmission Section.*

CARTER BBD (Dual) (277 Cu. In. Eng.)

Transmission	Carter Carb. Nos.
Synchro-mesh	①BBD 2299S or 2407S
Overdrive	①BBD 2300S or 2408S
PowerFlite	**①BBD 2301S or 2409S, SA**

(270 Cu. In. Eng.)

Synchro-mesh	②BBD 2259SB or 2422S
Overdrive	②BBD 2260SB or 2423S
PowerFlite	②BBD 2261SB or 2424S

① - "Cross-over" type choke. ② - "Integral" choke.

Idle Setting - ¼-1¼ turns open (2259SB, 60SB, 61SB), ½-1½ turns open (All Others). Turn both screws out equally for richer mixture.

Idle Speed-450-500 RPM (Synchro-mesh or Overdrive), 475-500 RPM (PowerFlite in neutral).

Float Level - ¼" distance from top surface of body castcasting to top of each float (float pin retainer and gasket removed and float pin down at bottom of guide slots. *NOTE* - This supersedes previous setting of 7/32" on some models.

Accelerating Pump (277")-Install connector rod in center hole (Medium stroke) of throttle lever and inner hole of pump arm.

Accelerating Pump (270")-Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm.

Fast Idle Cam Clearance (277"): .020" (Gauge T109-29) between lip on fast idle cam and boss on casting with choke valve closed and lip on inner choke shaft lever contacting lug on outer lever. Adjust by bending lip on inner choke shaft lever. On late carburetors, align index mark on cam with adjusting screw.

Fast Idle Throttle Clearance (270" & 277"): .015-.019" (270"), .015" (277") clearance between lower edge of throttle valve and carburetor bore with adjusting screw on high step on cam.

Automatic Choke (Integral Type): Set at Index.

Slow Closing Throttle (Dashpot): Maximum dashpot action is obtained by placing 1/16" gauge between shaft and operating lever, then adjust dashpot in or out to obtain fully closed throttle.

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64-3-64" between kickdown lever and switch stem guide.

Throttle Linkage Adjustment (PowerFlite): *See CARBURETOR above.*

►*OTHER DATA: See "Carter BBD (Dual)" Carburetor in Carburetion Section.*

Fuel Pump Pressure: 5-6½ lbs.

Model	CARTER WCFB Carburetor Model

"Fury" (303 Cu. In. Eng.)	WCFB 2442S

►***MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.***

Idle Setting - 1 - 2 turns open. Turn screws out for richer mixture.

Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive), 475-500 RPM (PowerFlite), with transmission in neutral.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Throttle Linkage Adjustment: *See CARBURETOR above.*
▷*OTHER DATA: See Carter "WCFB" Carburetors in Carburation Section.*
Fuel Pump Pressure: 5 - 6½ lbs.

CARB. EQUIPMENT

Fuel Pump: Carter or Auto-Lite. Mechanical type.

Model	Auto-Lite	Carter
6 Cyl. (All)	FA-4005	M2242S
V8 (270° Eng.)	FB-4006	M2361S, M2348S
V8 (Others)	FB-4006	M2241S

Pressure - 5 - 6½ lbs.
See "Fuel Pumps" in Carburation Section.
Gasoline Gauge: Auto-Lite. Electric type.
Dash Unit - 14038A (Suburban), 13997A (Others).
Tank Unit - 13905A (Suburban), 13969A (Others).
See "Fuel Gauges" in Carburation Section.

BATTERY

Auto-Lite 11-HS-50 or Willard HO-11-50 (Std.). *12 Volt,* 9 plate, 50 ampere hour capacity.
Optl. (Warm Climate) - Auto-Lite 11-MS-45 or Willard MO-11-45. *12 Volt,* 7 plate, 45 ampere hour capacity.
Grounded Terminal - Negative.
▷*CAUTION - This is reversed from previous models.*
Engine Ground - Left front of engine.

STARTER

6 Cyl. - Auto-Lite MDG-6001 (Std.), MDF-6002 (PowerFlite). *12 Volt.*
V8 - Auto-Lite MDG-6002 (Std.), MDF-6007 (PowerFlite). *12 Volt.*

Armature (All) - Auto-Lite MDF-2088.
Drive - Bendix "Folo-Thru" type EBB 20.
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 42-53 ozs. (with new brushes).

Performance Data - MDF

Torque	RPM	Volts	Amperes
0 ft.lbs.	3200 min.	10.0	60 max.
6.5 ft.lbs. min.	Lock	4.0	240 max.

Performance Data - MDG

Torque	RPM	Volts	Amperes
0 ft.lbs.	4400 min.	10.0	50 max.
5 ft.lbs. min.	Lock	4.0	210 max.

Starting Switch: Auto-Lite SAE-4001 (Std.), SAE-4002 (PowerFlite). Magnetic type switch controlled by ignition switch. Neutral safety switch mounted on transmission on Automatic Transmission cars. *See "Starter Controls" in Electrical Section.*
Neutral Safety Switch Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

GENERATOR

12 Volt. Application as follows:

Auto-Lite Generator No.	Armature No.
GJC-7002A or GGA-6001L (6 Cyl. Std.)	GJC-2030F
GJC-7001A or GGA-6003A (V8 Std.)	GJC-2030F
GJC-7003B or GGA-6002A (Pow. St.)	GJC-2090F
GJC-7006B or GGA-6001N (Air Con.)	
GJC-7003C or GGA-6002C (P.S. & A.C.)	

▷*SPECIAL GENERATOR NOTE: GGA & GJC* type generators used. Performance specifications below apply equally to all generators within either of the groups specified.

Performance Data - GGA - 12 Volt

Amperes	Volts	RPM 70° F.
4.0	14.6	950 max.
40.0 ①	14.6	1600 max.
40.0 ①	15.0	1600 max.

Performance Data - GJC - 12 Volt

Amperes	Volts	RPM Cold
20.0 ①	15.0	1750 max.
30.0 ①	15.0	2050-2250

① - Do not operate at high output without ventilating fan for any length of time. To do so may result in burned armatures and fields.

Brush Spring Tension - 18/36 ozs. (GJC), 34-41 ozs. (GGA) with new brushes.
Field Current - 1.2-1.3 amps. (GJC), 1.1-1.3 amps. (GGA), all at 10.0 volts (70°F.).
Metering Current - 3.4-3.9 amps. (GJC), 2.3-2.6 amps. or 3.1-3.5 amps. with felt oil seal in drive end head (GGA), all at 10.0 volts (70° F.).
Rotation - Counter-clockwise at commutator end.
Belt Adjustment: 1/2" deflection between generator and compressor (air conditioning) or water pump (Others) with normal thumb pressure.

REGULATOR

12 Volt. Use with generators as follows:

Auto-Lite Regulator No.	Generator
VAT-6201A	GGA
VRX-6201A	GJC

Cutout Relay
Cuts In - 13.0-13.7 volts (VRX), 13.0-13.75 volts (VAT).
Cuts Out - 8.2-9.3 volts (approx. 3-5 amps. discharge).
Contact Gap - .015".
Air Gap - .031-.034".

Voltage Regulator
Setting - 14.5 volts at 80° F. while charging at 10.0 amperes or with .25 ohm resistor in series between regulator and battery.
Air Gap - .048-.052" with contacts just opening.
Checking & Adjusting - *See Electrical Section.*

Current Regulator
▷*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A - Operating Amperes	Test B
VRX	36 Max.	30 (28-32)
VAT	46 Max.	40 (38-42)

Test A - After 15 minutes operation charging at 10 amperes.
Test B - After additional 15 minutes operation on current regulator (load applied to hold voltage at 13.7-13.9 volts (VAT), 13.6-13.8 volts (VRX).
Air Gap - .048-.052" with contacts just opening.
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signal: *See Electrical Section.*
▷*IGNITION - STARTER SWITCH CAUTION: When installing accessories, use accessory terminal only on ignition-starter switch and not ammeter terminal post.*
Lighting & Panel Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut. Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft. Headlamp knob is held on its shaft by a recessed hex screw.
Stop Light Switch (Location): On forward end of master cylinder.

CIRCUIT BREAKERS: Lighting - 20 ampere. Mounted on headlight switch. Protects all lighting circuits.
Windshield Wiper & Back-Up Lights - 5 ampere (single speed wiper), 8 ampere (2-speed wiper). Mounted on wiper switch. Protects wiper and back-up lights.
HORNS: Auto-Lite. Dual horns with relay.
High Pitch - HAD-4702.
Low Pitch - HAD-4701.
Horn Relay: Auto-Lite RAH-4002.

ENGINE

6 CYL. ENGINE

ENGINE SPECIFICATIONS: Six Cylinder "L" head.

Bore	Stroke	Displacement
3½"	4 5/8"	230 cu. ins.

Compr. Ratio	Rated HP	Developed HP
7.6-1 ①	25.4	② 125 at 3600 RPM

① - 7.9-1 compression ratio engine available for taxicabs and other vehicles with H.D. 10" clutch. Special cylinder head used, Part No. 1676377.
② - 131 at 3600 RPM with Power Package.
Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Plymouth Special Data.*
OIL PAN REMOVAL: Remove clutch housing pan to prevent damaging oil pan gaskets on clutch housing pan dust seal. Turn crankshaft so No. 1 connecting rod journal is at bottom dead center. Remove tie rod. Remove oil level indicator. Drop pan and while holding up oil strainer so it clears baffle inside pan, slide pan to rear and remove. NOTE— New end gaskets should protrude 1/8" above oil pan. *Ends must not be cut off.*

ENGINE MOUNTINGS: *See "Engine Mountings" in Plymouth Special Data.*
CYLINDER HEAD: *See "Cylinder Head & Manifold" in Plymouth Special Data.*
▷*MANIFOLD INSTALLATION CAUTION:* Two long capscrews extend into cylinder block water passage. Before installing, apply sealer to these capscrews. It is important that conical washers at flange ends of exhaust manifold be installed to permit expansion and contraction without loosening
TIGHTENING TORQUES: *See "Tightening Specifications" in Plymouth Special Data.*

PISTONS

Aluminum alloy, U-slot, cam grouhd type.
▷*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bore .020" Oversize.*
Weight - 16 ozs. (stripped).
Removal - Pistons and rods removed from above.
Fitting New Pistons: .0007" measured ¾" from the bottom on thrust face. With piston pin and rings removed, cylinder wall and piston dry and clean, insert

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

piston, upside down, into cylinder bore, with feeler stock, .002" x 1/2", inserted between cylinder wall and piston, on high spot of piston contour. Pull to withdraw feeler should be 6-10 lbs.

Replacement Pistons: Std., .005", .020", .030", .040", .060" Oversize.

Installing Pistons: "U" slot away from valves.

PISTON PINS

Full floating type.

Diameter—55/64". **Length**—2-3/4".

Pin Fit in Piston—.0000-.0005". DOUBLE THUMB push fit at room temperature (70° F.).

Pin Fit in Rod Bushing—.0001-.0002". Tight thumb push fit at room temperature (70° F.).

Replacement Pins: Std., .003", .008" Oversize.

NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.010-.020"	.0025-.004"
Compr. (#2)	3/32"	.010-.020"	.002-.0035"
Oil (#3)	5/32"	.010-.020"	.001-.0025"
Oil (#4)	5/32"	.010-.020"	001-.0025"

Replacement Rings: Std., .010", .020", .030", .040", .050", .060" Oversize.

Installing Rings: #1 Compression, with step on inner edge up. #2 Compression with step on inner edge up (step down, if step on outer edge).

CONNECTING RODS

Length (Center.to.Center)—7 13/16"

Weight—27.9 ozs

►*THICKER WALL-BEARING & JOURNAL DIAMETER CAUTION (One or more Journals Machined Undersize). "See "CRANKSHAFT" below.*

Crankpin Journal Diameter—2.0625".

Maximum out-of-round and taper limits—.001".

Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*

Clearance—.0005-.0015".

Endplay—.006-.011".

Bearing Adjustment: None. Replace bearings.

Replacement Bearings: Std., .001", .002", .003", .010", .012", .020" Undersize.

Installing Rods: Oil metering hole toward valve side of engine.

CRANKSHAFT

Journal Diameter—2.4995-2.5005". Four bearing.

Bearing Type—Removable, precision type, thin babbitt on steel. No shims.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows: **.010" UNDERSIZE (All Main & Connecting Rod Journals)**—Letter "B" stamped with engine serial number indicates that ALL Main & Connecting Rod Journals are .010" Undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—When replacing bearings, look for stamped number on middle throw arm of crankshaft. An "M" or "R" followed by a number indicates that a main or connecting rod bearing has a thicker-wall bearing. For example "M2" and "R1" means that .001" thicker-wall bearing inserts are used on the No. 2 main bearing and the No. 1 connecting rod bearing.

Clearance—.0005-.0015".

Replacement Bearings: Std., .001", .002", .003", .010", .012", .020", .030", .040" Undersize.

Crankshaft Rear Oil Seals: *See "Crankshaft & Main Bearings" in Plymouth Special Data*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Plymouth Special Data*

End Thrust: Taken by flanged faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT

Journal Diameters—(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-1/4".

Bearings—Removable, steel-backed babbitt lined bushings (exc. #4— machined in crankcase).

Clearance—.001-.003" NOTE—If clearance exceeds .005" (measure with dial indicator placed against cam lobe and pry toward indicator), install new camshaft for test and if clearance is greater than .0035", replace bearings.

Removal & Installation: *See "Camshaft & Bearings" in Plymouth Special Data.*

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width—1". **Pitch**—.500". **Length**—24" or 48 links.

Camshaft Setting: Sprockets marked. Mesh chain in sprockets with "0" marks on sprockets adjacent and in line with straightedge across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Plymouth Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Plymouth Special Data.*

VALVES

Tappet Clearance: .010" Intake. .010" Exhaust. Engine hot and idling. NOTE—.002" additional clearance on exhaust tappets if car driven at continuous high speed.

Valves	Head Diam.	Stem Diam.	Length
Intake	1-17/32"	.340-.341"	4-27/32"
Exhaust	1-13/32"	.340-.341"	4 25/32"

Valves	Seat Angle	Lift	Stem Clearance
Intake	45°	.365"	.001-.003"
Exhaust	45°	.365"	.003-.005"

Valve Seat Width—1/16-3/32". Runout .0015" maximum.

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Plymouth Special Data.*

Valve Guides: Remove from above. Press new guides in with upper end 7/8" below top of block, ream guides to inside diameter of .342-.343" (Intake), .344-.345" (Exhaust). *CAUTION—Guides must be installed with counterbore end UP on exhaust valves and counterbore end DOWN on intake valves.*

Valve Springs: Can be installed with closely coiled end at either top or bottom. *NOTE—Springs are available in several colors. Colors do not refer to spring tension but merely identify the manufacturer.*

Free Length—2".

Valve Spring Specifications	Spring Pressure	Length
Valve Closed	40-45 lbs.	1-3/4"
Valve Open	110-120 lbs.	1-3/8"

Valve Lifters: Mushroom type (remove from below).

Stem Diameter—5/8". Ream holes from above (pilot in guide). Oversizes .001", .008", .030".

Lifter Clearance in Block—.002" maximum.

V8 ENGINE

►***AIR CONDITIONED CAR SERVICE CAUTION:*** *Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*ENGINE NOTE:* Three engines used. All have polyspherical combustion chamber with lateral valves and single rocker arm shaft. Bores and strokes differ in engines as indicated in Specifications below.

ENGINE SPECIFICATIONS: 90° V8 (All Models).

Engine	Bore	Stroke	Displacement
P-29-1,2,3 Std.	3.75"	3.13"	277 cu. ins.
P-29-1,2 Optl.	3.63"	3.256"	270 cu. ins.
P-29-3 (Fury)	3.8125"	3.3125"	303 cu. ins.

Engine	Compr. Ratio	Rated HP	Dev. HP at RPM
P-29-1,2,3 Std.	8.0	45.0	①187 at 4400
P-29-1,2 Optl.	8.0	42.2	180 at 4400
P-29-3 (Fury)	9.25	46.5	240 at 4800

①- 200 at 4400 RPM with Power Pack.

Compression & Vacuum Reading - *SEE TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Plymouth Special Data.*

ENGINE MOUNTS: *See "Engine Mountings" in Plymouth Special Data.*

OIL PAN REMOVAL: Remove starter, clutch housing dust cover, front and rear engine mounting bolts, oil pan capscrews, and idler bracket at right frame sub side rail. Lower tie rods. Place base of hydraulic jack against lower control arm and opposite end of jack against torque converter housing at starter location. Move engine approximately ¾ - 1" toward rear of car and remove oil pan.

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Plymouth Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Plymouth Special Data.*

PISTONS

Aluminum alloy, elliptically turned, horizontal slot, tin-plated, thermally controlled by steel band.

Clearance - .005-.0015" at top of skirt. Pull to withdraw .0015" x 1/2" feeler should be 5-10 lbs. at 70° F.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" oversize.*

Removal: Pistons and rods removed from above

Replacement Pistons: Std., .005", .020", .030", .040",

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

.060" oversize

Installing Pistons: Assemble pistons to connecting rod on right hand cylinder bank (2-4-6-8) with indent on top of piston on side opposite to large chamfer at insert end of connecting rod. On left bank (1-3-5-7) assemble with indent on same side as large chamfer at insert end of connecting rod. *See Rod Installation*

PISTON PINS

Full floating type.

Diameter - .859" (270 Cu. In. Eng.), .984" (Others).

Clearance in Piston - .0000-.0005". Tight double thumb press fit at 70° F.

Clearance in Rod - .0001-.0004". Tight thumb press fit at 70° F.

Replacement Pins: Std., .003", .008" oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0775-.0780"	.010-.020"	.0015-.003"
Compr. (#2)	.0775-.0780"	.010-.020"	.001-.0025"
Oil (#3)	.1860-.1865"	.010-.020"	.001-.003"

Replacement Rings: Std., .010", .020", .030", .040", .050", .060" oversize.

Installing Rings: Compression rings with step on inner edge up.

CONNECTING RODS

Length (Center to Center) - 5.94" (270 Cu. In. Eng.), 6.12" (Others).

Crankpin Journal Diameter - 1.94" (270 Cu.In. Eng.), 2.13" (Others).

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE): See "CRANKSHAFT" below.*

Lower Bearing - Replaceable, precision type.

Clearance - .0005-.0015" (270 Cu. In. Eng.), .0007-.0022" (Others).

Endplay—.006-.014" (two rods)

Bearing Adjustment: None. Replace bearings

Replacement Bearings: Std., .001", .002", .003", .010', .012" undersize

Installing Rods—*See "Pistons (Installation)" above.* Install rod and piston assembly with indent on top of piston pointing toward front of engine. NOTE—Connecting rod bores are chamfered more on one side than the other. Larger chamfer must be installed toward crankshaft journal fillet

►*BEARING INSERT CAUTION:* When installing lower bearing insert, make certain that "V" groove in insert is in line with "V" groove in cap. Tighten bearing cap nuts to 45 ft. lbs.

CRANKSHAFT

Journal Diameter - 2.38" (270 Cu. In. Eng.), 2.50" (Others).

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows:

.010" UNDERSIZE (Main & Connecting Rod Journals)—Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—When replacing bearings, look for stamped number on middle throw arm of crankshaft. An "M" or "R" followed by a number indicates that a main or connecting rod bearing has a thicker wall bearing. For example, "M2" and "R1" means that .001" thicker wall bearing inserts are used on the No. 2 main bearing and the No. 1 connecting rod bearing

Clearance - .0005-.0015" (270 Cu. In. Eng.), .0007-.0023" (Others).

Replacement Bearings: Std., .001", .002", .003", .012" undersize.

Crankshaft Rear Oil Seals: *See "Crankshaft & Main Bearings" in Plymouth Special Data*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Plymouth Special Data.*

End Thrust: Taken by center (No. 3) main bearing. **Endplay**—.002-.007"

CAMSHAFT

Journal Diameters—(1) 2", (2) 1 63/64", (3) 1 31/32", (4) 1 61/64", (5) 1 9/16".

Bearings - Removable, Steel-backed babbitt.

Clearance - .001-.003".

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay** - .002-.006".

Timing Chain: Width - 1.125" (270 Cu. In. & 303 Cu. In. Engs.), 1.02" (277 Cu. In. Eng.). **Pitch** - .38". **Length** - 68 Links.

Camshaft Setting: Place crankshaft "Zero" mark exactly in line with center of camshaft. Temporarily install camshaft sprocket less chain, line up dowel pin holes in hub and gear, while at the same time positioning camshaft gear "Zero" mark exactly in line with center of crankshaft. (A straightedge should be used to check accuracy of this alignment). Remove camshaft gear and engage with timing chain. Place timing chain over crankshaft gear and at the same time, slide the camshaft gear over end of camshaft, keeping timing mark in position With timing marks aligned, push gear on camshaft. *CAUTION* - block camshaft to prevent rearward movement. If shaft allowed to move back, there is possibility of striking rear camshaft plug.

Removal & Installation: *See "Camshaft & Bearings" in Plymouth Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Plymouth Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Plymouth Special Data.*

VALVES

Tappet Clearance: 270 Cu. In. Eng. - None in service. Hydraulic lifters.

277 Cu. In. Eng. - .008" Intake, .018" Exhaust, with engine hot and idling.

303 Cu. In. Eng. (Fury) - .010" Intake, .018" Exhaust, with engine hot and idling.

270 Cu. In. Eng.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.72"	.372-.373" ②	4.25"
Exhaust	1.47"	.371-.372" ②	4.20"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.360"	.001-.003"
Exhaust	45°	.360"	.002-.004"

277 Cu. In. & 330 Cu. In. (Fury)

Valve	Head Diam.	Stem Diam.	Length
Intake	1.84"	.372-.373" ②	4.54"
Exhaust	1.56"	.371-.372" ②	4.48"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.374" ①	.001-.003"
Exhaust	45°	.380" ①	.002-.004"

① - On 303 Cu. In. Eng. (Fury) Intake .379", Exhaust .376".

② - Standard. *See Valve Guides Below.*

Valve Seat Width—1/16-3/32" (Intake), 3/64-1/16" (Exhaust).

►*VALVE OVERSIZE NOTE:* "I" or "E" stamped on cylinder head at rock cover gasket boss, indicates that all intake or exhaust valves are oversize in that bank depending upon what letter is stamped.

►*VALVE GRINDING CAUTION:* If the position of the valve in the head has been changed (due to valve or valve seat grinding) so as to shorten the operating length of 1/32" or more from its factory installed position, the dimension from valve spring seat in the head to valve tip should be checked with gauge C-3436, If the valve tip exceeds the maximum allowable on the gauge, grind the tip as necessary (do not go below the minimum allowable on the gauge) Improper valve clearance at high speed will result if this condition is not corrected.

Valve Guides: Cast integral with cylinder head Service as follows. When valve stem clearance excessive, use Reamer Tool Set to ream guides for NEXT OVERSIZE Valve as follows Tool C-3433 (.005" O.S.), Tool C-3430 (.015" O.S.), Tool C-3427 (.030" O.S.) Valves furnished Std and .005", .015", .030" Oversize

►*VALVE SPRING NOISE CORRECTION:* Adjust tappets. If noise continues, increase engine revolutions until noise is at highest level, then rotate valve spring left to right ¼ to ½ turn.

Valve Springs: Same spring used on intake and exhaust valves. **Free Length.**- 1 15/16" (270"), 2" (Others).

270 Cu. In. Eng.

	Pressure	Length
Valve Open	134-146 lbs.	1 5/16"
Valve Closed	49-57 lbs.	1 11/16"

277 Cu. In. & 303 Cu. In. (Fury)

	Pressure	Length
Valve Open	160-172 lbs.	1 5/16"
Valve Closed	68-76 lbs.	1 11/16"

►*VALVE SPRING HEIGHT CAUTION.* If valves or seats are reground, check **installed** height of spring If height of spring is 1-11/16" or greater, install a 1/16" spacer (Part No 1400482) in the head counterbore to bring spring height back to nominal 1 5/8—1 11/16"

►*VALVE SPRING NOISE CORRECTION (Caused by Spring Striking Head at Edge of Valve Recess).* To correct, bevel or chamfer edge of recess to provide necessary clearance for spring

Valve Lifters (270 Cu. In. Eng.): Hydraulic, one-piece integral type.

See "Hydraulic Valve Lifters" in Plymouth Special Data.

Valve Lifters (Others): Mushroom type. Remove from below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

S *"Camshaft Setting" under CAMSHAFT above.*

6 Cyl. Engine

Intake Valves - Open 12° BTDC, Close 44° ALDC.
Exhaust Valves - Open 50° BLDC, Close 6° ATDC.

V8 (270 & 277 Cu. In. Engines)

Intake Valves - Open 14° BTDC, Close 50° ALDC.
Exhaust Valves - Open 52° BLDC, Close 12° ATDC.

V8 (303 Cu. In. Eng. - Fury)

Intake Valves - Open 9° BTDC, Close 55° ALDC.
Exhaust Valves - Open 47° BLDC, Close 17° ATDC.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add one additional quart when filter changed.

Normal Oil Pressure: 40-50 lbs. at 25-30 MPH.

Oil Pressure Relief Valve - (6 Cyl.) Located on left side of cylinder block below starter. **(V8)** Located on oil pump body. Adjustable by replacing springs.

►*OIL PRESSURE RELIEF VALVE NOTE:* Springs identified as follows:

6 Cyl. Engine

Color	Free Height	Spring Pressure & Checking Height
Gray (Light)	2 1/16"	16.1-17.1 at 3 1/32"
Red (Standard)	2 1/16"	19.5-20.5 at 2 27/32"
Brown (Heavy)	2 1/16"	22.9-23.9 at 2 31/32"

Color	Free Height	Spring Pressure & Checking Height
Red (Light)	1 13/16"	12 4-13 8 at 1¼'
Black (Standard)	1 13/16"	14 4-15 8 at 1¼'
Green (Heavy)	1 13/16"	16 2-17 8 at 1¼"

Oil Pressure Gauge

Oil Pump (6 Cyl.): Rotor type. On right side of crankcase.

Oil Pump (V8): Rotor type. In crankcase at rear end. Mounted on rear bearing cap.

Priming Oil Pump (V8 - After Overhaul) - Prime oil pump before installing oil pump and strainer to rear main bearing cap.

Overhaul (All) - *See "Oiling System" in Plymouth Special Data.*

Oil Filter: Different types used as follows:

6 Cyl. Engines - By-pass type. With relief valve closed, all oil passes through filter. When oil pressure is greater than relief valve tension, valve starts to open, and excess oil returns to crankcase. *NOTE* - No filter used on P-28-1.

270 Cu. In. V8 Eng. - Shunt type. A portion of oil from oil pump is directed through filter and remainder flows into engine lubrication system.

277 & 303 Cu. In. Engs. - Full flow type. All oil enters engine lubrication system through filter at full pump pressure. Safety valve in filter opens if filter is clogged, allowing oil to pass into lubrication system under a reduced pressure.

Filter Element - Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: (P-28) 13 qts., (P-29 270" Eng.) 19 qts., (P-29 Others) 20 qts. Add one additional quart for models with heater.

Pressure Valve (Exc. Fury & Air Cond.) - Plymouth 1373136. Radiator filler cap. Opens at 7 lbs.

Pressure Valve (Fury & Air Cond.) - Radiator filler cap. Opens at 14 lbs.

Thermostat: Bellows type (Exc. Fury & Air Cond.). Pellet type (Fury & Air Cond.). Located in cylinder head water outlet. Bellows type starts to open at 155-160° F. Pellet type starts to open at 157-162°.

Water Pump: (6 Cyl.) - Packless type. Grease fitting for lubrication.

(V8) - Ball bearing type. No lubrication required. *NOTE* - 270 Cu. In. Engine pump not interchangeable with pumps on other V8 models.

Water Distribution Tube (6 Cyl. Eng.): *See "Cooling System" in Plymouth Special Data.*

Temperature Gauge: Auto-Lite 13998A. Electric type.

CLUTCH

Borg & Beck. *NOTE* - Auburn Clutch Optional on 6 Cyl.

Borg & Beck	Model	Assy. No.	Disc. No.
P-28 (Exc.Stn.Wgn.)	9A7	361373	382237
P-28 (Stn.Wgn.)	10A7	361368	382358
P-29	10A7	361368	382358
P-28 H.D.	10A7	361378	382358
P-29 H.D.	11A6	929	381850
P-28 (Can.)	9A7	361383	382237
P-29 (Can.)	10A7	361368	382358
P-88, 29(Can.) H.D.	11A6	929	381850

Auburn - Assembly No. 100052-2 (P-28 Std.).
See Borg & Beck" or "Auburn" Clutches in Clutch Sect.

Pedal Adjustment: Turn clutch release fork rod adjusting nut until 3/16" free movement of clutch fork outer end is obtained. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: Tighten eyebolt sleeve on clutch pedal overcenter spring bolt finger tight with pedal in depressed position, then tighten four complete turns.

Removal: Disconnect propeller shaft, speedometer cable, parking brake cable, and gearshift control rods. Remove transmission (See Synchro-mesh Transmission). Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel, loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse)
See "Plymouth Synchro-mesh" in Transmission Section.

Transmission Controls *See "Transmission Controls" in Transmission Section*

►*CAR TOWING CAUTION* If car is to be towed long distances, disconnect propeller shaft at rear axle carrier.

Removal: Disconnect propeller shaft, speedometer cable, hand brake cable, and control rods. If transmission is to be disassembled, apply hand brake to hold mainshaft while loosening flange nut. This method will also prevent possible brinelling of bearings, or other damage caused by pounding on wrench. Remove transmission by pulling it straight back until pinion shaft clears clutch disc before lowering transmission. This precaution will avoid bending clutch disc.

OVERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down
See "Warner R10" Overdrive in Transmission Section

Overdrive Controls *See "Overdrive Controls" in Transmission Section*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated planetary transmission
See "PowerFlite" Transmission in Transmission Section

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION* *See "PowerFlite" Transmission in Transmission Section*

►*TESTING & TROUBLE SHOOTING* *See "PowerFlite" Transmission in Transmission Section*

►***THROTTLE VALVE "BUZZING" DURING DOWNSHIFT CORRECTION: See Production Changes under "PowerFlite" Transmission in Transmission Section.***

►***DRAINING OF TRANSMISSION PROCEDURE CHANGE:*** Approximately April 15, 1956 oil pan drain plug was discontinued. Draining of transmission is accomplished by removing filler tube connector at oil pan.

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid "Type A".

►***OVERFILLING CAUTION:*** High engine speed or high temperature operating conditions may cause transmission oil to expand to point where transmission is, in effect, overfilled, causing governor pressure to drop to point to cause a high speed downshift in transmission. *See "Checking Fluid Level" below.*

Checking Fluid Level - Manufacturer recommends checking fluid level with engine cold (70° F.).

Cold Check - If oil level between (L) Low mark and end of dipstick, **1 pint** of Transmission Fluid "Type A" may be added, but no more than 1 pint.

After Operation Check - If oil level is above (L) Low mark, do not add oil. If oil level is above (F) Full mark, drain to ½" below full mark. Add oil ONLY WHEN OIL LEVEL IS BELOW THE (L) LOW MARK on dipstick and transmission has been brought up to actual operating temperatures. In this case add **1 pint** of oil only.

Oil Filler Tube (Location) At right rear of engine compartment

►*CAUTION* To prevent dirt from entering transmission make sure oil level indicator is properly seated in filler tube.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Universal. Ball & Trunnion, front and rear (Exc. Fury). Ball & Trunnion - front, Cross type - rear (Fury).

REAR AXLE

Own. Semi-floating with separate carrier and Hotchkiss Drive.

Transmission (Ratios)	Standard	Optional
Standard	3.73-1	3.54,3.9,4.1,4.3-1
Overdrive	4.1-1	3.9, 4.3-1
PowerFlite (P-28)	3.73-1	3.9, 4.3-1
PowerFlite (P-29)	3.54-1	3.73, 3.9, 4.1-1
PowerFlite (Fury)	3.73-1	3.54, 3.9-1

►*REAR WHEEL BEARING PRODUCTION CHANGE:* Rear wheel bearing grease holes and plugs were eliminated during production. Relubrication during normal life of car is not required (clean and repack bearings if removed).

Backlash—.006-.010"

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly

Axle Shaft Removal: Remove wheel, drum, and hub assembly (use screw type hub puller—Tool C-845), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 Puller)

Wheel Bearing Adjustment: Shims between backing plate and axle housing With wheel and hub removed check endplay with dial indicator To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick (equally at both wheels). **Endplay**—.003-.008"

SHOCK ABSORBERS

"Oriflow". Direct-acting, hydraulic type Serviced by replacement

FRONT SUSPENSION

Independent. Coil springs and direct-acting shock absorbers. Shock absorbers located within coil springs.

Kingpin Inclination: 5—6½° at 0° camber

Caster—Neg. 2° to 0° (Left side 0° to Neg. ¾° more than right side, Right side 0° preferred)

Camber—Neg. 1/8° to Pos. 5/8° (Left side Pos. ½°, Right side 0° preferred)

Toe-In - 1/8" preferred.

Toe-Out on Turns - With inside wheel at 20°, outside wheel should be 17½-19°.

STEERING

Manual: Gemmer. Worm and three-tooth roller *See "Gemmer Worm & Roller" in Steering Section.*

Power Steering: "Coaxial". Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column *See "Coaxial" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: Plymouth "Safe-Guard" Lockheed hydraulic *See "Plymouth Safe-Guard" in Brake Section*

Drum Diameter - 10" front and rear (P-28), 11" front, 10" rear exc. Suburban (P-29), 11" rear (P-29 Suburban), 11" front and rear (Fury).

Wheel Cylinder Diameter - 1 1/8". Single acting (front), double acting (rear).

Lining - Molded asbestos (bonded to shoe).

Width - 2". **Thickness** - 3/16". **Length** - (P-28 Exc. Rear Secondary) 10.5". (Rear Secondary) 8". (P-29 & Fury-Exc. Rear Secondary) 11.5". (Rear Secondary) 8.8".

Braking Power - 60% front (P-28 & Fury), 40% rear (P-28 & Fury). 62% front (P-29), 38% rear (P-29).

Clearance - .006" at each end of all shoes.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid - Filler plug at top of master cylinder (on dash panel in engine compartment).

Removal - Disconnect pushrod. Disconnect stop light wires and brake line tube at master cylinder. Remove four stud nuts from studs, remove master cylinder.

►*MASTER CYLINDER REPLACEMENT COVER CAUTION:* Some new replacement covers have reduced lower crown or a reduced overall height. Original hold-down bolt will bottom when used with these covers. Use bolt, Part No. 1671571, which is ¼" shorter.

Power Brakes: Synchro-mesh Cars - Integral type. Replaces regular master cylinder. Unit mounted on engine side of firewall.

PowerFlite Cars - Bellows type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder).

Removal of Integral Type Power Unit - Same as for standard master cylinder, after stop light wires and hydraulic lines are removed.

Removal of Bellows Type Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond extremities of bracket *(NOTE* - If pedal linkage is allowed to extend through hole in dash panel, trigger arm may be damaged). Disconnect vacuum hose at power unit. Remove complete power unit and bracket assembly by removing four nuts and lockwashers.

Parking Brake: On shaft at rear of transmission 6" external contracting type used with Synchro-mesh Transmissions. 7" Internal expanding type used with Powerflite Transmission.

Adjustment—*See "Hand Brake Notes" in Plymouth Special Data.*

Lining—	Width	Thickness	Length
6" Ext Type	2"	5/32"	15 3/8'
7" Int Type	2"	5/32"	13 1/16"

Clearance (Internal Expanding) - Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

Clearance (External Contracting) - Adjust anchor screw so clearance between band and drum at anchor is .015-.020".

MISC. MECHANICAL

Windshield Wipers: Auto-Lite EPH-4101 (Std.), EPF-4001 (2-Speed - Optl.). *See "Auto-Lite Electric Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: *See "Plymouth Airtemp" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type Reversible type motor in each window Controlled by door switch and master control switch *See "Electric Window Regulators" in Misc. Section.*

Power Seat Adjusters: Electric type *See "Power Seat Adjusters" in Miscellaneous Section.*

Convertible Top Control: Electrical-hydraulic type. *See "Power Top Controls" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	95
Intake Manifold	40
Exhaust Manifold	25
Oil Pan	12
Main Bearing Caps (Exc Rear)	95
Main Bearing Cap (Rear)	120
Flywheel	95
Con Rod Caps	45
Rocker Arm Cover	3
Pushrod Cover	10
Water Pump Mounting	15

ENGINE

ENGINE REMOVAL: *NOTE—The engine may be removed with the transmission attached, however if it is desired to remove transmission before removing engine, see "Transmission Removal" on Car Page.*

1) Drain engine oil, water, and transmission lubricant. With hood raised, remove hinge to cowl attaching screws and hinge to hood attaching screws, and remove hood.
2) Remove battery. Remove carburetor air cleaner and disconnect throttle linkage. On cars with power steering, remove power steering pump belt and pump with mounting bracket, leaving hoses connected. Place pump in position where it will not become damaged. Remove upper and lower radiator hoses and disconnect heater line from intake manifold and bottom of radiator
3) Disconnect flex fuel line at fuel pump, oil pressure gauge line at connector near dash, and windshield wiper vacuum hose at rear of engine. Disconnect power brake vacuum hose at check valve to carburetor pipe. Remove thermo gauge unit from fitting in intake manifold. Disconnect coil primary lead at coil Disconnect generator to regulator wires from generator (release from clips retaining to valve cover and pull clear of engine).
4) Disconnect wire loom running to right headlight across radiator at junction block on right side of radiator support to fender brace and release loom from clips retaining it to radiator. Remove fan, fan shroud, and radiator
5) Remove engine right side apron and crankcase ventilator outlet pipe Disconnect exhaust pipe from exhaust cross over pipe. Disconnect wiring from starter solenoid. Remove gearshift linkage at transmission. Disconnect linkage from clutch throwout fork and remove clutch control countershaft bracket from flywheel housing on synchromesh cars.
6) Hook a chain fall to intake manifold by means of a strong chain threaded through the openings in manifold just behind carburetor. Raise engine just enough to take weight off engine insulators. Remove screws holding front and rear insulators to frame crossmembers
7) On Hydra-Matic Cars, support bottom of transmission with a jack and jack adapter J-2808 and remove frame crossmember to which engine rear insulators were fastened. *CAUTION*—Use care to prevent transmission swinging down when crossmember is removed.
8) Carefully hoist engine and transmission out of car checking frequently to see that sufficient clearance exists to prevent bending any parts.

ENGINE MOUNTINGS

FRONT INSULATOR: *NOTE—If new rear insulators are also to be installed, they should be installed first since the engine locates from the rear insulators.*

Removal: 1) Take weight of engine off insulators using suitable lifting equipment *(CAUTION—Do not use a jack under oil pan).* Remove screws fastening engine support to timing chain cover.
2) Remove screws which fasten insulator to frame front crossmember (these screws can be reached through an access hole in bottom of front crossmember). Raise engine just clear of insulator and support assembly
3) Disconnect exhaust crossover pipe at both manifolds and exhaust pipe so it can be lowered to provide clearance for removing insulator. Remove insulator and assembly.

Installation: 1) Position insulator and support assembly against timing chain cover and install attaching screws with lockwashers. Tighten to 60 ft. lbs.
2) Connect exhaust crossover pipe to both exhaust manifolds and exhaust pipe, using all new gaskets. Use four thin (075"), or two thick (.135") gaskets at each flange. Tighten attaching bolts securely. Lower engine and install frame to insulator screws with lockwashers and tighten

REAR INSULATOR: *NOTE—Rear insulator locates engine. Front insulator must be allowed to position itself after rear insulator installed.*

Removal: Remove two front insulator to frame bolts. Support engine securely at rear to remove engine weight from rear insulators *(CAUTION—Do not use jack under oil pan)* Remove two bolts holding each rear insulator to frame crossmember, and then remove insulators by removing two bolts holding each insulator to flywheel housing. Disconnect exhaust pipe from exhaust crossover pipe so exhaust pipe can be moved to gain access to right insulator frame bolts

Installation: Install new insulators on flywheel housing using lockwashers under each of two bolts holding insulator. Lower engine so rear insulators are resting on frame crossmember and insert insulator to frame bolts from top. Install self locking nuts and tighten to 35 ft. lbs. Raise front of engine slightly to take weight off front insulator, then lower engine completely so it rests on front insulator and install two front insulator to frame bolts (with lockwasher and flat washer on each)

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD: Removal—Remove intake manifold and push rod cover. Remove rocker arm covers (On left bank, remove spark plug wires and wire support). Remove battery and engine ground straps, Hydra-Matic level indicator tube bracket and indicator. Loosen all rocker arm adjusting nuts and move rocker arms off pushrods Remove pushrods and place in order so they can be reinstalled in the same position (*NOTE*—The rearmost pushrod on left bank (cars with defroster) cannot be removed withdraw rod part way and tie to head. Remove exhaust crossover pipe to manifold attaching screws and remove screws from cylinder head water outlet fitting. Remove cylinder head (dowel pins will hold head in place) and remove head with exhaust manifold attached (*NOTE*—When left head being removed, raise head off dowels, move it forward and "jockey" the the head in order to clear defroster, power steering, and power brake equipment).

Installation: (*NOTE—Right and left cylinder heads are interchangeable except for water passage plug in end of water passage which must be installed in correct position if new head installed).* To install, reverse removal procedure and note the following: Head screws are three different lengths and when properly installed, all screws will project an equal distance from head. Do not use sealer of any kind on threads.

CONNECTING ROD & BEARINGS

CONNECTING ROD BUSHING REPLACEMENT: Press out old bushing using Bushing Remover & Installer J-5753-3 and Block J-5753, (*NOTE*—For removal of bushing, the smallest diameter or third shoulder on tool is inserted in bushing). Press new bushing into place using same tools as for removal, but using opposite end of Bushing Remover & Installer. This tool must be used since the thin wall bushing will distort when pressed into rod unless supported by shank of tool. Drill a 5/32" hole in bushing through oil hole in top of rod, using care to prevent end of tool damaging opposite side of bushing. Swage or expand bushing into connecting rod using Burnisher Tool J-5753-1 and Block J-5753, pressing Burnisher Tool through bushing with connecting rod assembly supported on Block. Hone bushing to fit piston pin.

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL REPLACEMENT:
1) Drain oil and remove oil pan, oil pump, and oil pump drive shaft. Remove oil baffle and cylinder block to oil baffle tube (lower oil level indicator tube). Remove transmission (See Synchro-mesh Transmission Removal on Car Page or Hydra-Matic Drive in Transmission Section).
2) Remove rear center main bearing cap and upper half of rear center main bearing shell to allow crankshaft to be lowered and to prevent damage to thrust surfaces of bearing. Remove rear main bearing cap and loosen remaining bearing caps sufficiently to allow crankshaft to be lowered approximately 3/8" at rear.
3) With crankshaft lowered to provide clearance, remove upper half of rear main bearing oil seal and bearing shell.
4) Install seal in cap with one end flush with cap and compress seal using hammer and Seal Compressor J-3048-A. *Do not pack seal into locking recess in cap.* Remove seal from cap and install in groove in block by slipping over crankshaft into cavity of block Insert end which was flush with cap first Install rear main bearing cap with bearing shell and tighten to 95 ft. lbs., to pull crankshaft up into place against seal. Carefully trim both ends of seal flush with block.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

5) Install a new seal in cap, as above, *except that Seal must be packed into locking recess in cap.* Trim seal flush with cap. Install cap with shell and tighten to 95 ft. lbs. Remove rear main bearing cap again and inspect split line to be certain that none of seal material has been compressed between cap and block. Make sure mating surfaces are clean.

6) Next, apply a bead of sealer (Permatex No. 3) approx. 1/16" in diameter to mating surface of cap extending from packing seal groove outward to the groove for oil pan cork rear gasket. Install rear main bearing cap and tighten to 120 ft. lbs. torque.

7) Remove rear center main bearing cap and reinstall upper half of bearing shell. Install cap and tighten to 95 ft. lbs. Tighten remaining bearing caps to 95 ft. lbs. Replace transmission, oil pump, oil pump drive shaft, oil baffle, oil pan and flywheel lower cover and shield.

▷*CAUTION:* Seal must be installed exactly as detailed above to prevent oil leaks at rear bearing. Make certain that seals not cut too short and that mating surfaces of bearing cap and block are free of any packing material, dirt or oiliness (except for Permatex bead on cap) and that they are not scratched or burred.

VIBRATION DAMPENER

VIBRATION DAMPENER: Removal–Loosen generator at adjusting strap and remove fan belt from vibration dampener. On card equipped with power steering, also remove power steering pump belt. Position fan so wide angles will be at top and bottom allowing access to balancer. Remove dampener attaching screw (15/16" socket) and retaining washer, and slide dampener off shaft.

Installation: Reverse the removal procedure.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal–1) Drain radiator. On cars with power steering, remove pump with mounting bracket from pad on top of engine front cover and lay it back on fender skirt where it will be out of the way. *(CAUTION–Disconnect battery ground strap).*

2) Disconnect wires from generator and remove generator and mounting bracket and adjusting strap. Remove fan belt, power steering pump belt, and fan and pulley. Disconnect upper and lower radiator hoses, remove fan shroud, and remove radiator. Remove water inlet elbows from cylinder heads (leave hose attached). Remove fuel pump and remove vibration dampener.

3) Take weight off engine front insulator using suitable engine lifting equipment. *(CAUTION–Do not use jack under oil pan).* Remove screws and lockwashers attaching front insulator to engine front cover. Remove four front oil pan-to-engine front cover screws. Remove engine front cover-to-block attaching screws and nuts. Pull cover forward to clear studs and remove.

Installation: See Crankshaft Oil Seal (below), install new front oil pan gasket (cement gasket to oil pan), Position new front cover gasket over studs on front of block, position front cover on engine, install all capscrews and nuts with lockwashers and tighten securely. Install four oil pan-to-front cover capscrews and lockwashers, then tighten these screws to 10 ft. lbs. Install front engine support-to-front cover screws loosely, then lower engine and tighten screws to correct torque of 60 ft. lbs. Reassemble engine by reversing removal procedure (above).

CRANKSHAFT FRONT OIL SEAL REPLACEMENT: After front cover removed (above), slide old seal off end of crankshaft. Coat face of new seal with graphite lubricant and install on crankshaft before installing front cover.

FLYWHEEL

HYDRA-MATIC DRIVE CARS

FLYWHEEL INSTALLATION: Clean mating surfaces of flywheel and crankshaft thoroughly (use Acetone to clean old Pliobond 30 from surfaces). Apply a thin coat approximately ½" wide) of Pliobond 30 sealing compound on surface of crankshaft at bolt circle. Smooth seal compound around toward outer edge and allow to dry about one minute. *(CAUTION–*In no case will a fibre gasket be used between flywheel and crankshaft. Use only Pliobond 30 sealing compound). Install flywheel on crankshaft flange carefully and enter all flywheel bolts through plates. Tighten bolts diametrically opposite uniformly to correct torque. *(NOTE–*Draw flywheel on evenly during this operation to prevent leakage and excessive runout). Mount a dial indicator so stem or button rests on torus cover gasket seal area and check flywheel runout. Runout should not exceed .005".

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL & INSTALLATION: Drain radiator. Remove intake manifold, crankcase ventilator outlet pipe, pushrod cover and rocker arm covers. Disconnect and move spark plug wires out of way. Loosen rocker arm ball nuts so rocker arms can be disengaged from pushrods and turned sideways. Remove pushrods and hydraulic lifters. Mark or store pushrods and lifters so they can be installed in original positions *(NOTE* - Exhaust valve pushrod of No.7 cylinder cannot be removed because of interference with defroster core. It should be blocked up so that it will not interfere with removal of camshaft. Use spring-loaded clothes pin). Remove radiator and timing chain cover. Remove timing chain cover seal and fuel pump eccentric. Slide timing chain and sprockets off ends of crankshaft and camshaft. Remove camshaft thrust plate attaching screws and remove thrust plate. Slide camshaft out of engine carefully, making sure not to damage bearings in block. Front of engine should be raised as necessary to permit shaft to slide between grille and hood catch support plate. To install camshaft, reverse removal procedure.

TIMING CHAIN

▷*TIMING CHAIN REMOVAL CAUTION:* Do not rotate crankshaft with timing chain out of engine. Damage to valves, pistons, or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage to valves.

TIMING CHAIN: Removal–Remove engine front cover (See Engine Front Cover above). Remove fuel pump eccentric. Align timing marks on sprockets. Slide timing chain and sprockets off camshaft and crankshaft.

Installation: Install new timing chain and sprockets making sure that marks on sprockets are aligned exactly on a straight line passing through shaft centers. Install fuel pump eccentric indexing pin on eccentricwith hole in sprocket. Install retainer screw and retainer washer and tighten securely. Install engine front cover.

VALVE SYSTEM

EXC. 285 HP ENGINE

▷*NOTE: Valves on 285 HP Engine are 3/32" longer than on regular production engines.*

CHECKING VALVE STEM LENGTH: Position rocker arm on stud and hold in place using Rocker Arm Stud Installer J-6301. Slip valve into place and hold it against valve seat. While holding rocker arm and valve in position securely, insert Valve Train Gauge J-6324 through pushrod hole and seat snugly in pushrod seat of rocker arm. With all parts seated, step end of gauge should be at least flush with gasket face of head, but should not project past step on gauge. If gauge projects too far (indicating valve stem too long), grind off tip of valve stem as necessary. *CAUTION–*When grinding end of valve stem be careful not to overheat it which will soften the hardened stem.

ROCKER ARMS

ROCKER ARM STUD REPLACEMENT: *NOTE–Use oversize stud (.003") only when original stud is found to be loose in cylinder head. Use Std. size stud for replacement when original stud threads are damaged).*

Removal: 1) Remove cylinder head from engine. With rocker arm removed, file two slots 3/32" to 1/8" deep on opposite sides of rocker arm stud. Top of slots should be 1/4-3/8" below thread travel. Place washer J-6392-3 at bottom of rocker arm stud. Position Rocker Arm Stud Remover J-6392-1 on rocker arm stud and tighten screws securely with 5/32" allen wrench. Place spacer J-6392-2 over stud remover. Thread 7/8" standard nut on stud remover and turn nut until rocker arm stud is out of cylinder head. If oversize stud being installed, ream out stud hole with Reamer J-5715.

2) Remove plugs from ends of cylinder head oil gallery and thoroughly clean out metal deposits and foreign matter from cylinder head (head must be right side up so metal or foreign material will not lodge around studs).

Installation: 1) Position rocker arm on new rocker arm stud and place Rocker Arm Stud Installer J-6301 on stud in place of rocker arm ball. Carefully press stud into head using a 2-Ton press, until it is installed about half-way (7/16").

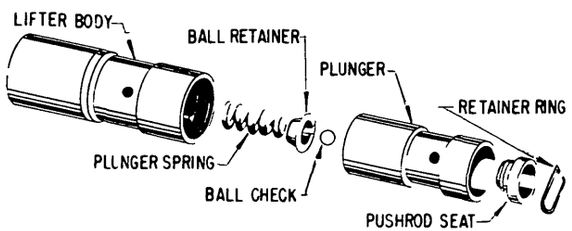
2) Position Valve Train Gauge J-6324 in pushrod hole so that it seats properly in the rocker arm. With valve seated, slowly press rocker arm stud into cylinder head until gauge projects about midway between end of gauge and step with respect to gasket surface of cylinder head.

3) Remove Rocker Arm Stud Installer, rocker arm and ball. Blow air through hole in new stud to insure that passage is not restricted, and blow air through oil

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

gallery. Replace plugs in ends of oil gallery. Check oil passages from oil gallery to all studs. Install rocker arm and ball and install nut loosely Replace cylinder head



HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTER OVERHAUL: Removal–Remove intake manifold, pushrod cover and rocker arm cover. Loosen rocker arm ball nut and move rocker arm off pushrod. Remove pushrods (rear lifter on left bank cannot be removed if car is equipped with defroster, but must be raised and moved out of way for removal of lifter). Remove lifter from bore in cylinder block.

Disassembly: Remove pushrod seat retaining ring by holding down seat with pushrod while dislodging spring from lifter body with pointed tool (*NOTE*–it may be necessary to unseat lifter ball, using plunger unloader J-5097, before plunger can be pushed down) Invert lifter and allow plunger to slide out of body. If plunger sticks, place lifter in large end of Hydraulic Valve Lifter Plunger Remover J-4160-A, with pushrod end of lifter downward. Hold tool firmly in hand with thumb over lifter body and strike sharply against a block of wood until plunger falls out (it may be necessary to soak a lifter with a stuck plunger in cleaning solvent to loosen plunger in body) *CAUTION–If more than one lifter is being disassembled at a time make very sure that parts for each individual lifter be kept together so that parts are not intermixed.*

Inspection: Wash individual lifters separately, keeping parts for each lifter together. If necessary, soak lifter in suitable carbon solvent to dissolve varnish and carbon. Using a lint free cloth, clean each part with a hard wiping action Use a bristle brush if required. Do not use a wire brush or sandpaper. Inspect lifter body for scoring, and check cam surface at end of lifter for wear Check plunger, and using a magnifying glass, inspect check ball seat for defects, and outer surface of plunger for scratches or scores Inspect pushrod seat for roughness and make sure hole in seat is open. Inspect lifter ball for nicks or scoring. If any part of lifter is found defective, replace entire unit.

Assembly: Rinse all parts in clean kerosene before assembly and assemble without drying Rinse plunger spring and ball retainer and position retainer in spring **Install ball in retainer (check ball spring not used in regular production lifters, used in 285 HP engine). Rinse plunger and place on retainer so seat on plunger mates with ball. Invert plunger with parts assembled thus far and, after rinsing body, install body over spring and plunger. Place lifter body on clean paper, rinse and install pushrod seat and retainer ring.**

V8 HYDRAULIC LIFTER

Checking Leakdown Rate: Fill tester cup in Valve Lifter Leakdown Tester J-5790, to approximately 1 inch from top with special testing fluid Swing weight arm up out of way, raise ram, and position lifter into boss in center of tester cup. Place ¼" steel ball in pushrod seat of lifter and lower ram onto ball Adjust ram (with weight arm clear of ram) so that pointer is positioned on set line (marked "S") Tighten jam nut to maintain setting. Operate lifter through full travel of plunger by pumping weight arm to fill lifter with test fluid and force out air, (Lifter must be completely submerged at all times). Continue pumping for several strokes after definite resistance is felt (*NOTE*–If noticeably weak resistance is felt during any one of last few strokes (of hard pumping), replace ball in lifter and repeat test to this point Raise weight arm to allow plunger spring to expand fully, lower arm onto ram and commence turning crank slowly (1 revolution every 2 seconds) Time indicator travel from lower line (first line above set line) to line marked .125" or 1/8", while still rotating cup with crank. Lifter is satisfactory if rate is between 12 and 30 seconds. Retest all doubtful lifters.

Installation: *(CAUTION–If new lifter is to be installed, remove sealer coating from new lifter, making sure that hole in pushrod seat is not plugged with sealer coating. Check leakdown rate).* Place new lifter in lifter boss and replace pushrod exactly as removed (same end against rocker arm). Tighten rocker arm ball retaining nuts to 15 ft. lbs. Replace rocker arm cover, pushrod cover and intake manifold.

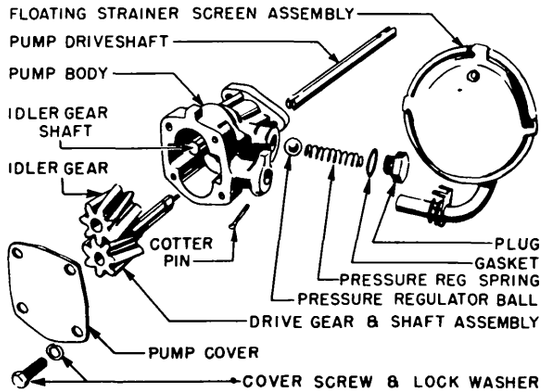
OILING SYSTEM

OIL PASSAGE PLUG (IN CYLINDER HEAD) REPLACEMENT: *This plug is located on intake side of cylinder head bolt which feeds cylinder head oil gallery (toward rear of head on left bank, and toward front of head on right bank).*

Removal: Remove cylinder head bolt from hole which feeds oil gallery. Attach a piece of rag to a wire for removing rag, and push rag down into bolt hole past the oil passage in which plug is located. Drive old plug through passage into bolt hole where it will drop onto rag. Pull rag out pulling old plug with it.

Installation: Drive plug into place using a tool which bears into bottom of plug (½" x 3" bolt can be used) until outer edge of plug is flush with surrounding surface of head.

OIL PUMP



OIL PUMP OVERHAUL: Removal–Remove oil pan and remove oil pump attaching screws while holding pump in place. Carefully lower oil pump away from block with one hand while removing oil pump drive shaft with the other hand

Disassembly: Remove cotter pin which retains floating screen to pump inlet and remove screen. Remove pressure regulator and spring retainer, spring and pressure regulator ball Remove screws retaining cover to oil pump body and remove cover. Remove driven gear and drive gear with shaft.

Cleaning & Inspection: Clean all parts thoroughly (clean screen with Bendix Cleaner). Inspect pressure regulator spring for distortion, cracks, and wear on sides. Inspect pressure regulator ball for nicks or other damage Inspect oil pump drive shaft (distributor to pump shaft) for wear or cracks. Inspect all other pump parts for wear. Replace parts as necessary.

Assembly: Install drive and driven gears. Install cover and turn drive shaft by hand to insure that it turns freely and has a slight amount of endplay. Install pressure regulator ball, spring and retainer using a new gasket on retainer *(CAUTION–Do not attempt to chang oil pressure by varying length of pressure regulator spring).* Install screen assembly on oil pump and install new cotter pin retainer.

Installation: To install pump, position drive shaft into position in distributor and oil pump drive gear, then position oil pump in place on block, indexing drive shaft with pump drive gear shaft. Install two attaching screws with lockwashers and tighten securely *(NOTE–*Removal and installation of pump does not disturb distributor timing). Install oil pan.

V8 OIL PUMP

FUEL SYSTEM NOTES

FUEL FILTER (Draining & Cleaning): Remove drain plug and drain out dirt and water. If filter is excessively dirty remove filter from car and agitate it in a carburetor cleaner or solvent. Direct an air stream through the *outlet port* which will force water and dirt out through inlet port. Rinse filter in kerosene and again flush with air. Install drain plug and reinstall filter.

EXCESSIVE FUEL PUMP PRESSURE (Causing Carburetor Flooding): If fuel pump pressure in excess of 5 lbs., check pump for incorrect diaphragm installation (insufficient slack) before replacing pump.

1) Mount pump in vise with fuel side up, loosen fuel pump cover screws two turns to free diaphragm.

2) Flex diaphragm by moving rocker arm up and down several times (use short piece of pipe fitted over rocker arm to provide leverage)

3) Hold rocker arm in extreme upper position while tightening all cover screws securely This will provide slack in diaphragm.

4) Reinstall pump and check pressure. If pressure still in excess of 5 lbs., replace pump

► *FUEL FILTER PRODUCTION CHANGE (To Prevent Carburetor Flooding): See "CARBURETOR" on Pontiac Car Model Pages.*

► *SPECIAL 285 HP "STRATO-STREAK" V8 ENGINE NOTE This engine furnished as a factory install d option on all models exc pt those with air conditioning. Service adjustments and specifications are included below.*

► *AIR CONDITIONED CAR SERVICE CAUTION Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model	Series Designation
Star Chief	56-28
Star Chief Safari	56-27
Eight Seventy (870)	56-27
Eight Sixty (860)	56-27

SERIAL & ENGINE NUMBERS (Numbers are the same): On left front hinge pillar post and on raised pad at front of right hand cylinder block.

► *ENGINE & SERIAL NUMBER NOTE Engine and Serial number (example P756H 1001) includes following identification information in sequence.*

Assembly Plant	Model ①	Model Year	Trans. Type ②	Serial No.
See below	7	56	H	1001

①–**7** (27 Series). **8** (28 Series).
②–**H** (Hydra-Matic). **S** (Synchro-mesh).

Assembly Plant Designations

P–Pontiac	**K**–Kansas City
C–South Gate	**L**–Linden
W–Wilmington	**A**–Atlanta
F–Framingham	**T**–Arlington

TUNE-UP

► *SPECIAL 285 HP "STRATO-STREAK" V8 ENGINE SERVICE NOTE* Service specifications and procedures are different than standard engines, as noted below

COMPRESSION PRESSURE: 145-155 lbs. (8 9-1 Head), 120-130 lbs. (7.9-1 Head), at 160-170 RPM cranking speed.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

► *VALVE ADJUSTMENT NOTE Because of new design, it is no longer necessary to initially adjust the tappet clearance when cylinder head or valve system disturbed.*

MANIFOLD HEAT CONTROL: Thermostatic coil type mounted in right hand exhaust manifold.

► *DUAL EXHAUST NOTE* Optional equipment on all but 860 four door station wagon. With control valve closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders–RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035", (.033-.038").

Spark Plugs - AC No. 46. 14 mm. Torque to 25 ft. lbs. max. or finger tight plus ¾ turn with wrench. *NOTE* - Supersedes AC No. 44 plug previously recommended.

COIL: Delco-Remy 1115087 (Exc. 285 HP Engine), 1115099 (285 HP Engine). *12 Volt.*
Ignition Current - (1115087) 1.2 amps. idling, 3.5 amps. stopped, (1115099) 1.8 amps. idling, 4.0 amps. stopped.
Resistor - Delco-Remy 1927809 (Exc. 285 HP Engine). 1931395 (285 HP Engine). **Resistance** - 1.40-1.65 ohms (1927809), .27-.39 ohm (1931395).

► *COIL RESISTOR NOTE Resistor is connected in lead from ignition switch-to-coil. This resistor is by-passed during cranking by lead from starter solenoid to coil.*

DISTRIBUTOR: Delco-Remy 1110862 (Exc. 285 HP Engine); 1110875 (285 HP Engine). *12 Volt.*

► *1110875 DISTRIBUTOR (285 HP ENGINE) NOTE:* This distributor is equipped with a dual set of contacts and has centrifugal advance only (vacuum advance is not provided).

Condenser - Delco-Remy 1869704. **Capacity** - .18-.23 mfd.
Contact Point Set - Delco-Remy 1918148.
Breaker Gap - .016" (Exc. 285 HP Engine), .014-.018" (285 HP Engine).
Cam Angle - 26-33° (Exc. 285 HP Engine), 29°±1° (individual breaker operating), 34°±1° (both breakers operating - 285 HP Engine).
Breaker Arm Spring Tension–19-23 ozs.
Rotation–Counter-clockwise viewed from above.

Automatic Advance–1110862

Degrees Distr.	RPM	Degrees Eng.	RPM
0.5-2.5	525	1-5	1050
7-9	1050	14-18	2100
8-10	1400	16-20	2800
9-11	1800	18-22	3600

Automatic Advance–1110875

Degrees Distr.	RPM	Degrees Eng.	RPM
0-0.5	350	0-1	700
1-3	600	2-6	1200
5-7	1000	10-14	2000
6.5-8.5	1500	13-17	3000
8-10	2000	16-20	4000

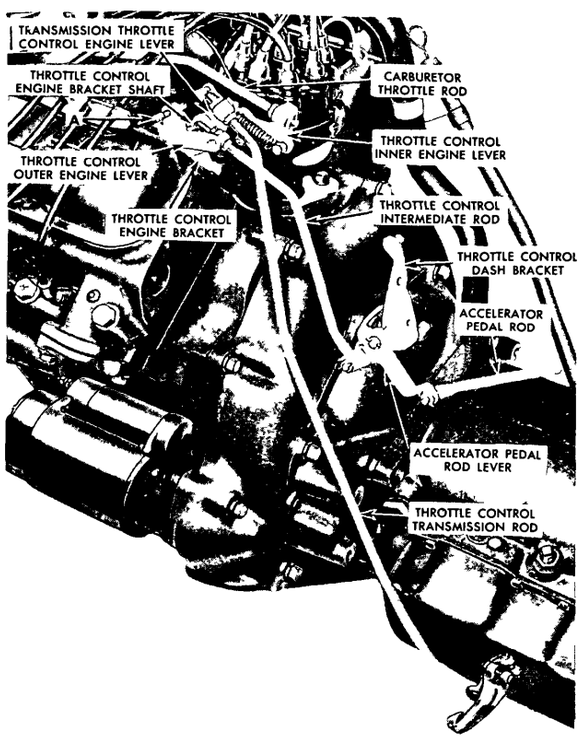
Vacuum Spark Control (Exc. 285 HP Engine): 1116080.
Plunger Travel - 11/64-3/16"

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4-6"
8	16	12.5-13.5"

IGNITION TIMING

Setting (Exc. 285 HP Engine)–5° BTDC, with distributor vacuum line disconnected and engine idling at 450-470 RPM (transmission selector in "N").
Setting (285 HP Engine) - 10° BTDC, with engine idling at 650 RPM (normal idle speed).
Timing Marks - On harmonic balancer.

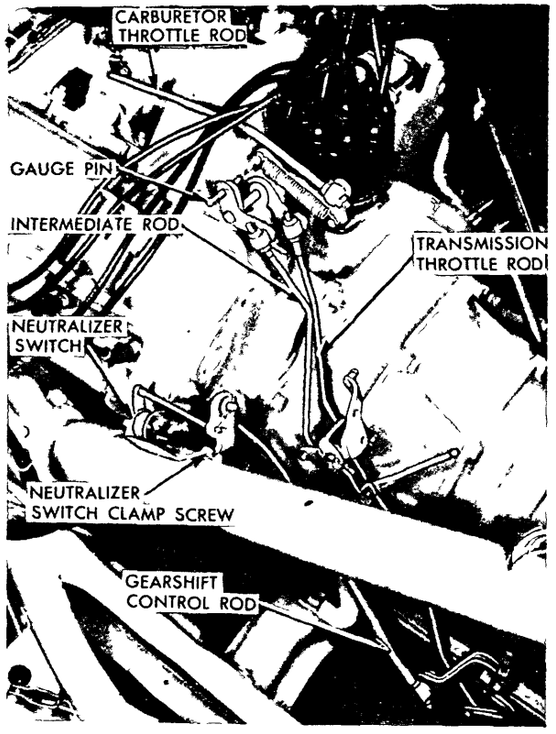


CARBURETOR

► *CARBURETOR APPLICATION: Rochester 2-barrel Carburetors are standard on 56-27 Series Cars. Rochester 4-Barrel Carburetors used on 56-28 Series Cars with Standard Transmission. Rochester or Carter 4-Barrel Carburetors used on 56-28 Series Cars with Hydra-Matic Transmission. Rochester or Carter 4-Barrel carburetors optional on 56-27 Series Cars. Two Rochester 4-Barrel Carburetors are standard on 285 HP Engine.*

► *FUEL FILTER PRODUCTION CHANGE (To Correct Carburetor Flooding Conditions):* New glass bowl, impregnated fiber element, precipitation type fuel filter is now being used in production and is available for installation on earlier cars. Filter Package, Part No. 854345, can be installed using one 90° elbow, Part No. 504500 or 114920.

THROTTLE LINKAGE ADJUSTMENT (DUAL-RANGE HYDRA-MATIC DRIVE CARS) *NOTE–On cars with "Strato-Flight Hydra-Matic" see below.* With engine at normal operating temperature, idle speed set at 450-470 RPM, and with transmission selector lever in "N" (neutral), install linkage adjustment pin J-2544 through holes in lever and bracket at rear of left head Pin should fit freely in holes without lever movement. If free fit not obtained, adjust trunnion nuts on carburetor throttle valve rod until pin is free then tighten nuts securely Leave gauge pin in hole Loosen trunnion nuts on transmission throttle control rod and push rod downward until control outer lever is felt to touch end of its travel (top nut must not be touching trunnion). **Shorten throttle control rod two turns** by loosening lower nut two turns and tightening upper nut two turns Remove gauge pin. With carburetor throttle in full open position and Downshift Return Spring fully extended, adjust throttle control intermediate rod trunnion (at lever on engine bracket) so that accelerator pedal clears floor mat by approximately 1/4" at closest point, tighten trunnion locknuts.



CONTINUED ON NEXT PAGE

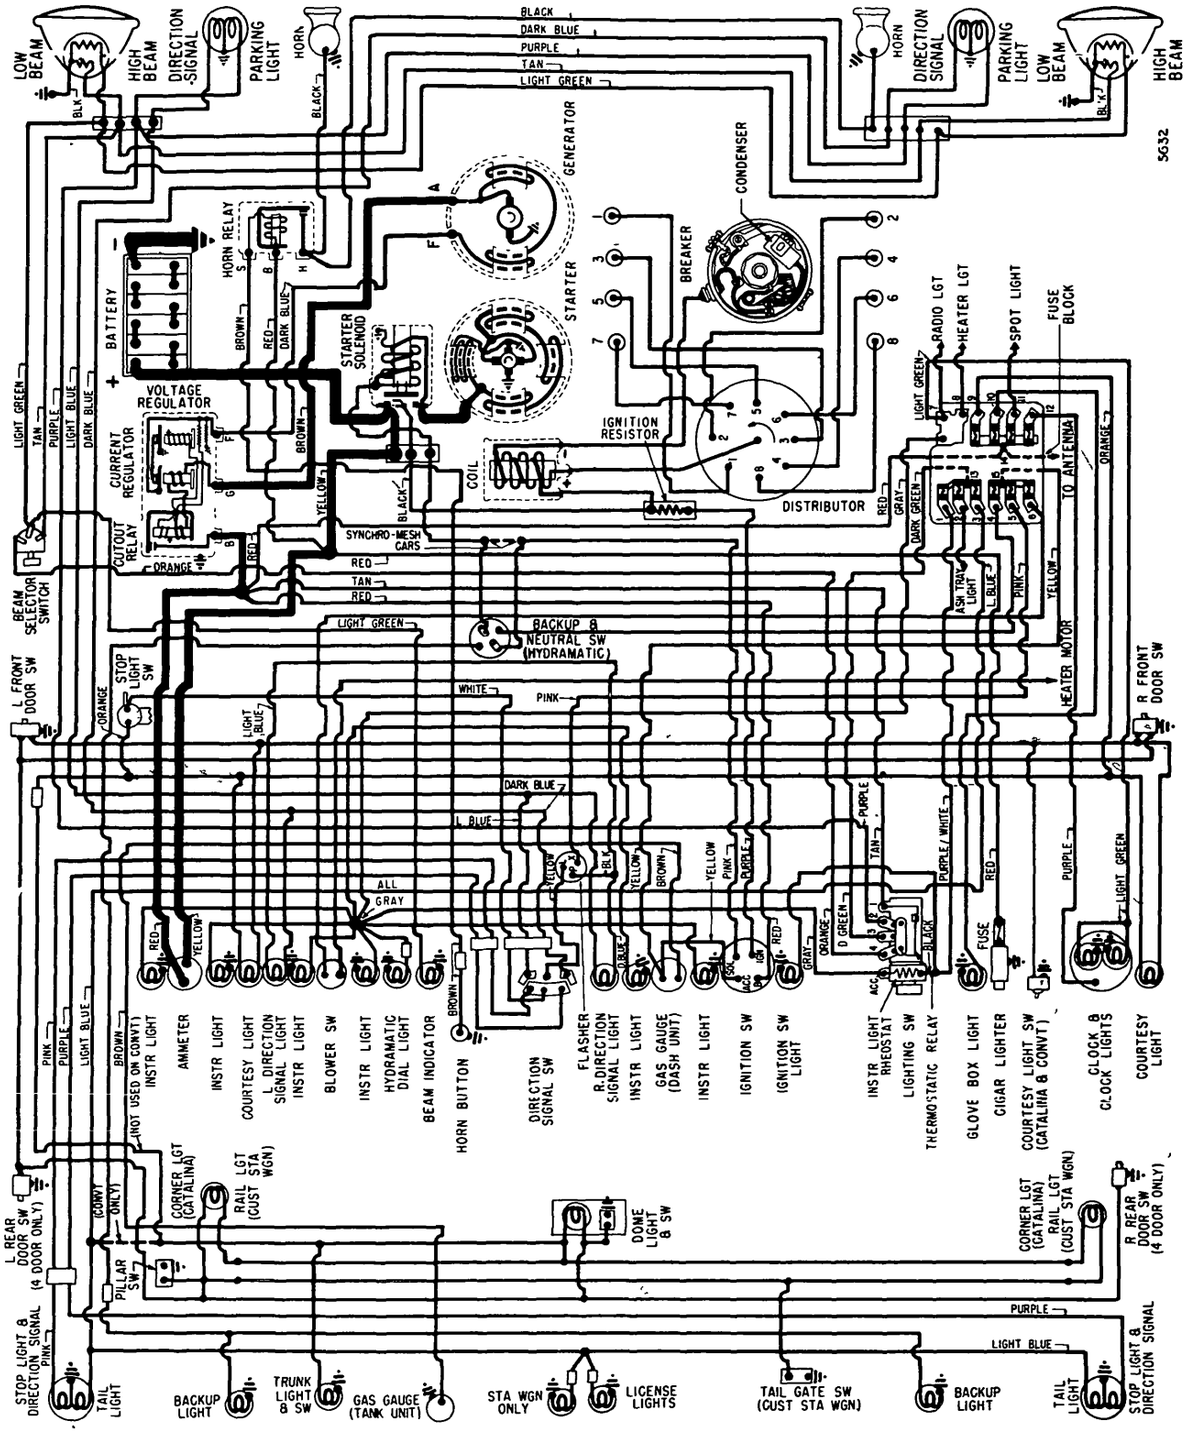
DUAL RANGE HYDRA-MATIC THROTTLE LINKAGE

CONTINUED FROM PRECEDING PAGE

THROTTLE LINKAGE ADJUSTMENT (STRATO-FLIGHT DUAL COUPLING HYDRA-MATIC DRIVE): *NOTE - cars with "Dual-Range Hydra-Matic" see above.* With engine at normal operating temperature and idle speed set to 460 RPM, adjust carburetor throttle rod so that linkage pin fits freely in gauge holes in throttle control bracket assembly. Loosen trunnion on transmission throttle control rod. Push transmission throttle control rod downward until transmission throttle

DUAL COUPLING HYDRA-MATIC THROTTLE LINKAGE

valve control lever is lightly against end of its travel (make sure that top trunnion locknut does not contact trunnion). While holding rod in this position tighten top trunnion locknut until it just touches trunnion, **then two complete turns further.** Tighten lower locknut securely. Adjust throttle control intermediate rod so that with carburetor throttle lever in wide open position there is 1/8" clearance between accelerator rod lever and underside of accelerator rubber bellows.



ROCHESTER 2GC

Rochester 2GC, No. 7008695 (Hydra-Matic Cars); No. 7008696 (Synchro-mesh Cars).

MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls 2-3-5-8, LEFT barrel 1-4-6-7.

Idl Setting—1 1/2 turns open from lightly seated position (turn screws out for richer mixture).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idl Sp ed (Exc pt Air Conditi n d)–450-470 RPM (with transmission in "N" position).

Idl Sp ed (Air Condition d Cars)–510-530 RPM (with Air conditioner turned off).

Float L v l–1-15/64" from air horn gasket to top of float assembly with assembly inverted. Use Gauge BT-105

Fl at Drop–1-29/32" between air horn gasket and lowest point on bottom of float with air horn held upright (Gauge BT-105).

Fast Idl : No adjustment of fast idle is provided. It is necessary however to have correct relationship between fast idle cam position and choke valve position. Check & adjust as follows Turn the idle screw in until it just contacts the second step of the fast idle cam, then with the screw on the second step and against the shoulder of the high step, the small end of Gauge BT-128 (.061"), should just fit into place between the upper edge of the choke valve and the wall of the air horn. To adjust, bend counter-weight tang on choke lever.

Automatic Ch k S tting: Centered (at index).

►*OTHER DATA See "Rochester 2GC Carburetor" in Carburetion Section.*

Throttl Linkag Adjustm nt: See *CARBURETOR above.*

Fu l Pump Pr ssur - 4-5 lbs. at 450-1000 RPM.

ROCHESTER 4GC
(Standard Engine)

Rochester 4GC, No. 7008697 (Hydra-Matic Cars); No. 7007900 (Synchro-m sh Cars).

►*LEFT TURN "CUT-OUT" CORRECTION: See "Carter WCFB" Carburetor in Carburetion Section.*

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idl S tting–1-1/4–2-1/4 turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idl Sp ed–450-470 RPM (all models–with transmission in "N").

►*AIR CONDITIONED CAR NOTE. Adjust idle speed with Air Conditioner "ON".*

►*OTHER DATA: See "Carter WCFB" Carburetor in Carburetion Section.*

Throttle Linkage Adjustment: See *CARBURETOR above.*

Fuel Pump Pressure: 4-5 lbs. at 450-1000 RPM.

ROCHESTER 4GC
(285 HP Engine)

Rochester 4GC, No. 7009820 (Two Used).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor. RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Speed, Mixture Adjustment & Synchronization: Turn idle mixture screws in finger tight and then open each screw on both carburetors 2-1/2 turns. Proceed as follows:

1) Hold choke valve fully open (use a pump return spring or other light spring meshed over top edge of choke valve and dividing wall of air horn in such a manner as to provide a slight clamping action). Remove cotter pin and anti-rattle spring and disconnect carburetor throttle rod (rod between bellcrank at rear of engine and front carburetor) from throttle lever of front carburetor.

2) Remove cotter pin and anti-rattle spring and disconnect inter-connecting rod (rod between throttle valve levers of front and rear carburetors), and remove inter-connecting rod. Spacer washer between rod and throttle levers may be left in position. Check pins in throttle levers for tightness. Tighten if necessary

3) Back off idle speed adjusting screws until throttle valves are fully closed (hold throttles closed with suitable springs hooked between throttle levers and some point on engine). Turn idle speed adjusting screws in on both carburetors until they **just touch** fast idle cams *(CAUTION–It is very important that idle screws are contacting cam equally and from this point to completion of adjustment, screws are turned equally to maintain balance between carburetors).*

4) Adjust trunnion on end of throttle inter-connecting rod so that rod can be installed over pins on carburetor throttle levers freely without changing throttle lever position. Install inter-connecting rod over pins of both carburetors (trunnion toward rear and front end of rod pointing toward engine). Make sure that spacers are still in position between rod and throttle levers.

5) Turn each idle speed adjusting screw in 1 1/4 turns (to give approximate idle adjustment). Check throttle inter-connecting rod for freeness and if found to be tight, repeat adjustment as outlined above. Remove springs holding throttle valves closed.

6) Install anti-rattle spring and cotter pin at rear end of inter-connecting rod. Install carburetor throttle, anti-rattle spring and cotter pin on throttle lever at front carburetor. Check rods to see that trunnions on rear of both rods are positioned so flats on front ends of rods are parallel with throttle lever. Remove springs holding choke valves open. Start engine and allow to warm up thoroughly Install tachometer.

7) With engine warm and fast idle cam fully released, turn both idle speed screws equally to obtain an idle speed of 650 RPM. Adjust idle mixture screws for best quality and highest engine idle. Recheck engine idle speed and readjust to 650 RPM if necessary.

►*OTHER DATA: See "Rochester 4GC" Carburetor in Carburetion Section.*

Thr ttl Linkag Adjustm nt: See *CARBURETOR above.*

NOTE - Normal idle speed 650 RPM.

Fuel Pump Pressure: 4-5 lbs. at 450-1000 RPM.

CARB. EQUIPMENT

►*HIGH FUEL PUMP PRESSURE CORRECTION (Causing Carburetor to Flood):* May be caused by the diaphragm being installed with insufficient slack *See "Fuel System Notes" in Pontiac Special Data*

►*FUEL FILTER PRODUCTION CHANGE: See CARBURETOR above.*

Fuel Pump: AC. Replacement - AC No. 4123 (Fuel & Vacuum - used with vacuum wipers), AC No. 4239 (Fuel only - used with electric wipers).

Pressure - 4-5 lbs. at 450-1000 RPM.

►*FUEL PUMP PRESSURE CAUTION - If pressure too high or too low, replace pump.*

Fuel Filter: Disc type. *See "Fuel System Notes" in Pontiac Special Data & "Production Change" above.*

Gasoline Gauge: AC Electric type.

Dash Unit - AC No. 1518504.

Tank Unit - AC No. 1518395. (Exc. Sta. Wgn.), No. 1518524 (860 Sta. Wgn. - 4-Dr.), No. 1518467 (870 4-Dr., 860 2-Dr., Star Chief Safari Sta. Wgns).

►*PASS. CAR IMPROPER GASOLINE GAUGE READING CORRECTION (EXC. STA. WGN.):* Caused by tank unit rheostat float arm being positioned improperly. To correct condition, remove unit, place in vise, and bend float arm so that it is 7/32" lower in tank. Condition has been corrected in production. Units so corrected have a daub of red paint on tank unit outlet tube (over 90 day period).

See "Fuel Gauges" in Carburetion Section.

BATTERY

Standard - Delco 2SMR53. *12 Volt,* 9 plate, 53 ampere hour capacity (20 hr rate).

Air Conditioning & Police - Delco 3SMR72. *12 Volt,* 11 plate, 72 ampere hour capacity (20 hr. rate).

Battery Ground- Negative Left front corner of left head.

Engine Ground - Between engine and fender at battery ground.

STARTER

Delco-Remy 1107641. *12 Volt.*

Armature - Delco-Remy 1932185.

Drive–Overrunning clutch (solenoid pinion shift).

Rotation–Counter-clockwise at commutator end.

Brush Spring Tension–35 ozs minimum.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs	3500	10.1	95
10.5 ft. lbs.	Lock	5 4	. 470

Starting Switch: Delco-Remy Solenoid 1119760 (no relay) mounted on starter and controlled by Ignition & Starter Switch, Delco-Remy No. 1116472. Neutral Safety Switch used on Hydra-Matic Drive Cars.

Neutral Safety & Back-up Light Switch: Delco-Remy 1998039. At lower end of steering column Connected

in starter control circuit so that starter operates only when selector lever in "N" (Neutral).

Adjustment - *See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Transmission Section.*

GENERATOR

Delco-Remy. *12 Volt.* Application as follows

Delco-Remy Generator No.	Armature
1100304 (Standard)	1928952
1102052 (Air Cond.) Early	1932900
1102073 (Air Cond.) Later	1932900
1102054 (Hvy. Duty)	1932900
1100333 (285 HP Eng.) ①	1928952

① - Replacement Generator No. 1100313.

Maximum Charging Rate - *See Voltage Regulator.*

Performance Data - Cold

Generator	Amperes	Volts	RPM
1100304	25	14.0	2780
1102052	35	14.0	2100
1102073	35	14 0	2100
1102054	35	14.0	2100
1100333	25	14.0	2570

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.5-1 62 amps. (1100304, 1100333), 1.62-1 82 amps (1102052, 1102073, 1102054). All at 12.0 volts (80°F.).

B lt Adjustment: ¼" belt deflection with approximately 8 lbs. (5 lbs. with Air Conditioning) pressure midway between pulleys.

REGULATOR

Delco-Remy Regulator No.	Use with Gen. No.
1119000	1100304, 1100333
1119002	1102052, 1102073, 1102054

►*NOTE: Regulator is "1119000 Series". Specifications below are for "Normal" settings.*

Checking & Adjusting - *See "1119000 Series" Regulator in Electrical Section.*

Cut-Out Relay

Cuts In–11.8-13.5 volts (hot).
Contact Gap– 020".
Air Gap– 020" (with contacts just closed).

Voltage Regulator

Setting–13.8-14.8 volts (hot).
Air Gap–075" with armature pressed down to point where contacts just touching.
Checking & Adjusting – *See "1119000 Series" Regulator in Electrical Section.*

Current Regulator

Setting (1119000) - 23-27 amps. (hot).
Setting (1119002) - 32-37 amps. (hot).
Air Gap - 075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "1119000 Series" Regulator in Electrical Section.*

MISC. ELECTRICAL

H adlamps: Sealed Beam. *See El ctrical S ction.*
Dir cti n Signals: *S e Electrical Section.*
Autronic Ey : *See Electrical Section.*
Lighting Switch Rem val: Remove one battery cable from battery. Pull headlight switch knob to "on" position, push latch button on side of switch assembly and pull out switch knob assembly. Screw bushing from switch assembly allowing switch assembly to be removed from instrument panel
Stop Light Switch Location: Mechanical type switch located on bracket attached to steering column behind instrument panel.
Back-Up Light Switch: Located on left rear side of transmission case.
FUSES: Fuses listed below (except as noted) are located on a fuse block behind instrument panel on dash to left of steering column
Instrument Panel–4 amps.
Hood Ornament & Ash Tray–7½ amps.
Stop Lights, Dome & Courtesy Lights–7½ amps.
Tail Lights–7½ amps.
Back-up Light–7½ amps.
Glove Box & Underhood Light–7½ amps.
Direction Signal & Brake Light–7½ amps.
Spot Lights–7½ amps.
Heater & Defroster–7½ amps.
Radio & Clock–7½ amps.
Air Conditioner–30 amp. Located in a line holder either on defroster core housing or if car not equipped with defroster, on front of dash where defroster should be.

LIGHTING THERMOSTATIC CIRCUIT BREAKER: *12 Volt.* 22 amperes. Located on lighting switch.

HORNS: Delco-Remy. Dual horns operated by relay (Std.).
Low Pitch - Delco-Remy 1999763.
High Pitch - Delco-Remy 1999768.
Optional - (Trumpet type) Delco-Remy 1999588, (Tri-tone type) Delco-Remy 1999793.
Horn Relay: Delco-Remy 1116781. *12 Volt.*
Air Gap - .014". **Point Opening** - .027".
Closing Voltage - 5 0-9.5 volts.

►*HORN RELAY CORROSION CAUTION* An irregular shaped opening occurs where left hand radiator baffle and radiator cross bar join in front of horn relay. This opening should be sealed with auto body putty or similar compound. At time sealing operation is performed, relay mounting screws should be removed and base inspected for corrosion. If evidence of corrosion exists, relay should be replaced.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own. V8 Valve-in-head.

Engine	Bore	Stroke	Displacement
All.	3.94"	3.25"	316.6 cu. ins.

Engine ①	Compr. Ratio ②	Rated HP	Dev. HP
S M ③	8.9-1	49.6	192 at 4400 RPM
S M ④	8.9-1	49.6	216 at 4800 RPM
H M ③	8.9-1	49.6	205 at 4600 RPM
H M ④	8.9-1	49.6	227 at 4800 RPM
Special ⑤	10.0-1	49 6	285 at 5100 RPM

①–S M (Synchro-mesh), H M (Hydra-Matic).
②–7.9-1 Compression Ratio Optional.
③–Standard engine with 2-Barrel Carb.
④–Standard engine with 4-Barrel Carb.
⑤–Special engine optional on all models except Air Conditioner equipped cars.

C mpr ssion & Vacuum R ading - *Se TUNE-UP above.*

ENGINE REMOVAL: *See "Engine" in Pontiac Special Data.*

OIL PAN REMOVAL: Remove right and left engine side side aprons. Remove steering idler lever support attaching screws and lower steering linkage as far as possible. Disconnect exhaust crossover pipe and jockey it around to a position where it can be removed without forcing. Remove flywheel housing lower cover and front shield. Loosen crankcase ventilator outlet pipe brace and swing brace out of way.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Pontiac Special Data.*

►*CYLINDER HEAD REPLACEMENT CAUTION 1956 cylinder heads are not interchangeabl with previous models.*

►*285 HP ENGINE CYLINDER HEAD CAUTION· This cylinder head not interchangeable with other 1956 models.*

Oil Passage Plug (In Cylinder Head) R plac ment: *See "Oiling System" in Pontiac Special Data.*

TIGHTENING TORQUES: *See "Tightening Sp cifications" in Pontiac Special Data.*

INTAKE MANIFOLD: With **Special** flat washers under attaching nuts, tighten nuts evenly to 40-45 ft lbs.

ENGINE MOUNTINGS: *See "Engine Mountings" in Pontiac Special Data.*

PISTONS

Cast aluminum alloy, slipper skirt, with piston pin offset 1/16" toward right side of engine.

►*DIFFERENT PISTONS USED IN "HIGH" & "LOW" COMPRESSION ENGINES:* Pistons identified as follows: High compression pistons are flat on top, and low compression pistons are "dished" out. Low compression pistons also have an "L" stamped on rear side near pin boss.

Removal–Pistons and rods removed from above.

Replacement Pistons: Std. size, and .005", .010", .020", 030" Oversize.

Fitting New Pistons: Clearance .0007-.0017" (measured). just far enough above bottom of skirt to make sure micrometer is in full contact, and perpendicular to piston pin boss). Use a .0015" x ½" feeler gauge and spring scale. With piston and cylinder clean and dry, insert inverted piston and feeler gauge into lower half of cylinder (feeler 90° from pin hole). Pull required to withdraw feeler should be 8-15 lbs.

Installing Pistons: Install with notch in piston head and "F" mark on side of piston toward front of engine. *See Rod Installation.*

PISTON PINS

Pin is floating in piston and connecting rod and is retained by snap rings at each end.

Diameter–.9803-.9807".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Pin Fit in Pist n - .0000-.0004" loose with piston and pin at room temperature. When pin is toward high limit (.0004") pin can be inserted with light hand pressure, *pin should not fall through of its own weight.* When pin toward low limit (.0000"), considerable hand pressure will be required (a brass drift can be used to tap pin into place with light pressure).

Pin Fit in C nn cting R d - .0001-.0006" loose

R plac m nt Pins: Std. size, .001", .003", .005" Oversize.

PISTON RINGS

Upper compression ring is chrome plated. Both compression rings are taper faced and have either a chamfer or a step on inside diameter of top side.

Ring	Width	End Gap	Side Clearance
Upper Compr.	.078"	.010-.020"	.0012-.0027"
Lower Compr.	078"	.008-.020"	.0012-.0032"
Oil	.183"	.015-.035"	.0025-.0095"

Installing Rings: Install compression rings with chamfer or step (on inside diameter) toward top of cylinder. Oil ring can be installed either way.

Replac m nt Rings: Std. size, .005", .010", .020", .030" Oversize.

CONNECTING RODS

L ngth—6.623-6.627" (center-to-center).

Crankpin J urnal Diam t r—2.2488-2.2498".

C nn cting R d Upp r Bushing (Piston Pin) Removal & Installation—*See "Connecting Rods & Bearings" in Pontiac Special Data.*

Lower B aring—Replaceable precision type.

Cl arance—.0009-.0029" (new).

Sid play—.006-.011"

Replac m nt Bearings: Std. size, .001', .002" Undersize.

Installing R ds: Install rods **2-4-6-8 (right bank)** with machined boss at lower end of rod toward the **rear.** Install rods **1-3-5-7 (left bank)** with boss toward the **front** of engine. When installed, machined bosses on rods will face each other *See Pistons above.*

CRANKSHAFT

►*REAR MAIN BEARING PRODUCTION CHANGE* Engines built beginning Jan. 3, 1956 have new type rear bearing shell. However, a number of engines were built after Dec. 16, 1955 with grooves machined in block and cap but with first type bearing shells installed. If leaks are encountered on engines having new groove and first type shells, second type shells may be installed. Part No. of new shell is 522825 (one upper and one lower). New shells have oil drain groove and three oil drain holes.

Journal Diamet r—2.2498-2.2499". Five bearings.

Bearings—Steel backed babbitt lined inserts. No shims.

Cl arance—.0005-.003" (Except Rear), .0008-.0033" (Rear).

End Thrust: Taken by No. 4 (rear center) main bearing

Endplay—.0035-.0085".

R plac m nt B arings: Std. size, 001", .002" Undersize.

Crankshaft R ar Main B aring Oil S al Installati n: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data.*

Vibration Dampener Removal & Installation: *See "Vibration Dampener" in Pontiac Special Data.*

FLYWHEEL INSTALLATION (Hydra-Matic Cars): *See "Flywheel" in Pontiac Special Data.*

CAMSHAFT

►*CAMSHAFT IDENTIFICATION. Camshafts can be identified by numeral stamped on front end of shaft or absence of that numeral. Standard engine with synchro-mesh transmission has numeral "0", standard engine with Hydra-Matic transmission has numeral "4", and 285 HP engine has no marking.*

Journal Diameters—1.8992-1.8997". Five bearings.

Clearance—.0015-.0025".

End Thrust: Steel thrust plate located behind camshaft sprocket. Replace if worn or grooved.

Endplay—003-.007".

Timing Chain: Length—60 links.

Timing Chain Installation—*See "Timing Chain" in Pontiac Special Data.*

Camshaft Setting: Both sprockets marked '0'. Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers.

Camshaft Removal & Installation: *See Camshaft & Bearings" in Pontiac Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): Installation - *See "Engine Front Cover" in Pontiac Special Data.*

VALVES

►*VALVE REPLACEMENT CAUTION Valves used on 285 HP engine are 3/32" longer than valves used on other engines (not interchangeable).*

►*VALVE ADJUSTMENT NOTE Because of new design, it is no longer necessary to initially adjust the tappet clearance when cylinder head or valve system is disturbed. See "Rocker Arms" below.*

Tappet Clearance: None in service (hydraulic).

Valve Specifications

Valve	Head Diam.	Stem Diam.	Length
Intake	1.778-.1.784"	.3407-.3417"	① 5.250"
Exhaust	1.497-1.503"	.3407-.3417"	② 5.230"

Valve	Seat Angle	Lift	③ Stem Clearance
Intake	30° ⑤	.370" ④	.0002-.0008"
Exhaust	45° ⑤	.370" ④	.0002-.0008"

①—5.340" (Special 285 HP Engine).

②—5.330" (Special 285 HP Engine).

③—In small end of taper reamed valve guide hole in head (valve guide integral with head), or hole in valve guide (pressed into head). Correct fit of valve stem in guide is when valve will just drop through of its own weight and with no perceptible side play.

④—Standard Synchro-mesh Engine. Standard Hydra-Matic Engine (.400"). Special 285 HP Engine, Intake (.409"), Exhaust (.413").

⑤—Valve face angle 29° (Intake), 44° (Exhaust).

Valv S at Width - 3/64-1/16" (Intake), 1/16" (Exhaust).

R plac m nt Valv s: Furnished Standard size, .001", .003" oversize.

Valv St m Oil Seal: Neoprene seal installed in second groove of intake valve stems. An oil splash shield is installed over top of inner intake valve spring (except 285 HP Engine).

Checking Valve Stem Length: *See "Valve System" in Pontiac Special Data.*

Valve Springs: Inner and outer valve springs used.

Standard Engines

Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
54-60 lbs.	1.153"	98-106 lbs.	1.203"
23-29 lbs.	1.483"	55-61 lbs.	1.533"

285 HP Engines

Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
33 lbs.	1.48"	59 lbs.	1.53"
95 lbs.	1.08"	128 lbs.	1.13"

►*285 HP ENGINE VALVE SPRING NOTE.* Interference may be found between inner and outer valve springs during assembly. In such a case, springs must be forced together.

Valve Guides: Cast integral with cylinder head. When valve stem clearance excessive, ream guides using Valve Guide Reamer J-5713 (.001"), J-6341 (.003"). *See Valve Guide Note Below.*

►*VALVE GUIDE NOTE:* Some production engines may be found with removable type guides (same as 1955 models). Guides have tapered hole (.0015" taper to inch), with greater clearance at rocker arm end. To replace guide, drive old guide out from combustion chamber side using Tool J-2542. Start chamfered end of guide into cylinder head and drive into place using Tool J-2542 until end of guide is 1 1/32" below roof of combustion chamber. Ream guides with taper reamer J-5712-2. *CAUTION* - Guides furnished with straight hole which must be taper-reamed.

Valve Clearance in Guide - .0002-.0008". Valve should just fall through guide of own weight and with no perceptible side play.

Valve Lifters: Hydraulic type. *NOTE* - Three different type lifters used in production. Lifters used on standard engines have ribs or a radial groove on lifter body. Lifters used in 285 HP engine are identified by letter "A" stamped on lifter body and area that contacts cam has a lubrited (blackened) finish. The 285 HP engine lifter has spring under ball check valve and redesigned ball check valve retainer. *CAUTION* - It is extremely important that regular production lifters are not used in the 285 HP engine.

Diameter - .8424-.8427". **Length** - 2.000".

Clearance (In Lifter Boss) - .0013-.0028".

Hydraulic Valve Lifter Overhaul: *See "Valve System" in Pontiac Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Installation of Rocker Arm to Stud - When valve rocker arm ball retaining nut is tightened to 15 ft. lbs., proper location of rocker arm, with respect to pushrod and valve lifter, is automatically assured.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Synchro-mesh Engines
Intake - Opens 22° BTDC. Close 67° ALDC.
Exhaust - Opens 63° BLDC. Close 27° ATDC.

Hydra-Matic Engines
Intake - Opens 27° BTDC. Close 73° ALDC.
Exhaust Opens 69° BLDC. Close 31° ATDC.

Special 285 HP Engines
Intake - Opens 34° BTDC. Close 75° ALDC.
Exhaust - Opens 81° BLDC. Close 37° ATDC.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill), 6 qts. (when filter changed).

Normal Oil Pressure: 35-45 lbs. at 40 MPH.

Pressure Regulator—In oil pump body. Not adjustable.

Oil Pump: Gear type, located on right rear bottom of cylinder crankcase and driven by distributor drive gear. Distributor timing is not affected by removal and installation of pump.

▷*OIL PUMP NOISE:* "Grinding" noise may be caused by upper end of oil pump drive shaft rubbing in hole in cylinder block. Examine outer diameter of shaft above upset nibs for rubbing and correct by reducing shaft diameter in this area by grinding or turning in a lathe. *CAUTION*—Do not remove nibs on shaft.

Pump Overhaul—*See "Oiling System" in Pontiac Special Data.*

Oil Filter: "Full Flow" type (optional). Replace filter element once every year or every 15,000 miles. *Use only AC Type PF-122 filter element.*

Oil Passage Plug (In Cylinder Head) Replacement: *See "Oiling System" in Pontiac Special Data.*

Crankcase Ventilator Air Filters: Located in oil filler cap and in ventilator outlet pipe. Clean and re-oil every 10,000 miles or oftener if necessary.

▷*VENTILATOR OUTLET PIPE CAUTION: If pipe is removed from pushrod cover, make sure that when it is installed, it is not pushed into cover beyond the two locating points on pipe. Excessive oil consumption at high speed will result*

Oil Pressure Gauge: AC No. 1508429. Not electric.

COOLING

Water Capacity: Without Heater - 22¾ qts.
With Undercoat Heater - 24½ qts.
With Hydra-Matic Drive - 23½ qts.
With Hydra-Matic Drive & Air Cond. - 23 qts.
With Undercoat Heater & Air Cond. - 25 qts.

Pressure Valve: AC No. 850795 (Exc. Air Cond.). 7 lb. type. AC No. 850800 (Air Cond.). 13 lb. type. Radiator filler cap.

Thermostat: Harrison No. 3133596 (Exc. Air Cond.) 160° No. 3126289 (Air Cond.) 160°. No. 3133597 (Exc. Air Cond. - use with permanent anti-freeze) 170°.

Water Pump: Packless, sealed ball bearing shaft. *See "Pontiac" in Water Pump Section.*

Temperature Gauge: AC No. 1513171. Not electric. *See "Temperature Gauges" in Miscellaneous Section.*

CLUTCH

Inland. Single plate, "Diaphragm", dry disc type with Long driven member.
See "Inland" in Clutch Section.

Clutch Disc No. - Pontiac No. 518130.

Pedal Adjustment: 7/8-1 1/8". Adjust at clutch fork-to-countershaft rod.

Overcenter Spring Adjustment—Remove overcenter spring, spring extension, and pushrod. Loosen lock screw which clamps spring lever to countershaft. Install Gauge J-5819, inserting pins which are closest together into holes in overcenter spring link and lever from which pushrod was removed. Then, while applying rotation to clutch countershaft to hold clutch pedal against stop, rotate overcenter spring lever until third pin in gauge can be inserted into overcenter spring lever. Tighten lockscrew securely, and replace spring, spring extension, and pushrod.

Removal: Remove transmission (see Transmission Removal below), remove clutch bearing support spring washer (in rear face of clutch housing) and remove clutch housing bottom cover and control shaft inner bracket. Remove release bearing support and release bearing. Tap bearing support from inside clutch housing to aid removal (*CAUTION*—Avoid striking tubular portion of support). Mark flywheel and clutch cover (to insure installation in same manner to maintain balance), remove clutch cover bolts evenly, move clutch assembly away from flywheel at bottom and withdraw driven member. Lower clutch assembly out of car.

Clutch Installation Note—Install new felt oil seal against shoulder ahead of oil slinger retainer ring on transmission main drive gear (will bear against flared end of release bearing support when installed). Lubricate seal with engine oil before transmission installed. Coat entire length of outer diameter of release bearing support tube with grease. Lubricate release fork fulcrum points with a very light coat of grease. Apply light coat of Lubriplate on main driving gear splines. Use new paper gasket between support flange and clutch housing, make certain that flange is not bent or distorted (will cause misalignment of transmission).

SYNCHRO-MESH TRANSMISSION

Own. All helical gear type.
See "Pontiac Synchro-Mesh" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: 1) Disconnect speedometer cable, gearshift selector rod, control rod and backup lamp switch wires from transmission.

2) Disconnect rear universal joint (use a wire or rubber band to prevent trunnions from slipping off spider). Remove propeller shaft by sliding it to rear off transmission mainshaft splines.

3) To give clearance for removing upper capscrew holding transmission to clutch housing, remove transmission shift lever spring yoke and extension. Remove shift lever screw while holding shift lever in neutral (center position) to avoid damage to shift levers on shaft inside transmission. Remove shift lever.

4) To give clearance for removing lower capscrew holding transmission to clutch housing, remove transmission outer lever. Remove transmission upper capscrews and install two transmission guide pins (pins can be made by cutting the heads off two transmission capscrews and sawing a screw driver slot in the ends). *CAUTION*—Guide pins must be used since they support transmission and prevent distortion of clutch driven plate hub when lower transmission capscrews are removed.

5) Remove lower capscrews and move transmission to rear, bringing rear bearing extension into intersection of frame "X" members until main drive gear is free, then lower to floor. *CAUTION*—Use care to avoid getting dirt into front bearing when pulling transmission away from clutch housing.

Installation Note: Use guide pins installed in two upper transmission mounting holes to assist in sliding transmission straight forward into place (to avoid damage to clutch release bearing tubular support).

HYDRA-MATIC DRIVE

"Dual Range" or "Dual Coupling". Four speed automatic transmission and fluid coupling. *NOTE* - "Dual Range" Hydra-Matic used on early Series 27 cars (same as used in 1955). "Strato-Flight (Dual Coupling)" Hydra-Matic used on later Series 27 and other cars.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Transmission Section.*

Lubrication - Check fluid level every 1000 miles, drain and refill every 25,000 miles. Use "G.M. Hydra-Matic Fluid" or Automatic Transmission Fluid "Type A" (marked AQ-ATF on container).

Checking Fluid Level (Dual Range) - Run engine 1½ minutes at a speed equivalent to 20 MPH with selector lever in "N". Reduce speed to slow idle and move selector lever to "D" position. Measure oil level. Add fluid to bring level to "FULL" mark on dipstick.

Checking Fluid Level (Dual Coupling) - With selector lever in "P" position, engine at normal operating temperature and idling at normal idling speed (450-470 RPM) measure oil level. Add fluid to bring level to "FULL" mark on dipstick.

Capacity - (Dual Range) 11 qts. refill. (Dual Coupling) 9½ qts. refill.

▷*OTHER HYDRA-MATIC SERVICE DATA: See "Dual Range" or "Dual Coupling" Hydra-Matic Drive in Transmission Section.*

UNIVERSALS

Mechanics or Saginaw. Needle bearing type.

▷*CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload (must be adjusted whenever nut is loosened). *See "Pontiac Hypoid" in Rear Axle Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

REAR AXLE

►*REAR SPRING SHACKLE TO FRAME INTERFERENCE CORRECTION* Make sure spring upper frame bushing is flush with frame bracket toward car centerline If spring clamp is touching frame, bend as necessary for clearance

Own. Hypoid gear, semi-floating with Hotchkiss Drive. *See "Pontiac Hypoid" in Rear Axle Section.*

Axle Identification–Code mark stamped on pad at forward side of differential carrier between bottom web and right hand horizontal web. Axle shaft also marked with daub of paint on end of shaft to indicate ratio. See Code & Paint Markings in table below

Axle Ratios & Code Marking

Ratio	Gear Teeth	① Code Mark	② Code Color
3.08-1③⑨⑤	40 13	D	Yellow
3.23-1③⑥	42 13	9	Brown
3.64-1⑦	40 11	6	Blue
3.90-1⑧	39 10	4	Red

①–See Rear Axle Identification
②–Paint daub on end of axle shaft
③–Hydra-Matic Drive
⑨ – 27 Series.
⑤ – Except Station Wagon.
⑥ – 28 Series & Station Wagons.
⑦–Synchro-mesh Transmission (Standard)
⑧–Synchro-mesh Transmission (Optional)

Backlash–.003-.012" (new), 012" (used)

Axle Shaft Removal· Remove wheel, brake drum, four brake backing plate bolt nuts, static collector, and loosen bearing retainer (do not move backing plate or brake line may be damaged) Pull shaft with Puller J-942 (do not drag axle shaft on seal)

Wheel Bearing Adjustment· None

Differential Carrier Assembly Removal· Disconnect rear universal and wire trunnion in place (do not disengage spline joint at transmission), remove axle shafts and carrier flange capscrews. Withdraw carrier assembly from housing

►*CAUTION. Rear universal joint companion flange nut controls rear axle pinion bearing preload. Readjust whenever nut loosened.*

SHOCK ABSORBERS

Delco. Direct acting, non-adjustable, sealed (not refillable) Service by replacement

Model	Front	Rear
Standard	5522515	5524031
Taxi, Police, H D	5352226	5513346

FRONT SUSPENSION

Independent. Shock absorber mounted within front coil spring.
See "Pontiac" in Front Suspension Section.

Kingpin Inclination–4½° at ½° camber

Caster–Neg 1°±½°

Camber–Pos ½°±½°

Toe-In–0" to 1/16"

Toe-Out on Turns- With inner wheel at 20°, outer wheel should be 18-19°.

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm and nut.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Saginaw (In Line). *See "Saginaw (In Line)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Bendix Hydraulic. Duo-servo, single anchor (without eccentric adjustment). Hand brake applies rear wheel service brakes

See "Bendix Hydraulic Single Anchor (Without Eccentric)" in Brake Section.

Drum Diameter - 12" (front), 11" (rear).

Wheel Cyl. Diameter - 1 1/16" (front), 15/16" (rear).

Lining Width - 2¼" (front wheels), 1¾" (rear wheels).

Thickness - 13/64".

Clearance–Tighten adjusting "star wheel" to point where wheel can just be turned by hand, then back off star wheel 14 notches.

Standard Master Cylinder: Forward of brake pedal on engine side of fire wall.

Checking Fluid Level–Maintain fluid level in master cylinder reservoir to 7/8" from gasket surface of filler neck.

Power Brakes: Bendix or Moraine Power Unit. *See "Moraine Power Unit" or "Bendix Power Unit" in Brake Section.*

Checking Fluid Level–Maintain fluid level in master cylinder reservoir to within ½" of top of filler cap opening.

Removal of Power Unit–Disconnect upper end of vacuum hose attached to inlet at vacuum cylinder, and hydraulic lines at master cylinder. Disconnect pushrod from pedal and wires from stop light switch Remove nuts from U-bolt retaining pedal pivot bracket to steering column and remove pedal and bracket (with stop light switch assembly attached). Remove clutch pedal and steering column seals at floorboard. On Hydra-Matic cars, remove screws retaining power brake unit to floor pan and remove mounting plate with power unit attached. On Synchro-mesh cars, remove screws retaining power unit to mounting plate (power unit will rest on frame). Remove screws attaching mounting plate to floor pan and remove mounting plate, "jockeying" it as necessary to clear clutch pedal Remove power unit. *CAUTION*–Do not carry or support brake unit by pushrod as pushrod may be pulled out of cylinder.

MISC. MECHANICAL

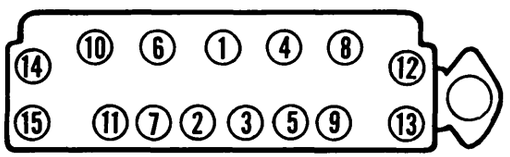
Windshield Wiper: Vacuum or electric type.
See "Windshield Wipers" in Miscellaneous Section.

Air Conditioning: Harrison. *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.*

Power Top Control: Hydro-Lectric with reversible pump motor. *See "Power Top Controls" in Miscellaneous Section.*

Power Window Regulators: Electric type with individual motors in each window. *See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Six-way electric type. Fore & Aft, Up & Down, and Tilting movement provided through three switches and two motors. *See "Power Seat Adjusters" in Miscellaneous Section.*



TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head Stud Nuts	60-65
Con Rod Cap Nuts	27-30
Main Bearing Cap Screws	66-70
Flywheel Retaining Cap Screw	100-110
Camshaft Sprocket Screw	50-55
Vibration Damper Retaining Screw	70-80

CYLINDER HEAD & MANIFOLD

►*RELOCATION OF VACUUM BOOSTER PUMP OUTLET CONNECTION (To eliminate rough engine idle when windshield wipers turned "ON")* Remove carbruetor, plug intake manifold with greased shop cloth to catch drill chips. Mark and drill 21/64" hole in left rear side of carburetor mounting pad and tap hole for 1/8" pipe thread. *NOTE* - Coat drill and tap with grease to prevent chips from falling into intake manifold. Remove vacuum outlet fitting from rear of intake manifold cover (plug opening with 1/8" pipe plug), and reinstall it in new location. Cut 4" section from flared end of vacuum line, and install this piece in newly located fitting. Connect line with 10" piece of windshield wiper hose. Reinstall carburetor and reroute line to clear throttle linkage.

CYLINDER HEAD INSTALLATION Use torque indicating wrench to tighten cylinder head stud nuts in sequence shown in cylinder head diagram Torque specifications are for engine at operating temperature

RAMBLER CYLINDER HEAD

Cylinder Head Gasket—Always use new gasket Coat gasket with very light application of Perfect Seal Gasket Paste to insure tight seal between cylinder head and block

ORIGINAL BORE & PISTONS

ORIGINAL BORE & CRANKSHAFT LETTER CODE A three letter code stamped adjacent to engine number indicates as follows

Letter Sequence Code

First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code

Letter "A"	Standard
Letter "B"	010" Undersize
Letter "C"	010" Oversize
Letter "D"	.001" Undersize

ENGINES NOT MARKED ARE STANDARD

PISTON PINS

PISTON PIN: Pin is press fit in connecting rod and no clamp bolt or locking rings are used to retain the pin. Piston pin must be removed and installed as detailed below to prevent distortion or damage to piston.

Removal - Remove pins with special Piston Pin Remover J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

Installation - Place piston pin pilot in support, insert piston and connecting rod. This aligns piston and connecting rod piston pin bores. Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support which will properly center rod on pin

►*CAUTION* Pin must be tight press fit in connecting rod.

ORIGINAL BEARING SIZES

ORIGINAL BORE & CRANKSHAFT LETTER CODE A three letter code stamped adjacent to engine number indicates as follows

Letter Sequence Code

First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code

Letter "A"	Standard
Letter "B"	010' Undersize
Letter "C"	010 Oversize
Letter "D"	001 Undersize

ENGINES NOT MARKED ARE STANDARD

CRANKSHAFT & MAIN BEARINGS

MAIN BEARING REMOVAL & INSTALLING· Upper bearing halve may be 'rotated' out by inserting pin in oil hole in crankshaft and turning shaft in the direction of locating tongue on bearing Bearings can be installed by reversing removal procedure

Fitting Bearings—Use Plastigage across full length of bearing insert and tighten cap to 66-70 ft lbs

CRANKSHAFT END THRUST PLATE· Crankshaft end thrust taken by flanged edges of front bearing A steel thrust plate is assembled between rear face of timing chain sprocket and flanged face of front bearing Plate keyed to shaft by Woodruff key which also secures sprocket on shaft When plate installed, chamfered edge on inner diameter should face toward the rear for tight fit against bearing journal

Adjustment—If endplay not correct with all parts correctly assembled, replace front main bearings or thrust plate

REAR OIL SEAL· Install new oil seal with rear main bearing cap off (crankshaft out of engine when replacing upper half) Packing in groove in block and cap behind oil slinger on crankshaft Cap sealed with rubber plugs in groove on each side where cap fitted in the recess in the block Use Tool J-1610 to install packing in groove in block and cap Place packing in groove (with bearing shell removed), place small diameter of tool over packing, hit end of tool with lead hammer to seat packing, cut ends of packing flush with bearing cap seat, remove tool Repeat operation for groove in block Install rubber seal plugs on each side of bearing cap (where angle seal used, make certain that seal also seated in horizontal groove in block)

ENGINE FRONT COVER

CRANKSHAFT FRONT OIL SEAL· A felt seal is fitted in the timing chain cover which bears against vibration dampener hub Seal seat in hub has inner edge turned up to form a shedder on inside of cover An oil slinger is assembled behind vibration dampener hub which extends over outer edge of oil shedder Use Tool J-1430 installed on end of crankshaft when tightening timing chain cover screws to align seal properly *NOTE*—A cork seal and rubber seal ring is assembled behind vibration dampener to seal front end of crankshaft *See VIBRATION DAMPENER above*

VIBRATION DAMPENER

REMOVAL & INSTALLATION· Non-adjustable, rubber cushioned type To install hub assembly Lock hub on shaft with woodruff key, install large lockwasher with notches on inner edge, cork seal ring, rubber seal ring and hub retainer in recess in hub Install hex head lock screw with helical lockwasher under it in screw hole in end of crankshaft and tighten screw to correct ft. lbs. torque. Rubber block retaining bolt nuts on front face of damper hub must be drawn up tight.

►*CAUTION* When installing vibration dampener on hub, timing marks must be aligned with the hub keyway and on same side

FLYWHEEL

►*FLYWHEEL REPLACEMENT CAUTION (Std & Overdrive Trans. Cars)* Flywheel on which starter ring gear is installed is balanced as an assembly with crankshaft and vibration dampener When flywheel is replaced, it is important that balance holes be duplicated as to size, depth, and angular location After replacing flywheel, tighten crankshaft to flywheel stud nuts with a torque wrench

CAMSHAFT & BEARINGS

REMOVAL: *Engine must be removed from chassis.* Remove fan assembly and cylinder head Remove valve tappet covers and vibration dampener Remove valves and valve springs, retain tappets with wire Remove timing chain cover and oil slinger Position engine with timing marks adjacent and in line across camshaft and crankshaft centers Remove camshaft sprocket retaining screw and remove timing chain and sprockets Sprockets can be pried off shafts

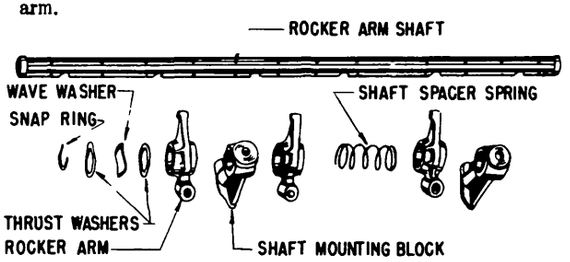
VALVE SYSTEM

VALVE STEM SEALS

VALVE STEM OIL SEAL: Consists of a rubber deflector installed on valve stem of all valves. Install deflector on valve stem with cupped side down over upper end of

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



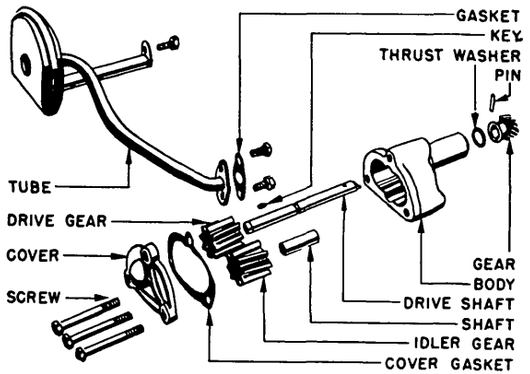
valve guide before installing valve spring and locks. Use new deflector whenever valves ground or replaced.

ROCKER ARMS

ROCKER ARM ASSEMBLY: Rocker arm shaft is one piece type and entire rocker arm assembly can be removed after taking out mounting bolts in shaft brackets.

Disass mbly & Inspecti n: Remove snap ring on end of shaft, slide thrustwashers, wave washer, rocker arms, mounting brackets, and springs off shaft. Inspect all parts for wear, see that end plugs are tight in shaft.

R ass mbly & Installati n: Install all parts in same relative positions *(CAUTION* - Rocker arms are "Right" and "Left" and must not be interchanged). Install assembly with rocker arm lubricating holes in shaft down or toward cylinder head. Make certain that baffle installed on rocker shaft supports does not interfere with rocker arm.



RAMBLER ROCKER ARM ASSEMBLY

OIL PUMP

OIL PUMP: Removal - Pump mounted externally on right side of engine. Remove pump by taking out three capscrews in pump cover.

Overhaul: Remove pump cover and gasket. Lift out pump drive gear, idler gear, and idler gear shaft. Remove key from keyway in shaft. Remove shaft and driving gear assembly through upper end of pump body *(NOTE* - Driving gear is held on shaft by a pin). Remove thrustwasher from shaft. Reassemble pump by reversing this disassembly procedure.

RAMBLER OIL PUMP

ELECTRICAL NOTES

►*BACK-UP LIGHT WIRING CORRECTION (First Cars):* If Backing Light comes on when shift lever placed in Reverse position, with Ignition Switch "Off", back-up light circuit should be checked and the following changes made:

Synchro-mesh & Overdrive Cars - If Back-up Light feed wire is attached to red wires of center terminal on Body Junction Block (behind battery), proceed as follows:

1) Disconnect this back-up light feed wire from the Body Junction Block, remove eye terminal from wire and replace with Douglas terminal.

2) Locate Back-up Light Switch Wire Extension (No. 18 red wire in harness) attached to "AUX" terminal of Circuit Breaker and extending through main wiring harness grommet in dash. This wire has Douglas terminal on engine side of dash. *NOTE* - If this wire missing, install the wire, Nash No. 4382421, and connect the eye terminal end to the "AUX" terminal of the circuit breaker.

3) Connect Douglas terminal of above wire (2) to the Douglas terminal installed on back-up light switch feed wire (1).

Automatic Transmission Cars - If Back-up Light feed wire is attached to right hand terminal of Body Junction Block (green wires), disconnect this wire and proceed in accordance with (1), (2), (3) above.

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment equipes for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.

Starting Serial No.—D-276101 (Domestic), DKD-5601 (Unassembled Export), DT-5401 (Canada).

ENGINE NUMBER: Stamped on machined surface at upper left front corner of cylinder block.

Starting Engine No.—B-1001

TUNE-UP

►*BURNED BREAKER POINTS OR HIGH SPEED MISS CORRECTION:* May be caused by incorrect ignition primary resistor. Use only resistor with Delco-Remy trademark. *See Resistor data below.*

COMPRESSION PRESSURE: 120 lbs. at cranking speed.

VACUUM READING: 18-21" at idling speed

VALVE TAPPET CLEARANCE: .012" Int., .016" Exh. hot & running.

MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .030".

Spark Plug—Auto-Lite AL-7. Torque to 30 ft. lbs.

COIL: Delco-Remy 1115393. *12 Volt*

Resistor—Delco-Remy No. 1927809. 1 40-1.62 ohm.

►*COIL RESISTOR NOTE:* Connected in series between battery and coil. Resistor is by-passed during cranking by solenoid or magnetic starter switch, making direct lead from battery to coil.

DISTRIBUTOR: Delco-Remy No. 1110242. *12 Volt.*

Condenser—Delco-Remy 1869704 **Capacity** .18-.23 mfd.

Contact Point Set — Delco-Remy No. 1918148.

Breaker Gap—.016".

Cam Angle—28°-35°.

Breaker Arm Spring Tension—19-23 ozs.

Rotation—Counter-clockwise viewed from above.

		Automatic Advance		
Degrees	Distr.	RPM	Degrees	Eng. RPM
Start		350	0-4	700
6.5-8.5		550	13-17	1100
11-13		1100	22-26	2200
15-17		1600	30-34	3200

Vacuum Spark Control: Delco-Remy No. 1116099.

	Vacuum Advance	
Distr. Degrees	Eng. Degrees	Vacuum ("of Hg)
Start	0	6-8
5	10	11-12

IGNITION TIMING

Setting—TDC. (Supersedes original specification of 4° ATDC).

►*IGNITION TIMING CHANGE:* Starting with engine number B-2461, ignition timing was changed from 4° ATDC to TDC. On engines prior to above number, paint mark vibration dampers and set ignition to new specification "TDC".

Timing Mark—Vibration Damper.

CARBURETOR

Carter AS No. 2349S. Single barrel downdraft.

►*CARBURETOR FLOAT PRODUCTION CHANGE: Carburetors with Brass Tag date B-6 or higher have split floats. See "Float Level" for adjustment of split type float carburetors.*

►*ROUGH ENGINE CORRECTION (Exhaust gas leakage into Intake Manifold):* May be caused by corrosion of of intake manifold cover. *For corrective procedure, see "Cylinder Head & Manifold" in Rambler Special Data.*

►*ROUGH ENGINE IDLE (Windshield Wipers Operating) CORRECTION:* For relocation of vacuum booster pump outlet connection, *See "Cylinder Head & Manifold" in Rambler Special Data.*

►*CARBURETOR FLOODING (Date Prior to B-6) CORRECTION:* If flooding is eliminated by loosening the needle seat, (gas line to carburetor fitting), it indicates a bind or interference between the float hinge and inner end of float needle seat. To correct, install needle and seat assembly Carter No. 25-313S, included in Repair Kit 1916A.

Idle Setting—¼-1½ turns open. Turn screw out for richer mixture.

Idle Speed—550 RPM (Std. & O.D. Trans.), 475 RPM (Hydra-Matic in Neutral), 500 RPM (Hydra-Matic in Neutral with Air Conditioning turned on)

Float Level — With cover gasket and float pin retainer removed, hold lip of float arm against seated needle with float pin at bottom of guide slots. Distance from top of casting to top of float should be ¼" (Gauge T-109-282). Adjust by bending lip on float arm. After adjusting floats, check clearance between overlapping tangs of float levers as follows: Replace pin retainer, invert carburetor to seat intake needle, check tang clearance with feeler gauge. Clearance should be .010-.015". Adjust by bending long tang of left hand float.

Fast Idle: .043" (T109-158) between throttle valve and bore of carburetor (side opposite idle port) with choke fully closed and fast idle cam in fast idle position.

Automatic Choke: 1 point lean.

Throttle Linkage Adjustment (Hydra-Matic Cars): Adjust engine idle speed to 450 RPM (with air conditioning 500 RPM, compressor running), with engine temperature 150-160°F, transmission warm and selector lever in neutral. Disconnect throttle rod at throttle lever at side of transmission. Clean back of transmission case, place checking Gauge J-2545-D flush against machined surface with edge of gauge against transmission side cover. Throttle lever stud should fit freely in notch of gauge. Use bending Tool J-3310 to correct throttle lever position. Gauge notch must be in alignment with pin through hole in T.V. lever with lever held against its stop to the rear. When properly adjusted, connect throttle rod to T.V. lever. Remove upper end of throttle rod at bellcrank. Disconnect carburetor to bellcrank rod at carburetor throttle rod. Insert an aligning pin in holes of the bell crank and bracket. Adjust carburetor to bellcrank rod. Fasten rod in place with clip fasteners. Adjust T.V. rod at bellcrank to fit freely with the hole in lever. Then shorten T.V. rod three full turns. Connect T.V. rod at bellcrank; remove aligning pin.

NOTE—Gauge 2545-C can be reworked by adding another notch behind original notch so that distance from center of notch to rear inside surface of gauge is 6½".

►*OTHER DATA: See "Carter AS Carburetors" in Carburetion Section.*

Fuel Pump Pressure: 3½ - 5¼ lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Fuel only or Fuel and vacuum.

Replacement Pump — Carter No. M-7975 (Fuel only), No. M-2379S (Fuel & Vacuum).

Pressure — 3½ -5¼ lbs. at 500 RPM.

See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, King-Seeley No. 46439.

Dash Unit — King-Seeley No. 49474.

Tank Unit — King-Seeley No. 44606.

See "Fuel Gauges" in Carburetion Section.

BATTERY

Standard — Auto-Lite 11-HS-45. *12 Volt,* 11 plate, 45 ampere hour capacity (20 hr. rate).

Air Conditioned Cars — Auto-Lite 11-HS-60. *12 Volt,* 11 plate, 60 ampere hour capacity (20 hr. rate).

Battery Ground — Negative.

►*CAUTION:* This is reversed from previous models.

Engine Ground — Battery to engine with body ground from transmission to rear engine cross member.

STARTER

Delco-Remy No. 1107647. *12 Volt.* **Armature** — 1926626.

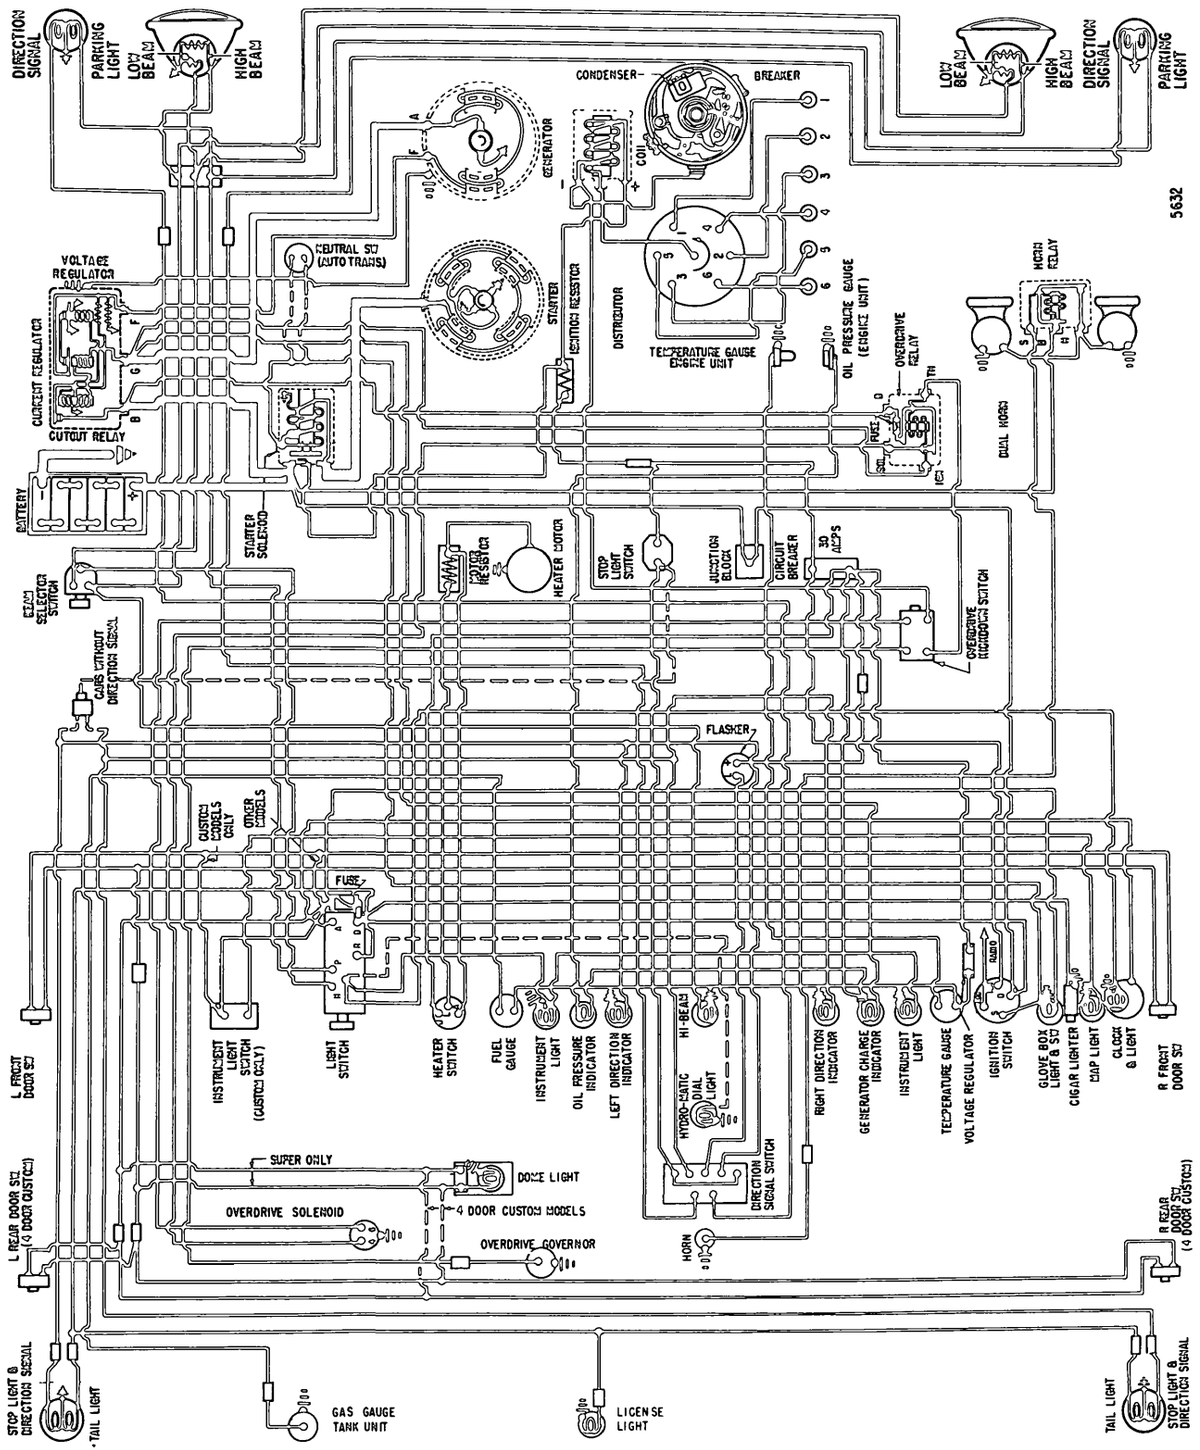
Starter Switch: Delco-Remy No. 1119793 solenoid switch located on starter, actuated by combination ignition and starter switch (Std. and Overdrive cars), by Delco Remy No. 1996084 switch operated by raising shift lever upward (Hydra-Matic Drive).

Drive—Overrunning clutch (solenoid pinion shift).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35 ozs.

	Performance Data		
Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	11.3	435



GENERATOR

Delco-Remy. *12 Volt.* Used as follows:

Application	Generator	Armature
Without Air Cond.	1100323	1933352
With Air Cond.	1102049	1934326

►*GENERATOR ARMATURE SHAFT PRODUCTION CHANGE:* Generators with tag code stamped 5K-20 or later have heavier brazing of water pump drive extension on armature shaft to prevent breaking. Brazing should withstand 25 ft. lb. torque applied to generator pulley (belt released) with pump shaft coupling held stationary.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

	Amperes	Volts	RPM
Standard	25	14.0	2780
Air Cond.	30	14.0	2150

Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–28 ozs.
Field Current–1.50-1.62 amperes (1100323), 1.48-1.62 amperes (1102049), 12 volts at 80°F.
Belt Adjustment: ½" deflection with 25 lbs. pressure applied midway between fan and generator pulleys.

REGULATOR

Delco-Remy No. 1119122 (1100323 Gen.), 1119003 (1102049 Gen.), 12 Volt. *NOTE – Specifications are "Normal" settings.*

Cut-Out Relay

Cuts-In–11.8-13.5 volts.
Contact Gap–.020".
Air Gap–.020" with contacts just closed.

Voltage Regulator

Setting–13.8-14.8 Volts (hot).
Air Gap–.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting–*See "Delco-Remy 1119000 Series Regulators" in Electrical Section.*

Current Regulator

Setting (1119122)–23-27 amperes (hot).
Setting (1119003)–27-33 amperes (hot).
Air Gap–.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting–*See "Delco-Remy 1119000 Series Regulators" in Electrical Section.*

MISC. ELECTRICAL

▷*BACK-UP LIGHT WIRING CIRCUIT CAUTION (Early Cars):* Incorrect assembly of wire to back-up light switch and circuit breaker causes back-up light to operate incorrectly. *See "Electrical Notes" in Rambler Special Data.*

Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Light Switch Removal: Disconnect battery. With switch in "OFF" position, press button release on top of light switch assembly, and pull knob and shaft clear of switch. Remove slotted nut, pull switch to rear of instrument panel.
Stop Light Switch: Located at tee fitting in line to left front brake.
FUSES: 7.5 Ampere. On lighting switch for Courtesy and Glove Box Light.
15 Ampere. Located on overdrive relay.
5 Ampere. Located in Radio wire back of instrument panel.
CIRCUIT BREAKERS: Three used as follows:
12 Ampere. On light switch for Instrument, Tail and Dome Lights.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

12 Amp re. On light switch for Head and Parking Lights.
30 Ampere. For Stop Light, Instruments and Indicators, Heater and Directional Signals. Located back of Instrument panel.

HORNS: Auto-Lite No. HAD-4741. (Low Pitch), **HAD-4742** (High Pitch).
Horn Relay – Nash No. 3145684.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use xtreme care when disconnecting any part of air conditioning system or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous S ction.*

►*ENGINE NOISE (Similar to bearing noise) CORRECTION:* A noise usually diagnosed as a bearing noise may come from improperly assembled Vibration Damper. Reassemble Cushions, Disc and Rubber correctly on engines built prior to Engine No. B-3597.

►*WATER PUMP LUBRICATION CHANGE:* Lubrication fitting now included. Use hand pressure lubrication gun to lubricate at 5,000 mile intervals.

ENGINE SPECIFICATIONS: 6 Cyl. valve-in-head.

Bore	Stroke	Displacement
3 1/8"	4¼"	195.6 cu. ins.
Compr Ratio	**Rated HP**	**Developed HP**
7.47-1	23.44	120 at 4200 RPM

Compression & Vacuum Reading–*See TUNE-UP.*

OIL PAN REMOVAL: Remove steering linkage cross tie rod before removing pan.

TIGHTENING TORQUES: *See "Tightening Specifications" in Rambler Special Data.*

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Rambler Special Data.*

PISTONS

Cam ground, aluminum alloy, tin-plated with steel strut and solid skirt.
Original Bore & Piston Sizes–*See "Original Bore & Pistons" in Rambler Special Data.*
Weight–13.59 ozs.
Removal–Pistons & rods removed from above.,

Fitting New Pistons: Piston to bore clearance .0006"-.0012". Piston properly fitted should support its own weight with piston and bore dry.

R placement Pistons: Standard, .002", .005", .010" .020", .030" and .040" oversize.

Installing Pistons: Install piston with notch on top perimeter toward front of engine

PISTON PINS

Press fit in connecting rod. No locking device.
Diameter – .8597". **Length** – 2¾".
Cl arance in Pist n–.0002" maximum. Thumb push fi at 70°.
Pin R m val & Installati n – *S "Piston Pins" in Rambl r Sp cial Data.*

R plac m nt Pist n Pins: Standard & .003", .005" Oversize.
NOTE – Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1&2)	.0930-.0935"	.010-.020"	.002-.004"
Oil (#3)	.1545-.1550"	.010-.020"	.002-.004"
Oil (#4 U-flex)	.1545-.1550"		.002-.004"

Replacement Rings: Sets of Std. & .020" oversize.
Installing Rings: Stepped inner edges of both compression rings must be up.

CONNECTING RODS

Length–6.625" center-to-center. **Weight**–25 ozs.
Crankpin Journal Diameter–2.0948"-2.0955".
Original Bearing Sizes–*See "Original Bearing Sizes" in Rambler Special Data.*
Bearings–Steel-backed babbitt. No shims.
Clearance–.001"-.0015". **Side Play**–.005"-.015".
Replacement Bearings: Std., .001", .002", .010", .012" Undersize.
Installing Rods: Identification marks (raised surface on center of rod and cap) toward front of engine.

CRANKSHAFT

Journal Diameter–2.4791"-2.4798". Four Bearing.
Original Bearing Sizes–*See "Original Bearing Sizes" in Rambler Special Data.*
Bearings–Steel backed babbitt. No shims.
Clearance–.001"-.0015".
Replacement Bearings: Std., .002", .010", .012" Undersize.
End Thrust: Taken by flanged front main bearing.
End Play–.003"-.008".
Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Rambler Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Rambler Special Data.*

FLYWHEEL REPLACEMENT: *See "Flywheel" in Rambler Special Data.*

VIBRATION DAMPENER REMOVAL & INSTALLATION: *See "Vibration Dampener" in Rambler Special Data.*

CAMSHAFT

Bearings–Steel-backed babbitt bushings.
Clearance–.002".
End Thrust: Thrust plate on front face of engine between No. 1 bearing and camshaft sprocket. Endplay controlled by sprocket on shaft. (Press fit on shaft). **Endplay** .004-.006".
Timing Chain: Morse non-adjustable type. **Width** 1", **Pitch** 3/8", **Length** 22½" or 60 links.
Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across centerline of sprockets.
Engin Fr nt Cov r Oil Seal (Crankshaft Fr nt Seal): *See "Engin Fr nt Cov r" in Rambl r Sp cial Data.*

VALVES

Tapp t Cl aranc : Intake .012", Exhaust .016" (Running Hot).

Valve	Head Diam.	St m Diam.	L ngth
Intake	1.594"	.3412-.3417"	4.759"
Exhaust	1.343"	.3407-.3412"	4.759"
Valve	**Seat Angle**	**Lift**	**St m Cl aranc**
Intake	45° ①	.383"	.0015-.0035"
Exhaust	45° ①	.385"	.002-.004"

① Valve face angle 44°.

►*VALVE GRINDING CAUTION:* Replace valves when refacing reduces distance from top of valve face to top of valve to less than 1/32".
Valve Seat Width – 5/64-3/32".
Valve Stem Oil Seal – Rubber deflectors mounted on all valve stems at upper end of guide.

Valve Springs: Valve springs may be removed without removing cylinder head by maintaining 90 lb. air pressure in combustion chamber to hold valve against valve seat.
Free Length – 2 3/8".

Valve Spring Sp cificati ns

Valve	Lbs. Pr ssure	Length
Closed	65-70	1.13/16"
Open	115-125	1 7/16"

Valve Guides: Use Tool J-1429-A to remove and replace guides. Guides should extend ¾" above cylinder head.
Rocker Arm Assembly: *See "Valve Syst m" in Rambler Special Data.*

VALVE TIMING

See "Camshaft Setting" und r CAMSHAFT above.
Intake Valve – Open 12°30' BTDC, Close 51°30'ALDC.
Exhaust Valve – Open 53°30' BLDC, Close 10°30'ATDC.
Valve Timing Check – Set valves on No. 1 cylinder at .003" lash. With No. 6 piston at TDC in firing position, timing will be correct if exhaust valve opens the same amount before DC on vibration dampener as intake valve opens after DC as engine is rocked back and forth over DC.

OILING SYSTEM

Crankcase Capacity: 4 qts. refill.
Normal Oil Pressure: 30 lbs. at 20 MPH. 12 lbs. minimum at 600 RPM.
Pressure Regulator Valve – Non-adjustable spring loaded valve located in cylinder block wher oil enters oil distribution channel.
Oil Pressure Indicator: Light goes on when Ignition switch is turned on, goes out as oil pressure reaches 6½ lbs. ± 1½ lbs. Sending unit Rambler No. 3142826 located on right rear side of engine block.
Oil Pump: Gear type. Mounted on right side of engine. *See "Oiling System" in Rambler Special Data.*
Oil Filter – Partial Flow type. Replace element every 5000 miles or less as needed.

Replacement Filter Unit – Rambler No. 8990068.
Crankcas Ventilati n: Filter in crankcase filler cap, and vent in rocker arm cover.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

COOLING

Water Capacity: 11 quarts.
Pressure Valve: 7 lb. Radiator Filler Cap Rambler No. 3142965 (less Air Conditioning), 14 lb. No. 3141371 (with Air Conditioning).
Thermostat: Choke type. (Std.) 170° type Rambler No. 3131817, (Optl.) 180° type Rambler No. 3131985 for use with permanent anti-freeze.
Water Pump: Sealed packing and bushing type.
See "Rambler" in Water Pump Section.
Pump Removal – Drain cooling system, disconnect coupling, hoses, and pump mounting screws.
Temperature Gauge: King-Seeley Electric Constant-Voltage ("CV") type with gauge voltage regulator, King-Seeley No. 46439.
Dash Unit – King-Seeley 48476.
Engine Unit – King-Seeley 44200.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 8.5A7. Assy. No. 1391. Single plate.
See "Borg & Beck" in Clutch Section.

Clutch Disc No.	Borg & Beck	Nash No.
Standard	382394	3144937
Overdrive	382480	3147133

Pedal Adjustment: Free play should be ½"-¾". Adjust at connecting link between throwout lever and release idler shaft assembly. Lengthening link reduces free play.
Removal: Remove transmission (see below), disconnect linkage, remove clutch housing and pan, punch mark flywheel, clutch cover and pressure plate, (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Warner. 3 speed, helical gear type.
See "Warner Transmissions" in Transmission Section.
Transmission Controls: *See "Transmission Controls" in Transmission Section.*
Removal: Disconnect brake tube at bracket underside of body, torque tube at rear of transmission, hand brake cable at bell crank and brake cable housing at the rear brake cable bracket. Move rear axle to rear to remove universal joint from transmission shaft. Disconnect speedometer cable and shifter rods. On overdrive cars, disconnect wires at solenoid, governor and overdrive cable at lever. Use two guide pins in place of two upper capscrews to guide transmission back to clear pilot bearing and clutch disc.

OVERDRIVE

Warner R10–*See "Warner R10" in Transmission Section.*
Overdrive Control: *See "Warner R10-R11 Overdrive Controls" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Range four speed automatic transmission with fluid coupling.
See "Hydra-Matic Drive" in Transmission Section.

▷*HYDRA-MATIC REVERSE GEAR SLIP-OUT CORREC-* Caused by incorrect adjustment of back-up light switch or manual linkage, or need for increased detent plunger spring tension. *See "Dual-Range Hydra-Matic Drive" in Transmission Section.*

▷*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication–Check fluid every 1000 miles, drain and refill at 25,000 mile intervals.
Capacity–8½ qts. (9½ qts. after overhaul).

Checking Fluid Level–Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of 2 minutes after transmission has reached normal operating temperature. With selector lever in "N" position, remove dipstick and check fluid level (dipstick located under right front floor plate). Add fluid to bring level to "F" mark.

▷*CAUTION:* Do not check oil level when transmission is excessively hot and do not fill above "F" mark on dipstick.

▷*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer or Mechanics – One used at transmission end.
Torque Tube Bracket Adjustment–*See "Hudson & Nash Hypoid" in Rear Axle Section.*

REAR AXLE

Own. Semi-floating, hypoid type with torque tube drive.
See "Hudson & Nash Hypoid" in Rear Axle Section.
Axle Ratio – Std. 3.8-1 (8-34), Overdrive 4.4-1 (8-35), Hydra-Matic 3.3-1 (13-43). *NOTE* – 3.58-1 (12-43) used in Hydra-Matic Cars with Air Conditioning or Outside Wheel Carrier to Serial No. D-325171.
Backlash – .002 - .003". Shim Adjustment.
Axle Shaft Removal: Remove wheel, pull drum (use hub puller J-1644-B or J-736-B). Remove brake support plate, slide plate, oil seal, and shims off axle. Attach special puller J-2498-A to axle shaft and remove shaft from housing.
Rear Suspension: *See "Hudson & Nash" in Suspensions & Wheel Alignment Section.*
Rear Axle Assembly Removal: Drain lubricant, raise and support rear of body. Disconnect hand brake cable at bellcrank, and hand brake cable housing at bracket. Disconnect torque tube from transmission, rear brake hose at bracket on body floor pan, shock absorbers from brackets and rear axle stabilizer bar at rear axle tube. Roll axle free from car.
Wheel Bearing Adjustment: Shims behind brake backing plate.

SHOCK ABSORBERS

Delco. Direct acting type. Serviced by replacement.
Front – Rambler No. 3119821. Rear – 3147605 (Before Serial No. D-287222), No. 3119822 (beginning Serial No. D-287222).

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper end of steering knuckle pin and seat in outer wheel house panel.
See "Rambler" in Suspensions & Wheel Alignment Sect.
▷*FRONT SUSPENSION SPRING NOTE:* Heavier spring used for Air Conditioned cars. *See "Rambler" in Front Suspension Section.*
King Pin Inclination – 6½°.
Caster (Std.) – ½° desired. Limits 0° to ½°.
(Pwr. Strg.) – 1° desired. Limits ½° to 1°.
Camber – 0° desired. Limits ¼° Neg. to ¼° Pos.
Toe-In – 1/16" to 3/16". CAUTION –When adjusting toe-in on Power Steering Cars, operate engine to supply oil pressure which will center spool in power cylinder valve.
Toe-Out on Turns – Outer wheel 22°, inner wheel 25°.

STEERING

Manual: Gemmer. Worm & Roller with push pull adjustments.
See "Gemmer Worm & Roller" in Steering Section.
Power Steering: Monroe "Power Guide". Linkage type.
See "Monroe Power Guide" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Sect.*
Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*
Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix (Lockheed) Hydraulic. Self centering (floating shoe) type. Hand lever applies rear wheel service brakes.
See "Bendix (Lockheed) Self-centering" in Brake Sect.
Drum Diameter – 9".
Wheel Cylinder Diameter – 1 1/16" (Front) 7/8" (Rear).
Replacement Linings & Shoes – Linings and shoes with linings furnished in standard size only.

	Lining Width & Length	
	Front Wheel	Rear Wheel
Primary Shoes	2½" x 9 7/8"	2" x 9 7/8"
Secondary Shoes	2¼" x 7 21/32"	1¾" x 7 21/32"

Clearance – All shoes just free of drag with brakes centralized (with slight drag on shoes rotate wheel in both directions). Eccentric adjustment for each shoe.
Standard Master Cylinder: In engine compartment under steering column.
Checking Fluid – Raise hood and fill from engine compartment. Check at 1000 mile intervals.
Removal – Remove from beneath car. Not necessary to disturb other parts.
Power Brakes: Bendix Power Unit. *See "Bendix Power Unit" in Brake Section.*
Checking Fluid – Same as for standard master cylinder.
Removal – Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*
Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Misc. Section.

TIGHTENING SPECIFICATIONS

	Champion Ft. Lbs.	Comm. & Pres. Ft. Lbs.
Cylinder Head	46-50	55-65
Intake Manifold		26-30
Exhaust Manifold	26-30	26-30
Oil Pan	13-17	13-17
Main Bearing Caps	88-93	88-93
Flywheel	33-35	33-35
Vibration Dampener	130-140	130-140
Con Rod Caps	28-32	52-54

Transmission Mounting	60-70	70-80

①—To cylinder block.
②—To Engine plate. Plate dowel bolt nut 28-32 ft. lbs.

ENGINE

CHAMPION

ENGINE REMOVAL: *NOTE*—If same engine block is to be reinstalled, engine should be disconnected at junction of clutch housing or torque converter housing (torque converter should be disconnected from engine drive plate so that converter will remain on transmission splines when engine removed). If new block to be installed, clutch housing or converter housing can be removed with engine, after removing transmission (this will allow housing alignment to be checked before engine reinstalled).

1) Remove hood and upper air deflector. On sedans and station wagons, remove radiator core. Disconnect Climatizer hoses (if so equipped) from water pump and cylinder head elbows. On coupe models, remove fan blade assembly and shroud (see Cooling System below). Disconnect and remove battery, remove carburetor air cleaner.

2) Disconnect windshield wiper hose and oil pressure gauge line from the flexible coupling. Disconnect cables from generator, starter solenoid, ignition coil, and heat indicator engine unit.

3) Remove cotter key and take out clevis pin connecting accelerator cross shaft to bellcrank rod. Remove lower stud nut from engine front support insulators and disconnect engine ground strap from right front engine support bracket.

4) Remove exhaust pipe flange to manifold nuts, remove U-clamp at clutch or converter housing bracket, and lower exhaust pipe off manifold studs. Remove the starter motor. On coupe models, turn front wheels all the way to the right. On sedans and station wagons, disconnect one end of the front tie rod, remove shaft from steering bellcrank and remove bellcrank out of way to provide clearance for oil pan. Disconnect gas tank to fuel pump line at flexible coupling.

5) Remove center (No. 1) cylinder head capscrew and replace it with an engine lifting eyebolt. Attach lifting device and raise engine just enough to take weight off front supports.

6) On automatic transmission models, disconnect accelerator bellcrank-to-transmission rod. Remove converter housing lower plate, and disconnect torque converter from converter drive plate *(see "Automatic" or "Flightomatic" Transmission in Transmission Section).*

7) Remove clutch housing to engine bolts and drive out clutch housing dowel pins. Raise engine slightly and move it forward sharply to break it loose from clutch housing. Continue to push engine forward until transmission spline clears clutch assembly, then lift engine out of car.

COMMANDER & PRESIDENT

ENGINE REMOVAL: *NOTE*—If same engine block is to be reinstalled, engine should be disconnected at junction of clutch housing or torque converter housing (torque converter should be disconnected from engine drive plate so that converter will remain on transmission splines when engine removed). If new block to be installed, clutch housing should be removed with the engine for checking alignment. On cars with air conditioning, remove compressor mounting bracket and compressor as an assembly without disconnecting refrigerant lines (see Compressor Removal under "Studebaker Air Conditioning" in Miscellaneous Section). Move assembly to position on front of right fender, being careful to keep compressor crankcase lower than compressor cylinder head, so that oil will not leak into chamber above compressor pistons.

1) Remove hood, upper air deflector and fan shroud. Disconnect and remove battery. On sedan and station wagon models, remove radiator core and water pump manifold. On coupe and hardtop models, remove fan blade assembly. Disconnect Climatizer hoses (if so equipped) from water manifold. Remove generator and fan belt.

2) Remove starter and remove exhaust crossover pipe. On sedan and station wagon models, remove steering bellcrank shaft. On coupe and hardtop models, turn steering gear all the way to left to provide clearance.

3) Remove carburetor air cleaner, fuel pump to carburetor pipe, and the spark modifier pipe. Unhook spark plug wires, remove spark plug cable support brackets from rocker arm cover, remove distributor clamp screw and remove distributor. Disconnect fuel pump inlet line at flexible coupling, and disconnect any vacuum connections at intake manifold.

4) Disconnect oil pressure gauge line at flexible coupling and disconnect wires at heat indicator gauge and ignition coil. Disconnect accelerator pushrod at throttle control bellcrank. On cars equipped with overdrive, disconnect wire at kick-down switch. On cars with Automatic Drive, disconnect the wire at anti-creep switch and disconnect accelerator bellcrank to transmission rod at bellcrank. Remove converter drive plate to torque converter bolts *(see "Studebaker "Flightomatic" Transmission in Trans. Section.*

5) Remove upper stud nuts from engine front support insulators and disconnect engine ground strap. Place a sling under intake manifold, attach hoist and raise engine just enough to take weight off engine supports. Remove clutch housing to engine bolts and take off the clutch housing front cover plate.

6) If clutch housing to be removed with engine, remove transmission. Remove the two capscrews holding clutch operating shaft, bracket, and bearing assembly to transmission case. Remove cotter key and clevis pin from inner end of clutch operating shaft sleeve and move clutch operating shaft away from clutch release shaft.

7) On cars equipped with Flightomatic Transmission remove the four engine rear support insulator capscrews which hold insulators to converter housing. On models equipped with overdrive or standard transmission, remove the two bolts which hold insulator and cage assembly to engine rear support crossmember.

8) On coupe and hardtop models, turn wheels to right to move steering bellcrank off to the side to provide additional clearance for oil pan. Push engine sharply forward to disengage clutch housing dowels. Continue to push engine forward until transmission spline is clear, then raise engine out of car.

OIL PAN

CHAMPION, COMMANDER & PRESIDENT

OIL PAN REMOVAL (CHAMPION): Remove oil level gauge. Raise car and support it with stands, drain oil. On long wheelbase models, swing wheels to right to move steering bellcrank out of way. On short wheelbase models, disconnect tie rods and reach rod from steering bellcrank, remove retaining pinch bolt, and remove bellcrank from shaft. On all models, remove oil pan capscrews and remove pan.

OIL PAN REMOVAL (COMMANDER & PRESIDENT): Remove oil level gauge and adapter tube. Disconnect one battery cable. Raise car, drain oil and remove starter. On coupe and hardtop models, swing wheels to right to move steering bellcrank out of way. On sedans and station wagons, remove steering bellcrank assembly. Remove exhaust crossover pipe. Remove oil pan cap screws and remove pan.

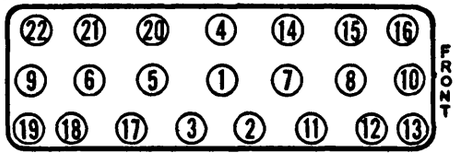
INSTALLATION (ALL MODELS): For installation of oil pan, the filler block must be removed. Remove the four screws holding filler block to engine front cover (V8), or to engine front plate (6 Cyl.). With a thin spatula or putty knife, carefully separate filler block from engine front cover gasket (V8) or engine front plate gasket (6 Cyl.). If this gasket is damaged, cut away the exposed portion of the gasket. Then cut the required amount from a new gasket and fit it in place as necessary using Perfect Seal or its equivalent to secure gasket in place. Apply a sealer to threads of the four front cover or front plate to filler block cap screws. Install filler block with a screw in one of the upper holes. Using a hardwood stick, pry upward against filler block and install a screw in the opposite upper hole. Install two remaining screws and tighten all four screws until heads just contact lockwasher.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

With all gaskets in position, install the oil pan and tighten the screws evenly. Then tighten the four filler block screws. Complete the installation by reversing removal procedure.

CYLINDER HEAD & MANIFOLD

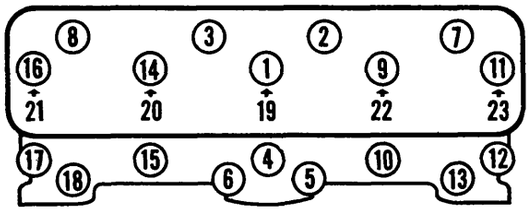


CHAMPION, COMMANDER & PRESIDENT

CYLINDER HEAD GASKET: Coat lower face of gasket and face of cylinder head with Perfect Seal gasket cement before installing (use sparingly and see that it does not enter screw holes and water passage openings).

CHAMPION

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head capscrews, tighten in correct sequence as shown in diagram. With engine cold, tighten all nuts evenly to correct tension. Then run engine until it is thoroughly warmed up and recheck all capscrews (additional tightening may be necessary for correct tension).



Tightening Torques—*See "Tightening Specifications" above.*

CHAMPION CYLINDER HEAD

COMMANDER & PRESIDENT

CYLINDER HEAD INTERCHANGEABILITY (RIGHT TO LEFT BANK): Both cylinder heads are identical (water pump ports are provided at front and rear of all heads). It is necessary to block off the rear port not in use with a dummy plate and gasket. *NOTE*—Heat indicator engine unit must be mounted in the water outlet opening cover plate at rear of the left bank cylinder head.

COMMANDER & PRESIDENT CYLINDER HEAD

COMMANDER & PRESIDENT

CYLINDER HEAD INSTALLATION: Clean all threads using a tap and die. Check head for warping *(NOTE*—If necessary, head can be planed .015". Apply gasket compound to gasket and install. *(CAUTION—Be sure main oil gallery-to-rock r arm assembly oil passage at rear of th right bank (on front of left bank) is not blocked by gask t).* Install cylinder head on the hollow dowel. Dip capscrews in engine oil and install the nine short screws in the two outer rows of holes and the five medium length screws in the center row of holes and tighten finger tight. Install rocker arm assembly (see "Rocker Arm Assembly"). Install and tighten long head screws finger tight. Insert rocker arm assembly capscrews through rocker arm brackets. Tighten all cylinder head capscrews in correct sequence as shown in diagram. Tighten water pump manifold screws alternately until they are tight.

Tightening Torques—*See "Tightening Specifications".*

ORIGINAL BORE & PISTONS

CHAMPION, COMMANDER, & PRESIDENT

ORIGINAL BORE & PISTON SIZES: Cylinder bore sizes are marked by a figure stamped on top face of cylinder block next to each cylinder bore as indicated below. Replacement pistons corresponding to these sizes are available under the part number for standard size pistons. The oversize is marked on the top of each piston. *NOTE—When replacing pistons in an engine which has been in use, the cylinder bore markings can no longer be used as a guide. It is important that pistons be selected to fit the cylinder bore. See "Fitting Pistons" on car model page.*

Cylinder & Piston Markings: Cylinder bores may vary in size from Standard to .0025" oversize in increments of .0005". Champion bore sizes vary from 3.000" (stamped "O"), to 3.0025" (stamped "25"). Commander and President bore sizes vary from 3.5625" (stamped "25"), to 3.5645" (stamped "45").

PISTON PINS

CHAMPION, COMMANDER & PRESIDENT

PISTON PIN REMOVAL & INSTALLATION: Use tool J-1293-A (Champion) J-1293-C (Comm. & Pres.).

Removal—Place rod and piston assembly on assembling fixture. Remove lock nut and star washer from clamp screw, and by tightening lock nut on other end of clamp screw, remove clamp screw, remove the screw from connecting rod. Then slide piston and connecting rod off piston pin.

Installation—Place piston pin on assembling fixture, slide piston and connecting rod into position. (Oil squirt hole and number on connecting rod should be on the solid side of the piston). Insert piston pin clamp screw in connecting rod, install star washer **and locknut, and tighten nut securely.**

6 Cylinder Engines — On connecting rods Nos. 1, 3, and 5 the clampscrew nut is installed on the T-slot side of the piston. On Nos. 2, 4, and 6 the nut is installed on the solid side of the piston. When installing the screw regardless of the number of the rod, if the rod is held with the offset of the rod to the left and the screw is inserted from the front the nut will be located on the correct side in relation to the piston. Be sure to align the flat surface on the piston pin with the flat surface on the clamp screw.

V8 Engines — If connecting rod is new and has not been marked, it should be checked to see if it is a left or a right bank rod. Hold rod so oil holes face you. All rods are offset at crankpin end. When held as above, left bank rods have offset or widest part of rod to the right; a right bank rod would have offset to left. Stamp correct number on rod and rod cap on oil hole side if even numbered or right bank rod, and on side away from oil hole if odd numbered or left bank rod. Be sure that when pin is inserted nut will be installed on slotted side of piston and that flat surface of clampscrew mates properly with flat surface of piston pin.

PISTON RINGS

CHAMPION, COMMANDER & PRESIDENT

Replacement Rings: Three types of Perfect Circle piston rings available for service replacement:

Standard Production Type Sets—Plain iron rings without chrome plating. To be used on relatively new engines. Furnished Std. and .020", .030", .040" Oversize.

Chrome Top Ring Sets—Same as standard ring set except that top ring is solid chrome-plated to increase ring life and oil control. Used on relatively new engines or after a rebore job, especially where heavy duty service is anticipated. Furnished Std. and .020", .030", .040" O.S.

"2 in 1" Chrome Sets—Set contains solid chrome-plated top ring and, in addition, an oil ring assembly made up of two chrome-plated steel rails, one cast iron separator or spacer and two complete sets of expander rings, one "Normal Pressure" set and one "Hi-Pressure" set. "Normal Pressure" set used where taper of bore does not exceed .006". "Hi-Pressure" set used where taper exceeds this limit. In general, use "2 in 1" set for all except new and rebored engines. Furnished Std. & .020", .030" O.S.

"2 IN 1" CHROME RING SET INSTALLATION CAUTION: Distribute oil control ring expander, separator, and ring rail gaps as follows: Place expander spring in ring groove with gap positioned above end of piston pin. Install one steel section with gap approximately 90° from spring gap. Install cast iron separator with gap approximately 90° from steel rail gap. Install remaining steel section with gap approximately 180° from gap of first steel rail. *NOTE*—Gap in rails and separator must not straddle humps on expander spring.

CRANKSHAFT & MAIN BEARINGS

CHAMPION, COMMANDER & PRESIDENT

►*V8 ENGINE OIL LEAK AT REAR OF ENGINE:* May be caused by step on rear bearing cap interfering with oil pan and preventing pan from compressing gasket properly. Check step on right rear corner of bearing cap and eliminate interference by grinding step down to a depth of 1/8" or even with crankcase flange (start grinding at rear of cap and extend relief forward to approximately center of capscrew boss).

►*REAR BEARING OIL SEAL PRODUCTION CHANGE & INSTALLATION CAUTION:* Revised type oil seal (less susceptible to shrinkage at high temperature) now being used in production and only this type seal should be used for replacement. Revised seal can be identified by TWO RAISED DOTS immediately ahead of "Brummer Stude 530311" marking (old seal had one dot at this point) and carries same part number (530311) as old seal.

REAR MAIN BEARING OIL SEAL INSTALLATION: *NOTE*—Seal assembly consists of three types used together: (1) Cork Seals between sides of bearing cap

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and block, (2) Neoprene seals in groove in face of bearing cap, (3) "Brummer" type seal on crankshaft journal (installed in block and bearing cap). Install seals as follows:

Neoprene Seals–Place new seals in cross grooves of bearing cap with inner end of seal not more than 1/16" from inner end of groove, press seals firmly and uniformly into grooves and trim outer ends flush with sides of bearing cap. *CAUTION*–Seals must not be more than 1/16" from inner edge of bearing cap and must not be so long as to interfere with Brummer seal.

"Brummer" Type Seal–Remove old seal, thoroughly clean seal channel just forward of rear flange by using a swab saturated with alcohol or similar solvent, dry channel thoroughly. Blunt the sharp edge of the flange on which the seal is mounted using the flat side of a screwdriver blade or similar tool (this will prevent scuffing inner edge of seal during installation). Install seal DRY as follows: Insert upper half between crankshaft and block at the rear flange with the wiping lip of the seal pointing forward or away from the flywheel, work seal around crankshaft until ends are horizontal and in line with the bearing cap face (see V8 Engine Note below), use great care to avoid scuffing the soft center sealing cushion at the bottom of the seal groove. Install lower half of seal on bearing cap flange, oil wiping edge of seal and crankshaft journal, install bearing cap and tighten bearing cap bolts to correct torque.

Cork Seals–After bearing cap installed, drive new cork seals down into grooves between sides of bearing cap and block (use drift and light hammer). *CAUTION*–Use care not to split or damage these seals.

Oil Leak Check–After installing new seals, run engine for approximately 45 minutes, then check for oil leaks.

►*V8 ENGINE NOTE:* To facilitate installation of the upper half of the Brummer seal, the three intermediate bearing cap screws can be loosened two turns. *CAUTION*–Do not loosen these intermediate bearing caps more than indicated or front bearing may be damaged.

ENGINE FRONT COVER

CHAMPION

ENGINE FRONT COVER: Removal–Remove fan shroud, radiator core, and vibration dampener. Using Puller Set HM-925, remove the crankshaft pulley (use HM-925-13 to prevent damage to crankshaft threads). Take out cover retaining screws and bolts and remove the cover.

Engine Front Cover Seal (Crankshaft Front Seal) Installation: Install new felt oil seal in cover, using hub of crankshaft pulley to seat it in recess in cover.

Engine Front Cover Installation: Install cover on engine using a new gasket. Install all the retaining bolts, leaving them finger tight so cover can center itself as the crankshaft pulley is installed. Using Pusher Set J-4704, press crankshaft pulley into position. Tighten cover bolts and screws securely and install vibration dampener, radiator core and shroud.

COMMANDER & PRESIDENT

ENGINE FRONT COVER: Removal–Drain cooling system and remove fan shroud and radiator core. Remove fan belt and power steering belt (if so equipped). Remove fan blade assembly and take off the water manifold. Remove fuel pump to carburetor pipe and remove fuel pump. Remove vibration dampener and fan pulley hub (on Power Steering cars a second pulley is used). Remove cover screws and remove cover.

Engine Front Cover Seal (Crankshaft Front Seal) Installation: Remove felt oil seal with an ice pick and clean out the recess in cover before installing new seal *(NOTE–Do not remove the four self tapping screws holding the seal retainer plate in position).* Install a new seal and wet it with clean engine oil. Insert crankshaft pulley hub to locate seal in center position.

Engine Front Cover Installation: Install cover on engine, using a new gasket, and install cover screws, but do not tighten. Using Pusher Set J-4704, install crankshaft pulley hub to locate hub and center cover properly. Tighten cover screws. Install fuel pump and the fuel pump to carburetor pipe. Assemble and install vibration dampener and tighten retaining screws to proper torque. Install water manifold assembly using new gaskets, and replace fan blade assembly. Install fan belt and adjust it to proper tension. Install power steering belt (if so equipped) and adjust it to proper tension. Install radiator core and fan shroud.

CAMSHAFT & BEARINGS

CHAMPION

CAMSHAFT REMOVAL (Champion): *NOTE–Camshaft can be removed with the engine in the chassis by removing fender, grille, and radiator core as an assembly.* Remove cylinder head, manifold assembly and valve cover plates. Take out valve locks, valves and valve spring retainers. Turn cylinder block over so that valve lifters will fall free of camshaft. If engine not removed from car, tie or block valve lifters so they will not interfere with cam lobes during removal. Remove oil pan, oil pump, and oil pump drive shaft. Remove vibration dampener, fan drive pulley and engine front cover. Unless camshaft is to be replaced, it is not necessary to remove camshaft gear. Turn crankshaft until camshaft thrust plate cap screws are visible through spokes of timing gear. Remove capscrews and lockwashers retaining thrust plate and carefully slide camshaft and gear out of cylinder block, being careful not to nick or scratch camshaft journals, lobes, or bearings.

COMMANDER & PRESIDENT

CAMSHAFT REMOVAL (Commander & President): With engine in car, camshaft can be removed as follows: Turn crankshaft until timing mark shows directly under pointer on engine front cover and distributor rotor is in the No. 6 firing position (in this position the timing mark on the camshaft gear is aligned between the marks on the crankshaft gear). On coupe and hardtop models, remove the fan shroud. On all models remove the radiator core, fan blade assembly and water manifold. Remove rocker arm covers, rocker arm assemblies and pushrods. Remove carburetor and intake manifold assembly. Remove breather pipe, valve lifter cover, and take out the valve lifters. Remove fuel pump and take off engine front cover (see "Engine Front Cover" above). Turn camshaft just enough to expose thrust plate retaining screws and remove screws. Turn gear back to align timing marks of the two gears. Remove camshaft and gear as an assembly, being careful not to damage camshaft bearings. *CAUTION–With camshaft removed, do not move crankshaft or disturb position of distributor rotor.*

TIMING GEARS

CHAMPION, COMMANDER & PRESIDENT

TIMING GEAR REMOVAL: Remove engine front cover *(see "Engine Front Cover" above).* Remove gear retaining screw, lockwasher, and flat washer. On Commander & President, remove fuel pump cam and lockplate. Using Puller HM-925, install puller screws in threaded holes provided in camshaft gear hub and pull gear from camshaft. Remove crankshaft pulley key and oil slinger. Remove crankshaft gear with Puller HM-925. Use HM-925-12 Adapter Plug to protect threads in end of crankshaft.

VALVE GUIDES

COMMANDER & PRESIDENT

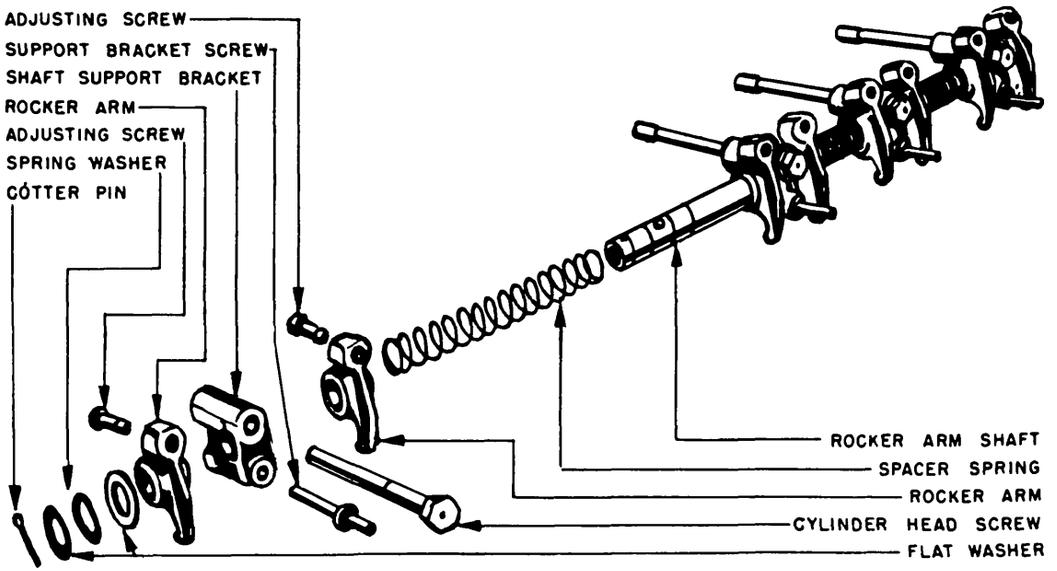
VALVE GUIDE REMOVAL AND INSTALLATION: Valve guide tool J-4673 is used to remove and install the valve guides. Drive guide out of cylinder head from the combustion chamber side.

Installation–Coat valve guide lightly with white lead and start chamfered end into cylinder head from the combustion chamber side. Place the installing plate on the face of the head so that the long side of the plate is paralliel to the end of the head and the bore of the plate centered over the guide bore. The plate is marked "Intake" on one side and "Exhaust" on the other side. Be sure that the exposed mark of the plate corresponds to the valve guide being installed so that the depth of the counterbore of the plate will control the depth to which the guide is driven into the head. Insert the driver through the plate and into the guide. Drive the guide into the head until the shoulder of the driver contacts the bottom of the counterbore in the plate.

ROCKER ARMS

COMMANDER & PRESIDENT

ROCKER ARM ASSEMBLY: Two identical hollow steel shafts (ends plugged) are used. Four removable supports doweled to each shaft with cylinder head capscrews. Three springs used to position rocker arms against supports. Lubrication is supplied by oil from the main oil galleys to a passage in the cylinder head which leads the oil up around the relieved capscrew shank in the rocker arm front support on the left bank and the rocker arm rear support on the right bank. The bracket is drilled to connect the capscrew hole with the rocker arm shaft hole. The oil flows under



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

pressure to the rocker arms and through holes drilled in the rocker arms to the adjusting screws and through the center of the adjusting screws to the push rods.

►*DISASSEMBLY CAUTION:* Mark rocker arms, brackets, and the rocker arm shaft so that they can be reassembled in their original position.

Reassembly—Make certain the oil holes and grooves in the rocker arm shaft and the oil holes in the brackets, rocker arms and adjusting screws are clean. Check rocker arms and shaft clearance which should be .0005" to .0025". Test springs. It should require 9-1/2 to 10-1/2 lbs. to compress springs to 2-1/32". If not within these limits, replace spring. Place a spring washer between two flat washers and install on one end of the rocker arm shaft and install a new cotter pin in the shaft. Place a rocker arm on the shaft next to the inner flat washer. (*CAUTION*—The oil groove side of the shaft must be at the bottom of the rocker arm and the adjusting screw end of the rocker arm be on the same side of the shaft as the cylinder head capscrew groove in the shaft). Place a shaft bracket on the shaft so that the bottom of the bracket is on the oil groove side of the shaft and align the cylinder head capscrew hole in the bracket with the capscrew groove in the shaft. Insert a capscrew through the bracket. Clamp the bracket in a vise and install the second rocker arm on the shaft, positioning it in the same way as the first rocker arm. Slide a spacer spring on the shaft and, holding the spring compressed, slide the third rocker arm and the second bracket on the shaft and position it in the same way as the first bracket. Align the screw hole in the bracket with the groove in the shaft, insert a capscrew and release the spring. Install the rest of the rocker arms, springs and brackets in the same manner. Slip the two flat washers with the spring washer between them, on the end of the shaft and install a new cotter pin in the shaft. If correctly assembled, when installed on the engine, the flat side on the end of the rocker arm shaft will be at the rear on the right bank and at the front on the left bank.

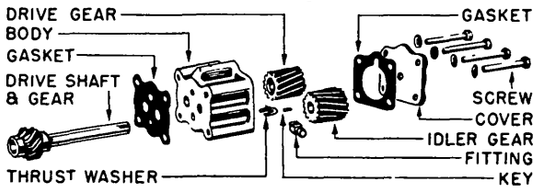
COMMANDER & PRESIDENT R CKER ARM ASSEMBLY

VALVE LIFTER

CHAMPION, COMMANDER & PRESIDENT

VALVE LIFTER INSTALLATION: Thoroughly clean lifter bores in cylinder block and inspect for smoothness. With lifter and bore clean and dry, check lifter fit and select correct lifter size. Lifters furnished Std., .001", .005" oversize. See ".005" Oversize Lifter Installation" below.

Checking Lifter Fit in Bore—When properly fitted, the valve lifter should just slide into place from its own weight. If .001" oversize lifter does not restore proper clearance, bore must be reamed to .005" oversize, and .005" oversize lifters installed.



.005" OVERSIZE VALVE LIFTER INSTALLATION (1949-56 MODELS): .005" oversize service replacement valve lifters are available for all models (1949-56). Special reamers are required for reaming engine block lifter bores as follows: 32L-STB (1949-56 Champion & 1949-50 Commander 6); 1356-STB (1951-54 Commander V8); 1352-STB (1955-56 Commander & President V8).

OILING SYSTEM

OIL PUMP

CHAMPION

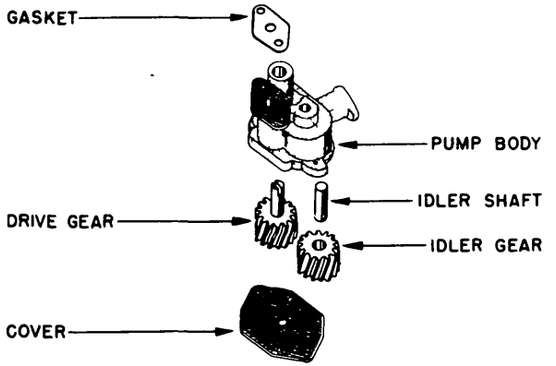
OIL PUMP: Removal & Disassembly—Disconnect oil pressure pipe. After removing four cover screws and washers, remove pump body cover, gasket and idler

CHAMPION OIL PUMP

gear. Remove drive gear using tool J-2959. Remove Woodruff key and horseshoe shaped thrust washer to permit removal of oil pump body and gasket. If it is necessary to remove pump drive shaft and gear, the oil pan must be removed. Remove distributor and push oil pump drive shaft inward, and remove it from the crankcase. To remove gear from oil pump drive shaft, press out the gear-to-shaft pin and then press shaft out of gear.

Inspection: Inspect pump cover for flatness and deep scratches or score marks. Check clearance between oil pump gears and pump body by placing a .005" feeler gauge between teeth of oil pump gear and body on each side of pump. The pump should be locked tight. The total clearance should not exceed .010". If pump gears can be rotated with the two .005" feelers in place, the pump body is worn and should be replaced. Check gears for smoothness, deep scratches and score marks. Replace all defective parts. Clearance between end of gears and cover plate must not exceed .007". To check this clearance, the lower ends of the gears should be exactly flush with the lower surface of pump body when gears are resting against the upper part of pump body. A new gasket .004-.006" thick, when compressed will provide proper clearance.

Installation & Reassembly: *(CAUTION—If oil pump drive shaft removed, install EXACTLY as described below to obtain correct ignition timing).*



Oil Pump Drive Shaft Installation—Install drive shaft, temporarily engaging camshaft gear and oil pump drive gear in any position. Then turn the crankshaft until No. 1 piston is on a compression stroke and the "UDC 1-6" mark on vibration dampener is directly under pointer on engine front cover. Slide the oil pump drive shaft away from camshaft to disengage the camshaft gear and turn drive shaft until keyway is pointing directly upward when the two gears start to engage. Pull the shaft into position so that the two gears fully mesh (the drive shaft will rotate so that the keyway is toward rear of engine). Install distributor to hold oil pump drive shaft in position while installing remainder of pump assembly (with slot in end of distributor shaft engaged, rotor should line up with No. 1 terminal in distributor cap).

Oil Pump Assembly—Dip each part of pump in clean engine oil before assembly. Place a new gasket and oil pump body over pump shaft and install horseshoe washer, woodruff key, and drive gear. Install idler gear, new cover gasket, and pump body cover. Secure entire assembly in place with the four cover screws

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Remove oil pressure pipe fitting from pump body and prime pump with clean engine oil. Install fitting and oil pressure pipe.

COMMANDER & PRESIDENT OIL PUMP

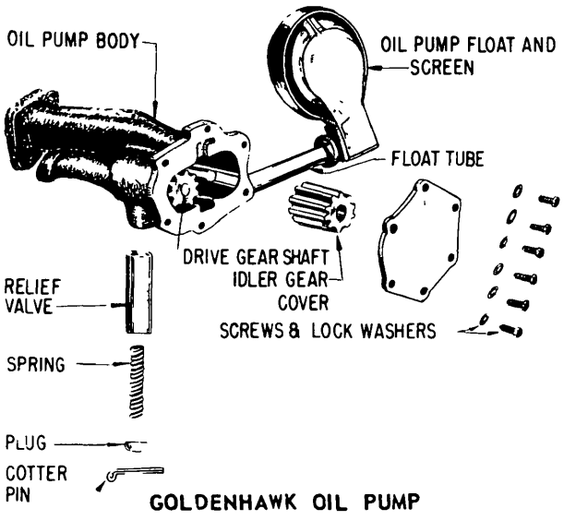
COMMANDER & PRESIDENT

OIL PUMP: Removal–Remove oil pan and take out the two oil pump retaining nuts and lockwashers. Slip pump assembly off mounting pad studs and remove gasket.

Disassembly: If necessary to replace strainer, straighten tab, and slip strainer off pipe. If floating strainer is to be cleaned, remove pump and strainer assembly. Do not remove the strainer by bending retaining tab. *(NOTE–the floating oil strainer is serviced only as an assembly and should not be disassembled).* Remove cover screws and pump body cover. Remove idler gear, drive gear and shaft (do not disassemble drive gear and shaft). Clean oil strainer with solvent and dry it thoroughly.

Insp ction: Inspect pump cover for deep scratches or scores and for flatness. Check clearance between oil pump gears and pump body by placing a .005" feeler gauge between teeth of oil pump gear and body on each side of pump. If pump gears can be rotated with the two .005" feelers in place, the pump body is worn and should be replaced. Check gears for smoothness, deep scratches and score marks. Replace all defective parts. With weight of gears resting against upper part of pump body, place a straightedge across face of pump body and measure distance between gear face and straightedge. This clearance should not exceed .007".

Reassembly: Place drive gear and shaft assembly in pump body. Install idler gear on idler shaft. Install pump body cover and cover screws (no gasket is used between body and cover). Insert pipe of floating oil strainer in cover inlet finger tight and set up strainer to get its proper position. While holding assembly so strainer is up against upper stop, lower surface of strainer should be parallel with pump cover and 1 7/8" below cover. Scribe aligning marks on pump body and pipe. Then, using suitable pipe wrench, tighten pipe until tight and aligning marks are aligned.



Installation: Clean all traces of old gasket off pump mounting flange and rear bearing cap pad. Install a new gasket and position slot in pump drive gear shaft so it will mate with tongue of the oil pump drive shaft and coupling, and install pump on mounting studs. Install nuts and lockwashers and tighten securely to 13-17 ft. lbs.

COOLING SYSTEM

GOLDENHAWK

OIL PUMP: Removal – Remove oil pan and remove two screws attaching oil pump to rear main bearing cap, remove oil pump and strainer assembly.

Disassembly: Remove cover screws and pump body cover. Remove idler gear, then remove pin from sleeve on shaft and drive sleeve off shaft. Remove upper and lower pump driving shaft and gear from housing. Press shaft out of driving gear, if necessary. To remove strainer, straighten tab which retains strainer on pipe, slip strainer off pipe. To remove oil pressure relief valve, pull out cotter pin which holds spring retainer *(CAUTION* – Spring retainer is under considerable tension). After removing spring retainer and spring, insert a 23/64" drill into skirt of valve piston and withdraw piston from pump housing.

GOLDENHAWK OIL PUMP

Inspection: Inspect float for leaks. Inspect strainer. Inspect relief valve spring (free length should be approximately 3 19/64". When compressed to 1 3/8", pressure should be 9-9½ lbs.). Inspect pressure relief valve plunger and bore in pump housing for scores and wear which might cause plunger to stick in housing. Check pump cover plate. It should be flat, smooth, and without any deep scratches or score marks. Clearance between oil pump gears and pump body should not exceed .010". To measure this clearance place a .005" feeler gauge between teeth of oil pump gear and body on each side of pump. Pump should be locked tight. If gears can be rotated, pump body is worn excessively and should be discarded. Clearance between end of gears and cover plate must not exceed .003" with weight of gears resting against upper part of pump body. Place straightedge across face of pump body, and with feeler gauges measure distance between each gear face and straightedge.

Reassembly: Install key in pump shaft keyway and press driving gear on shaft until it is flush with bottom of gear. Install upper and lower shafts and gear in pump body. Install sleeve on shafts. Install pin in sleeve and stake both ends of pin. Install idler gear on its shaft. Install oil pressure relief valve plunger, spring, and spring retainer. Compress spring and install cotter pin. Slip strainer over end of pipe and bend tab to retain strainer. If strainer pipe has been removed from pump body, be sure threads are tight and that strainer is properly positioned. Check position with scale and straightedge. With float in lowest position, there should be ¾" between center of button on top of strainer and lower surface of pump. Install cover on pump body.

Installation: Clean mating surfaces of pump and mounting pad. Start pump driving shaft into hole of rear main bearing cap and turn shaft to engage mating ends on distributor shaft. Torque screws to 25-30 ft. lbs.

RADIATOR & FAN SHROUD REMOVAL & INSTALLATION (Coupe & Hardtop): Shr ud - Drain radiator and remove inlet hose. Remove wiring. junction block from fan shroud. Pry open wiring harness clips and move harness out of way. Remove fan-to-hub screws and remove fan blades. Remove four capscrews holding shroud to radiator core support and remove fan shroud. To install, reverse removal procedures.

Radiator – Drain cooling system, disconnect battery and tie up hood. Remove horn relay and headlamp junction block screws, and free wires across top of shroud from clips. Except on Champion models, remove gasoline pipe clip screw. If car has power steering, free upper hose from hose support. Remove fan blade assembly. Disconnect upper and lower hoses from radiator. Remove screws and remove radiator core.

IGNITION NOTES

COMMANDER & PRESIDENT

DISTRIBUTOR DRIVE SHAFT ASSEMBLY: R m val– Turn crankshaft until "IGN" mark on vibration dampener is directly under pointer on engine front cover and distributor rotor is in line with No. 1 spark plug terminal of cap. Remove cap from distributor housing and carburetor air cleaner from carburetor. Disconnect coil-to-distributor secondary cable at coil. Remove spark plug cables, cable brackets and distributor cap as a unit. Disconnect coil-to-distributor primary wire at distributor. Disconnect spark modifier pipe. Remove distributor clamp capscrew and lift distributor out of cylinder block.

Installation: The "IGN" mark on vibration dampener must be directly beneath pointer. Position distributor so that spark modifier is to front and pointing slightly toward right. Turn rotor approximately 30° clockwise and insert the oil pump drive shaft and coupling into cylinder block opening. When the teeth on the distributor shaft gear contact the teeth on the camshaft

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

gear, the rotor will turn counter-clockwise, and as the teeth mesh, the distributor assembly will seat on the cylinder block. At the same time the tongue of the oil pump drive shaft will enter the groove of the oil pump shaft. The rotor will now point directly forward and be in line with the No. 1 terminal of the distributor cap. (NOTE—Very slight misalignment may cause difficulty in engaging the oil pump drive shaft tongue with the groove of the oil pump shaft). After the distributor gear is in mesh with the camshaft gear, the engine may be cranked to give proper alignment. Maintain a light pressure on the distributor while cranking the engine to facilitate the engagement. Install distributor clamp and capscrew. Connect the coil-to-distributor cable. Connect spark modifier pipe. Install spark plug cables, cable brackets and secure cap with retainer springs. Connect coil-to-distributor secondary cable. Install carburetor air cleaner. Check timing.

GOLDENHAWK

DISTRIBUTOR DRIVE SHAFT ASSEMBLY: Removal – Turn crankshaft until ignition mark on vibration damper is directly under 5° mark and distributor rotor is in line with No. 1 spark plug terminal of cap. Unsnap retainer springs and remove distributor cap from housing. Remove carburetor air cleaner. Disconnect coil-to-distributor cable at distributor. Disconnect spark modifier pipe. Remove distributor clamp capscrew and clamp. Lift distributor out of block.

Installation: Line up ignition indicator mark on vibration damper with 5° timing mark with No. 1 cylinder on firing stroke. With distributor cap removed, insert distributor to engage oil pump drive shaft by turning distributor rotor. With rotor pointing at right cylinder bank, select proper tooth so that when distributor is placed in full mesh with the camshaft gear, rotor will be pointing to the right bank and 37° rearward from the transverse line. This will also be the position for the No. 1 spark plug wire terminal. **Line up, but do not connect spark modifier pipe.** After distributor is in its bottom position, install retainer clamp, washer and screw. Install distributor cap, making sure that each of spark plug wires is tight in cap. Install coil-to-distributor cable. Before installing spark modifier pipe, check ignition timing and adjust. Install spark modifier pipe.

PROPELLER SHAFT

ALL MODELS

PROPELLER SHAFT & SUPPORT BEARING ASSEMBLY: Propeller shaft is a two unit type (separate front & rear shafts) with intermediate bearing in Support Assembly on frame crossmember.

Rear Shaft Removal: Straighten ear of lockplate, loosen grease washer nut and unscrew it from shaft. Mark universal joint flange and rear axle companion flange to assure original position and balance at reassembly. Remove U-bolts holding rear joint bearing cups and cross to rear axle flange. Shift shaft forward and separate joint by prying with a suitable bar between companion flange and universal cross. Hold bearing cups on the cross while separating joint to avoid dropping cups and spilling bearings. Then remove bearing cups and bearings or tape them securely in place on cross. Slide shaft rearward, slipping end of slip yoke out of splines of front shaft. To remove grease washer nut from slip yoke, first remove cork grease washer and washer retainer from within the nut and slide nut off slip yoke. Cork grease washer and washer retainer are split to facilitate removal.

Installation—Reverse removal procedure. Tighten U-bolts and nuts to 14-17 ft. lbs.

Front Shaft Rem val: Remove rear shaft and shaft support assembly. Mark front shaft universal joint flange and transmission companion flange. Remove U-bolts holding joint bearing cups and cross to transmission companion flange. Separate joint by prying with suitable bar between companion flange and universal cross. Hold bearing cups on cross while separating joint to avoid spilling bearings. Remove bearing cups and bearings or tape them in place on the cross. Then slide rear end of shaft out of crossmember and remove from chassis.

Installation—Reverse removal procedure. Tighten U-bolts and nuts to 14-17 ft. lbs.

Support Bearing Servicing: Bearing is sealed type (prepacked with lubricant) **and must never be wash d in gasoline or other solvents.**

►*CAUTION: Do not re-install support bearing which has been washed in gasoline or solvent.*

Support Bearing Removal: Remove rear shaft. Remove lock plate and spacer from projecting end of front shaft, and remove shield. Remove shaft support stud nuts, lockwashers, and plain washers. Slide bearing and support assembly off front shaft and support cushions. Remove dust shields from front shaft. To remove support bearing from support use a suitable tube which will fit the outer race of the bearing and, with an arbor press, remove the bearing. NOTE—Use care not to damage bearing seal.

Installation—Reverse removal procedure. NOTE—Press bearing into support so that it is laterally centered in the support. Install dust shields on front shaft with concave side of shield against shoulder on shaft. If shaft support cushions removed, be sure to install studs in same holes from which removed.

MODEL IDENTIFICATION

Mod l	Model Designation
Champion (All Models)	56 G

SERIAL NUMBER: Located on left front door pillar post.

Assembly Plant	Starting Numbers
South Bend	G 1,357,501
Los Angeles	G 936,701
Hamilton	G 763,701

ENGINE NUMBER: Stamped on pad on upper front left corner of engine block.

Starting Engine Number—1180251 (South Bend), L-3201 (Los Angeles).

TUNE-UP

COMPRESSION PRESSURE: 130-150 lbs. at 150 RPM. Variation limit (between cylinders) 10 lbs.

VACUUM READING: 17-18" idle speed.

VALVE TAPPET CLEARANCE: .016" cold. Intake & exhaust.

MANIFOLD HEAT CONTROL: Automatic thermostatic type.

Checking Thermostatic Coil Spring — With outer end of coil free from anchor, and valve closed (counter-weight up), hooked end of coil should be 90° clockwise from anchor post at 70° F.

IGNITION

FIRING ORDER: 1–5–3–6–2–4,

SPARK PLUG GAP: .030". Limits .028-.033"

Spark Plug — Champion J 7.

COIL: Auto-Lite CAF-4004. *12 Volt.*

Ignition Current — 4 Amps. (Idling).

►*IGNITION RESISTOR NOTE: Resistor not used.*

DISTRIBUTOR: Auto-Lite IAT-4201. *12 Volt.*

Condenser—Auto-Lite IAT-2015L. **Capacity** .21-.25 mfd.

Contact Point Set — Auto-Lite IGW-3028AS.

Breaker Gap — .020"

Cam Angle - 39°±3°.

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Counter-clockwise viewed from above.

►*DISTRIBUTOR SETTING & TIMING NOTE: See "Oil Pump Removal & Installation Change" under OILING SYSTEM below.*

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		400	0		800
2		680	4		1360
4		975	8		1950
6		1265	12		2530
7		1400	14		2800

Vacuum Spark Control: Auto-Lite, Integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4
1	2	4 7/8
4	8	7 1/2
8	16	11 1/8
9	18	12

IGNITION TIMING

Setting — 2° BTDC.

Timing Mark — On vibration damper. "IGN" mark in line with pointer (left side of timing cover).

Timing — Disconnect vacuum advance pipe at carburetor. Install plug in carburetor. With engine at idling speed, timing light should show index mark nearest IGN mark, directly under pointer.

CARBURETOR
CARTER WE

Car Model	Carter Carburetor
56G (to Serial No. G-1,182,938)	2108S
56G (After above Number)	2417S

Idle Setting — ½-1½ turns open. Turn screw out for richer mixture.

Idle Speed — 550 RPM. (With selector lever in "N" or "P" position on "Flightomatic" or "Automatic Transmission" cars).

Float Level — 3/8" measured from top of projection on bowl cover to top of soldered seam on free end of float with needle valve seated and bowl cover inverted.

Accelerating Pump — No seasonal adjustment.

Fast Idle: .046" throttle valve opening with choke valve closed. To check, crack throttle valve, hold choke closed, measure on side opposite idle ports using Gauge T109-158. Adjust by bending connector rod.

Automatic Choke Setting: 1 point lean.

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With transmission selector lever in "N" (Neutral) or "P" (Park) position, engine at normal operating temperature and choke valve wide open, proceed as follows:

1) Disconnect rod which connects accelerator bracket on firewall to auxiliary bellcrank on side of engine.

2) Connect a tachometer to engine and set engine idle speed at 550 RPM by adjusting the carburetor idle speed screw. Disconnect the rod which connects the main bellcrank on firewall to auxiliary bellcrank on engine by removing the main bellcrank ball joint stud from main bellcrank lever. Adjust the screw on main bellcrank to provide a 5/16" clearance between bellcrank and pad (use a 5/16' drill as a gauge).

3) Adjust the ball joint on main bellcrank-to-auxiliary bellcrank rod until ball joint freely enters hole in main bellcrank lever. During this adjustment the carburetor idle speed screw must be against its stop and the 5/16" gap at the bellcrank must be maintained.

4) Disconnect and adjust length of the main bellcrank-to-throttle valve outer lever (on transmission) so that ball joint stud freely enters the throttle valve outer lever. During this adjustment the throttle valve outer lever must be against its internal stop (outer lever held to rear of transmission). Remove the ball joint stud from the throttle valve outer lever **and shorten the rod four complete turns** of the ball joint assembly. Reinstall the ball joint stud and tighten nut. Hold accelerator bracket arm approximately 3 7/8" from the firewall and adjust bracket-to-auxiliary bellcrank rod clevis until clevis pin freely enters clevis and bracket arm.

AUTOMATIC TRANSMISSION THROTTLE LINKAGE ADJUSTMENT: *See "Studebaker Automatic Transmission" in Transmission Section.*

►*OTHER DATA: See "Carter WE" Carburetors in Carburetion Section.*

Fuel Pump Pressure: 3½-5 lbs.

CARB. EQUIPMENT

Fuel Pump: AC No. 4156. Fuel only.

Fuel Pump Pressure: 3½-5 lbs.

See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: Electric type.

Dash Unit — Studebaker No. 1541286 (Sedans & Sta. Wgn.), 1539880 (Hard Top "Hawk").

Tank Unit — Studebaker No. 1540262 (Sedans & Hard Top "Hawk"), 1540263 (Station Wagon).

See "Fuel Gauges" in Carburetion Section.

Air Cleaner: Dry Type or Oil Bath type

►*DRY TYPE FILTER CAUTION:* Remove filter element every 1,000 miles and shake thoroughly to remove dirt. DO NOT WASH. Replace filter every six months or 10,000 miles

BATTERY

Willard HDW-2SM-50. *12 Volt,* 9 plate, 50 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

►*CAUTION: This is reversed from previous models.*

Engine Ground - Left front of engine.

STARTER

Auto-Lite MBG-4103. *12 Volt.* **Armatur** MZ-2367.

Drive - Bendix A-3519. Barrel-Anchor Plate type.

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension — 42-53 ozs.

Performanc Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.0	50 max.
5.2 ft. lbs.min.	Lock	4.0	235 max.

Starter Switch; Magnetic Switch mounted on starter and controlled by combination Starter & Ignition Switch. *NOTE* - Automatic drive cars have Neutral Safety and Back-up Light Switch.

Automatic Transmission Neutral Saf ty Switch: Delco-Remy 1998038 (without Power Steering), No. 1998059 (with Power Steering). Mounted on lower end of steering column. Starter will operate only when selector lever is in "N" or "P" position.

Adjustment - *See 'Studebak r Automatic" or "Flightomatic" Transmission in Transmission Section.*

GENERATOR

Auto-Lite GJC-7002-F. *12 V lt.* **Armatur** GJC-2030F.

Performanc Data

Amperes	Volts	RPM
20	15.0	1750 max.
30	15.0	2050-2250

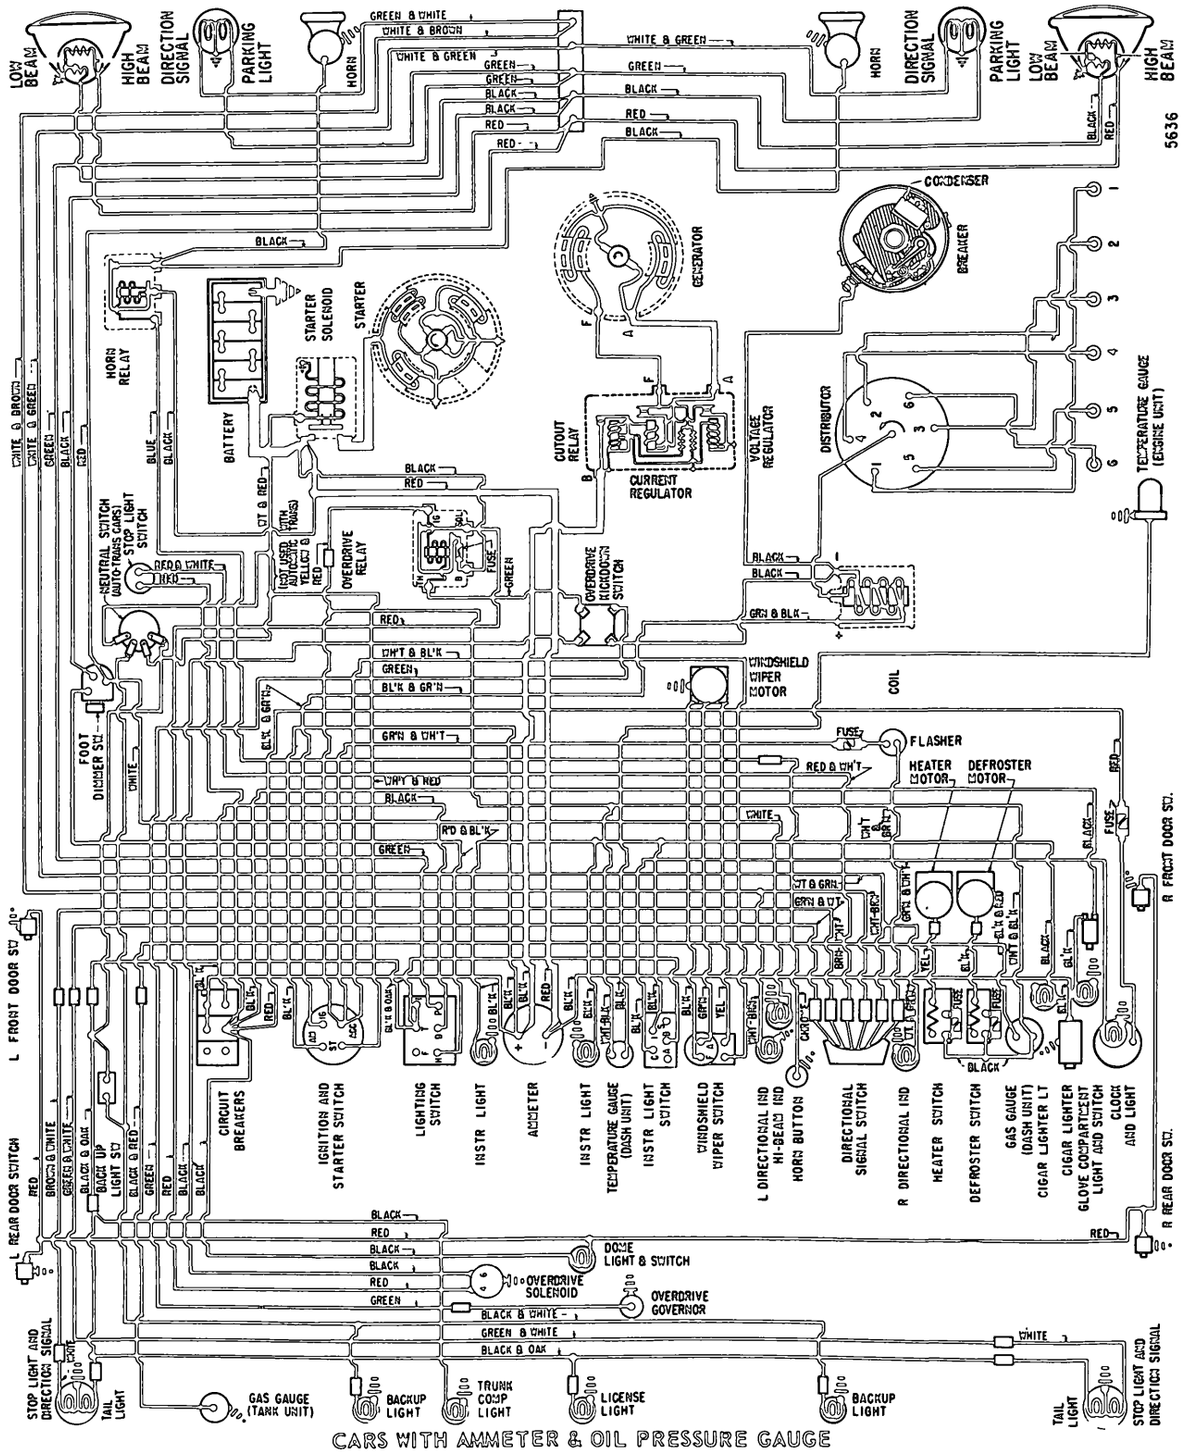
Brush Spring Tension - 18-36 ozs.

Field Current - 1.2-1.3 amps. at 10.0 volts (70°F.).

Motoring Current - 3.4-3.9 amps. at 10.0 volts (70°F.).

Rotation - Counter-clockwise at commutator end.

Belt Adjustment: 3/8-1/2" deflection midway between generator and fan pulleys.



REGULATOR

Auto-Lit VRX-6008A. *12 Volt.*

Cut ut R lay

Cuts In - 13.0-13.7 volts.

CONTINUED ON NEXT PAGE

CARS WITH AMMETER & OIL PRESSURE GAUGE

CONTINUED FROM PRECEDING PAGE

Cuts Out - 8.2-9.3 volts.
Contact Gap - .015" minimum.
Air Gap - .031-.034".

Voltage Regulator

Setting - 14.2-14.8 volts at 80°F., unit operating normally while charging at 10 amperes or with a .25 ohm resistor between regulator and battery.
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Checking & Adjusting - *See Electrical Section.*

Current Regulator

▷ *SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
36 amps		30 (28-32) amps.

Test A - After 15 minutes operation charging at 10 amps.
Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signals: *See Electrical Section.*

Lighting Switch Removal: (Toggle type)—Remove retaining nut. Remove lower panel cover screws and covers. Slide toggle switch back through panel and disconnect wires. (Knob type)—Use stiff wire to remove spring from back side of switch knob and pull knob from shaft. Remove bezel nut and shove switch assembly back through panel and remove wires.

Stop Light Switch Location: Inner side of left frame rail just forward of steering gear housing, except on Power Brake equipped cars, where it is screwed into rear end of power unit, located under hood on left front fender apron.

FUSES: Located as follows:
Overdrive - 20 amps. (in relay on dash panel).
Radio - 9 amps. (in lead behind instrument panel).
Direction Signal - 14 amps. (in bracket behind instrument panel).
Electric Clock - 3 amps. (in lead behind instrument panel).
Climatizer & Defroster - 14 amps. (Coupe & Hardtop); 15 amps. (Other Models), (on Climatizer & Defroster switch).

CIRCUIT BREAKERS: Located as follows:
1) - Head, Parking & Instrument Lights - 18 amps. (on main lighting switch).
2) - Body & Stop Lights - 15 amps. (below headlight switch on instrument panel).
3) - Windshield Wiper - 5 amps. (in wiper switch).
4) - Window Lift - 20 amps. (on left cowl panel).
5) - Seat Adjuster - 20 amps. (on left cowl panel).

HORNS: Dual horns with relay (Exc. Champion Custom models which have one horn).

Delco-Remy No.	Low Note	High Note
All Models	1999757	1999758

Horn Relay: Delco-Remy 1116781. 12 Volt.

ENGINE

ENGINE SPECIFICATIONS: "Sweepstakes 185". 6 Cyl. "L" head.

Bore	Stroke	Displacement
3"	4-3/8"	185.6 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
7.5-1 ℂ	21.6	101 at 4000 RPM

ℂ — 8.0-1 Optl. compression ratio.

Compression & Vacuum Reading—*See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Studebaker Special Data.*

OIL PAN REMOVAL: *See "Oiling System" in Studebaker Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Studebaker Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data.*

PISTONS

"T" slotted, cam ground, tin plated aluminum alloy. Three ring type.

Original Bore & Pistons—*See "Original Bore & Pistons" in Studebaker Special Data.*

Removal—Pistons and rods removed from above.

Fitting New Pistons: Clearance—Selective feeler fit. Use feeler 1" wide, .002" thick, and 12" long inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler with properly fit piston should be 11 to 16 lbs.

Replacement Pistons: Std. .010", .020", .030" and .040" Oversize.

Installing Pistons: Install piston in cylinder bore with "T" slot away from camshaft side. *See Rod Installation.*

PISTON PINS

Pin is locked in rod by tapered pin and locknut.

Diameter—.7491-.7495". **Length** 2.625".

Clearance in Piston—.0001-.0003" (selective fit). Light thumb push fit at 70°F.

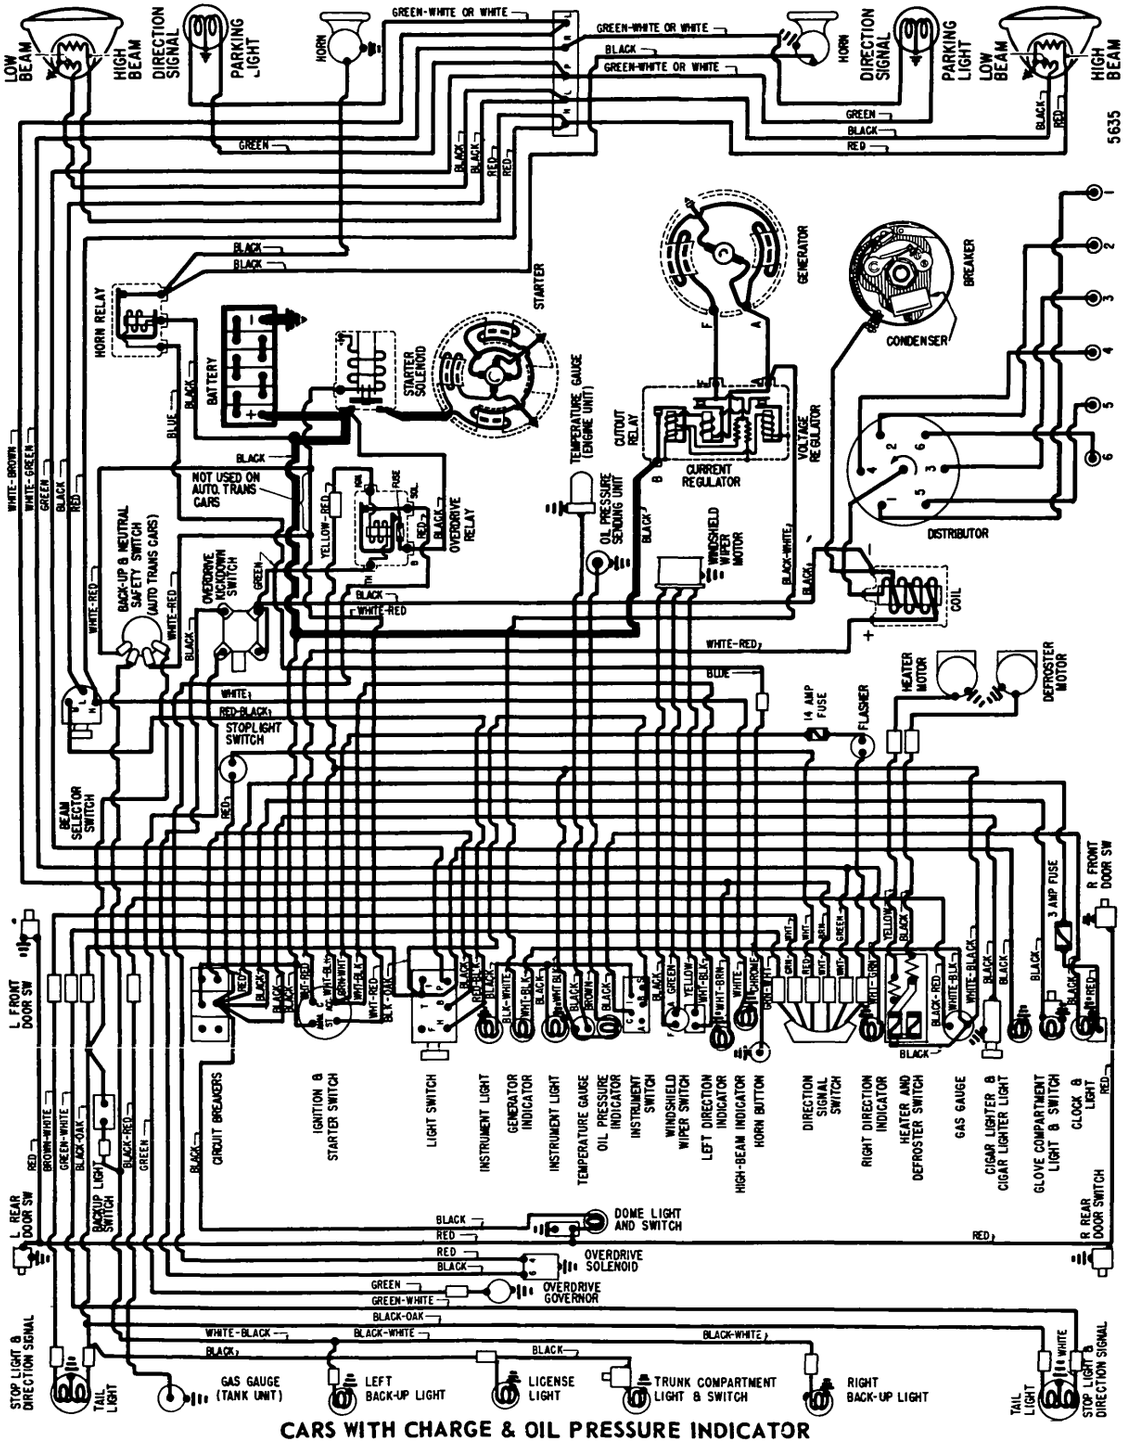
Piston Pin Removal & Installation—*See "Piston Pins" in Studebaker Special Data.*

Replacement Pins: Std. & .0025", .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.007-.017"	.002-.005"
Compr. #2	1/8"	.007-.017"	.002-.005"
Oil	5/32"	.007-.017"	.0015-.004"

Replacement Rings: Std., .020", .030", & .040" Oversize, in sets.



See "Piston Rings" in Studebaker Special Data.

Installing Rings: Top compression ring has step at the inside which must be installed up. Second compression ring has step at outside which must be installed down. Inner and outer oil ring end gaps must not come at the same point.

CONNECTING RODS

Length—(Center-to-center) 6 3/8". Weight—19.04 ozs.

CONTINUED ON NEXT PAGE

CARS WITH CHARGE & OIL PRESSURE INDICATOR

CONTINUED FROM PRECEDING PAGE

Crankpin Journal Diameter—1.81175-1.81275"
Bearings—Steel backed, Microbabbitt lined, no shims
Clearance—.0005-.002"
Side Play—.005-.009"
Replacement Bearings: Standard & .001", .005", .010", .020" Undersize.
Installing Rods: Assemble piston and pin on rod so "T" slot of piston on side opposite oil hole in lower end of rod. Insert tapered end of clamp screw toward heavy boss on rod. With "T" slot of piston away from camshaft side, the narrow part of rod offset will be to right on odd numbered rods, to left on even numbered rods. Rods (#1, 3, 5) cannot be interchanged with rods (#2, 4, 6).
►*REPLACEMENT ROD NOTE.* (Unnumbered Rods)—With spit hole toward you, narrow part of offset will be to the right for odd numbered cylinders, and to the left for even numbered cylinders.

CRANKSHAFT

Journal Diameter—3.0623-3.0628" Four bearings.
►*FRONT MAIN BEARING CAP REMOVAL NOTE:* Turn crankshaft until No. 3 and No. 4 pistons are at top of their travel. Remove bearing cap bolts, then remove cap by twisting end away from camshaft toward rear of engine.
Clearance—.0005-.0025"

Replacement Bearings: Std., 001', .010', .020", and 030" Undersize.
End Thrust: Taken by thrust washer assembled between front main bearing and crankshaft gear. Controlled by shims between thrust washer and main bearing journal.
End Play—003-.006"
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.7475-1.7480", (2) 1.7162-1.7170", (3) 1.6857-1.6865", (4) 1.6232-1.6240".
Bearings—Steel backed babbitt lined bushings.

Clearance—No.1—.0007-.0022", Nos. 2,3,4—0010-.0027"
End Thrust: Taken by thrust plate assembled on front face of engine block behind camshaft gear (spacer assembled on shaft behind gear hub). Tighten capscrews alternately a few turns at a time to prevent distortion of plate.
End Play—.003-.006"

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Crankshaft gear is Cast Iron, Camshaft gear is Celeron with steel hub.

Timing Gear Removal & Installation—*See "Timing Gears" in Studebaker Special Data.*

Backlash—.001-.003"
Replacement Gears—Camshaft gear furnished in two sizes. Standard & High limit. Crankshaft gear furnished standard size only.

Camshaft Setting: Mesh marked tooth on camshaft gear between two marked teeth of crankshaft gear.
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

Tappet Clearance: .016" cold. Intake & exhaust.

Valve	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	5/16"	4 11/32"
Exhaust	1 9/32'	5/16"	4 11/32"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	0015-.0035"
Exhaust	45°	11/32"	0015-.0035"

Valve Seat Width—1/16-3/32'
►*RECONDITIONING VALVE CAUTION.* If reconditioning results in knife edge at top of valve, valve must be replaced.
Valve Springs: Install springs so that flanged edge of retainer fits over flat surface of lower coil spring. Tongue on lower side of retainer must fit in groove in spring retainer lock.
Valve Spring Specifications—93-103 lbs. ± 10% when compressed to a length of 1 5/16".
Valve Guides: Use Tool No. J-2034 and drive old guide down and out from top of block into valve spring chamber. Use Collar J-2034-5, guide pilot J-2034-2 on driver J-2034-1 and drive new guide down until driver bottoms against spacing collar.
Valve Lifters: Mushroom type. Remove from below with camshaft out of engine.
Valve Lifter Installation & Fitting—*See "Valve System" in Studebaker Special Data.*
Replacement Lifters—Std., .001" & .005' Oversize.
►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore) See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves—Open 15° BTDC. Closes 49° ALDC.
Exhaust Valves—Open 54° BLDC. Closes 10° ATDC.
Valve Timing Check—Adjust No. 1 Intake valve at .020" cold. Rotate engine until No. 6 piston is on compression stroke (the IN-OP 1-6 marking on dampener should be several inches from pointer), then while moving lifter up and down continue to rotate crankshaft. Valve timing will be correct if lifter stops moving as above marking is directly below pointer.

OILING SYSTEM

Crankcase Capacity: 5 quarts refill.
Normal Oil Pressure: 40 lbs. at 1400-1600 RPM.
Pressure Regulator Valve: On lower right front corner of engine. For access, remove engine front cover bolt. If spring is weak, replace it (do not stretch spring).
Oil Pressure Indicators: Coupe & Hardtop Models—Direct reading, non-electric type gauge.
Other Than Coupe & Hardtop Models—Red indicator light on instrument panel. If light on at highway speeds, after warm-up, low oil level or other difficulty is indicated.
Oil Pressure Switch—Studebaker No. 1539898.
Oil Pump: Helical gear type. Mounted on right side of crankcase.
Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data.*
►*OIL PUMP REMOVAL & INSTALLATION CHANGE:* Turn crankshaft away from No. 1 TDC position to give clearance between counterweight and cylinder block. Have crankshaft in same position for replacement of oil pump. With pump and gear entered with shaft in this position, turn engine to No. 1 TDC position. Disengage pump shaft and gear from camshaft, turn pump shaft until keyway in shaft points toward bottom of engine. Draw pump shaft and gear into engagement with camshaft. This will turn the keyway toward the rear of the engine. This will be the correct location for distributor setting and timing.
Oil Filter: Partial Flow. Replace filter element at 5000 mile intervals. Change more often in dusty areas.
Replacement Filter Element: AC No. P-203X (Std.), No. P-209 (Optl.)
Crankcase Ventilation: Filter element in oil filler cap (air intake) and in breather pipe at left rear of engine (air outlet). Filter element in breather pipe replaceable.

COOLING

Water Capacity: 11 qts. (with heater 12½ qts.).
Pressure Valve: Radiator filler cap. 13 lb. type.
Thermostat: Choke type. (170° Std.), 155° & 177° (Optl.).
Water Pump: Packless, sealed ball bearing type.
See "Studebaker Champion" in Water Pump Section.
Pump Removal—Remove shroud. *See "Cooling System" in Studebaker Special Data.* Loosen generator and remove belt. Remove fan-to-hub capscrews and remove fan blades and pulley. Disconnect Climatizer hose, and generator adjusting arm. Disconnect outlet hose and remove mounting capscrews.
Radiator & Fan Shroud Removal: *See "Cooling System" in Studebaker Special Data.*
Temperature Indicators: Coupe & Hardtop Models—Direct reading, electric type gauge.
Other Than Coupe & Hardtop Models—Red-green indicator on instrument panel. Electric type. When indicator shows any green, engine is operating at normal temperature. If it turns red through entire range, engine operating temperature is above normal.
Dash Unit—Studebaker No. 1541287 (Sedans & Sta. Wgn.), 1539879 (Hard Top "Hawk").
Engine Unit—Studebaker No. 1539876 (All Models).
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 9A7. Assy. No. 361365 (U.S.), No. 361379 (Canada). Single plate, dry disc type.
Clutch Disc. No.—Borg & Beck No. 382276
Pedal Adjustment: Free Travel ½-1' To adjust, unhook pull-back spring on outside of frame rail, loosen locknut at adjusting clevis and remove clevis pin at inner end of pedal shaft, turn clevis on rear end of pedal shaft-to-operating shaft rod for correct clearance, reassemble linkage.
►*HILL-HOLDER NOTE* Check setting whenever clutch

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

pedal adjusted and adjust Hill-holder to release just as clutch engages Make sure Hill-holder operating rod installed with rod to inside (toward center of car) of clutch release shaft lever

Housing Removal· Remove oil level gauge and tube Remove starter mounting screws (only) and tie starter and cables up out of the way Remove floor plate and clutch housing top capscrews Remove transmission. *See "Transmission Removal" under Transmission.* Disconnect pedal rod at operating shaft-to-release sleeve, pull operating shaft out, remove sleeve Remove two bolts holding rear engine support insulator cage to crossmember Support engine at rear of oil pan (use block of wood on jack to protect oil pan) Remove crossmember Remove two clutch housing bolts releasing exhaust pipe support bracket Loosen clamp bolt and swing bracket out of way Remove remaining housing bolts and remove housing *NOTE*–Remove dowel bolts first

►*INSTALLATION CAUTION* Align clutch housing to rear engine plate with two tapered drifts, then install the dowel bolts. Draw dowel bolts in place by tightening the nuts—**do not drive them into place.**

Clutch Removal: Remove clutch housing (above),remove six screws evenly to relieve spring pressure, lift off clutch assembly and driven member

SYNCHRO-MESH TRANSMISSION

Warner Model AS1-T96 (Std.), AS24-T96 with R10 type Overdrive.

See "Warner Synchro-mesh Transmission" in Transmission Section

Transmission Controls: *See "Transmission Controls" in Transmission Section*

Removal: Drain transmission case Disconnect universal joint from transmission companion flange and remove propeller shaft support stud nuts and plain washer Move front propeller shaft and support assembly rearward on slip yoke splines Move end of shaft to one side as far as possible and tie it in position Disconnect shift rods from shift levers and remove speedometer cable from transmission case. Remove speedometer pinion Remove cap screws which hold transmission case to clutch housing. Remove clutch operating shaft, bracket, and bearing from the transmission case Then move case rearward until main drive pinion clears clutch pressure plate and remove unit from car

NOTE–On Coupes and Hardtops, it will be necessary to remove additional frame crossmember before removing transmission

OVERDRIVE

Warner R10. Governor controlled, solenoid operation with throttle controlled "kick-down"

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 Overdrive Control" in Transmission Section*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

AUTOMATIC TRANSMISSION

►*AUTOMATIC TRANSMISSION DISCONTINUANCE NOTE:* Effective Serial No. G-1360743 (Coupe & Conv.) & No. G-1361697 (Others) South Bend produced models, all cars will be equipped with the Flightomatic Transmission as optional equipment. The Studebaker Automatic Transmission is no longer used. *See "Flightomatic Transmission" below.*

Torque converter and 3-speed automatic transmission with hydraulic control Has mechanical parking lock and Anti-creep device which holds brakes applied when car standing and ignition "on"

See "Studebaker Automatic Transmission" in Transmission Section

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Studebaker Automatic Transmission" in Transmission Section*

►*TESTING & TROUBLE SHOOTING: See "Studebaker Automatic Transmission" in Transmission Section*

Lubrication: Check Oil Level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15,000 miles

Capacity–9½ quarts. *Use Automatic Transmission Fluid Type A (in containers with "AQ-ATF" symbol)*

Checking Fluid Level–Oil must be warm (set parking brake, place selector lever in "L" position, idle engine until normal operating temperature reached) Remove inspection cover on front floor carpet over transmission case, clean all dirt from around inspection hole, check oil level with dipstick gauge Add oil to bring level up to "Full" mark on dipstick (1 pint between "LOW" and "FULL")

►*OTHER AUTOMATIC TRANSMISSION DATA: See "Studebaker Automatic Transmission" in Transmission Sect.*

FLIGHTOMATIC TRANSMISSION

►*NOTE: See "Automatic Transmission Discontinuance Note" under AUTOMATIC TRANSMISSION above.*

Hydraulic torque converter and a hydraulically controlled automatic three-speed planetary type transmission which provides automatic operation in "D" range, and additional "Lo", "R", and "P" ranges which are controlled manually. In "D" position, the car starts in low gear and progresses to intermediate and high as car speed is increased.

See "Flightomatic" Transmission in Transmission Sect.

►*"NO REVERSE" CORRECTION: See "Flightomatic" Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Flightomatic" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Flightomatic" Transmission in Transmission Section.*

Lubrication: Check fluid every 1000 miles, drain and refill every 15,000 miles. Use Automatic Transmission FluidType "A" (container marked AQ-ATF).

Checking Fluid Level–Place selector lever in "P" position. Start engine and operate it for approximately four minutes or until engine and transmission have reached operating temperature. Remove floor mat from right side and remove oil inspection hole cover. Clean all dirt and foreign material from dipstick. Apply parking brake and foot brake, and move selector lever slowly from "P" position to "R" position, then back to "D" position. Remove dipstick, wipe clean, and install in transmission and **turn clockwise to lock position.** Remove dipstick and read fluid level. Add fluid to bring level to "FULL" mark on dipstick (1½ pints between "LOW" and "FULL" marks on dipstick).

Capacity–9 qts. Use Automatic Transmission Fluid Type "A" (container marked AQ-ATF).

►*OTHER FLIGHTOMATIC DATA: See "Flightomatic" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing cross type Three used with intermediate universal at propeller shaft support bearing on crossmember (see Propeller Shaft)

Propeller Shaft & Support Bearing: Two shafts used 1) Front shaft with intermediate universal yoke bolted on rear end (no slip-joint)

2) Rear shaft with slip-joint on forward end at intermediate universal

Propeller Shaft & Support Bearing Removal & Servicing–*See "Propeller Shaft" in Studebaker Special Data.*

REAR AXLE

Spicer. Semi-floating, hypoid gear, with Hotchkiss Drive

See "Spicer Hypoid" in Rear Axle Section

Transmission	Axle Ratios Standard	Optional
Standard	4 10-1	4 56-1
Overdrive	4 56-1	4 10, 4 88-1
Automatic	3 54-1	4.10-1

NOTE–Rear axle ratio stamped on plate attached to axle by cover capscrew and also on ring and pinion gears

Backlash–.003-.006". Shim adjustment

Axle Shaft Removal: Remove wheel, remove wheel hub (use puller J-1644-B) Take out backing plate retaining bolts, remove outer oil seal Pull backing plate out over end of axle shaft and wire plate to frame *(CAUTION*–Do not lose adjusting shims located between backing plate and axle housing flange), pull axle shaft with puller HM-931

Rear Axle Assembly Removal: Remove hub caps,take out cotter pin from axle nut, loosen rear wheel nuts. Place car on stands on frame just ahead of rear springs, Remove wheels, hubs and drums. Disconnect hand brake cable, take out backing plate bolts from backing plates free hydraulic brake line from axle housing clips (do not disconnect brake line from wheel cylinders) Disconnect rear universal (wire caps or use clamp to prevent losing rollers) Remove rear spring "U" bolts, disconnect lower shock absorber links, remove rear axle assembly from car

Wheel Bearing Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flange(shims .003", 005", .010", 030" thick)

End Play–.001-.006".

CONTINUED FROM PRECEDING PAGE

SHOCK ABSORBERS

Hydraulic, Manual and Direct Acting. Direct acting, hydraulic type. Serviced by replacement. *NOTE* - Heavy Duty Shocks are Gabriel.

Hydraulic Shocks (Studebaker Nos.)

	Front	Rear
2 Dr. Sedanet & "Hawk" ①	537021	537025

Manual Shocks (Studebaker Nos.)

Station Wagon	1539527	1539545
Others ②	1539525	1539543

Direct Acting Shocks (Studebaker Nos.)

All (Exc. Sta. Wgn.) ②	1539987	1539997

Gabriel Shocks (Studebaker Nos.)

Heavy Duty (Non-Adj.)	536398	536399
Heavy Duty (Adj.)	537712	537714

① – Before Serial No. G-1,359,504.
② – After above No. on 2 Dr. Sedanet & "Hawk".

FRONT SUSPENSION

Independent. Coil spring suspension with front shock absorbers located within coil springs.
See "Studebaker" in Suspensions & Wheel Alignmt Sect.

►*FRONT SUSPENSION NOISE CORRECTION (Due to Looseness of Bushing at Upper Control Arm Inner Shaft): See "Studebaker" in Suspensions & Wheel Alignment Section.*

Kingpin Inclination–5¼°.
Caster–Neg. 1°–Neg. 2½°. Not more than ¾° variation between wheels.
Camber–0° to Pos. 1°. ½° more camber favored on drivers side.
Toe-In–1/16-1/8".
Toe-Out on Turns–With outer wheel at 20°, Inner wheel should be turned 22½-23½°.

STEERING

Manual: Ross Cam & Twin Lever or Saginaw Worm & Roller Types.
See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.

Power Steering: Saginaw. Integral type.
See "Saginaw (G.M.) Power Steering" in Steering Section.

►*POWER STEERING GEAR "CHUCKLE" CORRECTION: See "Saginaw (GM)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

BRAKES

Wagner Lockheed Hydraulic Self-centering (With Bendix type shoes). Parking lever applies rear wheel service brakes.
See "Wagner Lockheed Self-centering" in Brake Section.
Drums–Diameter (Front) 10", (Rear) 9".
Wheel Cylinder Diameter–(Front) 1", (Rear) 13/16".

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary is ¼" thick, (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeal. This lining is applied to the full length of the shoe, and is marked "secondary" and "top" and should be installed as marked.

Braking Power – 62% (front wheels), 38% (rear wheels).

Lining Width & Length

	Front Wheel	Rear Wheel
Primary Shoes	2" x 10 29/32"	2" x 9 27/32"
Secondary Shoes	2" x 10 29/32"	2" x 9 27/32"

Thickness–3/16" (all except front wheel secondary), ¼" front wheel secondary.
Clearance–Lock shoes against drum then turn adjusting screw back eight notches or more as required to free drum.

Hill Holder: Used on Synchro-mesh Trans. Cars. *See "Hill-holder" in Brake Section for data.*

Standard Master Cylinder: On frame left side rail at base of brake pedal.
Checking Fluid–Access hole in front floor pan at left corner of drivers' seat. Fluid should be maintained at level ½" below top of filler opening.
Removal–Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from frame bracket and then from spring clip which is attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder. (*NOTE*–On cars equipped with Hill-holder, only one line is connected to master cylinder). Remove brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder. Insert forward mounting bolt ing bolt to hold Hill-holder while master cylinder is off car.

Power Brakes: Hydrovac Power Unit. Used in conjunction with standard master cylinder and located under hood on left front fender apron.
See "Hydrovac Power Unit" in Brake Section.
Removal–Disconnect vacuum and brake lines, stop light wires, remove power unit-to-bracket mounting bolts.

MISC. MECHANICAL

Windshield Wipers: Trico. Vacuum link and crank type (Standard) **Auto-Lite or Redmond.** Electric type (Optional).
See "Windshield Wipers" in Miscellaneous Section.

Power Window Regulators: Electrical, with reversible motors in each window. Individual switches at each door and master switch on left front door. *See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment.
See "Power Seat Adjusters" in Miscellaneous Section.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Misc. Section.*

MODEL IDENTIFICATION

Model	Model Designation
Commander	56B
President	56H

SERIAL NUMBER: Stamped on plate on left front door hinge post.

Starting Serial Numbers—As follows:

Assembly Plant	Commander	President
South Bend	8429601	7171001
Los Angeles	8849101	7808501
Hamilton	8960001	7900601

ENGINE NUMBER: Stamped on cylinder block to left and in front of oil filler pipe.

Starting Engine Numbers—As follows:

Assembly Plant	Commander	President
South Bend	V-363751	P-22001
Los Angeles	VL-6301	PL-2701
Hamilton	VC-8101	PC-601

TUNE-UP

COMPRESSION PRESSURE: 130-150 lbs. at 150 RPM cranking speed.

VACUUM READING: Steady 18-20" at idling.

VALVE TAPPET CLEARANCE: .023-.025" engine hot and idling. .025-.027" (cold).

MANIFOLD HEAT CONTROL: Automatic Thermostatic type located in right bank exhaust manifold outlet. Single exhaust with cross-over pipe standard on Commander models. Dual exhaust standard on President models.

►*DUAL EXHAUST NOTE:* When control valve closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders—RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.038".

Spark Plug—Champion H-11, 14mm. Torque to 30 ft. lbs. or seat spark plug on new gasket finger tight, then tighten an additional ½ turn.

COIL: Delco-Remy 1115087. *12 Volt.*

Ignition Current—3.8 amps. (idling).

Resistor—Delco-Remy 1927809. Located on firewall.

►*COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil. Resistor is by-passed during cranking by lead from starter-solenoid-to-coil.*

DISTRIBUTOR: Delco-Remy 1110864. *12 Volt.*

Condenser—Delco-Remy 1869704. **Capacity**—.18-.23 mfd.

Contact Point Set—Delco-Remy 1918148.

Break r Gap—.015".

Cam Angle—26°-33° (with .016" gap).

Break r Arm Spring T nsion—19-23 ozs.

Rotation—Counter-clockwise viewed from above.

Aut matic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0.5-2.5	350	1-5	700
2-4	400	4-8	800
7-9	800	14-18	1600
11-13	1125	22-26	2250

Vacuum Spark Control: Delco-Remy 1116058. Integral type.

Plunger Travel—11/64-3/16".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4-6
8	16	10-11.5

Distributor Removal & Installation: *See "Ignition Notes" in Studebaker Special Data.*

IGNITION TIMING

Setting—4° BTDC with vacuum line to distributor disconnected and opening in carburetor plugged. Engine at normal idle speed.

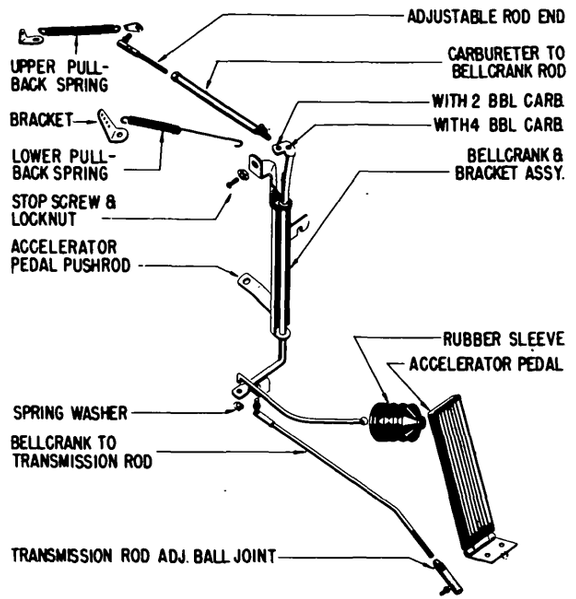
Timing Mark—"IGN" mark on vibration dampener.

Timing—Line up "IGN" mark on vibration dampener with pointer at left side of engine front cover, *after vacuum advance pipe has been disconnected and plugged at carburetor connection.*

►*IGNITION TIMING CAUTION: The manufacturer recommends that no attempt be made to time the engine except with a suitable timing light and that the timing mark on vibration dampener be directly under the pointer. DO NOT SET TIMING BY THE "PING" METHOD.*

CARBURETOR

►*CARBURETOR APPLICATION: Stromberg 2-Barrel Carburetor standard on all models except President Skyhawk & 4-Door Sedan. Carter 4-Barrel Carburetors standard on President Skyhawk & 4-Door Sedan and optional on all other models.*



FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows:

1) Adjust engine idle speed to 550 RPM with transmission selector lever in "N" (Neutral) position. Set the stop on the bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge). After stop is adjusted, hold in this position. Make sure that the carburetor-to-bellcrank rod ball joint is in the outer hole of the bellcrank pad (away from centerline of engine), and that the ball joint is on the underneath side of the lever.

►***2-BARREL CARBURETOR NOTE:*** It may be found to be impossible to shorten accelerator cross shaft-to-carburetor rod sufficiently to obtain proper bellcrank pad-to-stopscrew adjustment. If condition encountered, cut off ¼" of threaded portion of adjustment rod of cross-shaft-to-carburetor rod.

2) Adjust the carburetor-to-bellcrank rod until the idle speed adjusting screw just begins to leave its stop.

3) With the carburetor on the low step of the idle cam, hold the transmission throttle valve lever against its stop and adjust the bellcrank-to-transmission throttle valve lever rod until the ball joint stud enters the throttle valve lever freely. Shorten the rod by turning the ball joint assembly **thr c mpl t turns** (4-Barrel Carburetor); ***four complete turns*** (2-Barrel Carburetor). Install ball joint stud in throttle lever and install the stud nut.

FLIGHTOMATIC THROTTLE LINKAGE

THROTTLE RETURN CHECK (4-BARREL CARBURETOR) ADJUSTMENT: Loosen throttle return check assembly screw locknut and adjust the return check in the bracket until plunger just breaks contact with tab on throttle lever. Mark position of check assembly relative to bracket, then turn check assembly **1¾ t 2 turns toward lever.** Tighten locknut.

THROTTLE RETURN CHECK (2-BARREL CARBURETOR) ADJUSTMENT: Place idle speed adjusting screw on fourth step of fast idle cam (lowest step being No. 1). Adjust throttle return check screw until it just contacts the pad on throttle shaft lever.

STROMBERG WW

Model	Str mb rg Cod N.
Comm. (To Eng. No. V-336979)	6-115, 115A
Comm. (After above No.)	6-117, 117A
President	6-117, 117A

►*MANIFOLD FUEL DISTRIBUTION: Carbur tor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel 2-3-5-8.*

Idle Setting—Initial setting, 1-3/4 turns open, final setting approximately midway between missing and rolling points. Set both screws alike, turn screws out for richer mixture.

Idl Speed—550-600 RPM (with selector lever in neut-

Ⓢ – 195 HP at 4500 RPM with 2-Barrel Carburetor. 210 HP at 4500 RPM with 4-Barrel Carburetor.

C mpr ssi n & Vacuum R ading – *See TUNE-UP.*

OIL PAN REMOVAL: *See "Oil Pan" in Studebaker Special Data.*

ENGINE REMOVAL: *See "Engine" in Studebaker Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Studebaker Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data.*

PISTONS

Aluminum alloy, cam ground, T-slot, three ring type. *See "Original Bore & Pistons" in Studebaker Special Data.*

► *PISTON REPLACEMENT CAUTION: "259" & "289" Engine pistons are NOT INTERCHANGEABLE. "Flat Head" piston used on 259" Engine. "Concave Head" Piston used on 289" Engine.*

Fitting New Pistons: Clearance is selective fit. With piston inverted, slotted side away from camshaft, and with bottom of piston about 1" below top of block, insert a .002" x 1" x 12" feeler on camshaft side of piston. Pull to withdraw feeler should be 8-13 lbs.

Replacement Pistons: Std. size & .010", .020", .030", .040" oversize. Pistons furnished with fitted pins.

Installing Pistons: Install piston on rod so that solid side of piston is on same side as oil hole in bearing bore. Install piston in cylinder with the slot toward the left side of engine. *See Rod Installation.*

PISTON PINS

Locked in rod by tapered pin and locknut.

Diameter – .8741-.8745". **Length** – 3 1/16".

Clearance in Piston – .0001-.0003" (selective fit). Light finger push fit at 70° F.

Replacement Pins: Std. size & .0025", .005" oversize.

Removal & Installation: *See "Piston Pins" in Studebaker Special Data.*

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compression	5/64"	.008-.016"	.002-.005"
Oil	3/16"	.008-.016"	.0015-.005"

Replacement Rings: *See Studebaker Special Data.*

Installing Rings: Install rings with chamfered side of compression rings upward.

CONNECTING RODS

Length (Center-to-Center)—6-5/8". **Weight**—23.71 ozs.

Crankpin Journal Diameter—1.99925-2.00025".

Lower Bearing—Interchangeable. Steel backed, micro-babbitt lined type. No shims.

Clearance – .0005-.002". **Sideplay** – .008-.013".

Replacement Bearings: Std. size, .001", .005", .010", .020" undersize.

Installing Rods: Number on rod and bearing cap must be on same side and rod installed in same numbered cylinder with numbers down toward oil pan (toward right on right bank rods, toward left on left bank rods) and oil squirt hole on all rods toward right of engine. Rods are offset with widest half of bearing toward rear (right bank), toward front (left bank).

► *NEW (UNMARKED) ROD NOTE: Hold rod upright with oil hole toward you. Narrow part of offset will be to right on rods for right bank, and to left for rods on left bank.*

► *CAUTION:* Install piston and pin on rod so that T-slot of piston is on side opposite oil hole in bearing bore. Insert tapered end of clamp screw so it will be toward heavy boss. Be careful to align flat surface of screw with flat on piston pin. Bearing cap must be assembled on rod with groove in cap and rod on same side.

CRANKSHAFT

Journal Diameter—2.4995-2.5000".

Clearance—.0005-.0025".

Replacement Bearings: Std. size, .001", .010", .020", .030" undersize.

End Thrust: Taken by thrust plate assembled between front main bearing and crankshaft gear. Controlled by shims between thrust plate and face of main bearing journal.

Endplay—.003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.86975-1.87075", (2) 1.85375-1.85475", (3) 1.83875-1.83975", (4) 1.82275-1.82375", (5) 1.24475-1.24575".

Bearings—Precision type, steel backed babbitt lined.

Clearance – .00075-.00225" (No. 1), .001-.00275" (Others).

End Thrust: Taken by thrust plate located between front camshaft bearing and camshaft gear.

Endplay—.003-.006".

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Cast iron crankshaft gear and "Celeron" camshaft gear.

Timing Gear Removal & Installation—*See "Timing Gears" in Studebaker Special Data.*

Backlash—.001-.003".

Camshaft Setting: Mesh marked tooth of camshaft gear between two marked teeth of crankshaft gear.

Engine Front Cover Removal: *See "Engine Front Cover" in Studebaker Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

► *VALVE NOISE CORRECTION (When Due to Cupped Valve Stem Ends):* Valve stem caps, Part No. 536426 are available to correct above condition. Caps should be installed in complete sets. It is not necessary to disassemble rocker assembly to install caps. Loosen rocker arm bracket screws and cylinder head capscrews that hold rocker assembly to head, insert caps, retighten capscrews. Readjust valve clearance to original specifications.

► *1955-56 ROCKER ARM OIL RETURN PASSAGE CAUTION:* On these engines there is but one return hole in each bank of cylinders for oil from rocker arm chamber to crankcase. **These are at the rear.** Any attempt to drill front oil passages through into block would result in a passage into engine water jacket.

Tappet Clearance—.023-.025" (Engine hot, running). .025-.027" (Engine cold, standing).

Valve	Head Diam.	Stem Diam.	St m Clearance
Intake	1-21/32"	11/32"	.0015-.0035"
Exhaust	1-17/32"	11/32"	.0015-.0035"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Seat Angle—45° (all valves).
Lift—23/64" (all valves).
Valve Seat Width—1/16-3/32".

Valve Stem Oil Seal: "Umbrella" type, rubber seals installed on all exhaust and intake valve stems (with cupped side down toward top of valve guide) within valve spring below spring retainer.

Valve Springs: Single spring used. Replace spring if 10% weaker than pressure given in specifications below. *NOTE* - Damper installed on lower (close-coiled) end of all springs.

Valve Spring Specifications—110 lbs., ± 5 lbs., when compressed to 1-43/64".

Valve Guides: Pressed in head from underside.
Guide Removal & Installation—*See "Valve System" in Studebaker Special Data.*

Valve Lifters: Straight barrel type. Remove from above. Not necessary to remove camshaft.

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore): See "Valve System" in Studebaker Special Data.*

Valve Lifter Installation & Fitting—*See "Valve System" in Studebaker Special Data.*

Replacement Lifters—Std. size, .001", .005" oversize.

►*CAUTION—When lifters removed, make sure they are installed in original positions.*

Rocker Arms: *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves—Open 11° BTDC. Close 54° 36' ALDC.
Exhaust Valves—Open 51° 36' BLDC. Close 14° ATDC.

Valve Timing Check—Set tappet clearance of No. 1 intake valve at .030". Turn crankshaft until No. 6 piston is on compression stroke and vibration dampener mark "IN.OP.1" is approaching pointer on timing gear cover, continue to turn crankshaft slowly while working No. 1 intake rocker arm up and down to determine point at which all clearance is taken up. Dampener mark "IN.OP.1" should be directly under pointer.

OILING SYSTEM

Crankcase Capacity: 5 qts. (add one quart when filter changed).
Normal Oil Pressure: 40 lbs. at 1400-1600 RPM.
Pressure Regulator Valve – Located on right side at front of engine block slightly above crankcase flange.
Oil Pressure Indicator – Coupe & Hardtop Models – Direct reading, non-electric type gauge. Studebaker No. 1539878.

Other Than Coupe & Hardtop Models – Red indicator light on instrument panel controlled by pressure switch, Studebaker No. 1539898, on engine. Light should go on when ignition turned on but should not be lighted with engine running.

Oil Pump: Spur gear type. Mounted on rear main bearing cap and driven by camshaft gear.

Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Partial Flow. Replace filter element at 5000 mile intervals. Change more often in dusty areas.
Replacement Filter Element – AC No. P-209.

Crankcase Ventilation: Filter element in oil filler cap (air intake) and breather tube at rear of engine (air outlet).

COOLING

Water Capacity: 17 qts. (18.5 qts. with heater).
Pressure Valve: Radiator filler cap. 13 lb. type.
Thermostat: Choke type. 170° (Std.), 160° & 180° (Optl.).
Water Pump: Packless type. Sealed ball bearing type.
Pump Removal – Drain cooling system. Loosen generator, remove belt. Remove fan-to-hub screws and remove fan and pulley. On Coupe and Hardtop models, remove shroud. Remove four capscrews retaining pump cover to water pump manifold. Remove pump from manifold.

Radiator & Fan Shroud Removal: *See "Cooling System" in Studebaker Special Data.*

Temperature Indicators: Coupe & Hardtop Models – Direct reading, electric type gauge.
Other Than Coupe & Hardtop Models – Red-green indicator on instrument panel. Electric type. When indicator shows any green, engine is operating at normal temperature. If it turns red through entire range, engine operating temperature is above normal.
Dash Unit – Studebaker No. 1541287 (Sedans & Station Wagon), Studebaker No. 1539879 (Hard Top "Hawks").
Engine Unit – Studebaker No. 1539876 (All Models).
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck. Single plate, dry disc type.

Series	Clutch Model	Assy. No.	Disc No.
Commander	10A7	361371	382315
President	10A6	361386	382389

See "Borg & Beck" in Clutch Section.

Pedal Adjustment: Pedal free travel 1/2-1". To make adjustment, loosen locknut securing clevis to rod connecting release shaft lever to clutch operating shaft lever and remove the clevis pin. Turn clevis to shorten or lengthen rod as necessary for correct pedal free travel. *NOTE—If car is equipped with "Hill-Holder", adjust "Hill-Holder" operating rod as outlined in Brake Section.*

Clutch Housing Removal: Remove starter. Remove floor plate and clutch housing top capscrews. Remove clutch operating shaft. Remove transmission (see Synchro-mesh Transmission Removal below). Remove two bolts holding engine rear support insulator cage to crossmember. Place a small hydraulic jack at rear of oil pan and insert a block between jack pad and oil pan to prevent damage to pan. Raise engine just enough to take weight of engine off crossmember. Remove support crossmember-to-frame bolts and remove cross member. Remove the two clutch housing bolts retaining exhaust pipe support bracket. Loosen clamp bolt and swing support bracket out of way. Remove clutch housing cover plate. Remove remaining housing mounting bolts or capscrews and remove clutch housing.

Clutch Removal: Remove clutch housing (above), remove six screws evenly to release pressure, lift off clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model AS53-T86E (Std.), AS54-T86E with R10 type Overdrive.
See "Warner Synchro-mesh Transmission" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Drain transmission case. Disconnect universal joint from transmission companion flange and remove propeller shaft support stud nuts and plain washer. Move front propeller shaft and support assembly rearward on slip yoke splines. Move end of shaft to one side as far as possible and tie it in position. Disconnect shift rods from shift levers and remove speedometer cable from transmission case. Remove speedometer pinion. Remove capscrews which hold transmission case to clutch housing. Remove clutch operating shaft bracket, and bearing from transmission case. Move case rearward until the main drive pinion clears clutch pressure plate and remove unit from car.

OVERDRIVE

Warner R10 Type (part of AS54-T86E Transmission). Governor controlled, with electric solenoid operation and throttle controlled "kickdown".
See "Warner R10" Overdrive in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

FLIGHTOMATIC TRANSMISSION

Hydraulic torque converter and hydraulically controlled three-speed planetary type transmission which provides automatic operation in "D" range and additional "Lo", "R", and "P" ranges which are controlled manually. In "D" position, the car starts in low gear and progresses to intermediate and high as car speed is increased.

►*See "Flightomatic" Transmission in Transmission Sect.*

►*"NO REVERSE" CORRECTION: See "Flightomatic" Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Flightomatic" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Flightomatic" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A" (marked AQ-ATF on container).

Checking Fluid Level – Place selector lever in "P" position. Start engine and operate it for approximately four minutes or until engine and transmission have reached operating temperature. Remove floor mat from right side and remove oil inspection hole cover. Apply parking brake and foot brake, move selector lever slowly from "P" position to "R" position, then back to "D" position. Remove dipstick and read fluid level. Add fluid to bring level to "FULL" mark on dipstick (1½ pints between "LOW" and "FULL" marks on dipstick).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Capacity – 9 qts. Use Automatic Transmission Fluid Type "A" (marked AQ-ATF on container).

►*OTHER FLIGHTOMATIC DATA: See "Flightomatic" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing cross type. Three used, with intermediate universal at propeller shaft support bearing on crossmember.

Propeller Shaft & Support Bearings: Two shafts used.

1) Front shaft with intermediate universal yoke bolted to rear end (no slip-joint).

2) Rear shaft with slip-joint on forward end at intermediate universal.

Propeller Shaft & Support Bearing Removal: *See "Propeller Shaft Notes" in Studebaker Special Data.*

REAR AXLE

Spicer. Semi-floating, hypoid gear, with Hotchkiss Drive. *See "Spicer Hypoid" in Rear Axle Section.*

Series	Std.	O.D.	Auto.
Commander	3.54-1	3.92-1	3.31-1
President (Exc. 4-Dr. Classic)	3.54-1	3.92-1	3.31-1
President (4-Dr. Classic)	3.54-1	4.09-1	3.31-1

Rear Axle Ratio Identification: Rear axle ratio stamped on plate attached to axle by cover cap screw and also on ring and pinion gears.

Backlash–.003-.006".

Axle Shaft Removal: Remove wheel and wheel hub (use Puller J-1644-B). Take out backing plate retaining bolts, remove outer oil seal. Pull backing plate out over end of axle shaft and wire to frame out of the way (*CAUTION*–Do not lose adjusting shims located between backing plate and axle housing flange). Pull axle shaft with Puller HM-931.

Rear Axle Assembly Removal: Remove hub caps and axle shaft cotter pin. Loosen wheel nuts. Place car on stands (stands under frame just ahead of rear springs) and remove wheels, hubs, and drums. Disconnect brake pipes at wheel cylinders, remove backing plate bolts from both backing plates. Remove brake pipe clamps and capscrew which holds brake pipe tee to housing, remove brake pipe from housing. Remove backing plate and shims (suspend from frame). Remove rear universal joint U-bolts and nuts, disconnect rear propeller shaft and move to one side. Remove rear spring U-bolts and disconnect shock absorbers from spring plate. On President models, disconnect stabilizer shaft from spring plates. Remove rear axle assembly.

Wheel Bearing Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flange (shims furnished .003" .005" .010" .030" thick). **Endplay** – .001-.006".

SHOCK ABSORBERS

Hydraulic, Manual, Direct Acting. Direct acting, hydraulic type.

NOTE - Heavy Duty Shocks are Gabriel.

Hydraulic Shocks (Studebaker Nos.)

Ⓒ – Beginning with above number.

FRONT SUSPENSION

Independent. Coil spring suspension with shock absorbers mounted within coil springs.

See "Studebaker" in Suspensions & Wheel Alignmt. Sect.

►*FRONT SUSPENSION NOISE CORRECTION (Due to Bushing Looseness at Upper Control Arm Inner Shaft): See "Studebaker" in Suspensions & Wheel Alignmt. Sect.*

Kingpin Inclination–5-1/4° at 0° camber.

Caster–Neg. 1° to Neg. 2-1/2°. Not more than 3/4° variation between wheels.

Camber–0° to Pos. 1°. 1/2° more camber favored on driver's side.

Toe-In–1/16-1/8". **Adjust right hand tie rod only** for toe-in after left hand tie rod has been adjusted for straight-ahead position (with steering wheel centered) and center auxiliary tie rod has been adjusted so that steering gear arm and auxiliary steering arm parallel.

RHD Car Note–Make toe-in adjustments at left hand tie rod.

Toe-Out on Turns–With outer wheel at 20°, inner wheel should be 22-1/2–23-1/2°.

STEERING

Manual: Ross Cam & Twin Lever or Saginaw Worm & Roller types.

See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.

Power Steering: Saginaw (G.M.). *See "Saginaw (G.M.) Power Steering" in Steering Section.*

►*POWER STEERING "CHUCKLE" CORRECTION: See "Saginaw (G.M.) Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

BRAKES

Wagner Lockheed Hydraulic. Self-centering (with Bendix type shoes). Parking brake applies rear wheel service brakes.

See "Wagner Lockheed Self-Centering" in Brake Section.

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary lining is 7/32" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeak. This lining is applied to the full length of the shoe and is marked "secondary" and "top", and should be installed as marked.

Drums – Diameter 11" (front), 10" (rear).

Braking Power – 62% (front), 38% (rear).

Wheel Cylinder Diameter – 1 1/16" (front), 7/8" (rear).

Lining Dimensions	Width	Length	Thickness
Front Wheels	2¼"	12"	Ⓒ 3/16"
Rear Wheels	2"	10 29/32"	3/16"

Ⓒ – Front wheel secondary lining is 7/32" See "Front Wheel Secondary Lining Note" above.

Clearance–Lock shoes against drum with adjusting screw, then back off adjusting screw 8 notches, or more notches as required to free drum.

Standard Master Cylinder: On frame left side rail at base of brake pedal.

Checking Fluid–Access hole in front floor pan at left corner of drivers seat. Fluid should be maintained 1/2" below top of filler opening.

Removal–Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from its frame bracket and then from spring clip attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder.

(*NOTE* - One line with Hill-holder). Remove the brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder. Insert forward mounting bolt to Hill-holder while master cylinder is off car.

Power Brakes: Hydrovac Power Unit. Used with standard master cylinder.

See "Hydrovac Power Unit" in Brake Section.

Checking Fluid–Same as for Manual Brakes (same master cylinder used).

Removal of Power Unit–Disconnect manifold vacuum supply hose at the power unit and disconnect stop light switch wires. Disconnect hydraulic lines from power unit (lines leading to master cylinder and to wheel cylinders). Remove power unit-to-bracket mounting bolts and remove unit from car.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite, Redmond and Bosch Electric type. *See "Auto-Lite Windshield Wiper 'Single End' Motors" and "Redmond Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: *See "Studebaker Air Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electrical, with individual reversible motors in each window. Control switches at each door with a master control switch located on left front door. *See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment (seat raises and lowers with a tilting action).

See "Power Seat Adjusters" in Miscellaneous Section.

MODEL IDENTIFICATION

Model	Model Identification
Golden Hawk (Hardtop)	56J

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post
Starting Serial Numbers—6,030 001 (South Bend) 6,800 001 (Los Angeles)

ENGINE NUMBER: Stamped on front end of engine block between cylinder banks, directly behind water pump
Starting Engine Numbers (South Bend & Los Angeles): K-1001 (Overdrive) S-1001 (Ultramatic)

TUNE-UP

►*DETONATION CORRECTION (In Low Octane Areas)* If detonation not caused by carbon deposits, rough combustion chamber, or sharp edges in cylinder head, convert original Distributor IBJ-4001C to later IBJ-4001E performance (see DISTRIBUTOR below). If detonation still present, Ignition Timing may be retarded slightly from standard 5° BTDC setting.

COMPRESSION PRESSURE: 120 lbs minimum at 150 RPM Maximum variation between cylinders 10 lbs

VACUUM READING: 18-21" at idling speed

VALVE TAPPET CLEARANCE: None (hydraulic)

MANIFOLD HEAT CONTROL: Thermostatic spring type mounted between right bank exhaust manifold and exhaust pipe With heater valve in closed position hook in end of coil should assume a position approximately 90° clockwise from coil anchor pin at normal room temperatures Valve should operate freely

►*NOTE* With valve in closed position, most exhaust gases are discharged through the left exhaust pipe

IGNITION

►*ENGINE "MISS" CORRECTION* May be caused by cross-fire between No. 5 & 7 cylinders. Correct by installing new brackets and cables as follows

Transmission	Cable Set	Rt. Bracket	Left Bracket
Overdrive	6484554	6489377	6489917
Ultramatic	6484554	6489377	

NOTE - Eight No. 6489378 grommets also used.

►*ENGINE FAILURE TO START CORRECTION (Due to Moisture in Distributor Cap)* Remove tachometer drive unit assembly and drill two 7/64" holes in groove adjacent to outer rim.

FIRING ORDER: 1-8-4-3-6-5-7-2
Cylinders—RIGHT BANK 2-4-6-8 LEFT BANK 1-3-5-7

SPARK PLUG GAP: 033- 038"
Spark Plugs—Champion N8-67B 14mm Torque to 30 ft. lbs. *NOTE* - Champion N8-64B can be used if colder plug desirable.

COIL: Auto-Lite CAD-4004 *12 Volt*
Ignition Current—2 2 amps idling HOT
Resistor—Auto-Lite PU-4001

►*COIL RESISTOR NOTE* Resistor is connected in series with primary circuit between battery and coil Resistor is by-passed during cranking by lead from starter solenoid to coil

DISTRIBUTOR: Auto-Lite IBJ-4001C r IBJ-4001E *12 Volt.* Single breaker type.

►*DISTRIBUTOR CONVERSION TO CORRECT DETONATION (IBJ-4001C)* Install all parts furnished in Conversion Kit, No. 6486409, as follows Distributor Stop & Cam Plate, Governor Weight Springs (Weak & Heavy Springs), Vacuum Spring, and small parts. Install new IBJ-4001E nameplate (furnished in kit). Check Automatic & Vacuum Advance which should agree with IBJ-4001E specifications below.
Condenser—Auto-Lite IBB-2015L **Capacity**— 25- 28 microfarad
Contact Point Set—Auto-Lite IGW-2028HS
Breaker Gap— 017"
Cam Angle—31°±3°
Breaker Arm Spring Tension—17-20 ozs
Rotation—Counter-clockwise viewed from above

Automatic Advance—IBJ-4001C

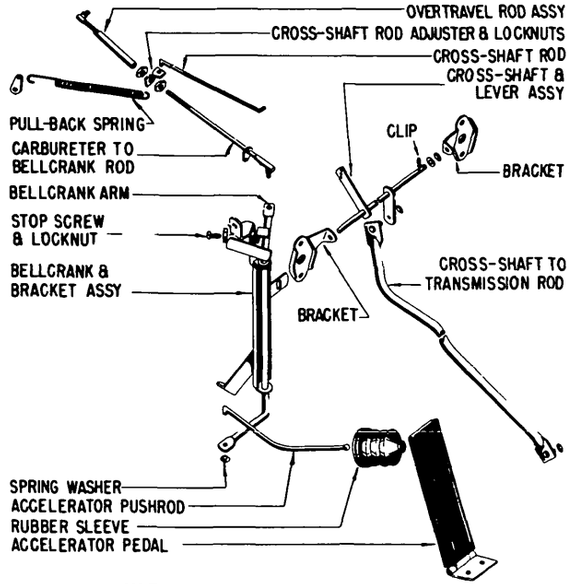
IGNITION TIMING

Setting—5° BTDC with engine idling at 550-600 RPM with transmission in neutral Before checking setting disconnect vacuum advance pipe at carburetor



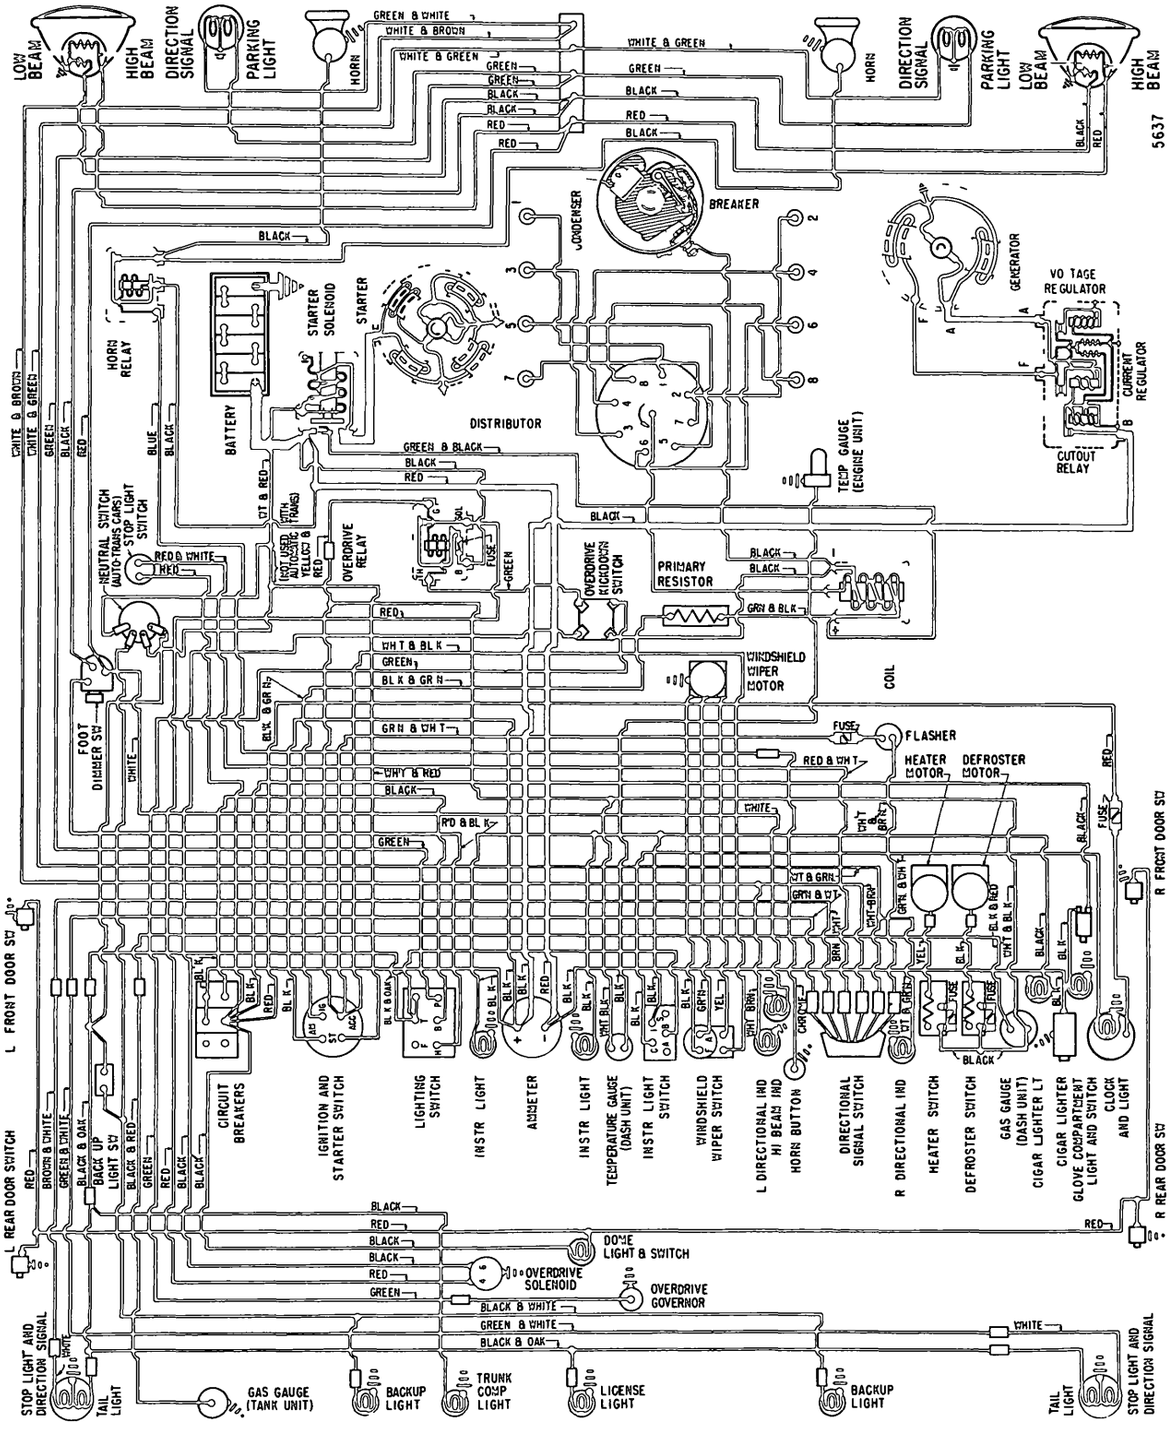
►*DETONATION NOTE* - Timing may be retarded slightly from standard 5° BTDC setting if necessary to correct detonation. *See Detonation Correction under TUNE-UP above.*
Timing Mark—Timing indicator on chain cover marked "0" "5" "10" "15" Align index mark (groove) on vibration damper with correct mark on indicator

CARBURETOR

Carter WCFB-2394S. Four-barrel downdraft type

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*
Idl S tting—¾-1¾ turns open Turn screws out for richer mixture
Idle Sp d—550-600 RPM with transmission in neutral

►*OTHER DATA See "Carter WCFB" Carburetor in Carburetion Section.*
Fu l Pump Pr ssur : 3½-5 lbs.
Throttle Linkage Adjustment (Ultramatic) Replace any excessively worn linkage, check for free action without bind, bring engine to operating temperature Set engine speed at 400 RPM (selector lever in "D" Drive position) with choke in wide open position Apply brakes, block open choke valve, disconnect rod at throttle valve outer lever (rear of transmission), hold lever against its stop, straight edge against milled surface of transmission case Taper end of lever should just contact straight edge To correct, loosen lever clamp nut, turn shaft to left against stop, reposition lever on shaft to proper position and secure clamp nut With adjuster to cross-shaft rod in the center in cross-shaft lever *(Supersedes the lower hole specification used previously),* both locknuts at adjuster released 4 or 5 turns, disconnect carburetor bell crank rod ball joint at bell crank, set stop to provide ¼" gap at bell crank Hold carburetor idle screw against its stop (¼" gap at bell crank), loosen overtravel end assembly and adjust until ball joint stud on carburetor to bell crank rod freely enters hole in bell crank arm Lock nut at overtravel end assembly Hold cross shaft lever forward and tighten rear locknut against adjuster then secure front nut



ULTRAMATIC THROTTLE LINKAGE

CARB. EQUIPMENT

Fuel Pump: AC No. 4299. Fuel only
Fuel Pump Pressure - 3½-5 lbs.
See "Fuel Pumps" in Carbur tion Section
Gas lin Gaug : Electric type.
Dash Unit - Studebaker No. 1539880.
Tank Unit - Studebaker No. 1540263.
S e "Fu l Gauges" in Carburetion Section

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BATTERY

Willard HDW-2SM-60. *12 Volt*, 9 plate, 60 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Cylinder head to dash.

STARTER

Auto-Lite MDF-6008. *12 Volt*. Armature MDF-2122.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 42-53 ozs. with new brushes.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200 min.	10.0	60 max.
6.5 ft. lbs. min.	Lock	4.0	240 max.

Starting Switch: Auto-Lite SAD-4101 Solenoid Switch, mounted on starter and controlled by Ignition & Starter Switch. Turn key full RIGHT to start. *See "Starter Controls" in Electrical Section.*
Ultramatic Neutral Safety & Back-up Light Switch: Delco-Remy 1998038 (Without power steering), 1998059 (With power steering). Located at base of steering column jacket. Connected in starter control circuit so that starter operative only in "N" or "P" position.
Adjustment - *See "Ultramatic" Transmission in Transmission Section.*

GENERATOR

Auto-Lite GJC-7002F. *12 Volt*. Armature GJC-2030F.

Performance Data - Cold

Amperes	Volts	RPM
20 Ⓒ	15.0	1750 max.
30 Ⓒ	15.0	2050-2250

Ⓒ - Do not operate at high output for any length of time without ventilating fan. To do so may result in burned armature and fields.
Brush Spring Tension - 18-36 ozs. with new brushes.
Field Current - 1 2-1 3 amperes at 10.0 volts (70°F.).
Metering Current - 3.4-3 9 amps. at 10.0 volts (70°F.).
Rotation - Counter-clockwise at commutator end.
Belt Adjustment: Loosen generator-to-mounting bracket bolts and adjusting arm screw. Place Fan Belt Adjusting Tool J-4672 over head of front mounting bolt and rotate tool until arm of tool contacts edge of generator end plate. Then using torque wrench, turn tool counter-clockwise until a 20-25 ft. lbs. torque is indicated on wrench scale. While holding wrench at proper torque, tighten adjusting arm screw securely. Remove tool and tighten the generator-to-mounting bracket bolts.

REGULATOR

Auto-Lite VRX-6008A. *12 Volt*.

Cutout Relay

Cuts In - 13 0-13.7 volts.
Cuts Out - 8 2-9 3 volts (point opening amperage discharge approximately 3-5 amps.).
Contact Gap - .015".
Air Gap - .031- 034".

Voltage Regulator

Setting - 14.2-14 8 volts at 80° F., unit operating normally while charging at 10 amps.
Air Gap - .048- 052" with contact just opening.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Checking & Adjusting - *See Electrical Section.*

Current Regulator

►*SETTING CAUTION "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
36 amps.		30 (28-32)

Test A - After 15 minutes operation at 10 0 amps.

Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).

Air Gap - .048-.052" with contacts just opening.

Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Direction Signals: *See Electrical Section.*

Lighting Switch Removal: Toggle Type - Remove switch retaining nut. Push switch sleeve back into panel, disconnect wires from switch.

Stop Light Switch Location: Located on inner side of left frame rail just forward of steering gear housing (except cars with power brakes). On cars with power brakes, switch is located in end of hydraulic cylinder of power brake unit.

FUSES: Located as follows

Overdrive - 20 amps. (in relay on dash panel).

Radio - 9 amps. (in lead behind instrument panel.)

Direction Signal - 14 amps. (in bracket behind instrument panel).

Electric Clock - 3 amps. (in lead behind instrument panel).

Climatizer & Defroster - 14 amps. (on Climatizer & Defroster switch.)

CIRCUIT BREAKERS: Located as follows

1) - Head, Parking & Instrument Lights - 18 amps. (on main lighting switch).

2) - Body & Stop Lights - 15 amps. (below headlight switch on instrument panel).

3) - Windshield Wiper - 5 amps. (in wiper switch).

4) - Window Lift - 20 amps. (on left cowl panel).

5) - Seat Adjuster - 20 amps. (on left cowl panel).

HORNS: Dual horns with relay.

High Pitch - Delco-Remy 1999758.

Low Pitch - Delco-Remy 1999757.

Horn Relay: Delco-Remy 1116781. *12 Volt.*

ENGINE

ENGINE SPECIFICATIONS: 90° V8.

Bore	Stroke	Displmnt.	Rated HP
4"	. 3½"	352 cu. ins.	51.2

Compr. Ratio	Developed HP
9 5-1	275 at 4600 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Remove steering bellcrank assembly. Remove left exhaust pipe, starter motor, and flywheel lower housing. Remove oil pan and screws.

►*OTHER ENGINE DATA See Packard 5660 Engine on Packard Car Model pages.*

OILING SYSTEM

Crankcas Capacity: 5 qts. (refill).

N rmal Oil Pr ssur : 45-50 lbs. at 2800 RPM.

Pr ssur R gulat r Valv - In pump body. Not adjustable.

Pr ssure R li f Valv Spring - 3 19/64" (free length). Compressed to 1 3/8", pressure should be 9-9½ lbs.

Oil Pressure Gauge: Studebaker No. 1539878. Not electric.

Oil Pump: Spur gear type. Located on rear main bearing cap and driven through distributor drive and camshaft gears.

Oil Pump Removal, Overhaul & Installation - *See "Oiling System" in Studebaker Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe in valve tappet cover.

COOLING

►*FAN BLADE ASSEMBLY PRODUCTION CHANGE (To Correct Cracks & Breakage)* A new fan assembly, Part No. 1542138-P, entered production effective with Car Serial No. 6033140. New assembly uses 15 instead of 14 gauge steel, and has 8 instead of 4 rivets.

Water Capacity: 25 quarts (1½ qts. additional with heater).

Pressure Valve: Radiator filler cap. 13 lb. type.

Thermostat: 170° F. (Std.), 160° & 180° F. (Optional).

Water Pump: Packless type with sealed ball bearing *See "Studebaker" in Water Pump Section.*

Temperature Gauge: Electric type.

Dash Unit - Studebaker No. 1539879.

Engine Unit - Studebaker No. 1539876.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long 11CF. Single plate, dry disc type.

Assembly No. Studebaker No. 403502. **Disc No.** 473176.

See "Long" Clutches in Clutch Section.

Pedal Adjustment: 1½" free travel.

Removal: *(NOTE* - Clutch housing and transmission removed as an assembly). Remove transmission and clutch housing (see Synchro-mesh Transmission below). Remove cover retaining screws by alternately backing off screws until spring pressure is released. Remove clutch pressure plate assembly and driven plate. *See "Hill-holder" in Brake Section for adjustment.*

SYNCHRO-MESH TRANSMISSION

Warner. 3-Speed, helical gear type with Overdrive (Std.). *See "Warner Synchro-mesh" Transmission in Transmission Section.*

Transmission Controls See "Transmission Controls" in Transmission Section.

Removal: *(NOTE* - Clutch housing and transmission with overdrive must be removed as an assembly.).

1) Disconnect clutch adjusting rod from release bearing lever. Remove operating shaft support bracket-to-transmission screws, swing bracket down and slip the bracket and ball stud out of operating shaft. Disconnect shift rods from shift levers. Disconnect propeller shaft from transmission Disconnect overdrive wiring and control cable.

2) Using jack or suitable lift to support engine, remove engine rear support mounting bolts, remove crossmembers.

3) Remove capscrews which attach bellhousing to flywheel housing and remove housing and transmission as an assembly.

4) Disconnect release lever pull-back spring and remove release bearing from transmission front flange. Remove transmission screws and remove housing.

OVERDRIVE

Warn r R10 Type. Governor controlled, with electric solenoid operation and throttle controlled "kick-down". *See "Warner R10" Overdrive in Transmission Section.*

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

ULTRAMATIC TRANSMISSION

"Twin Ultramatic". Torque converter with hydraulically operated direct speed clutch and hydraulically operated planetary unit with manual control.

See "Twin Ultramatic" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Twin Ultramatic" in Trans. Section.*

►*TESTING & TROUBLE SHOOTING See "Twin Ultramatic" in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level - Place selector lever in "P" position, start engine and operate for approximately four minutes or until engine and transmission have reached operating temperature. Remove inspection hole cover from floor pan above transmission. Clean area around inspection hole. Apply parking and foot brakes and move selector lever from "P" position to "R" position and back to the "D" position. Remove dipstick, wipe clean, and reinstall in transmission. Remove and read dipstick. Add fluid through dipstick hole to bring level to "F" mark (Fluid required to raise level from "L" to "F" mark is 1½ quarts). *Use only Automatic Transmission Fluid Type "A" (marked AQ-ATF on container).*

Capacity - Approximately 11 quarts.

►*OTHER TWIN ULTRAMATIC SERVICE DATA Se "Twin Ultramatic" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

Propeller Shaft & Support B arings: Two shafts used.

1) Front shaft with intermediate universal yoke bolted to rear end (no slip-joint).

2) Rear shaft with slip-joint on forward end at intermediate universal.

Propeller Shaft & Support B aring R m val: *See "Propeller Shaft Notes" in Studebaker Special Data.*

REAR AXLE

Spicer. Semi-floating, hypoid gear, with Hotchkiss Drive. *See "Spicer Hypoid" in Rear Axle Section.*

Rear Axle Ratios: 3 92-1 (Overdrive), 3.07-1 (Ultramatic).

Identification - Rear axle gear ratio stamped on plate attached to assembly by cover cap screw and also on ring and pinion gears.

Backlash—.003-.006".

Axle Shaft Removal Remove wheel and wheel hub (use Puller J-1644-B). Take out backing plate retaining bolts, remove outer oil seal. Pull backing plate out over end of axle shaft and wire to frame out of the way *(CAUTION*—Do not lose adjusting shims located between backing plate and axle housing flange). Pull axle shaft with Puller HM-931.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rear Axle Assembly Removal: Remove hub caps and axle shaft cotter pin. Loosen wheel nuts. Place car on stands (stands under frame just ahead of rear springs) and remove wheels, hubs, and drums. Disconnect brake pipes at wheel cylinders, remove backing plate bolts from both backing plates. Remove brake pipe clamps and capscrew which holds brake pipe tee to housing, remove brake pipe from housing. Remove backing plate and shims (suspend from frame). Remove rear universal joint U-bolts and nuts, disconnect rear propeller shaft and move to one side. Remove rear spring U-bolts and disconnect shock absorbers from spring plate. Remove rear axle assembly.

Wheel Bearing Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flahge (shims furnished .003", .005", .010", .030" thick). **Endplay** - .001-.006".

SHOCK ABSORBERS

Monroe. Direct acting, hydraulic type. Serviced by replacement. *NOTE* - Heavy duty shocks are Gabriel.

Shock Absorbers (Studebaker Nos.)

	Front	Rear
Monroe (Std.)	1539527	1539543
Gabriel (H.D.)	536398	536399
Gabriel (H.D. Adj.)	537712	537714

FRONT SUSPENSION

Independent. Coil spring suspension with shock absorbers mounted within coil springs.

See "Studebaker" in Suspensions & Wheel Alignment Section.

►*FRONT SUSPENSION NOISE CORRECTION (Due to Bushing Looseness At Upper Control Arm Inner Shaft):* *See "Stud bakr" in Suspensions & Wheel Alignment Section.*

Kingpin Inclination—5-1/4° at 0° camber.
Caster—Neg. 1° to Neg. 2-1/2°. Not more than 3/4° variation between wheels.
Camber—0° to Pos. 1°. 1/2° more camber favored on driver's side.
Toe-In—1/16-1/8". **Adjust right hand tie rod only** for toe-in after left hand tie rod has been adjusted for straight-ahead position (with steering wheel centered) and center auxiliary tie rod has been adjusted so that steering gear arm and auxiliary steering arm parallel.
RHD Car Note—Make toe-in adjustments at left hand tie rod.
Toe-Out on Turns—With outer wheel at 20°, inner wheel should be 22-1/2—23-1/2°.

STEERING

Manual: Ross Cam & Twin Lever or Saginaw Worm & Roller types.
See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.

Power Steering: Saginaw (G.M.). *See "Saginaw (G.M.)" Power Steering in Steering Section.*

►*POWER STEERING "CHUCKLE" CORRECTION: See "Saginaw (G.M.)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" or "Saginaw Worm & Roller" in Steering Section.*

BRAKES

Wagner Lockheed Hydraulic. Self-centering (with Bendix type shoes). Parking brake applies rear wheel service brakes.
See "Wagner Lockheed Self-Centering" in Brake Section.

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary lining is 7/32" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeak. This lining is applied to the full length of the shoe and is marked "secondary" and "top", and should be installed as marked.
Drums - Diameter 11" (front), 10" (rear).
Braking Power - 62% (front), 38% (rear).
Wheel Cylinder Diameter - 1 1/16" (front), 7/8" (rear).

Lining Dimensions	Width	Length	Thickness
Front Wheels	2¼"	12"	① 3/16"
Rear Wheels	2"	10 29/32"	3/16"

① - Front wheel secondary lining is 7/32". See "Front Wheel Secondary Lining Note" above.

Clearance—Lock shoes against drum with adjusting screw, then back off adjusting screw 8 notches, or more notches as required to free drum.
Standard Master Cylinder: On frame left side rail at base of brake pedal.
Checking Fluid—Access hole in front floor pan at left corner of drivers seat. Fluid should be maintained 1/2" below top of filler opening.
Removal—Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from its frame bracket and then from spring clip attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder. *(NOTE* - One line with Hill-holder). Remove the brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder. Insert forward mounting bolt to Hill-holder while master cylinder is off car.
Power Brakes: Hydrovac Power Unit. Used with standard master cylinder.
See "Hydrovac Power Unit" in Brake Section.
Checking Fluid—Same as for Manual Brakes (same master cylinder used).
Removal of Power Unit—Disconnect manifold vacuum supply hose at the power unit and disconnect stop light switch wires. Disconnect hydraulic lines from power unit (lines leading to master cylinder and to wheel cylinders). Remove power unit-to-bracket mounting bolts and remove unit from car.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite, Redmond and Bosch Electric type. *See "Auto-Lite Windshield Wiper 'Single End' Motors" and "Redmond Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Electrical, with individual reversible motors in each window. Control switches at each door with a master control switch located on left front door. *See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment (seat raises and lowers with a tilting action).
See "Power Seat Adjusters" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS
ALL MODELS

TIGHTENING TORQUES When tightening capscrews or bolt nuts retaining the parts listed below, use a torque indicating wrench and tighten to tensions listed

4 CYL. ENGINES

	Ft. Lbs.
Cylinder Head Stud Nuts or Screws	60-70
Main Bearing Cap Bolts	65-75
Con. Rod Cap Bolt Nut 3/8'	35-40
Con. Rod Cap Bolt Nut 7/16'	50-55
Con. Rod Cap Bolt Nut 11/32'	33-38
Crankshaft Counterweight Bolt	60-70
Flywheel to Crankshaft Bolts	36-40
Camshaft Thrust Plate Bolts	20-26
Camshaft Gear to Camshaft Bolt	30-40
Intake & Exhaust Manifold Bolts	31-35
Rocker Arm Bracket to Head Nuts	30-36
Spark Plugs	25-30
Engine Mounting (at frame crossmember)	38-42

6 CYL. ENGINES

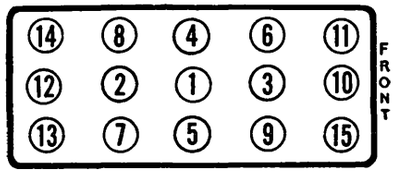
	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts	30-35	360-420
Spark Plugs	30	360
Con Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mounting Bolts	35-40	420-480
Camshaft Sprocket Nut	35-40	420-480
Int & Exh Manifolds	30-35	360-420
Vibration Dampener Bolt	100-130	1200-1560

CAUTION—Torque figures given are for clean and dry threads

CYLINDER HEAD & MANIFOLD
ALL MODELS

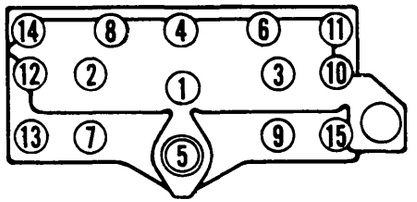
►*"F' HEAD CYLINDER HEAD BOLT CAUTION* One head bolt is located under carburetor in intake manifold.

►*6 CYL. HEAD TIGHTENING SEQUENCE CHANGE* New sequence is indicated in diagram and supersedes previous instructions. *See "Cylinder Head & Manifold' below.*



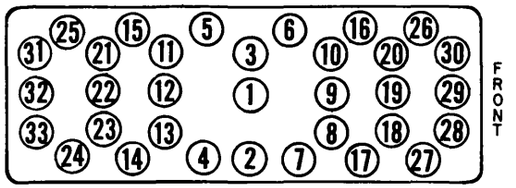
CYLINDER HEAD Installation—Use a torque indicating wrench to tighten cylinder head stud nuts and capscrews tighten in correct sequence as shown Recheck with engine water at 150°F

Tightening Torque—See Tightening (Torque Wrench) Specifications.



CRANKSHAFT & MAIN BEARINGS
4 CYL. ENGINES

CRANKSHAFT SERVICING: Bearing Replacement – Engine must be removed from car for bearing replacement (bearings "doweled' in case and crankshaft must be taken out to remove and install bearings). Make certain that oil holes in bearings line up with oil holes in crankcase, and that bearings fit snugly on dowel pins in crankcase and bearing caps.



Rear Bearing Oil Seal (Neoprene Type—*NOTE Upper and lower halves of seal can be replaced without removing crankshaft from engine* Seal is neoprene with a steel back Upper half of seal can be removed by using a suitable piece of strap steel (hack saw blade with teeth ground off) Rotate upper half of seal around shaft with steel strap until opposite end protrudes far enough to grasp end and remove To install coat both parts of seal with grease and install upper half by rotating it around crankshaft until it is in position with ends even at the engine block Coat both ends of lower seal with Permatex before installing to insure good seal with upper half

4 CYL. "L" HEAD ENGINES

4 CYL. "F-HEAD" ENGINE

6 CYL. 6226 "L" HEAD ENGINE

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. CAUTION—Do not cut off this protruding portion of the packing

6 CYL. ENGINES

►*FRONT FILLER BLOCK (LOWER) OIL SEAL PRODUCTION CHANGE·* Effective in early production new type seal used to prevent leakage between filler blocks and oil pan. To install new seal on earlier models, coat inner surfaces of filler block with gasket cement Install seals in grooves evenly centered so that each end extends an equal distance of 1/16' above faces of filler block ends. Be sure they are well seated in grooves and allow cement to dry Do not trim off ends. If necessary to use cork seals, follow procedure outlined below, **but first soak cork seals in water for a minimum of three hours to make them sufficiently pliable for satisfactory use.**

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front and rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket) Rear filler blocks (additional **upper filler block guard** in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger Filler blocks can be removed and replaced without disturbing crankshaft as follows

Front Filler Block (Lower) Servicing. Remove by taking out mounting capscrews and timing gear cover capscrews which enter the filler block When installing filler block, first install oil pan side gaskets (No 200266), install filler block (use Perma-tex), **install new end gasket on block**

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal) Remove and discard old gasket or seal Install new seal (no 204654) in same manner as described below for Rear Filler Block (Upper) Guard Install lower filler block **after** upper filler block guard has been installed

Rear Filler Block (Upper) Guard Servicing Guard is seated in groove in crankcase and can be 'rotated' out without disturbing crankshaft after lower filler block removed Remove and discard old gasket or seal, clean out seal groove Install new graphite impregnated seal (no 204654), flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward the center (ends must extend slightly above flat surface of guard) **Do not use shellac or sealing compound in groove.**

►*CAUTION*—Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft If necessary, seal can be built up using 1/32" thick gasket material, 3/16' wide, as shims shellacked to groove in block or guard behind seal

ENGINE FRONT COVER
4 CYL. ENGINES

FRONT COVER OIL SEAL: Cover has double metal baffle and spring-loaded leather seal which contacts polished surface of crankshaft pulley hub When installing seal, make certain that seal lip is inward or toward rear of engine

CAMSHAFT & BEARINGS
4 CYL. ENGINES

CAMSHAFT SERVICING: Removal—Drain radiator and cylinder block, remove radiator and grille, cylinder head, manifold, valves and valve springs Remove oil pump fuel pump, oil pan, crankshaft pulley (use puller), fan and governor drive belts, and fan assembly Remove nuts on front engine support rubber insulators (Jeep only). Remove timing gear cover, remove camshaft gear and thrust plate, block up all valve lifters (can be tied up with string to manifold studs) On Jeep only, place jack under crankcase (use block of wood on jack to avoid damage to oil pan), raise front end of engine to provide clearance for camshaft Remove camshaft through front of engine

Gear Puller Tool—Use Puller Tool No. W-172 to remove gear on engines equipped with timing gears.

Camshaft Front Bearing—Consists of a steel-backed, babbitt-lined bushing which takes thrust. When installing this bushing, make certain oil hole lines up with drilled oil hole in crankcase, stake bearing in place to prevent turning in service

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Camshaft Thrust Plate (On Engines with Timing Gears)—Thrust plate assembled behind gear with a spacer assembled behind plate If required, a thin shim can be installed behind spacer if too little clearance, or spacer can be dressed to provide greater clearance

VALVE SYSTEM

VALVE TAPPET ADJUSTMENT

6 CYL. ENGINES

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below) Remove right front wheel and access cover in fender splash shield for access to valve compartment Remove spark plugs so that engine can be turned over by moving fan or fan belt By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment**

Fully Raise Valve	Then ADJUST Valve:
Nos 1 and 3	Nos 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos 2 and 6	Nos. 7 and 11
Nos 10 and 12	Nos. 1 and 3
Nos. 4 and 5	Nos. 8 and 9
Nos 7 and 11	Nos. 2 and 6

ROCKER ARMS

4 CYL. "F" HEAD ENGINES

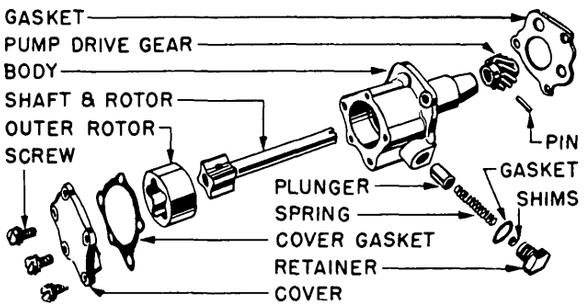
ROCKER ARM ASSEMBLY REMOVAL: Lock rocker arms, shaft, brackets and springs together as a unit by removing cover studs in front and rear rocker arm shaft brackets and installing 5/16'-24 thread set screws in the front and rear brackets in same manner set screws are installed in center brackets. Remove nuts on bracket studs and lift entire assembly off studs as a unit.

Installation: Check push rods, straighten or replace any that are bent. Place push rods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of push rods before installing nuts on bracket studs. Torque nuts to 30-36 ft. lbs. Remove extra set screws from front and rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.

OILING SYSTEM

OIL PUMP

4 CYL. ENGINE OIL PUMP



OIL PUMP REMOVAL & OVERHAUL: (Removal)—Rotate engine until distributor rotor points to No 1 firing position and timing mark on flywheel or vibration dampener is directly under pointer (do not remove distributor, pump must be installed so gears mesh without moving rotor for correct engine timing) ***CAUTION***—Crankshaft must not be rotated with oil pump removed) Remove pump mounting bolts and pull pump out as far as possible Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (Note—It may be necessary to loosen engine support bolts for more movement) Check pump shaft for wear before disassembling pump by mounting it in a vise with a dial indicator bearing against shoulder on gear, at right angles to relief valve housing Move gear toward, then away from indicator and note total reading If this play exceeds 010", replace complete pump

Disassembly Remove cover screws cover and gasket and shake outer rotor from housing Remove relief valve retainer, gasket shims spring, and plunger If rotor is to be replaced file off one end of gear retaining pin pull gear off shaft and remove shaft and inner rotor from housing Clean all parts in solvent and check for wear pits and scoring

Inspection: Measure clearance between outer rotor and pump body Replace body if clearance exceeds 012" Check body to make certain inner surface is not rough or scored and that lower face is flat within 001" Rotors must be within 001" thickness of each other With gear installed on pump shaft, clearance between gear and pump body should be 003- 010"

Checking Rotor Clearance· Position inner rotor with one lobe engaged between two lobes of outer rotor, then measure clearance of opposite inner rotor lobe and lobe of outer rotor This clearance should not exceed 010 To check end clearance place a small piece of 010 shim stock on inner rotor so that it does not overhang edge of rotor at any point Install cover and gasket and tighten screws If shaft can be turned by hand, end clearance is excessive Install new cover and repeat test If rotors still not tight, replace rotors

Reassembly: Install relief valve, spring, gasket and retainer If shims were removed, install them between spring and retainer If new rotors installed, slide gear on shaft after installing shaft and rotor in housing Position gear so there is not over 010' clearance between gear and pump housing and drill a 5/32 hole through pump shaft for retaining pin Install pin and peen ends Install cover and gasket and tighten screws

4 CYL. ENGINE OIL PUMP

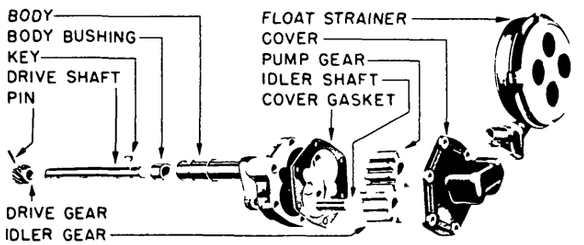
Installation (4 Cyl Models): Check to see that timing marks on flywheel or vibration dampener are directly under pointer and distributor rotor is pointed toward No 1 firing position Insert pump in block with pump gear positioned so that it will engage camshaft gear and the distributor shaft drive key without moving distributor rotor Installation can be made only in one position without moving distributor rotor as slot in drive gear and key on distributor shaft is machined off-center

6 CYL. ENGINE OIL PUMP

OIL PUMP SERVICING Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling Service pump as follows

Disassembly—Take out cotter pin and remove screen float assembly Remove cover and gasket Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear remove idler gear (remove idler shaft if required) Take off lower drive gear (press fit and keyed to shaft)

Oil Pump Clearances—Check as follows



1)—Pump Body Bushing if over 005' clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to 500- 501'

2)—Pump Shaft shaft diameter 4990- 4985"

3)—Lower Drive Gear end of gear should be 001- 006" beyond gasket seat on pump body

4)—Upper Drive Gear 002- 004" clearance between underside of gear and upper end of pump body Controlled by pressing lower drive gear on shaft until this clearance obtained

NOTE—Cover plate should be replaced if worn from contact with gears, or if cracked

6226 ENGINE OIL PUMP

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose) Replace by using drift inserted in distributor drive shaft bore from top of block Install new bushing from below (must be flush with bottom of block)

Reassembly—Press upper drive gear on shaft with pin hole at right angles to tongue on shaft Insert new pin and peen ends flush with gear Install shaft and gear in pump body Press lower drive gear on shaft (with key in place) until 002- 004" clearance obtained between upper drive gear and upper end of pump body Press idler gear shaft in body, install idler gear Install cover using new gasket and pin oil screen float assembly on cover Check shaft and gears—must rotate freely when turned by hand

Oil Pump Installation—Set #1 piston at top dead center Insert distributor main drive shaft from top of block Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut Remove distributor shaft for cyl head installation

Idle Speed - 600 RPM

Float Level - (2392S, 2467S) 9/32" - Gauge T109-126 (938SA, 951S) 5/16" - Gauge T109-107 From top of float at free end to gasket seat on cover with assembly inverted and float resting freely on intake needle.

Fast Idle. With choke held in wide open position, lip on fast idle arm should contact boss on body casting

► *OTHER DATA: See "Carter YF" in Carburetion Section.*

Fuel Pump Pressure 2½-3¾ lbs at 1800 RPM

CARTER WCD

Idle Setting—1-2 turns open Turn screws out for richer mixture

Idle Sp d—500 RPM

Fl at L v l—3/16" (Gauge T109-28) from top of each float to gasket seat on cover with assembly inverted

Accel rating Pump—No seasonal adjustment

Fast Idl S tting Hold choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite ports is 016" (T109-29)

Automatic Choke Setting: Centered (At Index)

Fuel Pump Pressure. 3 5-5 5 lbs at 1800 RPM

► *OTHER DATA: See "Carter WCD" in Carburetion S ction.*

CARB. EQUIPMENT

Fuel Pump: AC No 4032 (Jeep & Jeep Utility), Carter M957S (6-226), fuel and vacuum Carter M2195S (DJ-3A), fuel only.

Pressure - 2½-3¾ lbs. (4 Cyl), 3½-5½ lbs. (6 Cyl) at 1800 RPM.

See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric type

Model	Dash Unit	Tank Unit
Jeep	49452	44556
Truck	45727	44508
Station Wagon	45727	44506

See "Fuel Gauges" in Carburetion Section.

CRANKCASE VENTILATOR

Sealed Positive Ventilation (4 Cyl.). Clean air is drawn into oil filler tube and rocker arm cover through a hose to the air cleaner. All connections and gasket on filler tube must be air tight. The crankcase is ventilated by a sealed system from air cleaner tube to intake manifold. A valve is attached to valve spring cover in the line to air cleaner. This valve must be free of carbon and operate freely at all times to obtain smooth idle. Remove and clean valve every 5000 miles or more often if engine must run at idle speed excessively or is used for stationary power.

BATTERY

Auto-Lite 1H-100. 6 volt, 15 plate, 100 ampere hour capacity (20 hr. rate).

Battery Ground—Negative Battery to body

Engine Ground—Left front engine support (6-226), right front engine support (other models)

STARTER

Auto-Lite. Used as follows

Engine	Starter	Armature
4 Cyl. (Exc. Univ. Jeep)		MCH-2088
6 Cyl.		MCH-2088
4 Cyl. (Univ. Jeep)		MCH-2088

Drive—Bendix A3281 "Follow-thru" type.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs.

Performance Data

Torque	R.P.M.	Volts	Amperes
0	4300	5.0	65
6.0	Lock	2.0	335

Starting Switch. (Jeep) Auto-Lite SW-4015 foot operated. **(Other models)** Auto-Lite SST-4012. Key starting (magnetic switch controlled by turning key past "Ignition On" position).

GENERATOR

Auto-Lit GGW-4801D (4 Cyl.), GGW-4801EN (6 Cyl.).

Armature—Auto-Lite GGW-2006F (All Cars).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Amperes	Volts	Cold	-RPM-	Hot
0	6.4	870-970		950-1050
40.0	8.0	1800-2000		2150-2350
45.0	8.0	1925-2125		2350-2550

Brush Spring Tension - 35-53 ozs.
Field Current - 1.6-1.7 amps. at 5.0 volts (70°F).
Motoring Current - 5.0-5.5 amps. at 5.0 volts (70°F).
Rotation—Counter-clockwise at commutator end.
Belt Adjustment 1/2-5/8" deflection with thumb pressure midway between generator and pump pulleys.

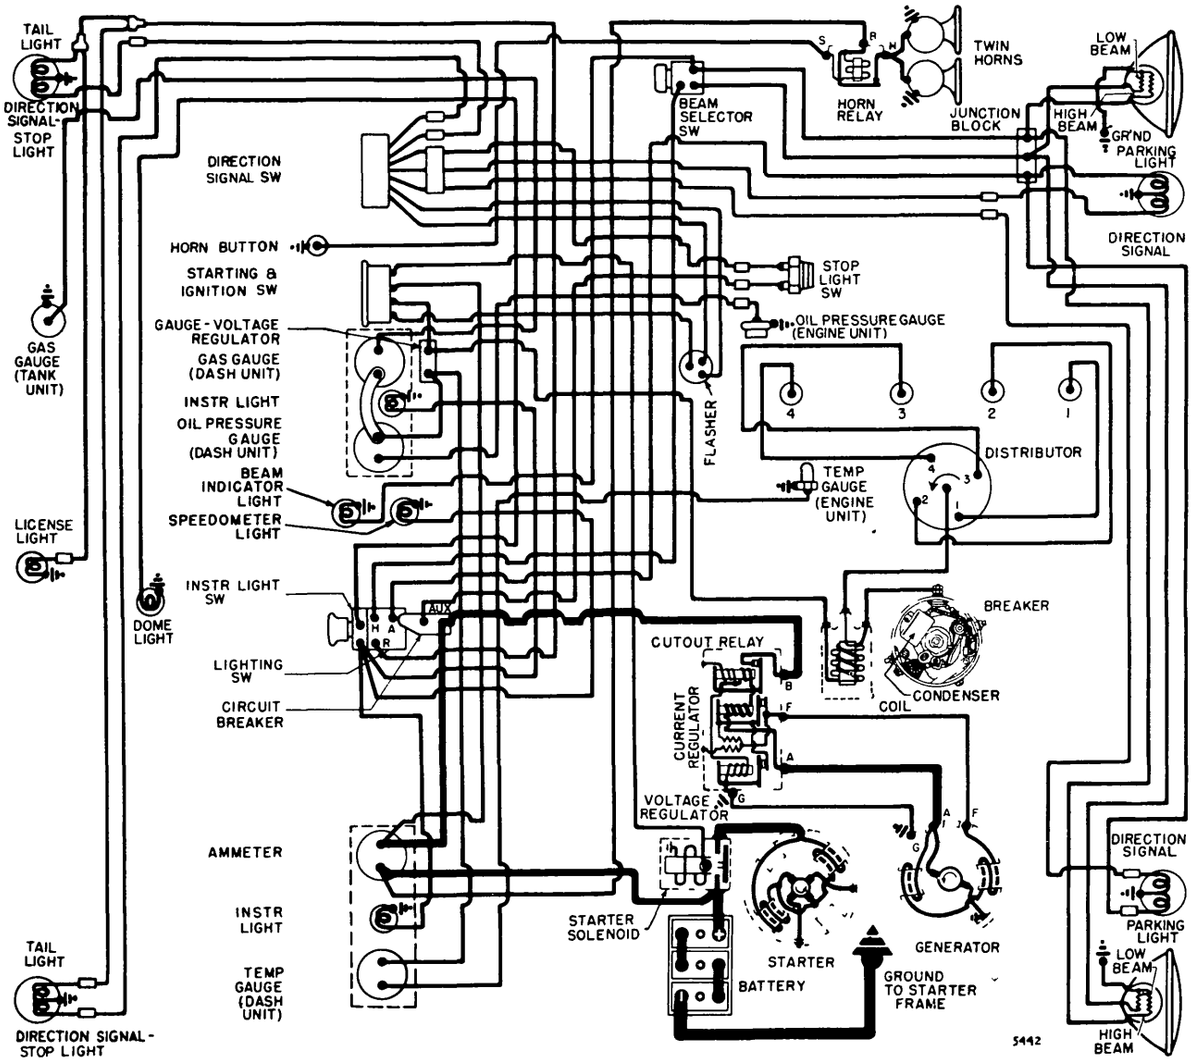
REGULATOR

Autolite VBE-6105A. Voltage & Current type with "Temperature Compensated" Current Regulator.

Cutout Relay

Cuts In—6.3-6.8 Volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 Volts (4.6 amps. discharge).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator



Setting—7.2-7.5 volts at 70° F *after 15 minutes operation charging at 1/2 maximum rate.*
Air Gap—.048-.052" with contacts just touching.
Checking & Adjusting - *See Electrical Section.*

Current Regulator

►*SETTING CAUTION "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A	-Operating Amperes-	Test B
VBE-6105A	52		45 (43-47)

Test A - After 15 minutes operation at 10.0 amperes
Test B—After 15 minutes additional operation with current regulator operating (load applied to hold to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just touching.
Checking & Adjusting - *See Electrical Section.*

UTILITY MODELS WITH 4 CYL. "F" HEAD ENGINE

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Direction Signal: *See Electrical Section.*
Lighting Switch Removal Loosen set screw on side of control knob and remove knob. Remove retaining nut and push switch through panel.
Stop Light Switch Location At front end of brake master cylinder.
CIRCUIT BREAKER: 30 ampere. Thermal type on light switch.
FUSES: Directional Indicator—SFE-14 ampere in flasher lead
Radio—SFE-9A ampere in lead to radio
Heater—SFE-14 ampere in lead to heater
Overdrive—SFE-20 at overdrive relay
HORNS: Auto-Lite HA-4037 (Jeep), HAB-4603 (Low Pitch) HAB-4604 (High Pitch) (Other Models).

ENGINE

►*THREE DIFFERENT ENGINES USED See "Model Identification" for application.*

4 CYL. "F" HEAD

Bore	Stroke	Displmnt.
3 125"	4.375"	134.2 cu. ins.

Ⓒ -On F-4-134 4X2 Jeep Utility Std. Hd. Compr. Ratio is 7 4-1, Optl. Hd. 7.8-1 and Developed HP is 75 at 4000 RPM
Compression & Vacuum Reading—*See TUNE-UP*
►*ENGINE NUMBER NOTE* Letters following engine number denote the following
"A" .010" main & connecting rod journals Undersize.
"B" .010" cylinder bore and pistons Oversize.
"AB" both above conditions exist.
CYLINDER HEAD & GASKET: *See "Cylinder Head & Manifolds" in Willys Special Data*
TIGHTENING TORQUES: *See "Tightening Specifications" in Willys Special Data*

PISTONS

Aluminum alloy, cam ground, T slot, Tin or Brass plated.
►*PISTON OVERSIZE NOTE* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.
Weight—13.5 ozs.
Removal—Pistons & Rods removed from above.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fitting New Pistons: Place .003" x ¾" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove ribbon feeler should be 5 to 10 lbs.

Replacement Pistons: Std. and .010", .020", .030" and .040" Oversize.

Installing Pistons: "T" slot toward valve (left side) of engine (opposite side from oil spray hole in connecting rod lower end).

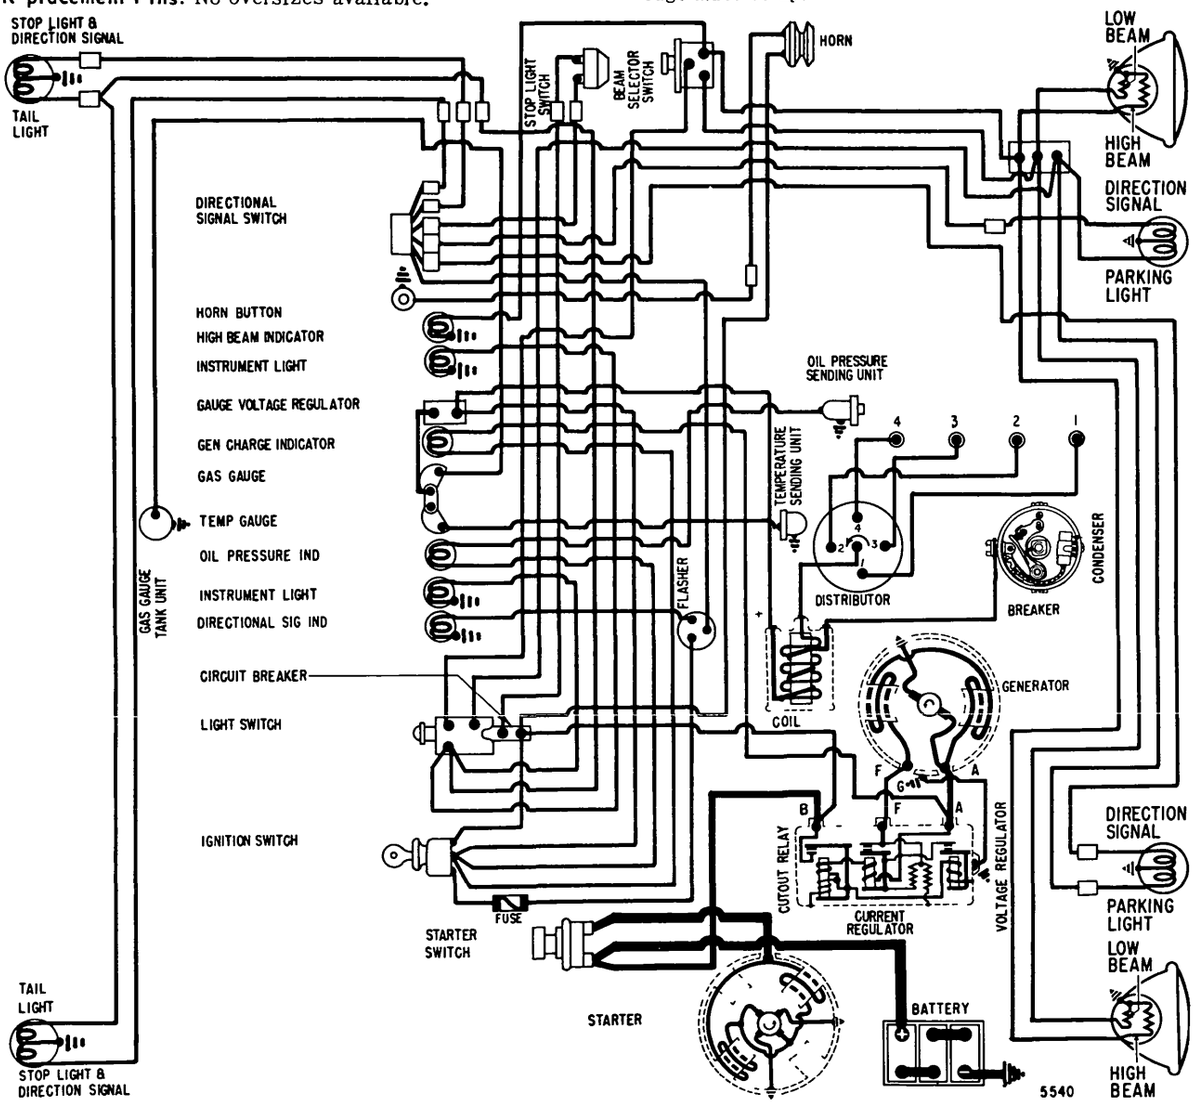
PISTON PINS

Locked in rod with clamp screw.

Diameter -.8118-.8120". **Length** - 2 25/32".

Clearance in Piston—.0001-.0005" Thumb push fit at 70° F.

Replacement Pins: No oversizes available.



PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.008-.013"	.002-.004"
Compr #2	3/32"	.008-.013"	.0015-.0035"
Oil	3/16"	.008-.013"	.001-.0025"

Replacement Rings: (For rebored cylinders)—Furnished .010", .020", .030" and .040" Oversize.

Service Type Rings—(For Cylinders not Rebored)—Furnished Std. (.000-.009"), .010" (.010-.019"), .020" (.020-.029"), .030" (.030-.039"), .040" (.040-.049") Oversize.

Installing Rings: Install compression rings with mark "Top" (on side) toward top. Rings have tapered face and must be installed correctly. Top ring inner bevel edge must be up.

CJ-5 JEEP MODEL

CONNECTING RODS

Length (Center to Center) - 9.1845-9.1905. **Weight** - 32 ozs.

Crankpin Journal Diameter - 1.9375".

►*JOURNAL DIAMETER UNDERSIZE NOTE.* The letter "A" or "AB" following the engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance—.0005-.0025"

Side Play - .004-.010".

Replacement Bearings: Std., .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), and toward rear (#2, 4). Oil spray hole in lower rod bearing toward right of engine (away from camshaft) on all rods.

CRANKSHAFT

Journal Diameter—2.3341-2.3331". All main bearings.

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance—.0003-.0029".

Replacement Bearings: Std., .010", .020", .030" Undersize.

Crankshaft Servicing: *See "Crankshaft & Main Bearings" in Willys Special Data.*

End Thrust: Taken at #1 main bearing. Shims between crankshaft thrust washer and shoulder on the crank.

Endplay—.004-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters - **(1)** 2.1860-2.1855", **(2)** 2.1225-2.1215", **(3)** 2.0600-2.0590", **(4)** 1.6230-1.6225".

Journal Diameters—**(1)** 2.188" **(2)** 2-1/4", **(3)** 2-3/16", **(4)** 1-3/4".

Bearings—#1 steel backed babbitt. #2, 3 & 4 cast iron.

Clearance—.001-.0025".

End Thrust: Taken by thrust plate assembled behind gear. To reduce clearance, add shim behind spacer. To increase clearance, reduce thickness of spacer.

End Play—.004-.007".

Camshaft Servicing: *See "Camshaft & Bearings" in Willys Special Data.*

Timing Gears: Crankshaft gear, steel. Camshaft gear, fibre with steel hub.

Camshaft Setting: Mesh marked tooth of camshaft with marked space (between teeth).

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Willys Special Data.*

CONTINUED FROM PRECEDING PAGE

VALVES

Tappet Clearance : Intake .018", Exhaust .016" Cold.

Valve	Head Diameter	Stem Diameter	Length
Intake	2"	.3733-.3738"	4.781"
Exhaust	1-15/32"	.371-.372"	5 909"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.351"	.0025-.0045"

►*EXHAUST VALVE NOTE:* Thompson Valve Rotators used.

Valve Seat Width—3/64".

Valve Springs: Install with closed coil upward toward block (Exhaust), down towards head (Intake).

Free Length—1 31/32" (Intake), 2½" (Exhaust)

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	73 lbs at 1 21/32"	53 lbs at 2 7/64"
Open	160 lbs at 1 3/8"	120 lbs at 1 3/4"

Valve Guides: Use Tool W-177 to remove and install guides. Drive Exhaust guide down into valve compartment to remove. Drive new Exhaust guide to 1" below surface of cylinder block and new Intake guide flush with bottom of valve guide bore in cylinder head.

Rocker Arm Assembly Removal: *See "Valve System" in Willys Special Data.*

Valve Lifters: Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004" Oversize.

Diameter—.6240-.6245". **Clearance**—.0005-.002".

►*NOTE:* Camshaft must be removed for lifter removal.

VALVE TIMING

See "Camshaft Setting" under "CAMSHAFT" above.

Intake Valves—Open 9° BTDC. Close 50° ALDC.

Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

Valve Timing Check—Set Intake valve clearance at .026". Rotate engine clockwise until No. 1 cylinder is ready for intake stroke. Intake opens 9° BTDC. Note the distance between TDC and the 5° mark and estimate 9° from this distance. With the crankshaft in this position timing is correct if lifter is just tight against valve stem.

ENGINE

4 CYL. "L" HEAD

Bore	Stroke	Displmnt.	Rated HP
3.125"	4.375"	134.2 cu. ins.	15.63
Compression Ratio			**Developed HP**
6.48-1			60 at 4000 RPM

►*OTHER ENGINE DATA* *See "4 Cyl. "F" Head" above and note the following differences.*

►*ENGINE NUMBER NOTE* *Letters stamped after engine number denote the following*

"A" - .010" undersize main & connecting rod bearings.
"B" - .010" oversize cylinder bore.
"AB" - Both above conditions exist.
"C" - .002" undersize piston pin.
"D" - .010" undersize main bearing journals only.
"E" - .010" undersize connecting rod bearing journals only.

VALVES: Tappet Clearance - .016" Cold (Intake & Exhaust).

Valve	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5 51/64"
Exhaust	1 15/32"	.3715"	5 51/64"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	3 51"	.0007-.0022"
Exhaust	45°	3.51"	.0025-.0045"

Valve Seat Width - 3/64".

Valve Springs: Free Length - 2½".

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	53 lbs. at 2 7/64"	53 lbs. at 2 7/64"
Open	120 lbs. at 1 3/4"	120 lbs. at 1 3/4"

Valve Guides: Use W-177 to remove and install guides. Drive guides into valve compartment to remove. Drive new exhaust guide to 1" below surface of cylinder block and new intake guide 1 5/16" below surface of cylinder block.

Valve Timing Check: Set No. 1 cylinder intake valve tappet clearance to .020" for check. After check made, reset No. 1 cylinder intake valve tappet clearance to a running clearance of .016".

ENGINE

6 CYL. "L" HEAD (6-226 ENG.)

Bore	Stroke	Displmnt.
3.312"	4.375"	226.2 cu. ins.
Compression Ratio	**Rated HP**	**Developed HP**
6.86-1 (Std. Hd.)	26.33	115 at 3650 RPM
7.3-1 (Optl. Hd.)	26.33	115 at 3650 RPM

Compression & Vacuum Reading—*See TUNE-UP above.*

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following.

"A" .010" Undersize main and connecting rod journals.
"B" .010" Oversize cylinder bore and pistons.
"AB" Both above conditions exist.

CYLINDER HEAD & GASKET INSTALLATION: *See "Cylinder Head & Manifolds" in Willys Special Data*

TIGHTENING TORQUES: *See "Tightening Specifications" in Willys Special Data*

►*FILLER BLOCK-OIL PAN OIL SEAL PRODUCTION CHANGE (To Prevent Oil Leakage Between Filler Block & Oil Pan):* Neoprene oil seal, Part No. 910220, was placed in early production and is available for installation on earlier models. Replaces earlier type cork seal. To install new seal, coat inner surfaces of filler block grooves with gasket cement. Install gaskets in grooves evenly centered so each end extends 1/16" above faces of filler block ends. Do not trim off ends. Install filler blocks, dust gaskets with graphite and install oil pan.

PISTONS

Aluminum alloy, steel band, T-slot Cam Ground. Tin Plated.

►*PISTON OVERSIZE NOTE* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.

Weight—15.312 ozs. Less rings and pin.

Removal—Pistons and rods removed from above.

Fitting New Pistons: Place .0015" x 2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove feeler should be 5 to 10 lbs.

Piston Replacement—Std., .010", .020", .025, .030", 040", 050", and .060" Oversize

Installing Pistons. Slot in skirt toward left or away from camshaft.

PISTON PINS

Floating type with lock ring at each end.

Diameter - .8591-.8593". **Length** - 2.779".

Clearance in Piston - .0002". Selective fit. Push fit at 160°F.

Clearance in Rod - .0002-.0006". Press fit.

Replacement Pins. Std., .003" and .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Upper)	.0930-.0935"	.008-.016"	.002-.004"
Compr. (Lower)	.0930-.0935"	.008-.016"	.003-.007"
Oil (Top ring)	.1545-.1550"	.008-.016"	.006-.010"
Oil (Bottom ring	.1545-.1550"	.008-.016"	.0025-.004"

Replacement Rings: Ring sets and single rings furnished in following sizes for oversize ranges indicated Std. (Std.-.009"), .020" (.010-.029"), .030" (.030-.039"), .040" (.040-.049"), .060" (.050-.069").

Installing Rings Side marked "Top" (compression rings) upward. Chrome plated ring must be installed in top (#1) ring groove.

CONNECTING RODS

Length—6.998"- 7.002" (Center to center).

Crankpin Journal Diameter—2.0619 - 2.0627".

►*JOURNAL DIAMETER UNDERSIZE NOTE.* The letter "A" or "AB" following engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings—Steel Backed Babbitt.

Clearance - .0018" maximum. **Sideplay** - .006-.011".

Replacement Bearings Std. and .001", .002", .010" and .012" Undersize.

Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. *NOTE*—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 forward), (#2, 4, 6 toward rear).

CRANKSHAFT

Journal Diameter—2.3744-2.3752".

►*JOURNAL DIAMETER UNDERSIZE NOTE* The letter "A" or "AB" following the engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings—Steel Backed Babbitt.

Clearance - .0007-.0020".

Replacement Bearings Std. and .001", .002", 010" and .012" Undersize.

End Thrust Taken by #4 rear main bearing which is flanged type.

End Play— 002-.006".

Rear Bearing Oil Seal Installation *See "Crankshaft and Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.8725-1.8735". (2) 1.8095-1.8105". (3) 1.7472-1.7485". (4) 1.2475-1.2485".

Bearings—Steel Backed Babbitt.

Clearance—.001-.003".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

End Thrust Taken by thrust plate on front of engine (between front bearing journal and hub of sprocket).
End Play—.003-.007".

Timing Chain Non-adjustable type. Width 1". Pitch .500". Length 23" or 46 links.

►*TIMING CHAIN CAUTION Morse and Link Belt chains used. Chains and sprocket interchangeable only in COMPLETE SETS.*

Camshaft Setting Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES

Tappet Clearance: Intake and Exhaust .014" Cold.

►*TAPPET CLEARANCE ADJUSTMENT PROCEDURE: See "Valve System" in Willys Special Data*

Valve	Head Diam.	Stem Diam.	Length
Intake	1 520"	3402-.3410"	5.187"
Exhaust	1 328"	.3382- 3390"	5 205 '

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.3520"	.001-.003"
Exhaust	45°	.3315"	.0032-.0052"

Valve Seat Width· 5/64-3/32" (intake), 3/32-7/64" (exhaust).

NOTE—Rotators used on Exhaust valves.

Valve Guides· Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides to inside diameter of .3432-3422".

Replacement Guides—Std., .0005" (marked "A"), .0055" (marked "L") to insure .0005-.003" press fit.

Guide Installation—Place guide (tapered end of guide toward top) in position in bore and drive in to correct position of 1-7/32" below top face of cylinder block.

Valve Springs· Intake & Exhaust valve spring interchangeable.

Free Length—1-31/32".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	51	1.672'
Open	118	1.312

Valve Lifters· Mushroom type with self locking adjusting screws.

Diameter—.6855-.6860".

Clearanc—Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.

R placem nt Lift rs—Furnished in Std. and the following oversizes marked as indicated "B" is .001", "D" is .002", and "K" is .005" O.S.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves—Open 10° BTDC. Close 60° ALDC.

Exhaust Valves—Open 55° BLDC. Close 10° ATDC.

Valve Timing Check—With .020" tappet clearance, #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark, after top dead center "0" mark on dampener aligned with pointer at front of engine. Reset tappet to .014" clearance COLD.

OILING SYSTEM

Crankcase Capacity: (4 Cyl.) 4 qts., (6 Cyl.) 5 qts. (refill).

Normal Oil Pressure: 35 lbs. at 1700 RPM (6 Cyl.) at 2000 RPM (4 Cyl.).

Pressure Regulator - In pump housing (4 Cyl.), right side of cylinder block below valve chamber to rear of engine (6Cyl.).

Oil Pressure Indicator; DJ-3A, CJ-5, CJ-6, CJ-3B Jeeps - Red telltale lamp, and Oil Pressure Switch, King-Seeley No. 47150.

Other Models—King-Seeley "CV" (Constant Voltage) electric type with voltage regulator
Dash Unit—King-Seeley No 45729
Engine Unit—King-Seeley No 44030
See "Oil Pressure Gauges" in Miscellaneous Section

Oil Pump: Gear type attached to rear intermediate main bearing (6226). Rotor type on left side of crankcase (475, 685).

Pump Overhaul—*See "Oiling System" in Willys Special Data*

Oil Filter Fram or Purolator. Located on cylinder head bracket at right front corner of cylinder head with oil outlet connected to timing gear cover.

Crankcase Ventilation: (4 Cyl) See Crankcase Ventilator above. (Others) Ventilator on Rocker Arm cover and tube from crankcase ventilator baffle on valve side cover.

COOLING

Water Capacity: 11 quarts Add 1 quart for heater.

Pressure Valve. Radiator filler cap. Opens at 7 lbs.

Thermostat Harrison. In water outlet elbow in cylinder head. Opens at 163-168°.

Water Pump Centrifugal, packless, ball bearing type.
See "Willys" in Water Pump Section.

Temperature Gauge: King-Seeley Electric.

King-Seeley No.	Dash Unit	Engine Unit
DJ-3A, CJ-5, 6, 3B	49454	44230
Others (4 Cyl.)	45734	44230
Others (6 Cyl.)	45734	44214

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Auburn 8501-39, Rockf rd 8½ RM, Borg & B ck 9A7 & 10A7. Single plate types. Used as follows
4 Cyl. (All) - Auburn 8501-39 or Rockford 8½RM. 8½".
6 Cyl. Utility (4X2) - Borg & Beck 9A7, Assy. No. 951
6 Cyl. Utility (4X4) & Trucks (4WD) - Borg & Beck 10A7, Assy. No. 360982.
See Clutch Section for compl t data.
Clutch Disc - (4 Cyl.) B & B No. 382298, (6 Cyl. 4X2) B & B No. 381929, (6 Cyl. 4X4 & 4WD) B & B No. 381806.

Pedal Adjustment: (4 Cyl.) 1½". Adjust cable length. (6 Cyl.) Adjust rod length between clutch control lever and clutch control tube lever.

SYNCHRO-MESH TRANSMISSION

4 WHEEL DRIVE

Warner AS1-T90. Three speed type. Constant mesh, synchro-mesh, helical gears (second & high), sliding spur gear (low & reverse).
See "Warner Transmissions" in Transmission S ction.

►*VIBRATION CORRECTION (4x4 Utility Models "Coasting Down Hill" with closed throttle)* May be due to endplay in transfer case output shaft. To correct, remove shims from between rear bearing cap and transfer case housing, so that when bearing cap is pulled up tight against case, endplay in shaft and bearings is just eliminated. Shims are in sets consisting of four .003", two .010", and two 031". *CAUTION* - Output shaft must roll freely by hand **aft r** bearing capscrews are tightened securely.

Transfer Case· Spicer Model 18. Two speed auxiliary transmission and front wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front wheel drive engagement (left hand lever).
See Transmission Section for complete data.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal· (4 Whl. Drive) Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shafts at universal joints *(NOTE*—If equipped with Power Take-off drive, remove front end of power take-off propeller shaft assembly). Disconnect speedometer cable at transfer case, brake cable, and clutch release cable at cross shaft bell crank (Jeep), Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and shift levers (*NOTE*—If Power Take-off used, remove power take-off shift lever plate screws and lift lever out). Remove bolts holding center cross-member at frame side rails and remove cross-member (*CAUTION* -With cross-member removed, engine and transmission weight will rest on support jacks). Remove bolts holding transmission on bell housing, force transmission to right until ball stud end can be disengaged from end of clutch control cross shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

2 WHL. DRIVE

Warn r AS50 with Ov rdrive. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.

Transmission Contr l: Remote control type with gear-shift lever on steering column. *See "Transmission Controls" in Transmission Section.*

R moval: (2 Whl. Drive) Remove floor boards, take off bell housing inspection cover, disconnect clutch throw-out bearing retracting spring. Disconnect transmission control rods and speedometer cable at transmission case. Disconnect propeller shaft at universal joints and remove shaft. Support engine with jack placed under bell housing, remove rear engine support bolts from cross-member under transmission case, raise rear end of engine so transmission clears cross-member *(CAUTION* –Use care that fan blades do not damage radiator). Remove transmission bell housing bolts, pull transmission straight back to clear clutch shaft, remove from car.

OVERDRIVE

Warner R10. *See "Warner R10" in Transmission Section.*

Overdriv Control: *Se "Warner R10 & R11 Overdrive Controls" in Transmission Section.*

R m val: Same as for Synchro-mesh Transmission (2 Wheel Drive above) after disconnecting control cable and wiring.

UNIVERSALS

2 WHEEL DRIVE

Spic r. Cross type. One at each end of propeller shaft.

4 WHEEL DRIVE

Driv Shaft J ints - Spic r. Cross type. One used at front and rear of both front and rear propeller shafts.
Fr nt Axl Shaft J ints - Rzeppa. Constant velocity type. One joint used at outer end of each shaft (within steering knuckle housing).

Pow r Tak - ff Shaft J ints - Detroit Ball-and-Trunion typ . Two used (one at each end of shaft - no splined joint used).

FRONT AXLE

4 WHL. DRIVE

Spic r (Salisbury) Mod l 25. Full floating, Hypoid gear type. Differential assembly (ring and pinion gear assembly) is serviced in same manner as Spicer Rear Axles.
See "Spicer(Salisbury)" in Rear Axle Section.

Rati - 5.38-1 (Exc. 6-226 4X4 & 4WD), 4.88-1 (6-226 4X4 & 4WD).
Backlash–.004-.007". Shim Adjustment.

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange cap screws and remove flange with puller, (*CAUTION*–do not lose shim pack under drive flange). Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly.(*(CAUTION*–use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

►*INSTALLATION CAUTION:* Adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment: Tighten inner adjusting nut until wheel binds (turn wheel while adjusting), then back nut off 1/6 turn, install lockwasher, locknut, and make certain nut locked by turning lockwasher ear up.

Axle Shaft End Play–No adjustment. Shims (.060") between driving flange and wheel hub establish correct endplay.

REAR AXLE

Spicer 44-2. Hypoid Semi-floating with Hotchkiss drive. *NOTE*–6226-4WD may have Timken Spiral Bevel as alternate equipment.

See "Spicer Hypoid Semi-floating" or "Timken Semi-floating" in Rear Axle Section.

Axle Ratios

Model	Standard	Overdrive
DJ-3A Jeep	4.56	
CJ-5, 6, 3B Jeep	5.38	
4 Cyl. Utility (4X4)	5.38	
4 Cyl. Utility (4X2)	4.89, 5.38	4.89, 5.38
6 Cyl. Utility (4X4)	4.27, 4.89, 5.38	
6 Cyl. Utility (4X2)	4.27, 4.89, 5.38	4.89, 5.38
4 Cyl. 4WD Truck	5.38	
6 Cyl. 4WD Truck	4.88, 5.38, 4.27	

Backlash–.004-.007". Shim adjusted.
Axle Shaft Removal: *See "Spicer Hypoid Semi-Floating" in Rear Axle Section.*

Rear Axle Assembly Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs. Remove axle assembly from beneath car.

Wheel Bearing Adjustment: End Play .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See "Axle Shaft Removal" above.

SHOCK ABSORBERS

Monroe or Gabriel. Direct acting type.

FRONT SUSPENSION

2 WHL. DRIVE

Planadyne Type. Independent, linked parallelogram type with transverse spring (spring acts as lower control arm).
See "Willys Front Suspension" in Front Suspension Section.
Kingpin Inclination - 7½° crosswise.
Caster - 3° (DJ-3A Jeep), 4¾° (Others).
Camber - 1° (DJ-3A Jeep), 1½° (Others).
Toe-In - .047-.094". *See "Willys Planadyne" in Suspensions & Wheel Alignment Section for Toe-In Adjustments.*
Toe-Out of Turns - With inner wheel turned 20°, outer wheel should be 19°.

4 WHL. DRIVE

Special front-wheel drive unit with semi-elliptic springs. Steering knuckle mounted on taper roller bearings carried on two stub shafts.

End Play–.001-.003".
Kingpin Inclination–7-1/2°.
Caster–3°. No adjustment. If caster incorrect, check front end, correct by installing new parts.
Camber–1-1/2°. No adjustment. Correct by installing new parts. Do not attempt to correct camber by cold bending or heating of parts.
Toe-in–3/64-3/32". (1/32" each wheel) To adjust first set each front wheel straight ahead (see note below), then set toe-in by shortening each tie rod approximately 1/2 turn. This procedure necessary to maintain correct position of steering idler arm.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

NOTE–To set front wheels straight ahead, first set tie rod end of steering bell crank (idler lever on frame cross member) exactly at right angles to front axle. Check front wheels by using a straight edge or sighting along rear and front wheels. Adjust each tie rod (loosen end clamp bolts and turn rod) until front wheels are exactly straight ahead. Then make toe-in adjustment as directed above. Tie rod lengths between ball end centers should be 20-7/8" (left), 25-5/8" (right).

Toe-Out on Turns–With inner wheel turned 20°, outer wheel should be turned 19° (Utility Wgn. & Del.), 19½° (Trucks), 20° (Univ. Jeep & DJ-3A Jeep).

STEERING

Ross. Cam & Lever type.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" in Steering Section.*

Steering Gear Removal: *See "Ross Cam & Twin Lever" in Steering Section.*

BRAKES

Bendix-Lockheed (Self-Centering). Hand brake applies rear service brakes (Exc. Univ. Jeep). Independent brake on drive shaft at rear of transfer case (Univ. Jeep). *See "Bendix-Lockheed (Self-Centering)" in Brake Section.*

Drums - (DJ-3A, CJ-5, 6, 3B Jeeps) 9", (Others) 11" front & rear.

Wheel Cyl. Diameter - Application as follows

Model	Front	Rear
DJ-3A Jeep Disp.	1 1/8"	13/16"
CJ-5, 6, 3B Jeeps	1"	3/4"
Others	1 1/8"	1"

Lining Length & Width

Model	Primary	Secondary
DJ-3A Jeep Disp.	9 7/8" x 2"	7 11/16" x 1 3/4"
CJ-5, 6, 3B Jeeps	10 7/32" x 1 3/4"	6 39/64" x 1 3/4"
Others	12 1/4" x 2"	10 1/32" x 2"

Thickness - (DJ-3A Jeep Disp.) .214", (CJ-5, 6, 3B Jeep) .211", (Others) .212".

Braking Power - (DJ-3A, CJ-5, 6, 3B Jeeps) Front 65%, Rear 35%. (Others) Front 57%, Rear 43%.

Clearance - Turn eccentric until shoe contacts drum, then back off until wheel turns freely.

Parking Brake (Univ. Jeep): Be certain hand brake cable and linkage operate freely. Lubricate if sticking or binding is evident. Place brake handle on instrument panel to "OFF" position. Rotate brake drum until one pair of adjusting holes (three pairs located on back face of drum) is opposite the adjusting screws (notched wheels) within the brake. Insert a screwdriver or adjusting tool through each hole and turn each adjusting screw equally until the brake shoes are snug against the drum (*NOTE*–with tool against edge of hole as a fulcrum, move outer end of tool out away from center of driveshaft to expand shoes). **Back off each adjusting screw 7 notches** to provide correct shoe clearance.

MISC. MECHANICAL

Windshield Wipers: Vacuum type.

(Univ. Jeep) - Individual motors operate wiper arms direct.

(Other Models) - Single motor operates wiper arms by cable control.

See "Windshield Wipers" in Miscellaneous Section.

ROCHESTER 4-BARREL 4GC

1956 All Series except Eldorado Engine.	
Early (No Air Cond.)	7008750
Late (No Air Cond.)	7009750
Early (With Air Cond.)	7008751
Late (With Air Cond.)	7009751

© - Replaces Carburetor Nos. 2333S, SA, 2334S, SA. When installing this carburetor on Air Conditioned Cars, it will be necessary to also use Unitized Package No. 202-44U.

℗ - Replaces Carburetor Nos. 2543S & 2544S. When installing this carburetor on Air Conditioned Cars, it will be necessary to also use Unitized Package No. 202-44U.

© -Replaces Carburetor Nos. 2372S & 2373S. When using this carburetor to replace 2373S (Front carburetor on cars with Air Conditioning), it will be necessary to also use Unitized Package No. 202-100U.

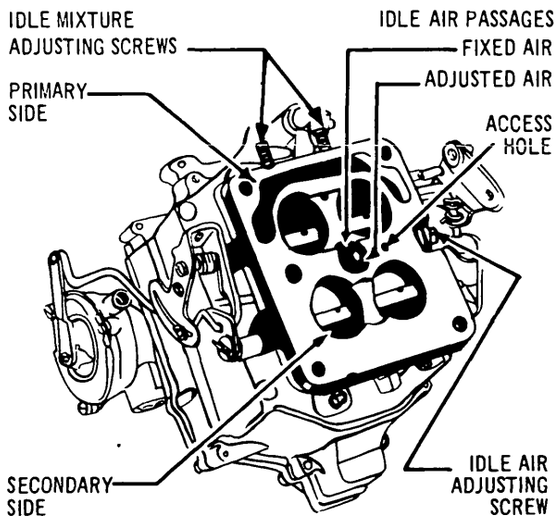
►CHANGES & CORRECTIONS

►*IDLE SPEED ADJUSTING SCREW ON CARTER CARBURETORS (For use during first 1000 Mile Break-in Period):* This idle speed adjusting screw (throttle stopscrew) installed on some carburetors after Eng. No 035500, and can be installed on cars between Eng No 033849 and 035500 where it is not possible to secure proper idle by use of the Idle Air Bypass Screw only. This screw is not necessary after break-in period and should be removed at end of the first 1000 miles *NOTE*–Later carburetors will have enlarged idle air bypass passage eliminating need for this idle speed screw

►*FLAT SPOT & SHUDDER CORRECTION (Eldorado Engines with Carter Carburetors before Engine No. 014141)* Install Accelerator Pump Jet Housing, Cadillac Part No. 7002451. The later type housings have larger bores and longer jets which reduce flat spots and shudder. The later type housing is installed in production after the above engine number.

►*FLAT SPOT CCRRECTION (Eldorado Engines with Carter Carburetors before Engine No. 044963 without Air Conditioning, or No. 044986 with Air Conditioning):* Install all parts furnished in special kit, Cadillac No. 3630751, as detailed below. *NOTE* - Later carburetors with **black** tag have these parts installed in production and no modification required.

1) Carburet r Parts Chang s–Install new Metering Rods, Vacumeter (vacuum piston) Springs, and Primary Jet Clusters furnished in kit



2) Carburetor Setting Changes–Secondary Throttle Shaft Torsion Spring should be wound up one additional turn. This will assure better idle stability.

3) Transmission Changes–Accumulator Inner Spring (furnished in kit) must be installed inside original accumulator outer spring (under accumulator piston in Servo & Accumulator Body) on transmissions prior to Transmission No. 56-5239 This spring is required due to increased engine torque when carburetor changes are made (above) and will change Throttle Valve adjustment from 18 flats to 24 flats. *NOTE*–Do not install this accumulator inner spring on transmissions after No 56-5239.

►*FULL THROTTLE LEANNESS OR SURGE CORRECTION (Cars with Carter Carburetors):* This condition may be caused by air leakage around metering rod dust cover and can be corrected by filing down the heavy flashing at both ends of cover until cover is level and will seat properly. It may also be necessary to file edge of cover at air horn to prevent interference at this point.

►*ENGINE STALLING CORRECTION (Cars with Carter Carburetors):* This stalling condition is noticeable when a hard left or right hand turn is made at zero throttle opening and is caused by air leakage between air horn and bowl gasket. Correct by installing an extra bowl gasket and securely tighten air horn-to-bowl screws. Readjust float level, metering rods and choke.

►*IMPROVED PERFORMANCE & ELIMINATION OF FLAT SPOTS ON ACCELERATION: (Cars with Carter Carburetors, except Eldorado Engine)* A kit, Cadillac Part No. 1467454 consisting of late type metering rods and vacumatic spring is available for service replacement on cars before Engine No 080810. In the event a late type throttle body, Carter Part No. 1-1436S (same as used on 2543S, 2544S & 2545S) is installed on earlier carburetors, the new kit should also be installed. It will not be necessary to install the throttle stop adjusting screw.

CADILLAC CARBURETOR IDLE SYSTEM

►*JET AND IDLE ADJUSTING SCREW PRODUCTION CHANGE (Cars with Carter Carburetors, except Eldorado)* To improve idle stability, new Primary & Secondary Metering Rod Jets, Carter Nos. 120-163 & 120-185 are being used in production beginning with Engine No. 113864. The diameter of the idle adjusting screw also has been changed.

►*IMPROPER AUTOMATIC CHOKE OPERATION NOTE (All Models)* Oil leakage at the rear of right hand rocker arm cover may affect choke operation. If oil is indicated in choke housing, the choke housing should be removed and cleaned, and the rocker arm cover gasket should be replaced.

►*ENGINE STUMBLE CORRECTION (Cars with Carter Carburetors):* Loss of power after a sharp left turn may be caused by fuel leakage from carburetor bowl into the choke vacuum passage. To correct, install a brass standpipe, Carter No. 145-142, tapping it into the choke vacuum passage in carburetor body.

►*THROTTLE LEVER ADJUSTING SCREW CHANGE (Cars with Carter Carburetors, except Eldorado)* Beginning with Engine No. 126955, the throttle lever adjusting screw has been eliminated. A 3/16" hole in each secondary venturi skirt will provide increased air for the idle by pass system.

►*FLAT SPOT CORRECTION (First Cars with Roch ster Carburetors):* On carburetors with original **brass** tag, new Primary Metering Jet No 7002651 can be installed to correct this condition *NOTE*–Later carburetors with **black** or **red** tag have this new jet installed in production.

DESCRIPTION: Four barrel downdraft types with idle air bypass system of same design used on 1955 models.

ADJUSTMENT: *All adjustments should be mad exactly as detailed below and sequence of adjustments should be followed as indicated*

Idling Adjustment: *Each model must be adjusted exactly as detailed below. This is important to secure correct balance between Idle Mixture and Idle Air settings.*

Cadillac (Singl Carburet r)

►*CAUTION These carburetors have TWO Idle Mixture Adjusting Screws and ONE Idle Air Adjusting Screw (regulates idle speed by controlling air for both primary barrels). See Idle Speed Adjusting Screw Not under "Changes & Corrections" above*

1) Make an initial adjustment by setting Air Adjusting Screw 3 turns open, set each Idle Mixture Screw 1 3/4-1-2 turns open (Carter Carburetor 2543S, 2544S, 2545S). 1-1 1/4 turns open (Rochester). Connect vacuum gauge and tachometer to engine, set hand brake securely, start engine and operate it until it **r ach s n rmal perating temperature** with choke valve wide open and fast idle not operating.

2) Loosen both jam nuts on transmission throttle control rod at carburetor throttle lever trunnion Place selector lever in either "Dr" position

CONTINUED ON NEXT PAGE

CADILLAC (CARTER & ROCHESTER) CARBURETORS (C nt.)

3) Adjust idle speed by turning Air Adjusting Screw in or out for engine speed of 420 RPM (supersedes original specification of 400 RPM) *On air conditioned cars, Air Conditioner must be turned on* Turn screw out minimum amount necessary to secure this idle speed

4) Adjust each idle mixture adjusting screw in turn until highest engine RPM is secured

5) Readjust idle speed (step 3 above)

6) Repeat steps 3-4-5 until no increase in RPM is noted when idle mixture adjusting screws are adjusted and smoothest engine idle is obtained

7) Adjust transmission throttle rod *See Throttle Linkage Adjustment under CARBURETOR in Cadillac data*

Eld rado Engin (Two Carburetors)

►*CAUTION Each carbur tor is same design as single carburetor (above) Linkage connecting the two carburetors must be adjusted for secure balanced operation*

1) Make an initial adjustment of each carburetor by setting Air Adjusting Screws 3 turns open set each Idle Mixture Adjusting Screw 1-2 turns open Connect Vacuum Gauge and Tachometer to engine set hand brake securely, start engine and operate it until it reaches **n rmal p rating temperature** with both choke valves wide open *NOTE*–Air cleaners must be in place for following adjustments

2) Disconnect manual throttle control rod from front carburetor and loosen jam nut on primary throttle control Check connector link between front and rear carburetors as follows Open throttle on front carburetor and then release throttle and allow engine to return to idle press on throttle lever to determine if front carburetor throttle valves can be closed further If engine speed drops more than 20 RPM, throttle connector link is too long Check rear carburetor similarly If engine speed drops off more than 20 RPM when rear carburetor throttle lever pressed closed, connector link is too short Adjust connector link trunnion in accordance with results of above tests With correct adjustment pressing either front or rear carburetor throttle lever toward closed position should not reduce engine speed more than 20 RPM Tighten connector link jam nut

3) Check and adjust Auxiliary Throttle Valve Connector on each carburetor as follows Disconnect one end of connector link attached to counterweight lever on auxiliary throttle valve shaft see that weights seat auxiliary throttle valves *(CAUTION*–Make certain that secondary lockout is not holding valves open) Adjust connector link by bending at center angle (use Tool J-1137) until link can be connected without disturbing valve position, connect link

4) Connect manual throttle control rod at front carburetor loosen both jam nuts at transmission throttle control rod trunnion

5) Start engine, place selector lever in "Dr" position Set hand brake Turn Air Conditioner ' on"

6) Adjust each idle mixture screw in the following sequence (1) Right Rear (2) Right Front (3) Left Front (4) Left Rear turning each screw in until lean limit reached (RPM will fall off or flutter will be noted), then turn screw out ¼ turn to enrich mixture

7) Adjust both Air Adjusting Screws equally (one for each carburetor) for idle speed of 490-510 RPM

8) Readjust Idle Micture Screws (step 6) to obtain highest possible engine RPM with highest possible manifold vacuum

9) Repeat Air Adjusting Screw adjustment (step 7), adjusting idle mixture screws each time the air adjusting screws are changed until engine idles smoothly at correct speed with highest possible manifold vacuum

10) Adjust transmission throttle rod *See Throttle Linkage under CARBURETOR in Cadillac data*

Fast Idle Adjustment· *CAUTION–When Fast Idle set "Off Engine", a final adjustment should be made "On Engine" as detailed below.*

"Off Engine" Fast Idle Setting

Carter Carburetors–Hold choke valve tightly closed so that high step of fast idle cam is in line with fast idle screw, turn fast idle screw in until primary throttle valve opening or clearance between edge of valve and wall opposite idle ports is 015" (Gauge T109-44)

Rochester Carburetors–Hold choke valve tightly closed and hold throttle lever in closed position so that fast idle screw rests on high step of fast idle cam Turn fast idle screw in until throttle valve opening or clearance between edge of valve and air horn wall is 020 (SMALL end of Gauge BT 67)

"On Engine" Fast Idle Setting

All Carburetors–After completing Idle Adjustment (above) idle engine place selector lever in Neutral rotate fast idle cam so that fast idle screw contacts highest step of cam, adjust fast idle screw for engine speed of 1700 RPM.

Throttle Return Check. Allow engine to idle and make certain that return check plunger does not contact throttle relay lever Open throttle fully momentarily and then snap throttle closed Throttle return check should insure smooth return to idle If engine races, throttle check plunger is too long If engine stalls plunger is too short Adjust plunger screw as necessary for correct operation

►*ADJUSTMENT CAUTION (Beginning Eng No 033849)* These engines have new camshaft which results in lower manifold vacuum and Throttle Return Check may open throttle when vacuum is low if check valve gap is set as low as 140" On these cars set gap to 185" *NOTE*–Later cars will have throttle return check with changed bleed hole size or spring.

Idle Speed-Up Control (Air Conditioned Cars)· After idling adjustment completed, and with engine at normal operating temperature, position selector lever in Neutral and turn Air Conditioning "On" Engine should idle at 900 RPM Adjust by loosening locknut on diaphragm shaft and turning knurled nut for correct idling speed

Accelerating Pump Rod Adjustment· Throttle valves must be tightly closed (fast idle screw must be backed off) when making this adjustment

Carter Carburet rs–See that pump link is connected in outer hole (long stroke) of pump arm Remove dust cover and gasket Place straightedge across dust cover boss at pump arm Flat on top of pump arm should be parallel to straightedge and top of pump plunger shaft should be 9/32" below top edge of dust cover boss Adjust by bending throttle connector rod using bending tool T109-213 (Cadillac No J-1137)

Rochester Carburetors–Use scale placed on end on bowl cover to measure height of pump plunger rod Distance from top of bowl cover to bottom edge of plunger rod should be 63/64" Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment (Carter Carburetors): *No gauge required and metering rods used only on primary sid of carburetor. Check metering rods after making pump rod adjustment (above)* Make certain that throttle valves seated in bores Remove dust cover and gasket Loosen metering rod arm clampscrew, press down on vacumeter link until metering rods bottom in carburetor body Hold rods in this position, rotate metering rod arm until finger on arm contacts lip on vacumeter link, carefully tighten clampscrew

Atmospheric Idle (Bowl Vapor) Vent Adjustment· *On Carter WCFB carburetors, make this adjustment after Pump and Metering Rod Adjustments completed.*

Carter Carburetors–With throttle valves seated in bores, clearance between lower edge of bowl vapor vent valve and dust cover should be 1/16 (Gauge T109-197) To adjust remove dust cover bend vent arm up or down

Rochester Carburetors–Open primary throttle valves 063' by inserting LARGF end of Gauge BT 79 between edge of valve and bore on side opposite idle adjusting screws Operating tang on pump lever should just contact vent valve Adjust by bending tang on contact arm using BT-69 bending tool

Float Level Adjustment· *Primary and secondary floats must both be adjusted VERTICALLY and LATERALLY and Float Drop must also be adjusted.*

Carter Carburetors

Carter Float Level–With bowl cover assembly removed from carburetor and inverted, **remove cover gask t,** place correct gauge (see table) directly under center of floats with notched portions of gauge fitted over edges of cover **Vertical Adjustment**–Floats should just clear horizontal portion of gauge (see table for vertical distance between tops of floats and machined surface of cover) Adjust by bending float arms up or down

Lateral Adjustment– Sides of floats should just clear vertical uprights of gauge Adjust by bending float arms as required

Carter Float Level

	Checking Gauge	Vertical Distanc
Primary (All)	①T109-232	1/8
Secondary (All)	②T109-222	3/16'

①–Cadillac No J-5457 ②–Cadillac No J-5458

Carter Float Drop - Hold bowl cover assembly upright so that floats hang down freely. Use scale to measure distance from machined lower surface of bowl cover (gasket removed) to top of floats at center If distance not correct (see table below) adjust by bending stop tabs on float bracket

Carter Float Drop

Primary (All)	5/8"
Secondary (All)	11/16

CONTINUED ON NEXT PAGE

CADILLAC (CARTER & ROCHESTER) CARBURETORS (C nt.)

Rochester Carburetors

Rochester Float Level—With bowl cover assembly removed from carburetor and inverted, and **cover gasket in place,** place correct gauge (see table) directly over center of floats with gauge against curvature in air horn bore. **Vertical Adjustment**—Floats should just touch top portion of gauge between gauge legs (see table for vertical distance from bottom of each float to gasket). Adjust by bending float arm at rear of float assembly. **Lateral Adjustment**—Each float should be centered between the gauge legs. Adjust by bending float arms horizontally. Check by tilting air horn assembly 90° to each side and make certain floats do not touch gauge legs

Rochester Float Level

	Checking Gauge	Vertical Distance
Primary & Secondary	③BT-101	1 19/32"

③—Cadillac No. J-5683.

R chester Float Drop—Hold bowl cover upright with floats down at limit of travel. Measure distance from bottom of floats at center to gasket on bowl cover. Adjust by bending float tang at rear of float toward needle seat to lessen drop and away from seat to increase drop

Rochester Float Drop

Primary & Secondary (All)	2 1/8"

Aut matic Choke & Modifier Adjustment: Choke setting on all models is given below. With this setting of the choke cover assembly, modifier lever should be adjusted as indicated

Automatic Choke Setting

Carter (Single Carburetor)	1 Point Lean
Carter (Eldorado Dual Carbs,)	Centered
Rochester (Single Carburetor)	Centered

Carter Choke Modifier—Set cover assembly as indicated above) Disconnect choke modifier rod at lower end, rotate metal pointer and lever (to which rod connected) until it is in line with raised pointer on coil housing. Hold pointer in this position, loosen clampscrew in modifier lever, rotate lever until scribed line on lever is vertical, tighten clampscrew Make certain that throttle valves fully seated, bend rod at upper angle until rod freely enters hole in throttle arm. Connect rod

R chester Choke Modifier—Set cover assembly at index for centered setting. Make certain that throttle valves fully seated, loosen lockscrew in modifier lever on choke cover, rotate index pointer counter-clockwise until it lines up with long scribed line on cover (choke valve should be closed), tighten lockscrew securely

Choke Rod Adjustment: *This adjustment should be made BEFORE adjusting Fast Idle, Unloader, and Secondary Throttle Linkage.*

Cart r Carburetors—Loosen clamp screw on lever on choke shaft Insert 015" feeler gauge between lip of fast idle cam and boss on flange casting, hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, tighten clampscrew while holding lever in this position

Rochester Carburetors—Turn fast idle adjusting screw in until it contacts the SECOND step of the fast idle cam, close choke valve until screw is against high step of cam and make certain that choke trip lever is in contact with counterweight lever Hold linkage in this position and check choke valve opening or clearance between upper edge of valve and dividing wall in air horn using SMALL end of Gauge BT-102 (040") Adjust by bending choke rod

Unloader Adjustment: *This is done after Choke Rod adjusted.*

Carter Carburetors—Move throttle lever to wide open position Check choke valve opening or clearance between upper edge of valve and inner wall of air horn using Gauge T109-39 (13/64"). Adjust by bending unloader lip on throttle shaft lever using T109-41 bending tool

Rochester Carburetors—Move throttle lever to wide open position and hold trip lever down in contact with choke counterweight Check choke valve opening or clearance between upper edge of valve and dividing wall in air horn using LARGE end of Gauge BT-102 (125"). Adjust by bending tang on fast idle cam using BT-69 bending tool

Secondary Throttle Linkage: Separate adjustments required on each carburetor as follows

Carter Carburetors

1) Secondary Throttle Lever (All Carburetors)—With choke valve wide open, move primary throttle valves to wide open position and note movement of secondary throttle valves which should reach wide open position at same time as primary valves. If no adjustment required, remove secondary throttle operating link, check wide open stops for both primary and secondary valves and adjust by bending tangs so that wide open position can be secured, connect link Bend link using heavy pliers so that both throttle shafts contact wide open stops at the same instant With both primary and secondary throttle valves tightly closed, measure clearance between positive closing shoes on primary and secondary levers using Tool T109-29 If clearance not 017- 022", adjust by bending shoe on primary lever

NOTE—Secondary throttle link should be connected in inner hole (nearest throttle shaft center) on both the primary and secondary throttle shaft levers.

2) Secondary Throttle Lock-out (Single Carburetors)—With Fast Idle adjustment correctly made (above), close choke valve and hold tightly closed so that throttle valves are open 015" *(NOTE*—This can be accomplished by inserting .015" wire gauge, Tool KMO-657 between edge of primary throttle valve and wall on side opposite idle ports and holding fast idle cam clear of fast idle adjusting screw) Secondary lock pawl should now be in unlocked position If not, adjust by bending tang on lock pawl which contacts primary throttle lever using bending tool T109-105 or long-nosed pliers Adjust secondary throttle shaft tang sideways to obtain clearance 015" between the side of the tang and the notch in the secondary lock-out cam Hold primary throttle valves halfway open, open choke valve fully, then open primary throttle valves all the way Lockout lever should fall free allowing secondary throttle valves to open before primary throttle valves are fully open. Adjust by bending tang on secondary throttle lever to obtain minimum clearance of .015" between tang and lockout cam. Make certain that tang on cam trip lever returns lockout cam to locked position when choke valve is fully closed

3) Auxiliary (Secondary) Lock-out (Eldorad Eng. Carburetors)—With choke valve held fully closed, hook on lockout arm should have maximum contact with locking step on auxiliary throttle shaft. Open choke valve slowly Auxiliary throttle valves should become unlocked and be free to open just before choke valve reaches wide open position. Adjust by bending tang on choke trip lever under lockout arm using long-nosed pliers

Rochester Carburet rs

1) Secondary Throttle Lever—With choke valve wide open, move throttle lever to wide open position and note movement of secondary throttle valves which should reach wide open position at the same time as primary valves If adjustment required, remove secondary throttle actuating link, check wide-open stops for both primary and secondary valves and adjust by bending tangs so that wide-open position can be secured, connect link Bend link so that both throttle shafts contact wide-open stops at the same instant

2) Secondary Throttle Lock- ut—With choke valve partially closed and throttle valves closed, check clearance between secondary lock-out lever tang and edge of slot in fast idle cam using a feeler gauge Clearance should be 015' Adjust by bending tang horizontally using bending tool BT-18

3) Secondary Throttle Contour Clearance—With choke valve wide open, open throttle valves so that tang on secondary lock-out lever rides over top of fast idle cam Measure clearance between tang and fast idle cam edge using a feeler gauge Clearance should be 015" Adjust by bending tang up or down using bending tool BT-91

OVERHAUL: *See "Carter WCFB 4-Barrel" and "Rochester 4GC 4-Barrel" Carburetors.*

SERVICE PARTS: Gasket Sets - Carter No. 277 (2333S, SA, 2334S, SA, 2370S, SA, 2371S, 2372S, 2373S). Carter No. 277A (2543S, 2544S, 2545S). Rochester No. 7009941 (Rochester Carburetors).

Repair Package - Carter No. 1818 (2333S, SA, 2334S, SA, 2370S, SA). Carter No. 1819 (2371S, 2372S, 2373S). Carter No. 1847 (2543S, 2544S, 2545S). Rochester No. 7009921 (Rochester Carburetors).

CHEVROLET CORVETTE (TWO CARTER CARBURETORS)

Carburetor Application

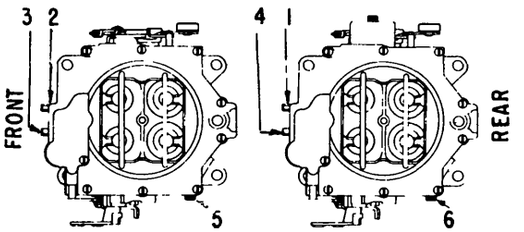
	Carter No.
Front ①	WCFB 2419S
Rear	WCFB 2362S

① - This carburetor does not have an automatic choke or choke valves, fast idle adjustment, unloader adjustment or secondary throttle lockout adjustment.

DESCRIPTION: Four-barrel downdraft types with automatic choke (rear carburetor), without automatic choke or choke valves (front carburetor). These carburetors have a new idle system as follows

Idle System - Consists of SEPARATE Primary Idle Fuel System and Idle Air System as described below. Vapor vent passages located in throttle bores directly above the throttle valves dissipate spill-over fuel from above throttle valves and improve engine idle performance.

Idle Fuel System - Primary idle fuel system is similar to other Carter WCFB Carburetors with Idle Mixture Adjusting Screw controlling fuel discharge through lower idle port below the throttle valves. Throttle valves are completely closed at low idle and air is admitted through Idle Air System (below). Secondary idle fuel system has been modified by elimination of closed throttle idle ports (below primary throttle valves) so that secondary idle system does not operate during closed throttle idling. At part throttle positions, the secondary idle system discharges fuel through ports located above the primary throttle valves.



Idle Air System - Consists of air by-pass passage (primary barrels only) through which air for closed throttle idling is taken from above the throttle valves and discharged into manifold below the throttle valves through a metered (non-adjustable orifice) and adjustable orifice in each primary barrel. An Idle Speed Screw (single screw for both barrels) controls this adjustable orifice and all Idle Speed Adjustments are made by means of this screw (no throttle stop used). Throttle valves are **completely** closed at low idling speed.

ADJUSTMENTS: *NOTE - Accelerator Linkage and Idle Adjustments are made with the engine running at normal operating temperature.*

Accelerator Linkage Adjustment: Remove carpet adjacent to accelerator pedal. Remove air cleaner and throttle pull-back spring on carburetor. With **rear** carburetor on wide open throttle, accelerator pedal should be 3/8" from toe board. Lengthen or shorten rear accelerator rod by removing spring clip and turning trunnion nut. Hold rear carburetor on wide open throttle and adjust nut on front carburetor control shaft until throttle on front carburetor wide open against stop. Front carburetor should begin to open when rear carburetor half open.

Idle Adjustment: Open and close throttle valve several times to make sure valves seat properly. Connect tachometer and vacuum gauge (on Powerglide models, place transmission selector lever in "DR" and set hand brake securely). Initially adjust by-pass screw (located on left side of carburetor) **2 turns** off seat making sure that by-pass screw on each carburetor is adjusted an equal number of turns. Adjust the two idle mixture screws on the forward side of each carburetor individually to their lean limit then back off or enrich **1 full turn.** Start engine and adjust idle by-pass screw on each carburetor an equal amount of turns counterclockwise, to obtain 600 RPM on engine. Adjust idle mixture screw on right side of rear carburetor until highest vacuum reading or best engine "feel" and highest engine RPM is obtained. Repeat this operation with idle mixture screw on right side of front carburetor, then left side of front carburetor, and finally on left side of rear carburetor. Readjust idle by-pass screw in both carburetors to set idle speed at 600 RPM. *(CAUTION - Idle by-pass screws must be turned equally).* After smooth idle is obtained, turn mixture screws in the same sequence as above 1/16 to 1/3 turn (1 to 2 flats of screw) clockwise (to lean). *NOTE* - This may roughen engine idle but engine will smooth out after thorough running.

IDLE MIXTURE ADJUSTING SCREWS

IDLE BYPASS ADJUSTING SCREWS

CARBURETOR IDLE ADJUSTMENT SEQUENCE

Float Level Adjustment: *Primary and secondary floats must both be adjusted vertically and laterally and Float Drop must also be adjusted.* With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. **Lateral Adjustment** - Side of floats should just clear the vertical uprights of float gauge. Adjust by bending float arms. **Vertical Adjustment** - Floats should just clear horizontal portion of gauge (see table below for vertical distance between tops of floats and machined surface of cover). Adjust by bending float arms up or down.

Float Level

	Checking Gauge	Vertical Distance
Primary	T109-232	1/8"
Secondary	T109-223	1/4"

Float Drop: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be as indicated in table below. Adjust by bending stop tabs on float bracket.

Float Drop

Primary	5/8"
Secondary	3/4"

Accelerating Pump Adjustment: *Throttle valves must be tightly closed (fast idle screw must be backed off) when making this adjustment.* Install pump connector link in inner hole (short stroke) of pump arm, with ends extending toward countershaft arm. Remove dust cover and gasket. Place straightedge across dust cover boss at pump arm. Flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle.

Metering Rod Adjustment: *No gauge required and metering rods used only on primary side of carburetor. Check metering rods after making pump rod adjustment (above).* Make certain that throttle valve seated in bores. Remove dust cover and gasket. Loosen metering rod arm clamp screw. With metering rods in place, press down on vacumeter link until metering rods bottom in carburetor body. Hold rods in this position, with throttle valves seated, and rotate metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

Fast Idle Adjustment: (Rear Carburetor Only) - *NOTE - When Fast Idle set "Off-Engine", a final adjustment should be made "On-Engine" as detailed below to insure correct engine warm-up.*

"Off-Engine" Fast Idle Setting

Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position. Hold in place and tighten clamp screw. With choke valve tightly closed bend fast idle adjusting tang until there is .015" (Gauge T109-44) opening between throttle valve and bore of carburetor side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

"On-Engine" Fast Idle Setting

With idle adjusting tang on high step of fast idle cam, engine speed should be 1800 RPM, with engine at normal operating temperature.

Unloader Adjustment: (Rear Carburetor Only) - With throttle wide open there should be 3/16" (Gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use Tool T109-41).

Atmospheric Idle (Bowl Vapor) Vent Adjustment: *This adjustment must be made after completing pump and metering rod adjustments.* Install dust cover and gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carburetor. There should be 1/16" (Gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

Secondary Throttle Lever Adjustment: Primary and secondary throttle valves should reach wide open position at the same time. *(NOTE - Secondary throttle valves will be a few degrees from wide open).* To adjust, bend throttle operating rod at upper angle. With primary and secondary throttle valves in tightly closed position there should be .017-.022" (Gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

Secondary Throttle Lock-out Adjustment: (Rear Carburetor Only) - *This adjustment should be made after completing fast idle and secondary throttle lever adjustments.* Crack throttle valves and hold choke valve tightly closed, then close throttle. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

Automatic Choke Adjustment: (Rear Carburetor Only) - Choke setting is CENTERED (at index).

OVERHAUL: *See "Carter 4-Barrel Carburetors".*

SERVICE PARTS: Gasket Set - Carter No. 286 & 286A.

►CHANGES, CAUTIONS, CORRECTIONS

►*ENGINE CUTTING OUT ON LEFT HAND TURN CORRECTION* A new standpipe, Carter Part No. 145-142 may be installed into the choke vacuum passage in main body casting. The standpipe (bushing) is tapered and should be tapped lightly into place. The use of this part provides a more positive seal and prevents fuel leakage from bowl into choke vacuum passage.

►*1956 BUICK METERING ROD PRODUCTION CHANGE (For Increased Fuel Economy)* In later production, a new metering rod, Carter No. 75-1235 is being used in production and can be used for service replacement. Carburetors having the later metering rod can be identified by the letter G, H. J, etc., following the carburetor number stamped on the brass tag attached to carburetor.

►*CHRYSLER 300B & DESOTO ADVENTURER (With Two Carburetors)* Special Idle Adjustment procedure must be followed to insure balanced operation of the two carburetors *See Chrysler & DeSoto car model data for complete procedure*

CARTER WCFB CARBURETOR AIR HORN & FLOAT ASSEMBLY

►*1955-56 DESOTO (EXCEPT ADVENTURER) ENGINE STALLING CORRECTION* Adjust slow idle speed to 500 RPM, and fast idle speed to 1200 RPM. Change choke setting to 1 notch rich (1956), 2 notches lean (1955). Adjust dashpot so plunger moves 1/16" when throttle closed. Check manifold heat control for free operation. Check manifold to carburetor heat tube as

CONTINUED ON NEXT PAGE

CARTER WCFB CARBURETORS (C nt.)

follows. Move asbestos cover to expose a small portion of tube, then run engine for one minute. Tube should be too hot to touch. If not, tube is cracked or loose in manifold.

►*1956 PLYMOUTH FURY IMFROPER CHOKE ACTION CORRECTION·* This condition may be caused by interference between carburetor throttle lever and dashpot mounted on intake manifold. Correct by installing three gaskets, Plymouth Part No. 1731516.

►*1956 PLYMOUTH (POWERFLITE) DASHPOT ELIMINATION:* The carburetor dashpot has been eliminated on later production cars.

►*1956 PONTIAC HARD STARTING CORRECTION (With Partially Warmed-up Engine):* Change choke setting from one notch rich to center index. If hard starting is not completely eliminated with this change, set choke to one point lean.

►*1956 PONTIAC CARBURETOR FLOODING CORRECTION (Early Cars):* Install fuel filter, Part No. 854345 which is a precipitation type filter having an impregnated fibre element.

►*1956 PONTIAC COLD ENGINE STALLING & WARM UP OPERATION IMPROVEMENT·* On carburetors tagdated before M-5, install ALL of the following parts and change settings as follows

1) Vacumeter Spring No. 61-478, identified by a free length of approximately 1½" (supersedes 61-496).
2) Choke Piston No 160-138 (supersedes 160-110S)
3) Automatic Choke Setting—1 Point Rich (changed from Centered setting)
NOTE—Carburetors tag-dated M-5 and later have these changes made in production

►*1956 STUDEBAKER 259" & 289" ENGINE CARBURETOR "BLOW-UP" PREVENTION NOTE·* To prevent gasoline collecting in air horn pockets in which bowl vapor vents are located (and igniting from engine backfire), drain holes must be provided through wall of choke valve chamber, on both sides of carburetor as follows Remove and disassemble air horn. With air horn inverted, locate the holes in wall of air horn at a point 3/8" from center line of choke chamber baffle (one hole on each side of baffle), and 5/32" below air horn gasket surface. Locate the other two holes in same location in wall at opposite end of baffle. Using a 1/16" (No. 53) drill, drill the holes from inside of air horn into pocket at an angle of approximately 20°. Clean all chips from air horn and reassemble.

DESCRIPTION: These 4-Barrel carburetors are same general design as used on 1955 car models and have the following new or special features

Aut matic Sec ndary Throttle Contr l (Chrysler 2314 S, SA & 2367S, SA, DeS to 2311S, SA, M rcury 2361S, SA). Consists of a diaphragm type vacuum control unit which opens and closes the secondary throttle valves in accordance with air velocity through primary venturi (vacuum passage connected at primary venturi). A mechanical override linkage ensures that secondary valves will always close with primary valves.

Auxiliary Throttle Valves (Buick 2347S, Chrysler 2317S, 2444S, 2445S, DeSoto 2317S, 2476S, 2445S, Dodge (All) Packard (All), Plymouth (All), Pontiac (All), Studebaker (2394S): Velocity type valves located directly over secondary valves (action is controlled by counterweight on the shaft and valves are not operated by the throttle linkage). On some carburetors, these valves are "locked out" when choke is operating and this lock-out must be adjusted (see Adjustments).

Spring-Loaded Primary Throttle Linkage (Chrysler 2314S, SA, 2367S, SA, DeSoto 2311S, SA, Mercury 2361S, SA): Consists of a torsion spring on the throttle shaft between the flex dog and the throttle spring arm with a stop pin located on the throttle shaft dog. This provides smoother operation and requires special Throttle Linkage Adjustment (see Adjustments).

"Cross-Over" Type Automatic Choke (Plymouth 2302S, SA & 2442S): On these models, the Thermostatic Coil Assembly is mounted in a well in the manifold and is linked to the choke shaft lever by a rod (a plain cover is used on the choke housing on the air horn and a lever is mounted in end of the choke shaft where it extends through cover). This type automatic choke is adjusted differently (see Adjustments).

ADJUSTMENTS: *Make all adjustments in sequence as listed below*

IDLE SETTING

Idle Setting: *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed) If initial adjustment required to allow engine to be started and warmed up, set both idle adjusting screws as indicated in table below With engine warm, adjust idle speed adjusting screw for correct engine idle speed as shown in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) until engine idles smoothly and RPM is at maximum

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Buick 2347S	1 1/8 turns
Chevrolet 2366S, SA	1/4-1 1/4 turns
Chrysler 2314S, SA	1-2 turns
Chrysler 2317S, SA, 2444S, 2445S	1/4-1 1/4 turns
Chrysler 2367S, SA	3/4-1 3/4 turns
DeSoto 2311S, SA	1-2 turns
DeSoto 2317S, 2445S, 2476S	1/4-1 1/4 turns
Dodge 2303S, SA, SB, 2432S, 2474S	1/2-1 1/2 turns
Dodge 2443S, SA	3/4-1 3/4 turns
Dodge 2445S. 2476S	1/4-1 1/4 turns
Mercury 2361S, SA	3/4-1 3/4 turns
Packard 2394S	3/4-1 3/4 turns
Plymouth 2302S, SA, SB, 2442S	1-2 turns
Pontiac 2364S, SA	1 1/4-2 1/4 turns
Studebaker 2214SA, SB, 2219SA, SB	1/2-1 1/2 turns
Studebaker 2394S	3/4-1 3/4 turns

Idl Speed S tting

Car	Synchr -m sh Trans	Aut . Trans.
Buick		450 RPM
Chevrolet	450-500 RPM	①400-450 RPM
Chrysler (1 Carb)		③ 450-500 RPM
Chrysler (2 Carb)		650 RPM
DeSoto (1 Carb)	475-500 RPM	③475-500 RPM
DeSoto (2 Carb)		600 RPM

①—With selector lever in Drive position
②—With selector lever in High position
③—With selector lever in Neutral position

Throttle Return Check (Dashpot) Adjustment: Used with automatic transmission See Throttle Linkage Adjustment under CARBURETOR on each car model data page

ACCELERATING PUMP

Accelerating Pump Stroke· *CAUTION—This is a linkag adjustment and not a seasonal change recommendation* Remove dust cover, make certain that pump connector link installed in **outer** (long stroke) hole of pump arm Back off throttle stopscrew so that primary throttle valves are fully seated Hold a straightedge across top of dust cover boss at pump arm The flat on the top of the pump arm should be parallel with straightedge Adjust by bending pump connector link at lower angle on all carburetors except the following which should be bent at the upper angle 2303S, SA, SB, 2317S, 2444S, 2445S, 2476S, Early 2302S, SA, SB, Early 2432S, Early 2442S, Early 2443S, SA, Early 2347S, Early 2474S. Use Tool T109-213 to bend connector link.

►*STUDEBAKER NOTE* On carburetors with dashpot, after completing pump rod adjustment (above), make certain that clearance between lower edge of countershaft arm and dashpot bracket is 015" minimum Correct by bending pump connector rod slightly

METERING RODS

Metering Rods (Primary Side)· *No gauge required for this adjustment and no metering rods used on secondary side.* With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment above), loosen setscrew in metering rod arm on pump countershaft just enough so that arm has slight bind on shaft, lift arm slightly Depress metering rod link until metering rods just bottom in bowl casting, position metering rod arm so that it contacts link, tighten arm setscrew Then adjust Atmospheric Idle Vent (following)

FLOAT LEVEL SETTING

Float Setting *CAUTION—Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL and FLOAT DROP must be checked for each assembly.* Remove bowl cover and float assembly from carburetor for these checks

CONTINUED ON NEXT PAGE

CARTER WCFB CARBURETORS (C nt.)

Fl at L v l—*Primary and Secondary Float Assemblies set to different heights (Except on Pontiac, Oldsmobile and Studebaker)* Check and adjust as follows Remove bowl cover gasket (take out float hinge pins, remove float assemblies with intake needles attached, remove gasket, re-install floats) Invert bowl cover, install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against sides of bowl cover casting Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should barely touch vertical uprights on gauge (bend float arms sideways for this clearance) This sideways adjustment is extremely important to prevent floats hanging up on sides of bowl casing

Float Level Setting
Primary Floats

Car & Carb.		Height	Gauge No.
Buick 2347S		3/16"	T109-222
Chevrolet 2366S, SA		1/8"	T109-232
Chrysler 2314S, SA, 2367S, SA	①	5/32"	T109-236
Chrysler 2317S, 2444S, 2445S		7/32"	T109-283
DeSoto 2311S, SA	①	5/32"	T109-236
DeSoto 2317S, 2445S, 2476S		7/32"	T109-283
Dodge 2303S, SA, SB		7/32"	T109-283
Dodge 2443S, 2445S, 2476S		7/32"	T109-283
Dodge 2432S, 2474S		1/8"	T109-232
Mercury 2361S		1/8"	T109-232
Packard 2394S		1/8"	T109-232
Plymouth 2302S, SA, SB, 2442S		7/32"	T109-283
Pontiac 2364S		3/16'	T109-222
Studebaker 2214SA, SB, 2219SA, SB		3/16'	T109-222
Studebaker 2394S		1/8'	T109-232

① — Supersedes previous float setting of 1/8".

Secondary Floats

Car & Carb.		Hgt.	Gauge No.
Buick 2347S		3/16"	T109-222
Chevrolet 2366S, SA		1/4"	T109-223
Chrysler 2314S, SA, 2367S, SA	②	7/32"	T109-283
Chrysler 2317S, 2444S, 2445S		11/32"	T109-285
DeSoto 2311S, SA	②	7/32"	T109-283
DeSoto 2317S, 2445S, 2476S		11/32"	T109-285
Dodge 2303S, SA, SB, 2443S, SA		9/32"	T109-284
Dodge 2445S, 2476S		11/32	T109-285
Dodge 2432S, 2474S		3/16"	T109-222
Mercury 2361S		3/16"	T109-222
Packard 2394S		3/16"	T109-222
Plymouth 2302S, SA, SB		9/32"	T109-284
Pontiac 2364S		9/32"	T109-284
Studebaker 2214SA, SB, 2219SA, SB		3/16"	T109-222
Studebaker 2394S		3/16"	T109-222

② — Supersedes previous float setting of 3/16"

Float Drop—*Primary and Secondary Float Drop is different (except Oldsmobile, Pontiac, Studebaker). Check and adjust as follows* Hold bowl cover assembly upright so that floats hang down freely Use scale to measure distance from machined lower surface of bowl cover (gasket removed) to top of floats at center If distance not correct (see table below), adjust by bending stop tabs on float bracket

Fl at Drop S tting

Car & Carb.	Primary	Secondary
Buick 2347S	11/16"	11/16"
Chevrolet 2366S, SA	5/8'	3/4"
Chrysler 2314S, SA, 2367S, SA	① 21/32"	②23/32"
Chrysler 2317S, 2444S, 2445S	23/32"	27/32"

Pontiac 2364S	11/16"	11/16"
Studebaker 2214SA, SB, 2219SA, SB	11/16"	11/16"
Studebaker 2394S	5/8"	11/16"

① — Supersedes previous setting of 5/8".
② — Supersedes previous setting of 11/16"

BOWL VAPOR VENT

Bowl Vapor Vent (Atmospheric Idle Vent) Adjustment· *This vapor vent not used on all carburetors*

Checking & Adjustment—With dust cover and gasket installed Back out throttle lever stopscrew so that primary throttle valves fully closed Check clearance between lower edge of vapor vent valve and dust cover using Gauge T109-197. Clearance should be 1/16". Adjust by removing dust cover and bending vapor vent arm.

AUTOMATIC CHOKE

Automatic Choke Setting· See table below for settings Adjust by loosening choke cover screws and rotating cover and coil assembly Then adjust connector rod

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick 2347S	1 Point Lean
Chevrolet 2366S, SA	Index
Chrysler 2314S, SA, 2367S, SA	1 Point Rich
Chrysler 2317S, 2444S, 2445S	Index

Pontiac 2364S	① 1 Point Rich
Studebaker 2214SA, SB, 2219SA, SB	1 Point Rich
Studebaker 2394S	Index

① — See 'Pontiac Hard Starting Correction' above.

Plymouth 2302S, SA, SB & 2442S Choke Setting — "Cross Over" type choke mounted in well in manifold casting. To adjust, with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc is centered on scale. When choke installed on engine, lift cover disc and open and close choke valve manually to make certain connector rod clears sides of hole in housing cover. If rod does not clear, replace unit (bending rod will affect calibration).

Choke Rod· *This adjustment is preliminary to checking and adjusting Fast Idle, Unloader, and Secondary Throttle Lock-out.* Loosen choke lever clampscrew, insert wire gauge of correct thickness (see table below) between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage Hold choke valve tightly closed and tighten clampscrew

Choke Rod Setting

Car & Carb.	Checking Gauge Size & No.
Buick 2347S	.020' T109- 29
Chevrolet 2366S, SA	.020" T109- 29
Chrysler (All Carburetors)	.020" T109- 29
DeSoto 2311S, SA, 2317S	.020" T109- 29
DeSoto 2445S, 2476S	.015" T109- 44
Dodge 2303S, SA, SB	.020" T109- 29

Studebaker 2214SA, SB, 2219SA, SB	.020" T109- 29
Studebaker 2394S	.025" T109-189

①—No clearance (cam lip should lightly contact boss on flange casting)

FAST IDLE

Fast Idle· *This adjustment can be made with carburetor "Off Engine" (on the bench) or "On Engin " (with engine operating)*

Fast Idle Adjustment "Off Engine" — Hold choke valve tightly closed so that fast idle cam is rotated to point where high step of cam is under fast idle screw (fast idle lug on Chevrolet). Turn fast idle screw (bend fast idle lug on Chevrolet) in or out until primary throttle valve opening is correct (see table below). Measure this opening between edge of valve and carburetor wall on side opposite idle ports.

Fast Idle Setting
"Off Engine"

Car & Carb	Checking Gauge Size & No.
Buick 2347S	.020" T109- 29
Chevrolet 2366S, SA	.015" T109- 44
Chrysler 2314S, SA, 2367S, SA	.012" T109-200
Chrysler 2317S, 2444S, 2445S	.006-.010" T109-200

Studebaker 2394S	.023" T109-189

Fast Idle Adjustment "On Engin "—Engine and Transmission must be at operating temperature, shift lever in neutral and air cleaner in place (Buick—Disconnect fast idle connector rod from trip lever so that cam may be held in "cold" position while engine running

CONTINUED ON NEXT PAGE

CARTER WCFB CARBURETORS (C nt.)

with choke valve fully open) On models listed below, rotate fast idle cam so fast idle screw rests on high step of cam Adjust fast idle screw to obtain fast idle speed as indicated in table below

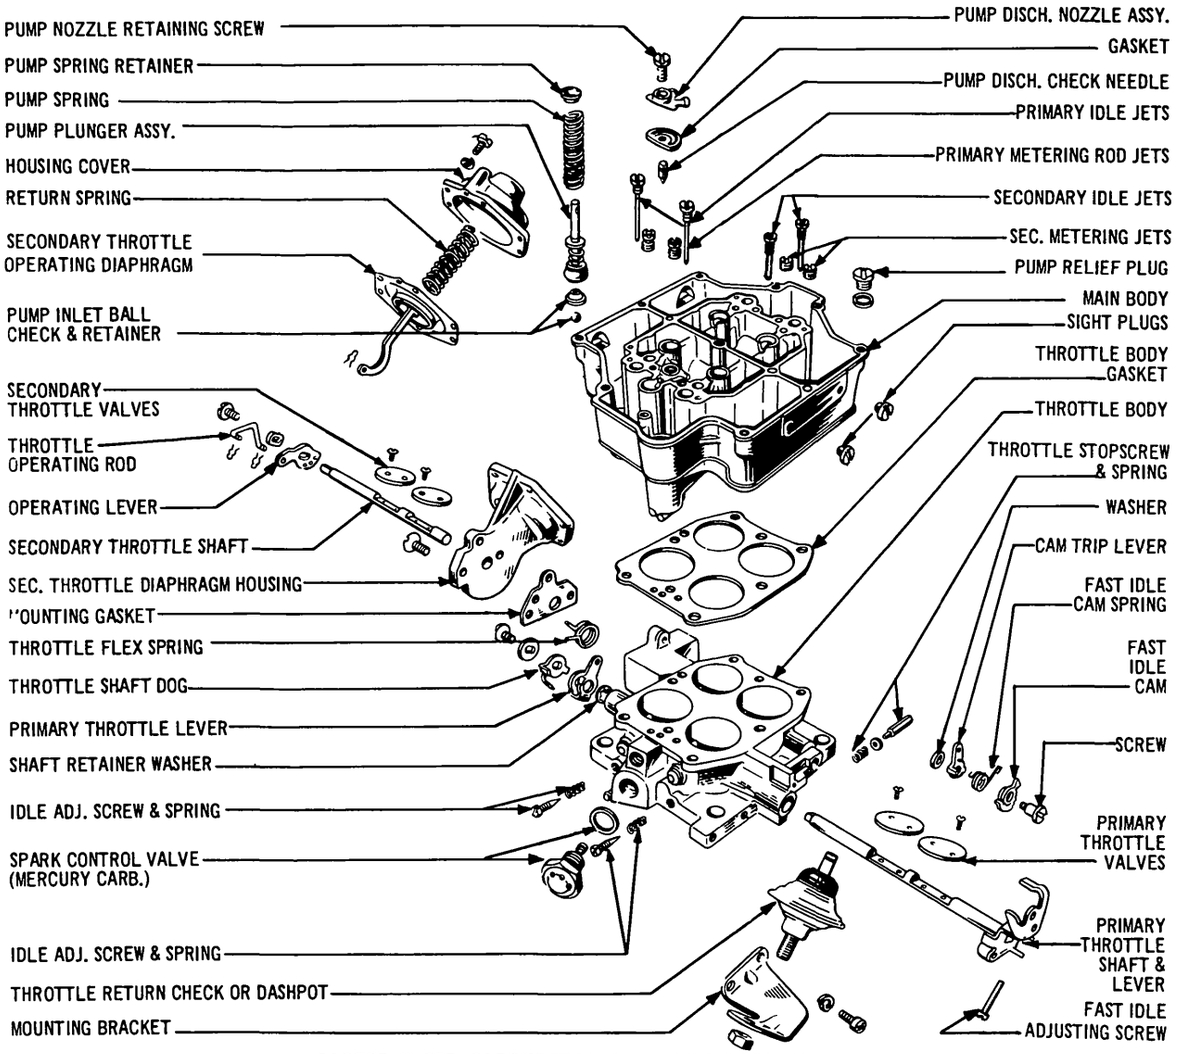
Car M d l	Fast Idle Speed	Engine RPM
Buick		1300
Chevrolet		1800
Chrysler		1450-1500
DeSoto		1350-1400
Dodge		1300-1350
Mercury		① 650
Pontiac		1900
Plymouth		1350-1400

①—With fast idle screw on lowest step of cam.

UNLOADER

Unl ader: *After Choke Rod adjusted (above),* rotate primary throttle valves to wide open position and hold valves in this position Check choke valve opening by inserting correct Unloader Gauge (see table below) between edge of choke valve and air horn wall. With correct setting, choke valve should have slight drag on gauge Adjust by using bending tool T109-41 to bend unloader tang on throttle lever as required

Unloader Setting



Car & Carb.	Checking Gauge Size & No.
Buick 2347S	5/32" T109-154
Chevrolet 2366S, SA	3/16" T109- 28
Chrysler (All Carburetors)	3/16" T109- 28
DeSoto 2311S, SA, 2317S	3/16" T109- 28
DeSoto 2445S, 2476S	11/64" T109-166
Dodge (Except 2432S, 2474S)	11/64" T109-166
Dodge 2432S, 2474S	3/16" T109- 28
Mercury 2361S	1/8" T109- 36
Packard 2394S	9/32" T109-126
Plymouth (All Carburetors)	11/64" T109-166
Pontiac 2364S	1/8" T109- 36
Studebaker 2214SA, SB, 2219SA, SB	1/8" T109- 36
Studebaker 2394S	9/32" T109-126

AUXILIARY THROTTLE VALVES

Auxiliary Throttle Valves (Buick 2347S, Chrysler 2317S, 2444S, 2445S, DeSoto 2445S, 2476S, 2317S, Dodge 2432S, 2474S, Packard & Studebaker 2394S, Plymouth 2302 S, SA, S3, Pontiac 2364S): Velocity type valves located directly above secondary throttle valves. On some models, these auxiliary valves are locked out when choke is operating and lockout adjustment is required. *NOTE* - No lockout adjustment required on Packard & Studebaker 2394S, Pontiac 2364S.

Auxiliary Throttle Valv Adjustment (Chrysler 2317S, 2444S, 2445S, De S t 2317S, 2445S, 2476S, Dodge 2432S, 2474S, Plym uth 2302S, SA, S3) — Disconnect secondary throttle operating rod. Adjust stop lug on secondary throttle lever using bending Tool T109-214 until clearance between lower edge of auxiliary throttle valve and bore is 27/64" (Gauge T109-242) with stop lug against stop on flange.

Auxiliary Throttl Lock ut Adjustment (All M d ls with Auxiliary Throttl Valv s Except Packard & Stud bak r 2394S, Pontiac 2364S) —After fast idle adjusted, proceed as follows· **(1)** With choke valve closed, make certain that edge of hook on lockout arm contacts auxiliary throttle lever with maximum contact on locking step on lever. **(2)** Open choke valve and make certain that auxiliary valves are unlocked a few degrees before choke reaches wide open position. Adjust be bending the lockout arm.

CARTER WCFB CARBURETOR THROTTLE BODY (WITH AUTOMATIC SECONDARY THROTTLE CONTROL)

SECONDARY THROTTLE LINKAGE

►*CAUTION: Adjustment procedure and settings differ due to diff rent linkage designs Secondary lock-out is not used on all carburetors with Auxiliary Throttle Lock-out (above)*

Secondary Throttle Linkage Adjustment (Buick 2347S, Chrysler 2317S, 2444S, 2445S, DeSoto 2317S, 2445S, 2476S, Dodge (All Carburetors), Plymouth (All Carburetors): Stop lug on both the primary throttle lever and secondary throttle lever should contact the stop bosses on the throttle body at the same instant *(NOTE* - At this point, secondary throttle valves will be a few degrees from wide open position). Adjust by bending secondary throttle operating rod at angle bend using T109-213 bending tool.

Ch vr l t, Packard, Pontiac & Stud bak r—Primary and secondary throttle valves must reach wide open

CONTINUED ON NEXT PAGE

CARTER WCFB CARBURETORS (C nt.)

position at same instant. Adjust by bending throttle operating rod at upper angle using T109-213 bending tool. Close both primary and secondary throttle valves tightly, check clearance between positive closing shoes on primary and secondary throttle levers. This clearance should be .017-.022" (Gauge T109-29 can be used). Adjust by bending the shoe on the primary lever.

Chrysler 2314S, SA, 2367S, SA, DeSoto 2311S, SA – Make following adjustments in order: **(1)** Move primary throttle valves to wide open position. Secondary valves should be 10° open (Chrysler), clearance between upper edge of secondary valves and bore should be .054" using gauge T109-193 (DeSoto). Adjust by bending secondary operating link. **(2)** Open primary throttle valves 40° (Chrysler), or until 1/4" gauge T109-31 can be inserted between upper edge of primary valve and bore (DeSoto). Secondary throttle valves should start to open at this point. Adjust by bending long tang on primary throttle shaft dog. **(3)** On Chrysler, bend flex spring arm to give positive tension on flex spring during last 5° movement of primary valves toward closed position. On DeSoto, hold primary and secondary throttle valves closed, bend short tang on primary throttle shaft dog for clearance of .040" (gauge T109-193) between short tang on primary throttle shaft dog and outer arm of flex spring.

Mercury–Block choke valve in wide open position, back out throttle stopscrew so that primary throttle stopscrew so that primary throttle valves fully closed Hold secondary throttle valves slightly open, close primary throttle valves. Secondary throttle valves should close tightly at same instant as primary valves. Hold primary valves closed. It should not be possible to open secondary valves. Adjust by bending throttle operating rod (Secondary connector rod) slightly at, the angle bend

Secondary Throttle Lock-out (Chevrolet, Packard, Pontiac, Studebaker): After fast idle and secondary throttle lever adjustment completed, crack primary throttle valves, manually close choke valve, then close throttle valve. Tang on secondary throttle lever should freely engage notch in lockout arm. Adjust by bending tang on secondary throttle lever.

Automatic Secondary Throttle Control (Chrysler 2314S, SA, 2367S, SA, DeSoto 2311S, SA): This unit requires no adjustment. Bend operating rod as necessary to insure secondary valves closing simultaneously with primary valves. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

CARTER CAR STARTER (BUICK)

Checking & Adjusting: Place transmission in neutral, set hand brake, remove left oil filler cap. Back off throttle stopscrew, see that fast idle cam in slow idle position, fully close throttle valve (On Dynaflow cars, see that Dashpot does not prevent throttle closing). Hold 6" scale or straightedge against rear face of throttle lever lower arm with scale resting on rocker cover. Mark rocker cover at edge of scale. Turn on ignition, slowly open throttle until starter begins to operate, make second mark on rocker cover at this point. Distance between marks should be ½-13/16". Adjust switch by changing timing shims on contact spring

OVERHAUL: *CAUTION–When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Bowl and Throttle Body) which can be overhauled separately.

Air Horn & Bowl Cover–Remove fuel inlet fitting, gasket, and strainer assembly. Disconnect and remove choke connector rod, accelerating pump rod, secondary throttle return spring. Remove dust cover and gasket. Remove metering rods by rotating rods off pins on vacumeter link and lifting rods out carefully. Remove pump connector link by removing pin spring, sliding upper end of link out of pump lever, and rotating link around lever. Remove vent arm (when used) by taking out vent arm screw. Loosen (do not remove) screw holding pump operating lever on pump countershaft and screw in metering rod arm, slide pump countershaft and lever assembly out, remove pump arm and metering rod arm. Take out all air horn attaching screws (inner screws will be lifted out after air horn removed), make certain that screw located within pump countershaft housing is removed, lift air horn assembly straight up (*CAUTION*–use care not to damage floats). Disassemble remaining parts from air horn as follows: Invert air horn on bench, take out float hinge pins, remove floats with intake needles and clips attached, remove needle seats and gaskets (*CAUTION*–Keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove vacuum piston by rotating it 90° in either direction and lifting it out. Remove accelerator pump plunger assembly. Remove and discard bowl cover gasket. If automatic choke to be disassembled, proceed as follows Remove choke lever from choke shaft, remove choke valve (file burrs from staked ends of attaching screws before removing the screws), take out attaching screws and remove thermostatic coil housing and gasket remove baffle plate, rotate choke shaft counter-clockwise to disengage vacuum piston from cylinder, withdraw choke shaft and piston assembly, disconnect piston from link by pushing piston pin out with a piece of wire. Take out attaching screws and remove choke housing and gasket (vacuum passage rubber gasket can be removed from inner side of choke housing by rotating gasket using blunt end of a thin wire).

Carburetor Bowl–Invert bowl to remove pump spring and vacuum piston spring. Take out housing screw and remove pump jet housing, gasket, and pump discharge check needle (needle will drop out if bowl inverted). Remove primary and secondary metering jets (*CAUTION*–keep these jets separate). Remove pump relief valve plug and gasket. Remove pump intake ball retainer from bottom of pump cylinder, invert bowl to remove intake check ball. Remove all primary and secondary low speed jets. (*NOTE* - No low speed jets used on secondary side of Cadillac 2371S, 2372S, 2374S, Chevrolet 2362S, 2419S, 2366S, SA, Mercury 2361S, SA, Packard, Pontiac or Studebaker carburetors). Loosen bowl to throttle body attaching screws, remove throttle body from bowl, remove screws, remove and discard gaskets.

Throttle Body – Remove two idle adjusting screws and springs (used on primary side only). Remove four idle port rivet plugs. Remove idle stop screw and spring, and fast idle adjusting screw. On carburetors with vacuum diaphragm assembly remove hairpin clips holding throttle operating link to primary and secondary operating levers. Slide link out and away from levers (don't lose washers). Disengage throttle flex spring from tang on throttle flex dog and slide flex dog off primary shaft. Remove operating lever and flex spring. Disconnect vacuum diaphragm plunger from secondary operating lever by removing hairpin clip. Remove operating lever retaining screw and washer, the slide lever off secondary throttle shaft. Remove screws attaching vacuum diaphragm to throttle body and remove diaphragm and gasket. On all carburetors, take out fast idle mounting screw, remove all fast idle parts (fast idle cam, spring, trip lever, and lockout cam and pawl). Remove primary-to-secondary throttle connector rod, remove secondary throttle lever by loosening clamp screw and sliding lever off shaft, remove primary throttle lever screw from end of shaft, remove all lever parts from shaft. On Buick carburetors, remove accelerator vacuum switch (remove terminal cap and spring, lift out switch guide block with contact spring and shims, turn body over to allow plunger and ball to drop out). **It is recommended that throttle body not be disassembled further,** however, if necessary to remove throttle valves and shaft, proceed as follows: *(NOTE - Mark all throttle valves so they can be reinstalled in the proper position with the correct side of valve upward).* File burrs from staked ends of all throttle valve screws and remove screws and valve from shaft. Remove secondary throttle shaft. Remove primary throttle shaft by using a rawhide hammer to tap shaft through retaining washer. Remove auxiliary throttle valves and shaft when so equipped.

Cleaning & Inspection: Wash all parts in carburetor cleaning solvent **except** pump plunger assembly, thermostatic coil and housing assembly, and choke housing gasket (clean these parts in clean gasoline). Clean and blow out all passages with compressed air. Remove all gum and carbon deposits. Make certain all calibrated restrictions are clean but DO NOT use drills to clean out these passages. Inspect floats for dents and leaks Check choke and throttle shafts for excessive wear, inspect pump plunger leather and replace plunger if cracked or creased. See that choke piston operates freely in cylinder (if carbon or dirt present in slots, remove welch plug in bottom of housing to clean slots, install NEW welch plug and make certain that it is air-tight).

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above), pay particular attention to the following points.

Valve Installation–Use new screws when installing valves, install primary and secondary as follows:

► *MERCURY SECONDARY THROTTLE VALVE INSTALLATION NOTE:* Place a piece of .002" x ¼" feeler gauge stock between lower edge of each secondary throttle plate and carburetor bore (side of bore closest to primary). Hold throttle tightly closed against feeler.

CONTINUED ON NEXT PAGE

CARTER WCFB CARBURETORS (Cont.)

Before tightening screws. shift valves to provide closest possible fit in barrel in closed position (short end of auxiliary valves should have a good bearing on stop bosses), tighten screws securely and stake ends lightly (*CAUTION*–Support shaft on steel block while staking screws). Install retaining washer on end of primary throttle shaft with prongs outward, press washer in on shaft just far enough to obtain snug fit without endplay in shaft.

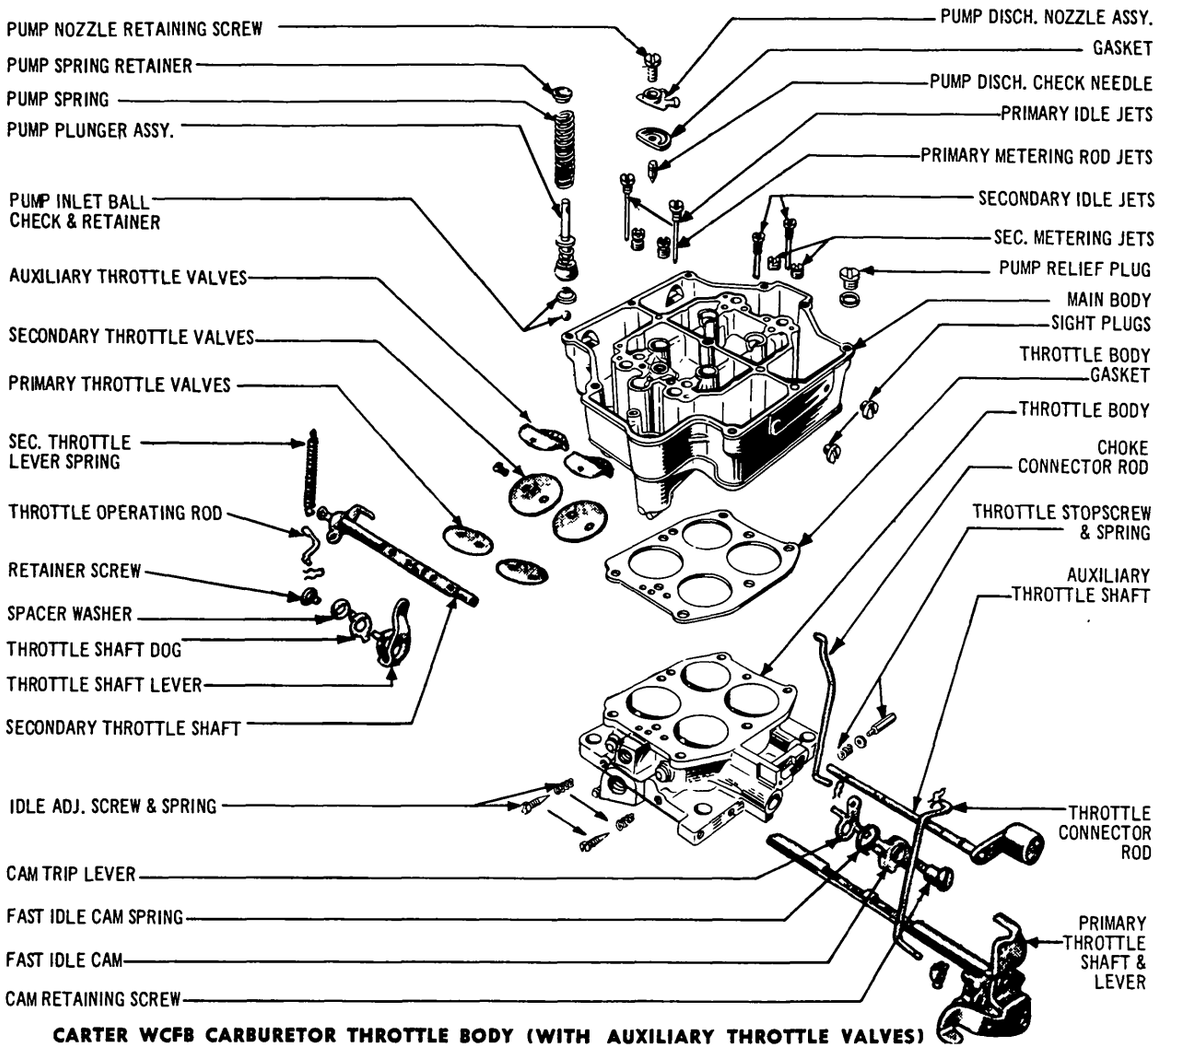
① – Port opening above top edge of throttle valve.
② – Bottom of port above top edge of valve.
③ – Top of port above top edge of valve.
④ – No secondary idle system.
⑤ – None used.



Buick Vacuum Switch Installation. Assemble contact spring in guide block with original number of timing shims. Place ball in body flange, guide block in switch plunger and install in body flange with grooved side of plunger upward toward main body flange. Install switch return spring and terminal cap.

Sec ndary Thr ttle Linkage–Secondary throttle lever, return spring, and operating rod design and hook-up differ on these carburetor models and each type should be assembled and connected as follows:

Buick–Single hole provided in primary throttle lever and secondary throttle lever for operating rod engagement. Likewise single hole provided in secondary throttle lever for return spring connection.

Cadillac – Install throttle connector link (end with short leg) in inner hole of secondary throttle lever. Long leg of link goes into hole nearest center of secondary actuating lever.

Chrysl r, D S t , Dodge & Plym uth (Carburet rs With ut Vacuum Controlled Automatic Sec ndary Thr ttl) - Connect secondary throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in single hole of secondary throttle operating lever (on Secondary throttle shaft).

CARTER WCFB CARBURETOR THROTTLE BODY (WITH AUXILIARY THROTTLE VALVES)

Chrysler, DeSoto & Mercury (With Vacuum Controlled Automatic Secondary Throttle) - Connect throttle operating link in single hole of primary and secondary throttle levers.

Packard & Studebaker 2394S – Connect secondary operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in single hole of secondary throttle operating lever.

Chevrolet 2366S, Pontiac 2364S, Studebaker 2214, 19SA, SB – Connect secondary throttle operating rod in single hole in primary throttle inner lever and single hole in secondary throttle lever.

Choke Assembly–When installing choke housing, line up choke shaft hole with bore in air horn so that shaft will not bind.

Vacumet r Piston Link–Install link with lip or tang at center opening pointing toward air horn.

SERVICE PARTS: Gasket Sets – Carter No. 234 (2302S, SA, SB, 2303S, SA, SB, 2432S), No. 260 (2214SA, SB, 2219SA, SB), No. 269A (2317S, 2445S, 2474S, 2476S), No. 270 (2361S, SA), No. 273 (2347S), No. 277 (2333S, SA, 2334S, SA, 2370S, 2371S, 2372S, 2373S), No. 277A (2543S, 2544S, 2545S), No. 279A (2364S, SA), No. 281A (2366S, SA), No. 282 (2311S, SA, 2314S, SA, 2367S SA), No. 283 (2394S), No. 286 (2362S, 2419S), No. 288 (2442S, 2443S, 2444S).

Repair Package (With Standard Metering Rods) – Carter No. 1783 (2214SA, SB, 2219SA, SB), No. 1804A (2361S, SA), No. 1818 (2333S, SA, 2334S, SA, 2370S), No. 1819 (2371S, 2372S, 2374S), No. 1821A (2364S, SA), No. 1822A (2374S), No. 1828A (2366S. CARTER DUAL "WCD"

NASH	Carter Carburetor No.
1956 Statesman	2350S
WILLYS	
1956 6-226 "L" Early	2204S

DESCRIPTION: Dual downdraft carburetors with automatic choke. Same design as used on previous models except as noted below.

ADJUSTMENT: *Set these carburetors to the following specifications:*

►*CAUTION—Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. See individual car model pages for complete Tune-Up instructions.*

IDLING ADJUSTMENT

Idle Mixture Screw Setting

Car	Idle Screw Opening
Nash	½-1½ turns
Willys	1-2 turns

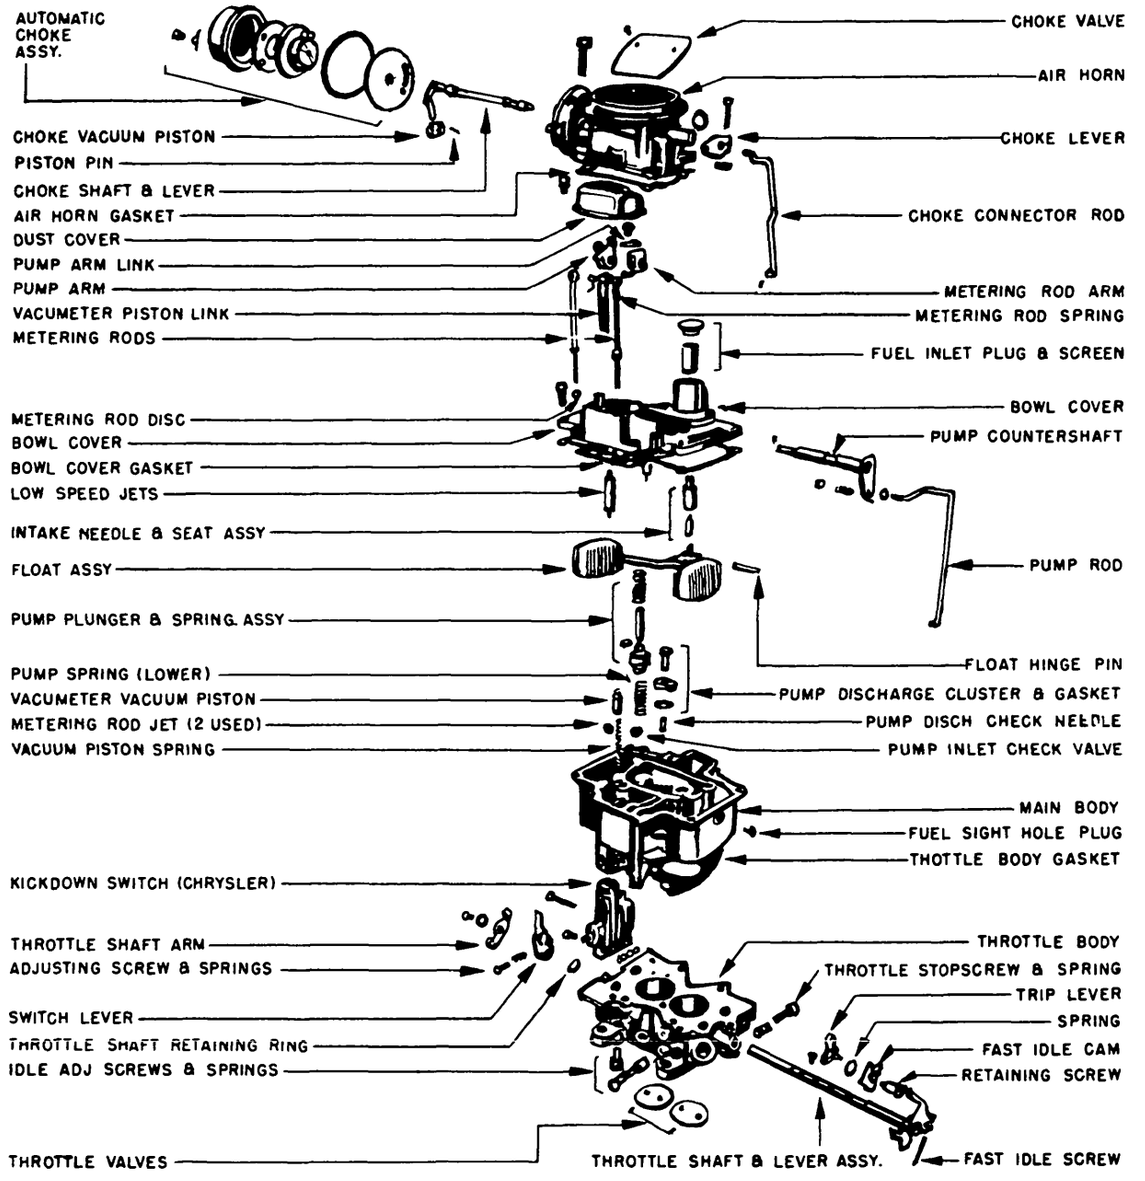
Idle Speed Setting

Car	Synchro-mesh	①Auto. Trans.
Nash	550 RPM	② 475 RPM
Willys	500 RPM	

① — With Selector Lever in Neutral.
② — 500 RPM with Air Conditioning turned on.

ACCELERATING PUMP

Pump Stroke Checking Note—"Gauge" reading in table below is gauge reading with gauge inverted on edge of dust cover boss on carburetor and gauge finger just touching upper end of plunger shaft, "Scale" reading is distance from top of pump plunger shaft to top of dust cover boss as measured with a scale. Throttle stopscrew must be backed out so that throttle valves tightly closed and pump plunger connector link must be connected in correct hole of pump arm on countershaft as listed below when checking pump stroke. Adjust by bending throttle connector rod at upper angle. Then check and adjust metering rods.



Pump Stroke Setting

Car	Gauge	Scale	Pump Setting
Nash			Special (Below)
Willys	33	22/64"	Long Stroke

►*NASH PUMP STROKE ADJUSTMENT CAUTION—* On these models, back out throttle stopscrew so that throttle valves seated (see that fast idle screw does not hold throttle open). Place straightedge across top of dust cover boss at pump arm. Flat on top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at upper angle using bending tool T109-213.

METERING ROD SETTING

Metering Rod Check— Check and adjust rods as follows: Back off throttle lever stopscrew so that throttle valves tightly closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover), press down on vacumeter link until both metering rods just bottom in carburetor casting, rotate metering rod arm until finger on arm contacts lip on vacumeter link, tighten clampscrew (*CAUTION*—do not disturb arm position).

CARTER "WCD" DUAL CARBURETOR

FLOAT LEVEL SETTING

Float Level Setting—With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge on cover directly under floats with notched portions of gauge fitting over edge of cover casting. Sides of floats should just barely touch vertical legs of gauge (lateral adjustment). Adjust by bending arms of floats. Both floats should just clear horizontal portion of gauge (vertical adjustment).

►***FLOAT SETTING CAUTION—Floats must be adjusted laterally (parallel to gauge uprights) as well as vertically (Float Level figure in table below).***

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

Float Level Setting

Car	Float Level	Checking Gauge
Nash	5/32"	T109-196
Willys	3/16"	T109-28

►*NASH "SPLIT" FLOAT NOTE* Float assembly consists of two floats (right & left hand) and auxiliary lever Floats are adjusted in same manner as on other carburetors and should be set for uniform height (float level or vertical adjustment)

Fuel Level Note—Quick check for correct float setting can be made by removing sight hole plug on side of bowl. Fuel level should be even with bottom of sight hole (or just run out of hole with engine idling).

CLIMATIC CONTROL (CHOKE) SETTING

Car	Choke Setting
Nash	Centered (At Index)
Willys	Centered (At Index)

FAST IDLE SETTING

CAUTION—TWO settings (1) and (2) required as explained below.

(1) Fast Idle Cam Clearance—Loosen choke valve lever clampscrew on choke shaft, insert gauge of correct thickness (See Checking Gauge (1) in table below) between lip of fast idle cam and boss on flange casting, hold choke valve tightly closed, remove all slack from linkage by pressing choke valve lever toward closed position, tighten choke valve lever clampscrew.

(2) Fast Idle Screw Setting—Hold choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle ports is correct (see Checking Gauge (2) in table below

Car	Setting & Checking Gauge (1)	(2)
Nash	026" T109-189	020" T109-29
Willys	040" T109-193	016" T109-29

UNLOADER SETTING

►*CAUTION—Fast Idle Cam Clearance (Fast Idle Setting (1) above) must be adjusted before Unloader Setting is adjusted*

Car	Choke Opening	Checking Gauge
Nash	3/16"	T109-28
Willys	1/8"	T109-36

Unloader Setting—Check choke valve opening with throttle valve held wide open. Adjust by bending unloader lip on throttle shaft lever using bending tool T109-41

THROTTLE VALVE SETTING

Car	Idle Port	Vacuum Port
Nash	③.074-.080"	⑤.033-.043"
Willys	⑤.125-.131"	⑤.027-.037"

③—Opening above upper edge of throttle valve

⑤—Top of port above upper edge of valve

OVERHAUL: *See "Carter WCD" in Carburetion Section of 1955 Final Data or later Manual editions.*

1956 Ambassador Spec V8	2352S
PACKARD	
1956 5640	2393S

►CHANGES & CORRECTIONS

►*1956 HUDSON & NASH POOR WARM-UP PRODUCTION CHANGE & CORRECTION* The following items were changed in production and are incorporated in Unitized package Carter No 75 1271-U, Hudson Nash No 311-9897 for installation in earlier carburetors

Vacuum Piston Spring (2231S,SA before Code date M-5) - Heavier Vacuum Piston Spring No 61 332 replaced Vacuum Piston Spring No 61-226 to improve choke operation, on later carburetors

Metering Rods (2231S Carbs.) - Metering Rods with 003" smaller power step used starting with Engine Serial Number P-24900

NOTE - Before installing these parts in earlier carburetors, they should be checked for the following items

1) Choke valve must have minimum of 005" clearance between valve and air horn from full open to full closed position
2) Choke valve shaft must be free of gum deposits, and operate freely in air horn.
3) Unloader arm must not bind on fast idle link (bend unloader arm to obtain clearance)
4) Baffle must be installed correctly with no bind and choke shaft arm must extend through small circular hole in outer revolving baffle
5) Choke piston must be free in bore
6) Choke heat tube must be free of any obstruction.
7) Automatic Choke must be set to specifications, plus or minus one notch

DESCRIPTION: Dual (double barrel), downdraft type with Carter Climatic Control of same design as used on previous models.

ADJUSTMENT: *Set carburetors to these specifications:*

IDLING ADJUSTMENT

►*CAUTION: Adjust only with engine warmed up so that choke valve is wide open and fast idle screw inoperative.*

Idle Screw Setting

Car & Carb.	Idle Screw Opening
Buick 2378S	1/4 - 1 1/4 turns
Buick 2400S	1/2 1 1/2 turns
Hudson 2252S	1 3/4 2 3/4 turns
Hudson 2231S,SA	1/2 - 1 1/2 turns
Hudson 2352S	1 2 turns
Nash 2231S,SA	1/2 - 1 1/2 turns
Nash 2352S	1 2 turns
Packard 2393S	3/4 1 3/4 turns

Idle Speed Setting

Car & Carb.	Synchro-mesh	Ⓒ Auto. Trans.
Buick 2378S	450 RPM	450 RPM
Buick 2400S	450 RPM	450 RPM
Hudson 2252S	② 540-560 RPM	490-510 RPM
Hudson 2231S,SA	425 RPM	425 RPM
Hudson 2352S	550 RPM	③ 425 RPM
Nash 2231S,SA	425 RPM	425 RPM
Nash 2352S	550 RPM	③ 425 RPM
Packard 2393S	450-500 RPM	④ 450-500 RPM

Ⓒ With selector lever in "N" Neutral, compressor running on air conditioned cars.

② Overdrive 575 RPM

③ 450 RPM with air conditioning turned on

④ With selector lever or button in "H" range

ACCELERATING PUMP

Pump Stroke Check—Back off idle screw to fully close throttle valves and have choke valve wide open Place straight edge across dust cover boss at pump arm Bend throttle rod at upper angle (Tool T109-213) until pump arm is parallel with straight edge

METERING ROD ADJUSTMENT

►***CAUTION—Adjust metering rods AFTER Pump Stroke adjustment has been completed.***

Adjustment Note—*No Gauge required*..Remove dust cover, back off throttle lever stopscrew so that throttle valves tightly closed, loosen clampscrew on metering rod arm on pump countershaft, press down on vacumeter link until metering rods just bottom in carburetor casting, hold link and rods in this position, revolve metering rod arm until lip on arm just contacts vacumeter link, tighten clampscrew.

FLOAT LEVEL

Float Level Checking Note—Remove bowl cover and float assembly and invert so that float hangs freely with needle valve closed. Measure from top of float at center to gasket face on cover. Adjust by bending lip on float arm.

Float Level Setting

Car & Carb.	Checking Gauge	Float Level
Buick 2378S	T109 31	1/4'
Buick 2400S	T109 31	1/4"
Hudson 2252S	T109 31	1/4"
Hudson 2231S,SA	T109 31	1/4"
Hudson 2352S	T109-106	7/32"
Nash 2231S SA	T109 31	1/4"
Nash 2352S	T109 106	7/32"
Packard 2393S	T109-28	3/16"

FAST IDLE SETTING

Fast Idle Checking Note—Thermostatic coil housing, gasket, and baffle plate must be removed. Crack throttle valve (to allow choke to close), close choke valve, then close throttle (will allow fast idle cam to revolve to fast idle position). With choke held tightly closed and slight tension on throttle lever, measure clearance between edge of throttle valve and carburetor wall on side opposite idle port See table below for correct clearance or throttle valve opening Adjust by bending choke connector rod at lower angle

CAR STARTER SETTING

Car Starter Switch Adjustment (Buick)—Connect test lamp across starter switch Hold choke valve wide open, adjust idle speed screw until it just contacts stop lug on throttle lever when throttle is fully closed Hold a scale between center of idle screw and top edge of throttle lever stop lug, open throttle until light comes on, indicating contact Distance from top edge of stop lug to center of idle speed screw should be between 31/64" and 11/16" Adjust by adding or reducing number of shims in switch guide block Shims available Carter Nos 153-11 (018") and 153-12 (006")

CARTER TYPE WGD CARBURETORS

OVERHAUL: *See 1955 Annual Data or later Manual dition.*

SERVICE PARTS

Gask t Sets - Carter No. 249 (2231S,SA, 2252S, 2393S), No. 274 (2378S, 2400S), No. 289 (2352S).

Repair Pkg. - Carter No. 1802A (2231S,SA), No 1823 (2378S), No. 1824 (2400S), No. 1831 (2393S), No 1843 (2352S).

CARTER "AS" DOWNDRAFT

RAMBLER	Carter Carburetor No.
1956 (Nash & Hudson)	2349S

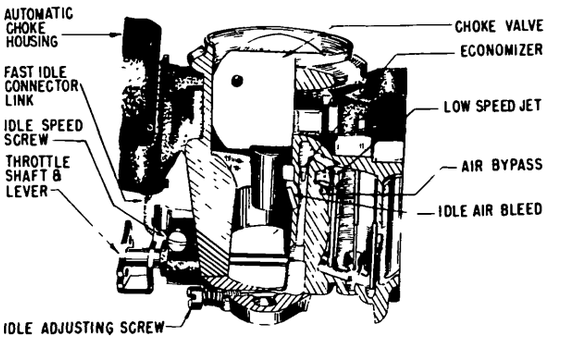
►CHANGES & CORRECTIONS

► *CARBURETOR FLOAT PRODUCTION CHANGE:* Carburetors with Brass Tag Date B-6 or higher have split floats. *See "Float Level" for adjustment of split type float carburetors.*

► *CARBURETOR FLOODING (Date Prior to B-6) CORRECTION:* If flooding is eliminated on early carburetors by loosening needle seat, (gas line to carburetor fitting), it indicates a bind or interference between float hinge and inner end of float needle seat. To correct, install needle and seat assembly, Carter No. 25-313S, included in Repair Kit 1816A.

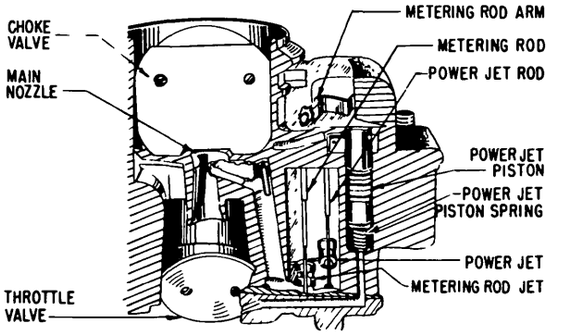
DESCRIPTION: Single barrel downdraft type, with automatic choke and fast idle. Fuel for idle and early part throttle operation is supplied through low speed circuit. Fuel for part throttle and full throttle operation is supplied through high speed circuit.

Low Speed Circuit - Gasoline enters idle well through metering rod and step up jets. Low speed jet measures amount of fuel for idle and early part throttle operation. Air by-pass, economizer, and idle air bleed are calibrated and break up liquid fuel mixing it with air prior to its reaching idle and idle adjusting screw ports.



High Speed Circuit - Position of metering rod in metering rod jet, and step up rod in step up jet, controls amount of fuel admitted to high speed nozzle. *NOTE* - Metering rod is larger in diameter at its lower end. As throttle is opened, metering rod moves downward and more fuel will flow through metering rod jet. Vacuum at vacuum piston controls position of step up rod. Step up rod is held in down position by manifold vacuum overcoming step up piston spring tension, metering fuel around large diameter of step up rod in step up rod jet. When vacuum drops, spring tension moves rod out of jet into power position. *NOTE* - There is no adjustment for step up rod. Permanently installed anti-percolating plugs or bushings and passages prevent vapor bubbles in nozzle passage and low speed well by venting vapors and relieving pressure so fuel is not pushed out nozzle.

ADJUSTMENTS: Set these carburetors to the following specifications:



Idling Adjustment: Warm up engine thoroughly, so that choke valve is wide open and fast idle inoperative. See table for idle screw setting. Turn screw out for richer mixture. See car model pages for complete tune-up data.

Idle Mixture Setting

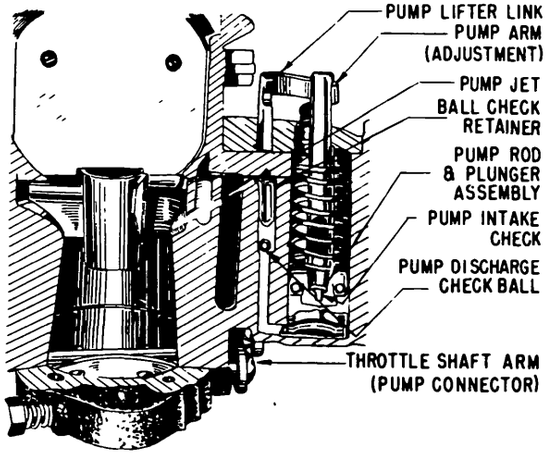
Car & Carb.	Idle Screw Setting
Rambler All Models	1/4 - 1 1/2 turns

CARTER "AS" LOW SPEED SYSTEM

CARTER "AS" HIGH SPEED SYSTEM

Idle Speed Setting

Car & Carb.	S-M & O.D.	Auto. Trans.
Rambler All Models	550 RPM	① 475 RPM



① - 500 RPM in Neutral with air conditioning turned on.

Float Setting: *See "Float Production Change" above.* Remove bowl cover, gasket and float pin retainer. Gauge and adjust each float arm against seated needle, making sure that float pin is at bottom of its guide slot. Measure distance from top surface of body casting and top of float shell at free end. Adjust by bending lip on float arm. Install float pin retainer, invert carburetor so floats will contact seated needle. Clearance between overlapping tangs on float levers should be .010-.015". To adjust bend long tang on left hand float.

Float Setting

Car & Carb.	Checking Gauge	Float Setting
Rambler All Models	T109-282	1/4"

Pump Adjustment: Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover. To adjust bend pump arm.

CARTER "AS" PUMP SYSTEM

Metering Rod Adjustment: With throttle wide open, metering rod should just bottom in carburetor casting. To adjust bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

Fast Idle Adjustment: Remove thermostat coil housing, gasket and baffle plate. Crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position. Close throttle. Measure clearance between throttle valve and bore of carburetor (side opposite idle port). See table below. Adjust (bending Tool T109-213), by bending link at lower angle.

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Rambler All Models	T109-158	.043"

Unloader Adjustment: Hold throttle valve wide open and close choke valve without forcing it. Measure clearance between upper edge of choke valve and inner wall of carburetor air horn. See table below. To adjust, bend choke shaft unloader arm.

Unloader Setting

Car & Carb.	Choke Opening
Rambler All Models	3/16"

Choke Setting: 1 point lean.

SERVICE PART: **Gasket Set** - Carter No. 276 (2349S). **Repair Pkg.** - Carter No. 1816A.

CARTER "YH" HORIZONTAL

CARTER "YH" HORIZONTAL

NASH	Carter Carburetor No.
1956 Amb.6 Super Jetfire	2368S
1956 Amb.6 Lemans Dual Jetfire	Two 2369S

►CHANGES, CAUTIONS, CORRECTIONS

►*NASH DUAL JETFIRE CAUTION:* TWO carburetors used per engine with interconnected throttle linkage. CARBURETORS MUST BE ADJUSTED AS SHOWN BELOW.

DESCRIPTION: "YH" type horizontal carburetors are similar to "YF" models with modifications as required for horizontal operation.

ADJUSTMENT: ***Make all adjustments exactly as follows:***

►*IDLING ADJUSTMENT CAUTION: Models with TWO carburetors must be adjusted exactly as detailed below for proper synchronization and correct performance.*

Idle Setting: Set idle mixture and idle speed as follows:

Idle Mixture Setting

Car & Carb.	Idle Mixture Setting
Nash (All Models)	¼ - 1¾ turns

Idle Speed Setting

Car Model	S-M & O.D.	Automatic Trans.
Nash (All Models)	500 RPM	Ⓒ 475 RPM

Ⓒ – 500 RPM with Air Conditioning turned on. In Neutral.

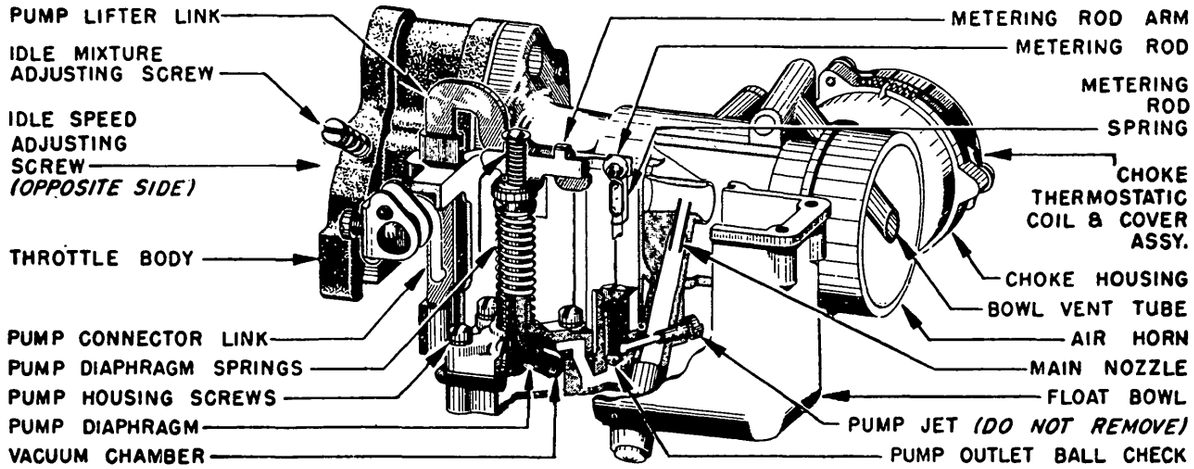
►***NASH DUAL JETFIRE IDLE ADJUSTMENT (Two-carburetor installation):***

1) Remove air cleaner boots and "Tee" from carburetor air horns.

2) Adjust throttle stopscrew on rear carburetor as follows: Hold choke valve open, back off throttle stopscrew until throttle valve is just closed, then turn screw in approximately 2 turns to crank throttle valve slightly. Adjust front carburetor similarly.

3) Start engine and allow it to idle until normal temperature reached. Attach Tachometer.

4) Adjust rear carburetor stopscrew for minimum idle speed (see above).



5) While noting idle speed, synchronize front carburetor by adjusting connecting throttle linkage between carburetors, opening front carburetor throttle just to the point where a further opening begins to increase engine speed. At this point, air suction noise in both carburetors should be identical.

6) Replace air cleaner boots and "Tee" connections.

7) Adjust idle mixture on rear carburetor by turning adjusting screw in (to lean mixture) until engine begins to be rough, then turn screw out ¼ turn. Adjust idle mixture for front carburetor similarly.

8) Recheck idle speed. If not within limits (see above), repeat throttle synchronization (1 thru 5).

Metering Rod Setting: ***CAUTION—Gauge required for this setting.*** Back off throttle stopscrew so that throttle valve fully seated, remove bowl cover assembly, unhook metering rod spring from rod and **remove metering rod,** insert correct gauge in place of rod and make certain tapered end is seated in metering rod jet (hold gauge vertical to insure correct seating in jet). Press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem. At this point, metering rod pin should rest lightly on metering rod gauge. Adjust by bending metering rod arm at undercut point using bending tool T109-22. Make certain that metering rod arm contacts lifter **at diaphragm shaft and at outer end of lifter link.** Remove gauge and re-install metering rod. Reset idle speed.

CARTER "YH" HORIZONTAL CARBURETOR

Metering Rod Setting

Car Model	Checking Gauge & Length
Nash (All Models)	T109-104 (2.312")

Float Level: Remove bowl cover and float assembly and remove cover gasket. Invert cover so that float hangs freely. Check float height at highest point on float by inserting gauge between float and cover. Adjust by bending float lever.

CAUTION—Do not compress spring in intake needle which would cause incorrect setting.

Float Drop—Check by holding bowl cover assembly in upright position so that float drops to limit of travel. Distance from float seam at free end of float to underside of bowl cover should be 2⅜". Adjust by bending stop tab on float arm.

Float Setting

Car & Carb.	Float Setting	Checking Gauge
Nash Amb. 2368S	5/16"	T109-107
Nash Amb. 2369S	7/16"	T109-81

Fast Idle Setting: Remove coil housing gasket, and baffle plate (for access to fast idle cam located within choke housing). Open throttle valve partially (to free fast idle linkage), close choke valve fully, close throttle valve. Hold choke valve tightly closed, apply slight tension to throttle lever to remove play from linkage, check throttle valve opening (clearance between edge of valve and carburetor bore on side opposite idle port). If clearance not correct, adjust by bending throttle connector link at lower angle using tool T109-213. Check Unloader.

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Nash Amb. 2368S	T109-29	.030"
Nash Amb. 2369S	T109-44	.018"

Unloader: After making fast idle adjustment (above), hold throttle valve in wide open position and close choke valve as far as possible ***(CAUTION—do not*** force valve beyond point where it is held open by unloader arm). Check choke valve opening (clearance between lower edge of wall and air horn wall). If clearance not correct, adjust by bending choke shaft unloader arm using tool T109-105.

Unloader Setting

Car & Carb.	Checking Gauge	Check Opening
Nash Amb. 2368S	T109-83	1/2"
Nash Amb. 2369S	T109-85	5/8"

CHOKE SETTING

Choke Setting

Car & Carb.	Check Setting
Nash Amb. 2368S	1 Point Rich
Nash Amb. 2369S	2 Points Lean

THROTTLE VALVE SETTING: ***See OVERHAUL data for throttle valve installation.*** With valve correctly installed, Idle Port Height (top of port above top edge of valve) and Vacuum Spark Port (bottom of horizontal port above top edge of valve) with throttle valve tightly closed should be:

Throttle Valve Setting

Car & Carb.	Ⓒ Idle Port	Vacuum Spark Port
Nash (All Models)	.124-.128"	② .026-.036"

Ⓒ – Top of Port above top edge of valve.

② – Bottom of port above top edge of valve.

OVERHAUL (With Carburetor removed from engine):

Disassembly: Remove bowl strainer nut and gasket, take out inlet screen. Remove bowl cover assembly (bowl cover, float, intake needle and seat). Remove choke connector rod, throttle shaft arm assembly, and pump connector link. Take out throttle valve screws, remove valve, remove throttle shaft by carefully tapping it through shaft retaining ring. Take out attaching screws and remove body flange assembly (throttle body) and gasket. Unscrew idle mixture adjusting screw and spring. Use tool T109-210 to remove idle passage rivet plug. Take out four diaphragm housing attaching screws, lift out entire diaphragm and metering rod assembly, disassemble this unit. Remove pump intake passage plug and ball check from diaphragm housing. Remove meter-

CONTINUED ON NEXT PAGE

CARTER "YH" (Cont.)

ing rod jet, pump discharge check plug, spring, ball, and low speed jet. Take out attaching screws and remove climatic control and housing assembly, remove gasket, baffle plate, and fast idle link. Take out choke valve attaching screws, remove choke valve, revolve choke shaft counter-clockwise until piston clears cylinder, remove choke shaft, fast idle cam, and piston as an assembly. Take out attaching screw and remove choke piston housing assembly and gasket. Remove all passage plugs.

▷*CAUTION—DO NOT remove Nozzle, Bowl Vent, Tube, Economizer, Passage Bushings, or Pump Jet.*

Cleaning & Inspection: Wash all parts except climatic control coil and housing assembly in cleaning solution. Remove all carbon from flange bore, blow out all passages with compressed air. If choke piston is not free in cylinder, remove welch plug from bottom of housing and clean out all carbon and dirt from cylinder walls and grooves. Install NEW welch plug air tight. Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Reassemble parts by reversing order of disassembly procedure (above) and note the following points:

Throttle Valve & Shaft Installation—After throttle valve shaft installed in body, back off throttle stopscrew, install throttle valve with trademark (c in circle) toward idle port when viewed from manifold side of body, insert screws loosely, tap valve lightly to center it in bore before tightening screws. *See Throttle Valve Setting (above).* Install throttle centering washer (prongs outward) while pressing on shaft at lever end, press washer tight against casting (use drive end of ⅜" drive ½" socket to press washer in place). Check throttle shaft for free operation after centering washer installed.

Pump Diaphragm Installation—Make certain that discharge hole in diaphragm is aligned with passage in diaphragm housing, install the four attaching screws through housing holes and diaphragm so that it is held smoothly against housing. After baffle plate installed in fuel bowl, install diaphragm assembly in the bowl and tighten the attaching screws evenly. Check for free operation.

Climatic Control Installation—After choke piston housing and gasket installed on body, install choke shaft, fast idle cam, and piston assembly in air horn and check for free operation (if shaft binds loosen housing attaching screws and align housing). Install choke valve so that trademark (c in circle) is visible when valve closed, use new attaching screws, tap valve lightly before tightening screws.

SERVICE PARTS: Gasket Sets – Carter No. 284 (2368S). 284A (2369S).
Repair Pkg. (With Std. Metering Rod) – Carter No. 1830 (2368S).

CARTER YF

WILLYS — Carter Carburetor No.
1956 Jeep Dispatcher (4 Cyl. "L" Hd.) 2392S
1956 Universal Jeep (4 Cyl. "F" Hd.) 938SA
1956 Others (4 Cyl. "F" Hd.) 951S
1956 Others (6 Cyl. L6-226) Later 2467S

▷*1956 JEEP ACCELERATION (OFF-IDLE) STUMBLE (Carter 938SA Carburetor Code-dated before E6):* If acceleration stumble (just off idle) not corrected by complete Tune-Up including check for correct opening of Cooling Thermostat, make changes listed below. *NOTE - Carburetors c de dated E6 and later have the enlarged (.031") pump jet and do not require this modification.* 1) Enlarge Pump Jet - Increase size of original Pump Jet (No. 72 drill or .025") to .031" using a No. 68 drill. Pump jet is pressed-in part and cannot be removed. 2) Adjust Carburetor - Make certain that Pump Discharge Ball Check seats properly. Float Level and Metering Rod Settings are critical and must be made carefully. 3) Metering Rod Change - In unusual operating conditions, 1 Step Rich Metering Rod, No. 75-913, may be helpful in improving performance.

DESCRIPTION: Single barrel downdraft type of same design as used on previous models.

ADJUSTMENT: *Set to following specifications:*

Idle Setting: Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. See table for screw settings. Turn screw out for richer mixture. See Car Model pages for complete tune-up data.

Car & Carb.	Idle Screw Opening	Idle Speed
	Idle Setting	
Willys 938SA, 951S	3/4-1 3/4 turns	600 RPM
Willys 2392S	1/2-2 turns	600 RPM
Willys 2467S	1-2 1/2 turns	600 RPM

Float Setting: Invert air horn and float cover assembly allowing float to hang freely, and measure from top of float at free end to bowl cover (gasket removed). Adjust by bending lip which contacts intake needle - do not bend float arm.

▷*CAUTION: On models with spring-loaded intake needle, do not compress this spring when checking float level (will result in false reading and incorrect float setting).*

Car & Carb.	Checking Gauge	Float Setting
	Float Setting	
Willys 951S, 938SA	T109-107	5/16"
Willys 2392S, 2467S	T109-126	9/32"

Accelerating Pump: Diaphragm type pump with ball check discharge valve (except 2467S), discharge needle (2467S). On 2467S only, check pump adjustment whenever carburetor disassembled or pump linkage disturbed before checking and adjusting Metering Rod.

Pump Adjustment (2467S) - With idle speed screw backed off so that throttle valves fully seated, press down on on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position). In this position, metering rod arm should contact pump lifter link at outer end nearest the springs. Adjust by bending pump connector link at lower angle using bending tool T109-213. *CAUTION - Bending link at any other point may cause binding of pump lifter link.*

Metering Rod Adjustment: *No gauge required.* Air horn and bowl cover must be removed for access to metering rod. Back off throttle lever stopscrew so that throttle valve completely closed. Press down on upper end of diaphragm stem until diaphragm bottoms in vacuum chamber (tool T109-212 can be used to hold diaphragm down). Metering rod arm must contact lifter link flat surface between springs and at supporting lug under metering rod pin spring (see note below for first carburetors without this lug) and the metering rod should contact the bottom of the metering rod well at the same instant. Adjust by bending lip of metering rod arm to which metering rod is attached up or down.

Fast Idle: To check fast idle, hold choke valve in wide open position and check to see that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

Car & Carb.	Throttle Valve Setting ① Idle Port	① Vac. Spark Port
Willys, 951S, 938SA, 2392S	.168-.172"	.035-.045"
Willys, 2467S	.143-.147"	.019-.029"

① - Top edge of port above top edge of throttle valve.

OVERHAUL (With Carburetor removed from engine): Disassemble in the sequence given and group all related parts before reassembly.

Disassembly: 1) Remove pin springs and fast idle connecting rod springs, remove fast idle connector rod. Take out air horn and bowl cover attaching screws, remove choke tube clamp, lift off air horn and gasket.

2) Take out pump disc check valve retainer ring (when used), lift out retainer and pump check valve disc or pump discharge needle. Then remove throttle shaft arm assembly from end of throttle shaft (pump connector link, shaft seal spring, dust seal washer, felt dust seal). Unscrew four pump diaphragm housing attaching screws, lift out entire pump and metering rod assembly.

3) Disassemble pump by removing attaching screws, pin spring, metering rod, upper pump spring retainer, upper pump spring, metering rod arm, pump lifter link, diaphragm spring retainer, diaphragm spring, and diaphragm housing. Remove intake strainer from housing (use knife tip to lift flat type strainer out of housing recess). On carburetors with disc type intake check valve, remove valve plug assembly.

4) Remove metering rod jet from body casting. Remove Low Speed Jet assembly.

▷*CAUTION: Do not attempt to remove pressed-in parts such as Nozzle, Pump Jet and Anti-percolator Air Bleed.*

5) Take out three body flange (throttle body) attaching screws, remove throttle body from main body.

CONTINUED ON NEXT PAGE

CARTER YF (C nt.)

6) Remove idle adjustment screw and spring, idle port rivet plug, throttle lever assembly and washer, fast idle arm. Take out throttle valve attaching screws, lift valve out, remove throttle shaft, remove shaft seal by prying out seal retainer.

►*CAUTION Do not attempt to remove vacuum passage orifice restriction which is pressed in.*

7) Remove float pin, lift out float, remove needle and seat assembly from air horn casting.

8) Take out choke valve screws, lift choke valve out, unhook choke spring, slide choke shaft out of housing. If necessary to replace choke lever assembly, pry off choke lever retainer ring (in end of shaft), remove lever assembly from shaft.

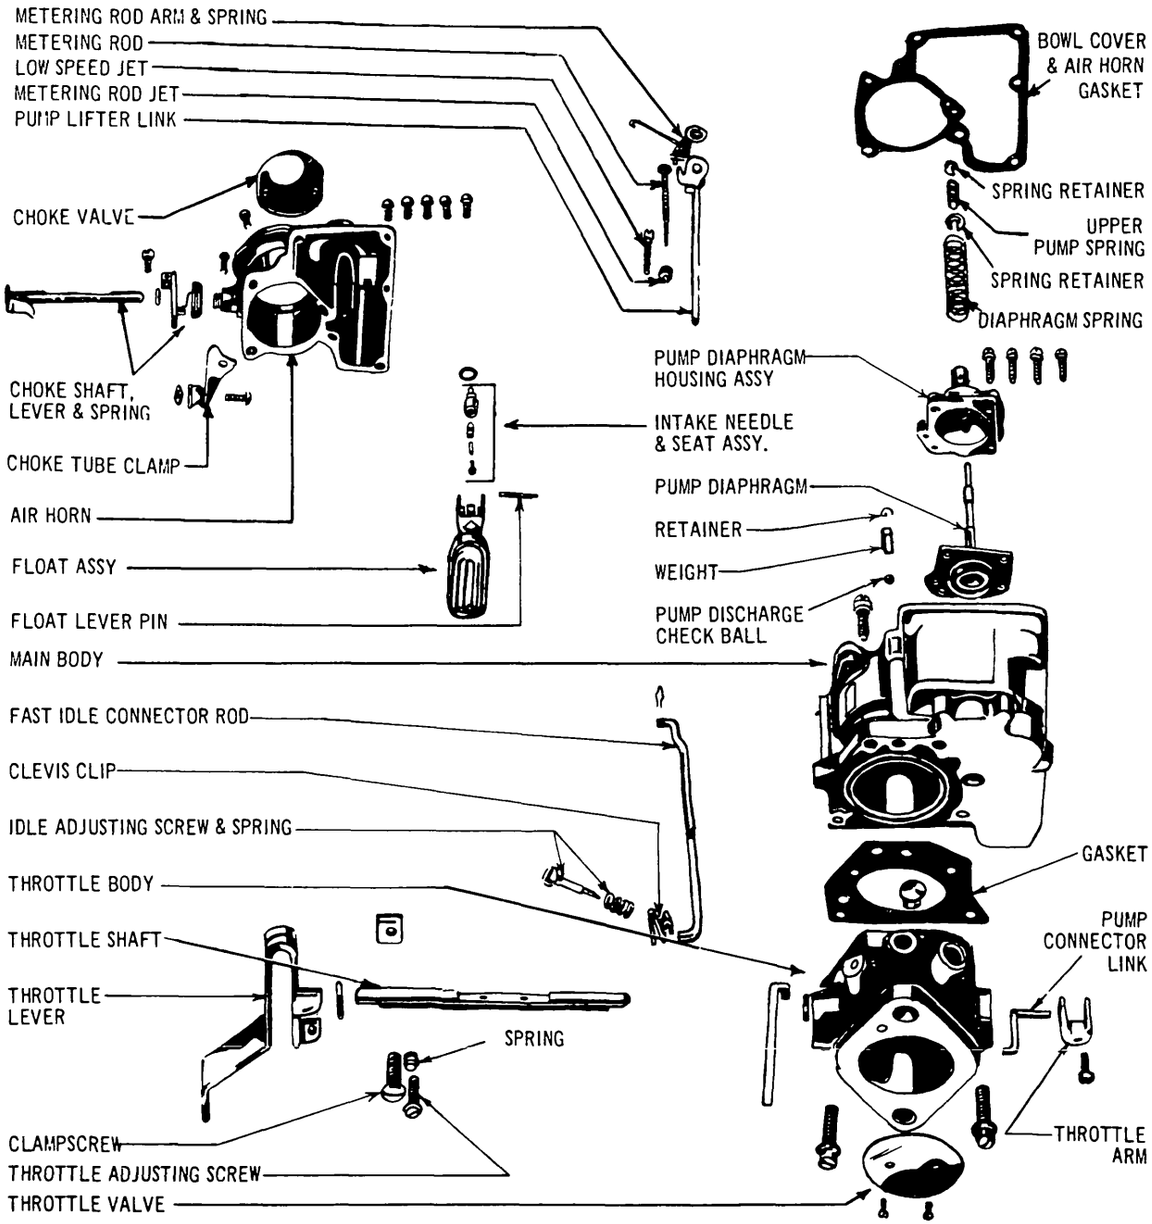
►*CAUTION· Do not attempt to remove balance vent tube.*

Cleaning & Inspection: Wash all parts in carburetor cleaning solution. *(CAUTION*–do not immerse diaphragm assembly, pump check disc, or seals in the solution). Inspect all parts for wear or damage, replace if necessary. Blow out all passages with compressed air.

Reassembly: Use all new gaskets. Assemble by reversing the disassembly order as given above and note the following important points.

Throttle Valve Installation–Install valve with trademark (c) toward idle port when viewed from manifold side of flange. Install screws loosely, tap valve and then hold with fingers to insure it being centralized in bore, tighten screws securely.

Metering Rod Jet Installation–DO NOT use a gasket with this jet.



Pump Diaphragm Assembly Installation–Make certain that intake check valve (when used) is properly installed in diaphragm housing. **Disc** type check valve is an assembly screwed in the underside of the housing (may have strainer screen on bottom end of valve assembly). **Ball** type check valve fits in intake passage in housing with a retainer below the ball. Before tightening housing attaching screws, make certain that diaphragm is flat and that edges are not wrinkled, then tighten screws securely.

Pump Linkage–Check pump linkage to make certain that it does not bind in any position. If binding noted, loosen throttle arm clampscrew and adjust throttle arm, retighten clamp screw.

Float Intake Needle & Seat Assembly–Soak new gasket in 90 proof alcohol for 15 minutes, install and let dry on needle seat before installing this part. When installing float, make certain that shoulder on float pin is on side away from carburetor bore.

Choke Valve Installation–Install the attaching screws loosely, center valve by tapping on valve lightly and hold in this position with fingers while tightening screws securely.

Fast Idl Linkag -Install connector rod with offset end upward, and with pin spring on outside.

CARTER "YF" DOWNDRAFT CARBURETOR

►*CARBURETOR INSTALLATION CAUTION:* Special slotted type flange gasket must be used to install carburetor on engine. Diaphragm type metering rod and accelerating pump control will not function if this gasket not used.

SERVICE PARTS: Gasket Set - Carter No. 206A (938SA, 951S), 200 (2392S), 241 (2467S).

R pair Pkg. (With Std. M tering R d) - Carter No. 1599C (951S, 938SA), 1546B (2392S), 1849 (2467S).

CARTER "WE"

STUDEBAKER — **Carter Carburetor No.**

1956 Champion (Early) 2108S
1956 Champion (Later) 2417S

DESCRIPTION: Single barrel downdraft type with automatic choke and fast idle. Similar to design used on previous Champion models.

ADJUSTMENT: *Set these carburetors to the following specifications:*

IDLING ADJUSTMENT

Idle Screw Setting - ½-1½ turns open. Turn screw out for richer mixture. Adjust only with air cleaner in place and with engine at normal operating temperature (choke valve open, fast idle inoperative).

Idle Speed – 550 RPM (With selector lever in "N" or "P" position on "Flightomatic" or "Automatic Transmission" cars).

ACCELERATING PUMP SETTING

Pump Stroke Setting - Check pump travel after carburetor has been reassembled. Back off throttle stopscrew so that throttle valve tightly closed, remove dust cover. Install Pump Gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft and gauge held vertically, turn nut on gauge until lip contacts top of plunger shaft, note gauge reading. Open throttle wide and again note gauge reading. Difference in two readings should be 14/64". Adjust by bending throttle connector rod at lower angle using T109-213 bending tool.

METERING ROD SETTING

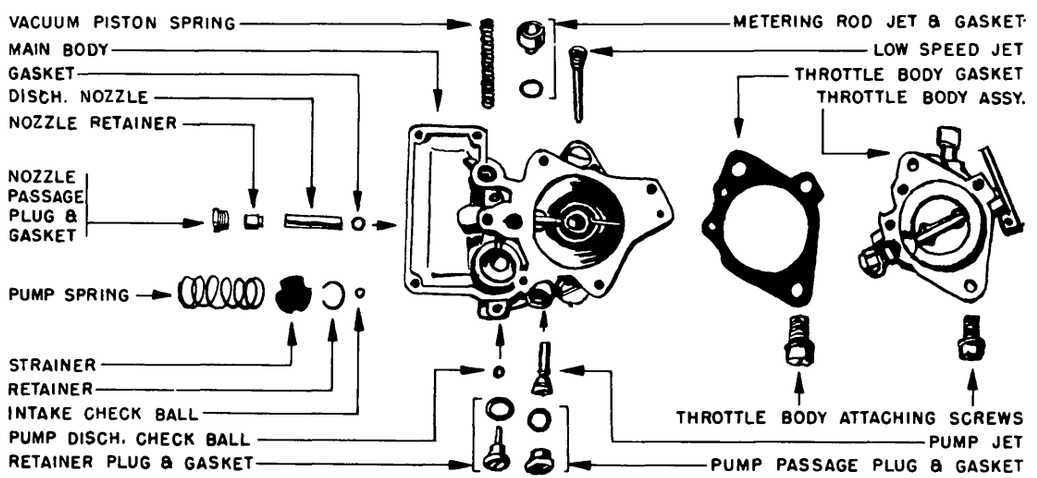
Checking & Adjustment - Remove metering rod and install Metering Rod Gauge No. T109-102 (2.468") in place of the rod making certain that gauge seated in metering rod jet. With throttle stopscrew backed off so that throttle valve tightly closed, press down lightly on metering rod arm so that upper lip of arm contacts pin in pump arm. At this point, clearance between metering rod pin and shoulder of notch in gauge should be less than .005"and gauge should not contact pin Adjust by bending upper lip of metering rod arm using bending tool T109-105. *Then check and adjust lower (economy) lip as follows:-* Remove gauge,press down on metering rod arm until upper lip contacts pump arm pin. Clearance between pin and upper surface of lower lip should be 3/16" (Float Level Gauge T109-28 can be used). Adjust by bending the lower lip.

ANTI-PERCOLATOR SETTING

Checking & Adjustment - Crack throttle valve open .030" by placing **large** end of Gauge T109-29 between edge of valve and carburetor wall on side opposite idle port. Clearance between rocker arm lip and pump arm should be .025" (Gauge T109-189 can be used to check this clearance). Adjust by bending rocker arm using bending tool T109-105.

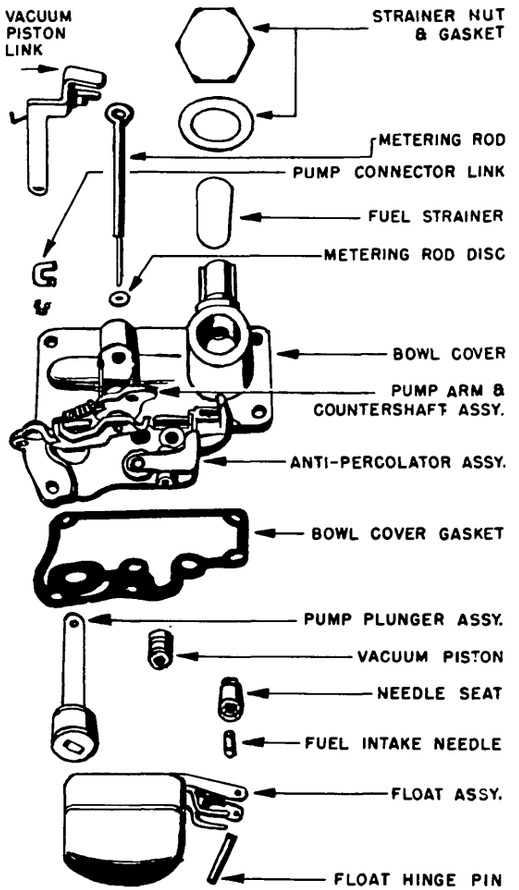
FLOAT LEVEL

Checking & Adjustment - Remove and invert bowl cover assembly so that float in closed position. Measure distance from top of projection on bowl cover to top edge of soldered seam on float using gauge T109-80 (3/8"). Adjust by bending lip on float lever which contacts intake needle.



THROTTLE VALVE SETTING

Idle Port Opening - Top of lower idle port should be .112-.116" above upper edge of throttle valve.



Vacuum Spark Port - Top of port should be .060-.070" above upper edge of throttle valve.

FAST IDLE SETTING

Checking & Adjustment - With thermostatic coil housing, gasket, and baffle plate removed, crack throttle valve to allow choke valve to close, close choke valve, move throttle valve toward closed position as far as possible. Check remaining throttle valve opening which should be .046" (.045" end of gauge T109-158 may be used). If opening not correct, adjust by bending choke connector rod at lower angle using bending tool T109-213. Then adjust Unloader.

"WE" MAIN BODY & THROTTLE BODY ASSEMBLY

"WE" BOWL COVER ASSEMBLY

UNLOADER SETTING

Checking & Adjustment - After fast idle adjustment completed, open throttle valve fully, close choke valve as far as possible without forcing. Check remaining choke valve opening using gauge T109-28 (3/16"). If opening not correct, bend arm on choke trip lever (within choke housing) using bending tool T109-214.

AUTOMATIC CHOKE SETTING

Setting (All Carburetors) ..... 1 Point Lean

Adjustment - Loosen retainer screws around rim of cover, rotate cover and thermostatic coil assembly clockwise (for leaner setting) or counter-clockwise (for richer setting).

OVERHAUL: *See "Carter WE" carburetors in 1955 Annual Data or later Manual edition.*

SERVICE PARTS

Gasket Sets - Carter No. 235.
Repair Pkg. (With Std. Metering Rod) – Carter No. 1746 (2108S), 1837 (2417S).

CARTER WA1

HUDSON	Carter Carburetor No.
1956 Wasp (Hi-Torque)	2009SA
1956 Wasp (Twin H-Power)	Two 2013S
1956 Hornet 6 (Twin H-Power)	Two 2113S

DESCRIPTION: Single barrel downdraft carburetors of same design used on previous models.

ADJUSTMENT: ***CAUTION—See special "Twin Carburetor" adjustment procedure below.***

IDLING ADJUSTMENT

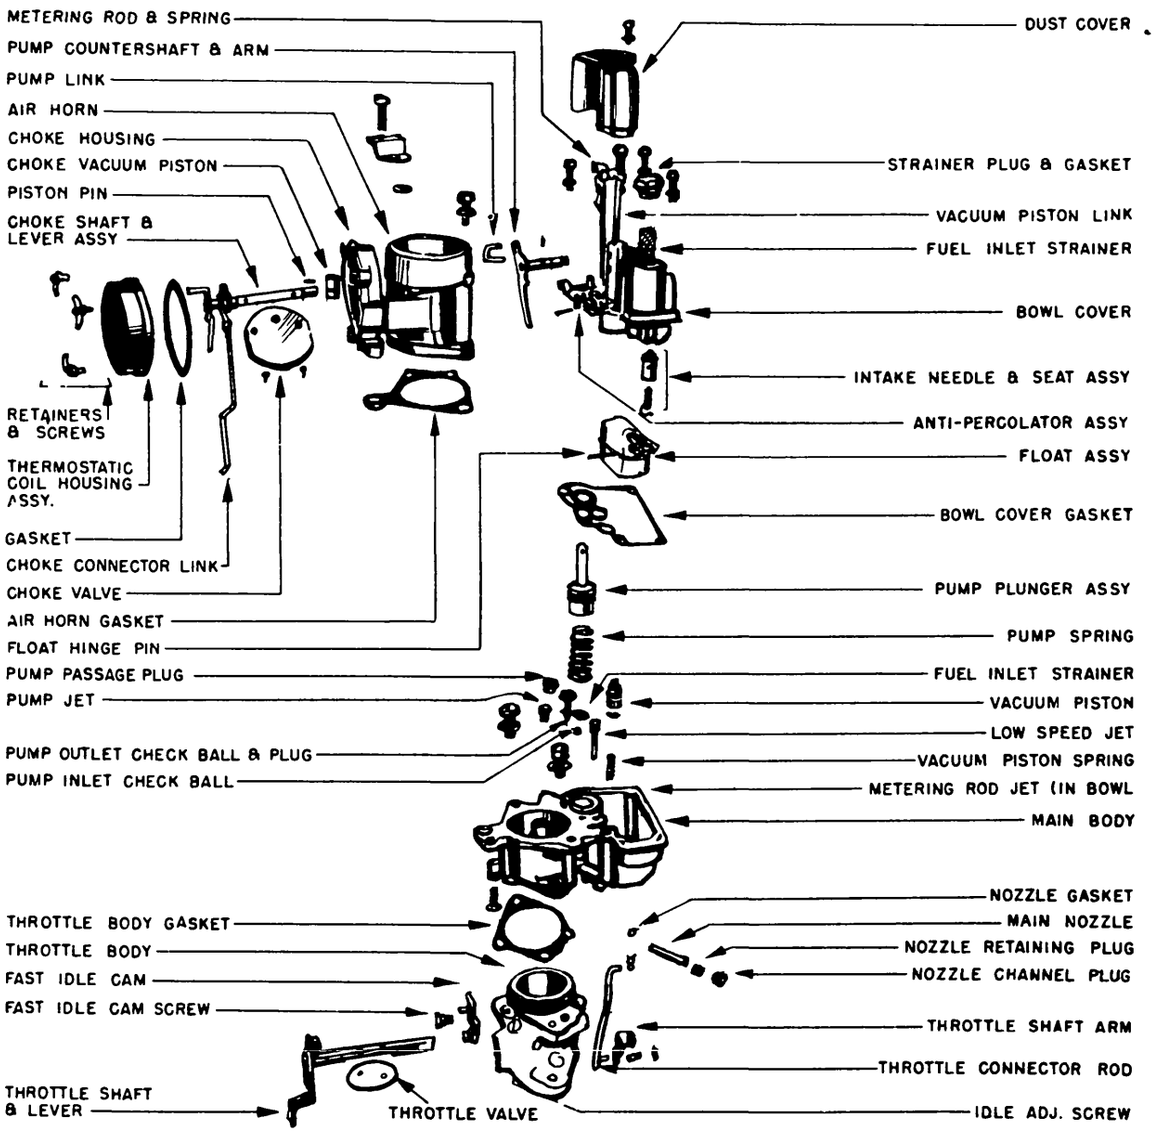
Single Carburetor—*See special Twin Carburetor adjustment procedure below.* Adjust only with engine warmed up to normal operating temperature with choke valve wide open and fast idle inoperative. Set throttle stopscrew for correct idle speed, then adjust idle mixture screw for smooth idle (turn screw out for richer mixture), recheck idle speed.

►*TWIN CARBURETOR ADJUSTMENT:* **Hudson**—Remove clevis pins from throttle shaft-to-carburetor rod clevises. Connect vacuum gauge and tachometer. Hold fast idle cam in normal idle position, adjust idle screws to just seat valves in closed position. "Crack" rear throttle valve and adjust idle mixture screws (Wasp ½-1½ turns out, Hornet 1¼-2¼ turns out). Warm up engine to normal operating temperature. With front carburetor throttle valve closed, adjust rear carburetor idle speed 25 to 40 RPM less than specified below. Adjust rear carburetor mixture for best operation Adjust front carburetor idle speed to point of 10 to 15 RPM increased idle speed, and adjust idle mixtures Readjust rear carburetor to bring idle speed to specifications and then adjust front carburetor until a slight increase in speed is noted Readjust idle mixture for best mixture and manifold vacuum. Adjust throttle shaft to carburetor rod clevis, retaining throttle valves in idle position and accelerator linkage in released position. Reinstall the clevis pins

Idle Screw Setting—(2009SA) ½-1½ turns open, (2113S) 1¼-2¼ turns open, (2013S, 780S) ¾-1¾ turns open

Idle Speed (Hudson)—540-560 RPM (Std. Trans.), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic with selector lever in Neutral). *NOTE*—On Air-conditioned Cars, compressor should be running.

ACCELERATING PUMP



Pump Stroke Adjustment—Use Pump Gauge T109-117S to measure travel of plunger stem from closed to open position with pump link connected in correct hole of countershaft arm (see table). Place base of gauge on ridged portion of bowl cover with projecting portion resting on top surface of connector link at pump plunger shaft, read gauge at closed throttle, and again at open throttle position).

Accelerating Pump Stroke

Car Model	Pump Stroke	Pump Setting
Hudson (All)	16 (16/64")	Medium Stroke

METERING ROD SETTING

Carb.	Checking Gauge
2009SA	T109-241
2013S	(2.468") T109-102
2113S	(2.468") T109-102

CARTER WA1 DOWNDRAFT CARBURETOR

Checking & Adjustment— Insert gauge in place of metering rod, seating tapered end in metering rod jet and holding gauge vertical. Back off throttle stopscrew so valve seated, press down on vacuum piston link until it contacts pump arm. Clearance between metering rod pin and notch in gauge should be less than .005" at this point and gauge must not drag on pin.

ANTI-PERCOLATOR

Carb.	Checking Gauge	Throttle Opening
2009SA	T109-29	②.030"
2013S. 2113S	T109-44	016"

②—Use LARGE end of gauge.

Crack throttle valve open by placing correct gauge for each model (see table above) between the edge of valve and carburetor wall on side opposite idle ports. Clearance between lip on rocker arm and pump arm should be .010". Adjust by bending rocker arm.

FLOAT LEVEL

Carb.	Checking Gauge	Float Setting
2009SA	T109-81	7/16"
2013S	T109-31	¼"

CONTINUED ON NEXT PAGE

CARTER WA1 (C nt.)

Checking & Adjustment—With bowl cover and float assembly removed, invert assembly so that float holds intake needle in closed position, place correct gauge (see table) on upper edge of raised projection on cover. Upper edge of soldered seam on free end of float should be even with top edge of gauge. Adjust by bending lip on float arm which contacts intake needle.

THROTTLE VALVE SETTING

Carb	①Idle Port	Vacuum Spark Port
2009SA	120-.124"	②.005-.015"
2013S	.103-.107"	③.010-.020"
2113S	178-.182"	③.049"

①—Port opening above top edge of valve.
②—Bottom of port above top edge of valve.
③—Top of port above top edge of valve.

CLIMATIC CONTROL (CHOKE) SETTING

Carb.	Choke Setting
2009SA	Centered (At Index)
2013S, 2113S	1 Point Lean

FAST IDLE

Carb.	Checking Gauge	Choke Opening
2009SA, 2113S	T109-85	5/8"
2013S	T109-83	1/2"

Checking & Adjustment—Use correct gauge (see table). Check with fast idle cam in normal (slow) idle position. With throttle lever stopscrew against cam, hold throttle valve closed, rotate fast idle cam until screw is against (not on) first step of cam. Use gauge to check choke valve opening or clearance between lower edge of valve and air horn wall.

UNLOADER

Carb.	Checking Gauge	Choke Opening
2009SA	T109-84	9/16"
2113S	T109-84	9/16"

Checking & Adjustment—Use correct gauge for each model. Open throttle valve wide, use gauge to check choke valve opening or clearance between lower edge of valve and air horn wall. Adjust by bending cam on throttle lever using tool T109-41.

OVERHAUL: *See "Carter WA1" carburetors in 1955 Annual Data or later Manual edition.*

⑤9 – Supersedes #72 (to correct Off-idle Stumble).

CARTER "BBS"

PLYMOUTH	Carter Carburetor No.
1956 6 Cyl. Synchro-mesh	2063SA Ⓒ or 2293S
1956 6 Cyl. Overdrive	2062SA Ⓒ or 2294S
1956 6 Cyl. PowerFlite	2116SA Ⓒ or 2295S
1956 6 Cyl. Taxicab	2410S
1956 6 Cyl. City Traffic	2403S
1956 6 Cyl. Repl. Carb.	2380S

Ⓒ - Temporary production.

► *REPLACEMENT NOTE:* When installing 2380S carburetor, use Pkg. 192-33U (to replace 2294S), Pkg. 202-80U (to replace 2295S).

► *1954-56 PLYMOUTH 6 TAXICAB CARBURETOR IMPROVED ECONOMY (Carter BBS 2062S,SA, 2063S,SA carburetors):* Improved gasoline economy can be secured by installing all parts furnished in Unitized Pkg. Carter No. 195-67U as listed below. Spark plug gap should be set at .040" when this modification made. *CAUTION* - If this change made on cars operated in normal highway use, high speed performance may be affected.

Part	Unitized Pkg. 195-67U	Part No.
Main Metering Jet		120-215S
Step-up Rod		75-1125
Idle Tube & Plug Assy		123-65S
Body Gasket		121-225

DESCRIPTION: Single barrel downdraft type with automatic choke. Carburetors are similar to previous "BBS" models

ADJUSTMENT: Make adjustments in order as listed below

Idle Setting: Adjust only with engine warmed up to normal operating temperature with choke valve wide open and fast idle inoperative Use tachometer to set engine idle speed, adjust idle mixture screw for smooth engine operation and highest vacuum reading. See car model page for complete tune-up data.

Idle Mixture Setting

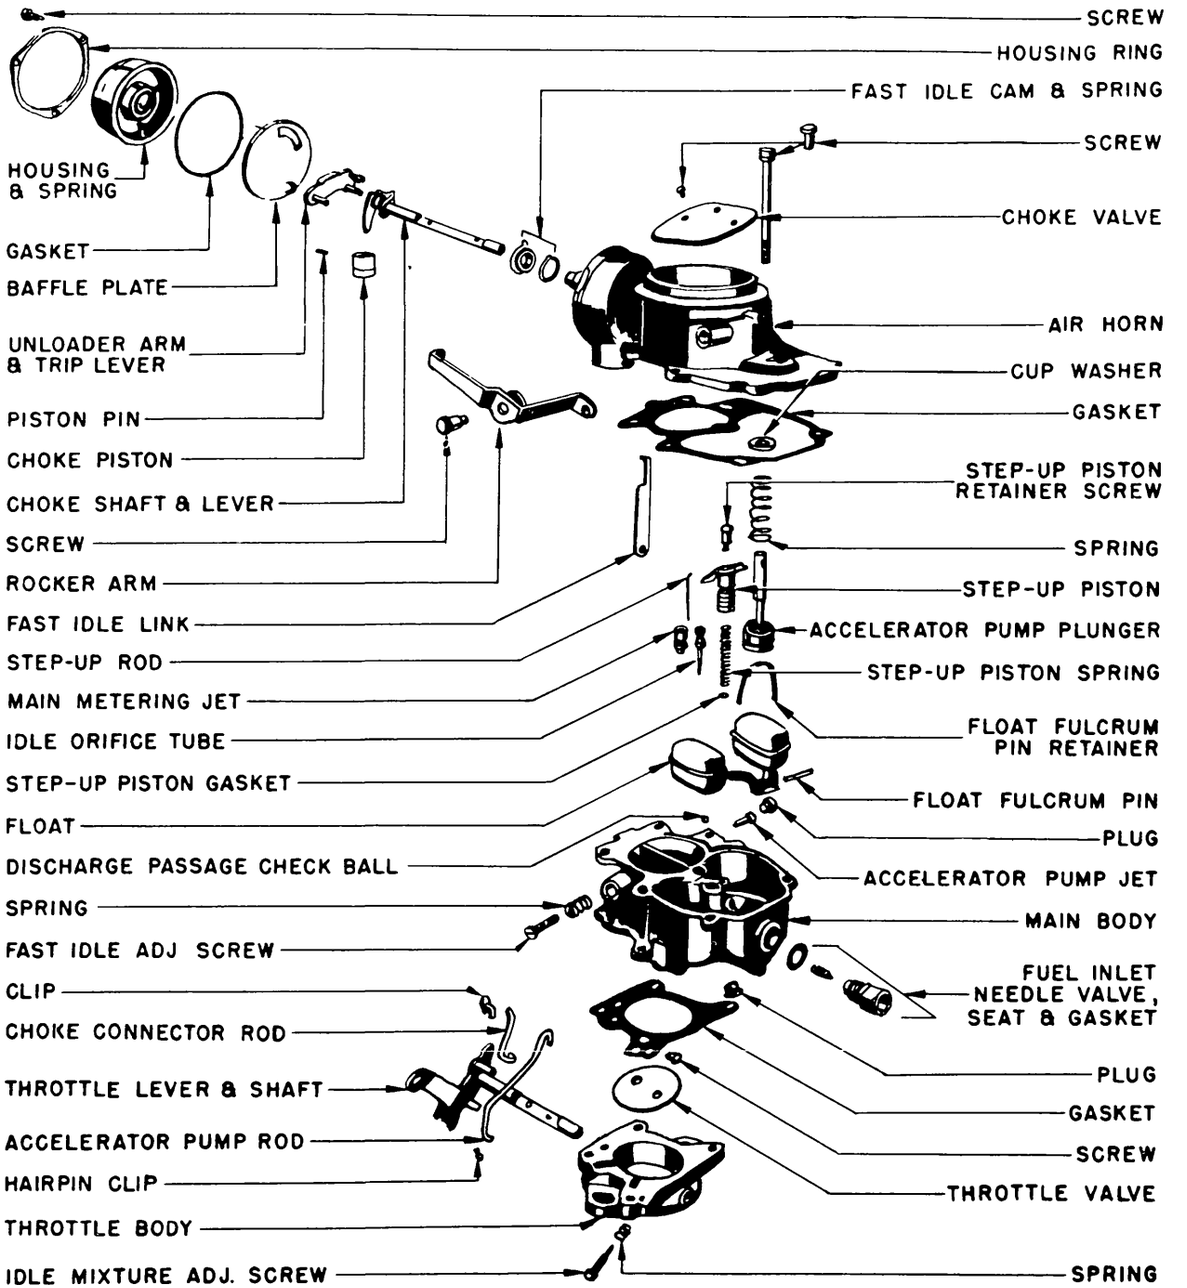
Carb.	Idle Mixture Setting
2293S, 2294S, 2295S, 2403S	1/2 - 1 3/4 turns
2063SA, 2062SA, 2116SA	1/2 - 1 1/2 turns
2410S	1 - 2 turns

Idle Speed Setting

Carb.	S-M & O.D.	PowerFlite
All Models	450-500 RPM	Ⓒ 475-500 RPM

Ⓒ - In Neutral.

Accelerating Pump Setting: Check Pump Stroke when overhauling carburetor, change Seasonal Setting as required for best performance



Seasonal Setting—Three holes provided in throttle lever for connector rod engagement Provides varied pump stroke as follows:

Center Hole —Medium stroke and normal setting

Upper Hole —Minimum stroke (less fuel delivery)

Lower Hole —Maximum stroke (more fuel delivery).

Pump Stroke Setting—Connect pump rod in correct hole of throttle lever (see table below), back off throttle stopscrew and make certain that throttle valve fully closed (choke valve must be open) Use scale placed on bowl cover adjacent to pump plunger to measure height of top edge of plunger (not pump arm) If height not correct, adjust by bending connector rod at lower angle near throttle lever, using bending tool T109-213

CARTER "BBS" SINGLE CARBURETOR

Pump Stroke Setting

Car & Carb.	Plunger Height	Connector Rod
Plymouth (All)	54/64"	Center Hole

Fast Idle Setting: Remove thermostatic coil assembly, gasket, and baffle plate for access to fast idle mechanism (within choke housing) Back out throttle stopscrew Crack throttle valve open, hold choke valve in fully closed position, then close throttle valve This will place fast idle cam in fast

CONTINUED ON NEXT PAGE

CARTER "BBS" (C nt.)

idle position. Measure throttle valve opening by inserting gauge (see table below) between throttle valve edge and bore on side opposite idle ports. If the throttle opening is not correct, adjust by bending choke connector rod at lower angle, using bending tool T109-213. ***Adjust Unloader before reassembling choke.***

►*CAUTION:* Be sure cam trip lever is all the way in piston housing with lug contacting cam.

Fast Idle Setting

Carb.	Checking Gauge	Throttle Opening
2062S, 63S, 2116S	T109-29	.022-.026"
2293S, 94S, 95S, 2380S	T109-44	.016-.020"
2410S, 2403S	T109-44	.016-.020"

Unloader Setting: After fast idle adjusted (above), hold throttle valve wide open, close choke valve as far as possible without forcing. Measure choke valve opening by inserting gauge (see table below) between upper edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending arm on choke trip lever (within choke housing) using bending tool T109-214. Then reassemble and adjust automatic choke.

Unloader Setting

Car & Carb.	Clearance & Checking Gauge
Plymouth (All)	9/64" T109-34

Automatic Choke Setting: After unloader adjusted (above), install baffle plate, gasket, and thermostatic coil housing assembly. Make certain that hook on coil picks up choke shaft lever, rotate cover until mark is in line with longer center graduation of scale on housing (centered setting), tighten retainer screws.

Automatic Choke Setting

Car & Carb.	Setting
Plymouth (All)	Centered (At Index)

Slow-closing Throttle Dashpot (PowerFlite equipped cars): To check the setting, close throttle valve fully, measure distance dashpot plunger can be moved inward (hold plunger in and measure clearance between end of plunger and throttle lever with a feeler gauge). This clearance should be 3/32" for maximum dashpot action. Adjust by loosening locknut and turning dashpot in or out of mounting bracket.

Kickdown Switch Adjustment (Cars with Overdrive): Hold throttle valve in wide-open position, check clearance between kickdown lever on throttle shaft and end of switch stem guide (after switch plunger has moved inward to kickdown position). This clearance should be 1/64-3/64": Adjust by moving switch up or down on bracket (loosen one mounting nut, tighten opposite nut).

Float Level: Float level must be checked with bowl cover gasket and float pin retainer removed. To check float level, remove air horn and bowl cover assembly, remove gasket. Remove float pin retainer. Hold lip on float arm against seated intake needle and see that **float pin is at bottom of guide slots.** Place checking gauge squarely on top edge of bowl with gauging lugs directly over centers of floats. Gauge lugs should just touch tops of floats. Adjust by bending float arm to equalize floats, bend lip on float arm if both floats require same adjustment.

►***CAUTION***—Floats must not rub against inner wall of float bowl. Bend float arm as required to provide clearance on all sides of floats.

Float Level Setting

Carb.	Checking Gauge	Float Setting
2062SA, 63SA, 2116SA	T109-239	Ⓒ 7/32"
2293S, 94S, 95S, 2380S	T109-239	Ⓒ 7/32"
2410S, 2403S	T109-239	Ⓒ 9/32"

Ⓒ - Gauge used for both 7/32" & 9/32" settings.

OVERHAUL: BBS carburetors are overhauled in same manner as BBD models except that they are single barrel rather than dual carburetors.

SERVICE PARTS: Gasket Sets - Carter No. 252 (2062SA, 63SA, 2116SA, 2293S, 94S, 95S, 2403S, 2410S).
Repair Pkg. - Carter No. 1766 (2062SA, 63SA, 2116SA), 1817 (2293S, 94S, 95S, 2380S), 1838 (2403S, 2410S).

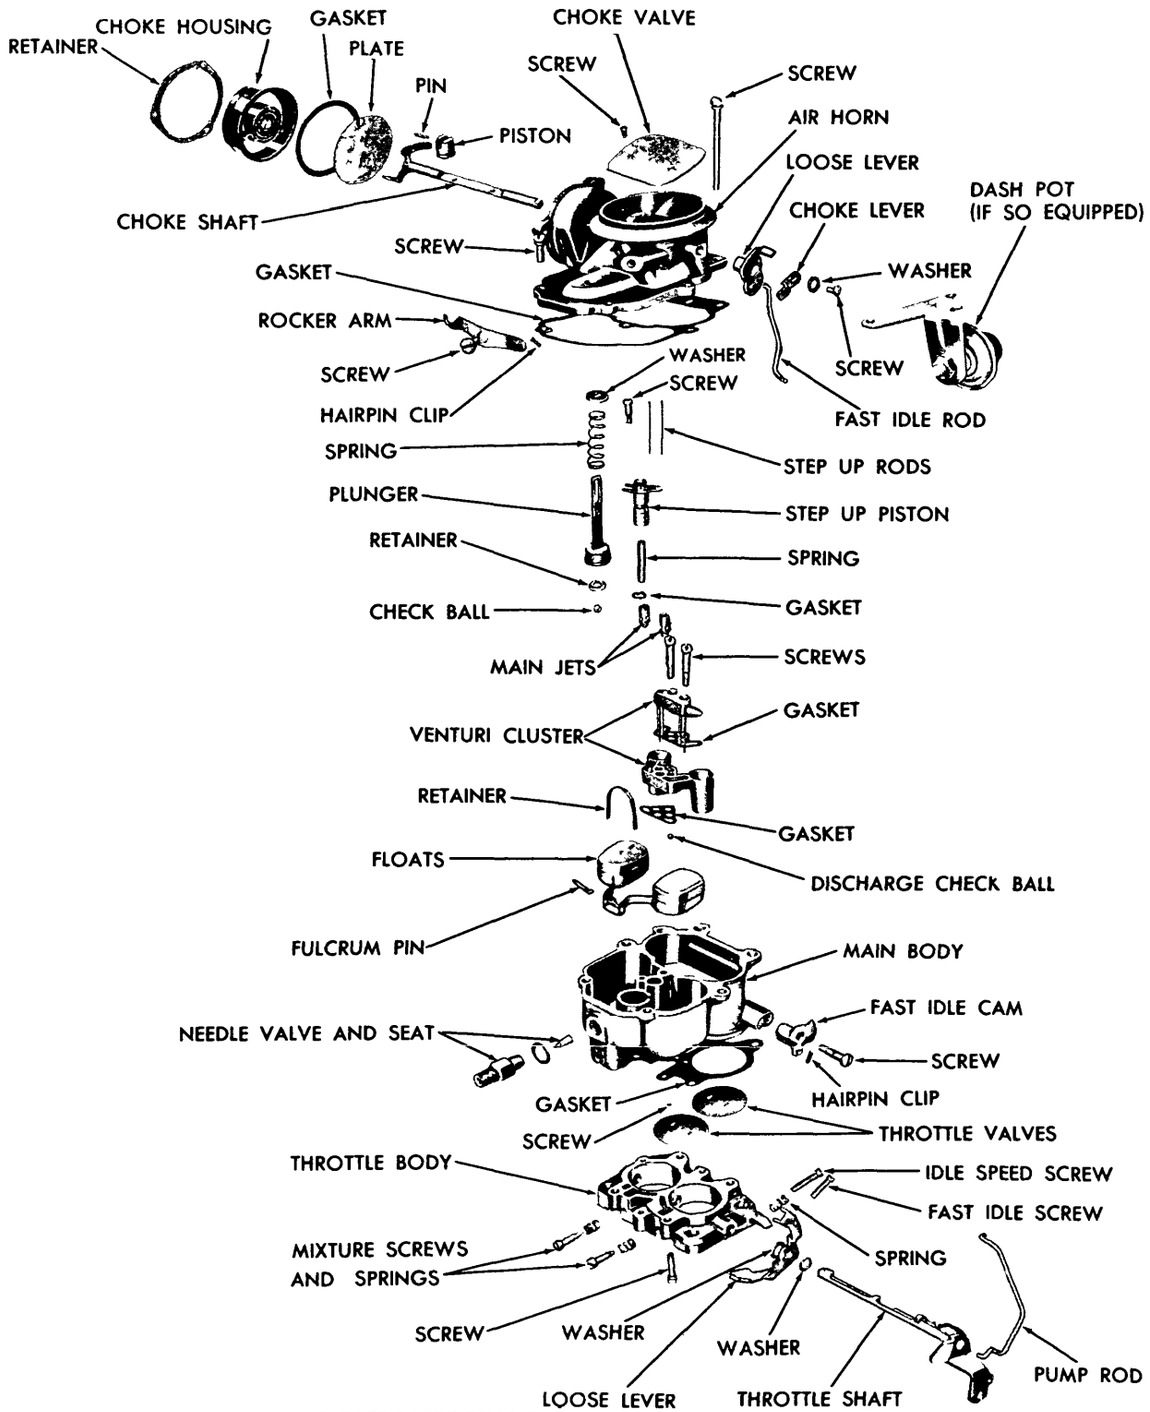
DESCRIPTION: Dual or double barrel downdraft type with automatic choke control.

Venturi Cluster (Main Nozzle) Assembly—This assembly consists of the secondary venturis, main nozzles, main vent tubes, and idle tubes which are mounted as a unit in the main body (attaching screws are hollow with calibrated restriction at upper end and serve as Idle Air Bleeds).

Metering Jets & Step-up Mechanism—Metering jets are fixed type located in bottom of bowl. Each jet has a metering wire (step-up rod) in the jet which is controlled by the vacuum step-up piston. For normal operation, when manifold vacuum holds vacuum piston down, fuel flow through the jets is restricted by the metering wire. For full power or acceleration, when manifold vacuum drops off, the vacuum piston is moved upward by the step-up piston spring and lifts the metering wires out of the jets allowing increased fuel flow to the nozzles.

Accelerating Pump—Similar to other pumps except that pump plunger is operated through idler lever or walking beam mounted on side of air horn. Pump discharge jets are vented to carburetor bowl through passage in air horn to prevent fuel being discharged through these jets during high speed operation when a vacuum exists at the jets.



Automatic Choke—Same design as used on previous Chrysler and DeSoto cars

ADJUSTMENT: Make adjustments in order as listed below (except for Idling and Pump settings).

IDLE ADJUSTMENT

Idle Screw Setting—Adjust only with engine warmed up to normal operating temperature so that choke valve wide open and fast idle inoperative. Make a preliminary setting by turning both idle screws out 1 turn from inner seated position. Set idle speed at 475-500 RPM. (use tachometer). Then turn both idle screws in or clockwise 1/8 turn for leaner mixture, if engine speed increases and engine is smoother, turn both screws in an additional 1/8 turn, reset idle speed and adjust each screw separately in or out not more than 1/8 turn for smoothest performance and highest RPM. If

CONTINUED ON NEXT PAGE

CARTER "BBD" DUAL D WNDRAFT CARBURETOR

CARTER BBD DUAL (C nt.)

first leaning of the mixture (when both screws turned in 1/8 turn) causes engine speed to drop off or engine is rougher, reverse the above procedure by turning the screws out or counter-clockwise for richer mixture.

Idle Speed - 500 RPM (Chrysler), 450-500 RPM (DeSoto), 450-500 (S-M), 475-500 RPM (PowerFlite) Plymouth Shift lever in Neutral.

ACCELERATING PUMP

Pump Str ke Setting - Seat throttle valves in bores, open choke valve, connect pump connector rod in correct hole (see table) of throttle lever and pump arm pin in top hole of plunger shaft. Distance from top of bowl cover to top of plunger shaft should be as indicated in table To correct bend throttle connecting rod.

Pump Stroke Setting

Carburetor	Scale	Throttle Lever Hole
2216S,50S,59SB	1"	Outer
2260SB,61SB,74SA	1"	Outer
2422S,23S,24S	1"	Outer
2312S, 13S	31/32"	Outer
2299S	1 1/32"	Center
2300S,01S,08S	1 1/32"	Center
2309S,SA,10S	1 1/32"	Center
2407S,08S,09S	1 1/32"	Center

FLOAT LEVEL

Carburetor	Checking Gauge	① Float Level
2307S,8S,9S,SA,12S,13S	T109-282	1/4"
All Others	1109-239	7/32"

① - Top of float to top of body casting.

Float Level Setting—Take off air horn and bowl cover, remove bowl cover gasket. Remove float pin retainer. Hold lip of float arm firmly against intake needle with the needle seated and make certain that float pin is at the bottom of its guide slots. Place correct gauge (see table) squarely on top edges of float bowl with gauging legs directly above center of each float. Each float should just touch gauge. If float heights not equal, adjust by bending one float arm, then adjust float height by bending lip on float arm.

Float Clearance Setting—Floats must not rub on inner walls of float bowl at any point throughout their entire travel. Adjust by bending float arms slightly for clearance on all sides of floats.

CAUTION—Both floats must be set alike and floats must b adjusted vertically (for correct float level) and laterally for clearance in bowl (to prevent floats dragging on sides of bowl).

►***AIR HORN INSTALLATION CAUTION*—When air horn removed for float level setting, spring will lift step-up piston so that step-up rods will pull out of metering jets. Install air horn exactly as follows: Press step-up piston down and guide rods into metering jets, place thin steel rule across bowl to hold piston down. AFTER air horn replaced, slide rule out.**

FAST IDLE

Carb. No.	Throttle Opening	Checking Gauge
All Models	.015"	T109-44

Checking & Adjusting - (Models with fast idle cam in choke housing). Remove thermostatic coil housing assembly, gasket, and baffle plate. Crack throttle valve to allow fast idle mechanism to operate, close choke valve fully, then close throttle valve. Check throttle valve opening or clearance between edge of valve and bore on side opposite idle ports using Gauge T109-44 (double end Gauge, 015" & .018") Adjust by bending choke connector rod at lower angle using bending Tool T109-213. Then check and adjust unloader.

Fast Idle Cam Clearance - (Models with fast idle cam on throttle body) Adjust by bending lip on inner choke shaft lever to obtain .020" (Gauge T109-29) between lip on fast idle cam and boss on casting with choke valve closed and lip on inner choke shaft lever contacting lug on outer lever. *NOTE* - On late carburetors, align index mark on cam with adjusting screw

Fast Idle Throttle Clearance - (Models with fast idle cam on throttle body) Same as other models after making Fast Idle Cam Clearance, adjustment.

UNLOADER

Carburetor	Choke Opening	Checking Gauge
①	1/4"	T109-28
②	3/16"	T109-31

① - Models with fast idle cam in choke housing.
② - Models with fast idle cam on throttle body

Checking & Adjusting - (Models with fast idle cam in choke housing) After fast idle adjusted (above), hold throttle valves wide open, close choke valve as far as possible (*CAUTION* - do not force valve closed). Check choke valve opening or clearance between upper edge of valve and air horn wall using correct gauge (see table above). If choke opening not correct, adjust by bending arm on choke trip lever, using Tool T109-214. Assemble thermostatic housing, gasket, and baffle plate, adjust automatic choke

Checking & Adjusting - (Models with fast idle cam on throttle body). Hold throttle valves wide open. Close choke valve as far as possible. Do NOT use force. Measure distance or clearance between top edge of choke valve and inner wall of air horn. Adjust by bending choke unloader arm on throttle lever. (Use Tool T109-213).

AUTOMATIC CHOKE

Setting - Mark on choke cover and proper line of scale on choke housing as follows

Car & Carb.	Setting
2310S,13S	One Point Rich
All Others	Set On Index

***SETTING CAUTION*—Heat tube connection on cover must be loosened to remove or adjust choke cover. When tightening heat tube coupling, hold connection on cover with second wrench to prevent rotating or distorting cover.**

SLOW-CLOSING THROTTLE DASHPOT

►*1956 PLYMOUTH "POWERFLITE" V8 DASHPOT CHANGE:* Installation of dashpots on PowerFlite equipped V8 cars has been discontinued. Dashpots will still be installed on PowerFlite cars with 6 Cylinder engines.

(PowerFlite Cars)

Checking & Adjustment—Check dashpot action with engine running by shifting to Driving Range (use brakes to hold car) and rapidly depressing and releasing accelerator pedal. If engine stalls, increase dashpot action by turning adjusting screw on end of dashpot plunger. Maximum dashpot action is secured with adjusting screw set so that dashpot plunger can be moved inward approximately 3/32" after engine has returned to normal idle speed. If correct action cannot be secured by adjusting dashpot, tune up engine and recheck performance.

KICK-DOWN SWITCH

(Overdrive Cars)

Adjustment—Place throttle valves in wide open position and adjust hex nuts on switch to have 1/64"-3/64" clearance between kickdown lever and switch stem guide

THROTTLE VALVE SETTING

Carburetor	① Idle Port	② Vacuum P rt
2216S,50S	.102-.106'	.030-.040"
2308S,09S, 10S, 2422S, 23S, 24S	.148-.152"	.035-.045"
All Others	.144-.148"	.035-.045"

① - Opening above upper edge of valve.
② - Top of Port above upper edge of valve.

Disassembly, Cleaning and Inspection, Reassembly: Carburetors with fast idle cam in choke housing. *See 1955 Annual Data or later Manual edition.*

Carburetors with fast idle cam on throttle body. Same as above except for **Choke Shaft Disassembly and Reassembly,** which follows Remove screws that attach thermostatic coil spring housing to air horn. Remove coil spring housing, spring, gasket and baffle plate. Use file or suitable tool to remove staking portion of screws, that attach valve to choke shaft and remove screws, sliding choke valve out of air horn. *CAUTION* - DO NOT break screws off in shaft. Remove screw that attaches choke lever to choke shaft. Hold choke shaft lever firmly with fingers to avoid jamming choke piston in its well. Slide choke lever, loose lever and washer off end of shaft Turn shaft clockwise until choke piston clears top of its cylinder, and withdraw choke piston link and shaft from air horn.

Choke Shaft Reassembly. Slide choke shaft and piston into air horn Turn choke shaft clockwise until piston clears choke well, then turn counter-clockwise allowing piston to enter well. Slide choke valve into position and start new screws. Holding valve in closed position, tap gently with screwdriver handle to center and locate valve. Tighten and stake screws securely Hold air horn in upright position and close choke valve. Choke valve should open freely of its own weight. *DO NOT lubricate the choke operating parts* Install choke baffle plate and gasket. Place coil housing retaining ring over housing, and with index mark in down position, install the coil housing. Turn housing clockwise until index on the rim is in line with center index mark on air horn. Install screws and tighten securely. Slide choke shaft loose lever and sleeve on choke shaft, and install choke shaft lever washer and screw

1956 CARTER BB UPDRAFT CARBURETORS

CARTER BB UPDRAFT

CHEVROLET FORWARD CONTROL — **Carter Model**
All Series Trucks — 871SB

►**ACCESS TO CARBURETOR (for Adjustment or Removal):** **Forward Control Models**—Remove toe pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod, remove toe pan.

DESCRIPTION: Plain tube, updraft type of same design as used on previous Chevrolet models

ADJUSTMENT & SERVICING: *See complete "Carter (BB) Updraft Type" carburetor in Carburetor Section of Manual and set this carburetor to the following specifications*

IDLING ADJUSTMENT

Idle Screw Setting—½-1½ turns open (turn screw out for richer mixture).
Idle Speed—450-500 RPM (Std Trans.), 400-450 RPM (Auto Trans in Neutral)

FLOAT LEVEL SETTING

Float Level—0-1/32" (Carter Gauge T109-49 or Chevrolet J-818-13A) from top of float to top edge of bowl with needle valve seated.
CAUTION—Use 1/32" side of gauge (other side used for 1/16" settings).
Intake Needle & Seat Assembly—Carter No. 25-44S

ACCELERATING PUMP

Pump Seasonal Setting—Short Stroke—Summer, Long Stroke—Winter.
Pump Stroke—9/16" (Short Stroke) with connecting screw in holes in throttle lever and pump link nearest throttle shaft, 1" (Long Stroke) with screw in holes farthest from shaft.

THROTTLE VALVE SETTING

Idle Port—.005-.009" from top of lower idle port to lower edge of throttle valve
Vacuum Spark Port—.000-.004" top of port below lower edge of throttle valve
NOTE—Above specifications apply with throttle valve tightly closed.

SERVICE PARTS

Gasket Set—Carter No. 202 (871SB),
Repair Pkg. (with Std. Met ring Jet)—Carter No. 1539A (871SB).

►CHANGES, CAUTIONS, CORRECTIONS

►*ROUGH IDLE CORRECTION (FORD PASS. CARS):* If engine rough idle cannot be eliminated by idle mixture screw adjustment, check for fuel being discharged from secondary transfer holes, or secondary discharge nozzles. Correct this condition by cleaning out secondary high speed bleeds which if plugged will cause a siphoning action.

►*1956 FORD HARD COLD STARTING CORRECTION (CARS WITH B6A-9510-L, M CARBURETORS):* Install Choke Kit, Part No. B6A-9849-D which contains all parts used on the later B6A-9510-N, Q carburetor choke assemblies. The complete kit must be installed as the individual parts are not interchangeable with the earlier parts. Install kit as follows: Disconnect choke outlet tube and remove the bi-metal spring cover, gasket and plate. Remove choke housing as an assembly (the fast idle cam will be loose and can also be removed). Remove choke plate nearest to choke housing. Check for any binding in linkage after plate removed. Install new plate, but do not tighten. Align choke plate by placing a ¼" wide strip of paper between choke plate and air horn. Close choke plate and tighten the screws (check for any binding before screws are tightened). Position new fast idle cam and bearing assembly. Use a new gasket and install the new choke housing as a complete unit. *(NOTE* - On early cars where the fast idle cam swings on a boss which is an integral part of the main body, it will be necessary to use the original cam plus the new spacer). Check operation, then open choke plates fully by means of the bi-metal arm. Position template (part of choke kit) on choke housing so that bi-metal operating arm protrudes through hole in template. Rotate template clockwise to close the choke completely. Scribe a mark on the choke housing at position where point of arrow on template indicates (this will be the central point of the bi-metal spring adjustment). Remove template and install gasket, plate and bi-metal spring cover. Set the cover on the line scribed on housing (disregard notches cast in choke housing). Connect the choke control outlet tube to choke housing, and place accelerator pump link in the hole giving the longest stroke. Adjust carburetor.

►*1956 CHOKE BINDING NOTE:* This condition may be caused by front portion of the aluminum heat baffle being bent toward the rear causing it to bind on choke linkage.

►*1956 FORD ACCELERATING PUMP PISTON ROD REPLACEMENT (ON B6A-9510-N CARBURETOR) NOTE:* The later type piston rod with an additional hole in the top end, Part No. B6A-9531-C, can be used as a replacement when used with later Main Body Cover, Part No. B6A-9984-D.

►*1956 FORD CARBURETOR DRY FLOAT LEVEL CAUTION:* B6A-9510-Q carburetor float level is 7/32". Float level of other carburetors is 1/4".

►*1956 LINCOLN & CONTINENTAL HARD COLD STARTING CORRECTION:* If after depressing the accelerator, the choke plates do not set themselves, the cause may be that too much stock has been removed from upper tip of cam at the point where cam contacts the choke link roller. Correct by replacing the choke cam assembly. Check the choke by operating the choke plates by hand with the throttle plates held open, to determine if the bi-metal spring in the assembly is imparting a closing action to the choke plates. If there is no closing tension, check the following: Choke link must be in place and held in its position by tab of thermostat lever. If link is found to be disengaged, reinstall choke link and bend tab of choke thermostat lever toward link sufficiently to prevent link from becoming disengaged, allowing sufficient clearance between tab of thermostat lever and choke link to permit operation without binding or sticking. Eye on thermostat spring must fit over tang on thermostat lever. Adjust choke setting.

►*1956 LINCOLN ECU-9510-D & MERCURY B6A-9510-N CARBURETOR PRODUCTION CHANGE:* A sleeve spacer, Part No. B6A-9644-A designed to provide a bearing surface for the fast idle cam assembly on these carburetors is available for service replacement, and should be installed between the integral choke housing and throttle body.

►*1956 LINCOLN VAPOR LOCK NOTE:* This condition may be caused by the fuel pump-to-fuel tank tube hose assembly being too small. The correct hose is Part No. LE-9288-A and an inside diameter of .310".

►*1956 LINCOLN & MERCURY AUTOMATIC CHOKE MALFUNCTION NOTE & AIR HEATER TUBE PRODUCTION CHANGE:* Improper choke action may be caused by a broken or leaking air heater tube which would be indicated by carbon deposits in choke housing. If this is the case, replace the early type air heater tube with Part No. ECU-9890-S (Lincoln), B6A-9890-A (Mercury) as follows: Remove intake manifold and inspect both ends of tube for leakage or insufficient clearance, particularly the small end (right side of manifold), which may be constricted or not properly entering hole in manifold. In this case it will be necessary to ream the small hole using a 5/16" Keystone expansion reamer with the adjusting screw removed. Turn reamer into manifold until 1/2" of cutting surface is sticking out. *(NOTE* - Later manifolds having an "X" stamped on right exhaust leg just below choke, have the manifold reamed slightly larger in production and do not require additional reaming). Install the new heat tube by inserting the small end of tube into large hole in manifold and guide it through heat riser until the end is started into small opening. Drive tube the rest of the way with a punch large enough to contact full diameter of tube.

►*1956 LINCOLN & MERCURY FLOAT & FLOAT SPRING PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE (To Maintain a Steady Fuel Level):* A new float Part No. B6A-9550-B, and float spring, Part No. B6A-9958-A is being used in production and can be used for service replacement on earlier 1956 carburetors. Carburetors having the later type float and spring assembly are identified by an "S" stamped on carburetor mounting flange adjacent to the idle adjusting screws. With the use of the later type float and spring, the dry float level has been changed to 7/32" in order to maintain a fuel level of 1/2".

►*1956 MERCURY HARD STARTING CORRECTION (ON A FEW EARLY CARS):* On carburetors built before the third week in September, identified by a date code on accelerator pump tower of the float bowl cover (Example: 5-9-3 means 1955, September, 3rd week), turn the automatic choke cover clockwise three additional notches.

►*1956 FORD, LINCOLN, MERCURY BOWL EXTERNAL VENT SEASONAL SETTING CHANGE:* For winter operation, close vent for temperatures below 30° F, and open vent for temperatures above 30° F.

DESCRIPTION: Four barrel downdraft type with integral automatic choke. Design is similar to that used on 1955 carburetors. Automatic choke thermostatic coil housing is mounted on air horn and directly connected to choke shaft.

ADJUSTMENTS: *Make all adjustments exactly as follows:*

Idle Setting: First set BOTH primary idle mixture adjusting screws (see table below) for initial adjustment. Start engine and operate it until normal operating temperature is reached with choke valve wide open and fast idle cam in slow idle position. Back off fast idle screw so it clears the fast idle cam. Set engine idle speed to correct hot or slow idle (see table below) by turning slow idle speed adjusting screw. Turn one idle mixture screw in until engine begins to run rough (lean), then back off screw until engine begins to roll (rich), then turn screw inward just enough to provide smoothest engine idle. Fuel mixture should favor the rich side. Repeat this procedure on other mixture screw. Recheck idle speed and if not within limits, readjust to correct specifications.

Initial Idle Screw Setting

Model	Turns Out
Ford (All Models)	5/8
Continental-Lincoln-Mercury	1 1/2

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY CENTRI-QUAD (Cont.)

Idle Speed

Model	Idle Speed
Continental	①475-500 RPM
Ford (Synchro-mesh & Overdrive)	475-500 RPM
Ford (Fordomatic)	②475-500 RPM
Lincoln	①475-500 RPM
Mercury (Synchro-mesh & Overdrive)	475-500 RPM
Mercury (Mercomatic)	②475-500 RPM

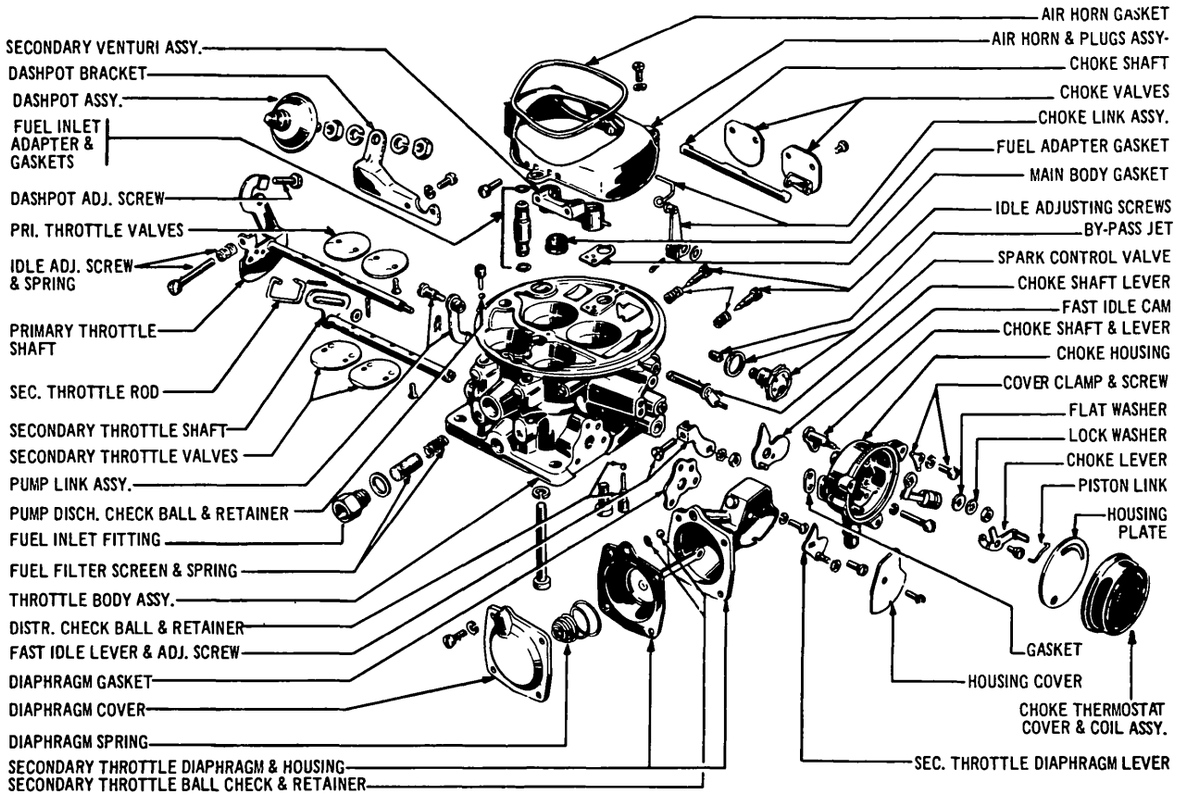
①—With transmission in "N" (Neutral).
②—With transmission in "N" (Neutral). Recheck with transmission in "Dr" (Drive), and adjust to 425-450 RPM, if necessary.

Fast Idle Setting: After making idle speed adjustment and with engine at normal operating temperature, turn fast idle speed adjusting screw until it just touches lowest step of fast idle cam. *NOTE*—If this setting is unnecessarily high, the idle speed may be reduced by backing off the adjusting screw not to exceed one full turn.

D popper Adjustment (Trucks): *(NOTE*—Depopper adjusting screws are located on underside of throttle body and carburetor must be removed for adjustment. Turn each screw in until spring is completely compressed, then back off screw 2 7/8 turns (adjustment must be held as close to this specification as possible). If engine popping is evident after idle adjustment and depopper ball adjustment is correct, back off depopper adjusting screws 1/8 turn at a time until popping is eliminated.

Dashpot Setting (All Auto. Transmissions): After idle adjustment completed, turn ignition off, see that fast idle cam in slow idle position, hold throttle lever in closed position, turn dashpot adjusting screw out (counter-clockwise) until dashpot rod is pushed in to the limit of its travel, then turn adjusting screw in (clockwise) 1½-2 turns which will provide correct clearance of .045-.064".

Accelerating Pump Setting: Set pump link in hole closest to throttle shaft (shortest stroke) for average or hot weather operation, outer hole for cold weather operation.



B wl External Vent Seasonal Setting: Adjust clip on lower end of accelerator pump rod to open or close vent hole for best operation as follows:

Winter Operation (Temperatures below 30° F) – Slide clip down on lower end of accelerator pump rod so that vent hole is CLOSED.

Summer Operation (Temperatures above 30° F) – Slide clip upward on accelerator pump rod so that full diameter of vent hole is OPEN.

► *NOTE – The above vent settings sup rs d the previous 50° F. setting.*

S c ndary Throttle Op rating Diaphragm Ch ck: Remove carburetor from engine, remove main body and choke housing from throttle body. Fully open (at the linkage) both primary and secondary throttle. Block off the secondary vacuum openings in the right primary and secondary venturi with the fingers. Release secondary throttle linkage while holding primary throttle linkage open. If no leak exists secondary throttle plates should remain partially open. To check diaphragm unit, remove complete diaphragm and housing assembly from carburetor. Pull diaphragm rod in a direction to compress spring. Cover slot located in housing to carburetor mounting face with finger. Release diaphragm rod. If no leaks exist spring should remain partially compressed.

FORD, LINCOLN, MERCURY CENTRI-QUAD CARBURETOR THROTTLE B DY ASSY.

Fu l L vel (All Mod ls): Remove air cleaner, anchor screw and main body cover from carburetor. Connect a jumper wire from distributor primary terminal to ground. Crank engine until fuel bowl fills to operating level. Check fuel level with Gauge T54L-9550-C (Ford Pass. Car & Truck), Gauge 9550-AH (Continental, Lincoln, & Mercury) squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as the longer "GO" pin, but must not touch the shorter "NO GO" pin. Adjust by bending float tab. *CAUTION—Both sid s of float must be the same height and must not touch side walls of float bowl.*

► *FLOAT LEVEL PRODUCTION CHANGE (CONTINENTAL, FORD, LINCOLN & MERCURY): See "Changes, Cautions, Corrections" above.*

Float Level: (Ford) 1/4" (Exc. B6A-9510-Q), 7/32" (B6A-9510-Q). **(Continental, Lincoln & Mercury)** 1/4" (Except carburetors marked "S" on mounting flange), 7/32" (Carburetors marked "S" on mounting flange). *See "Changes, Cautions, Corrections" above.*

► *FUEL LEVEL NOTE (ALL MODELS): Fuel level should be 1/2" ± 1/32".*

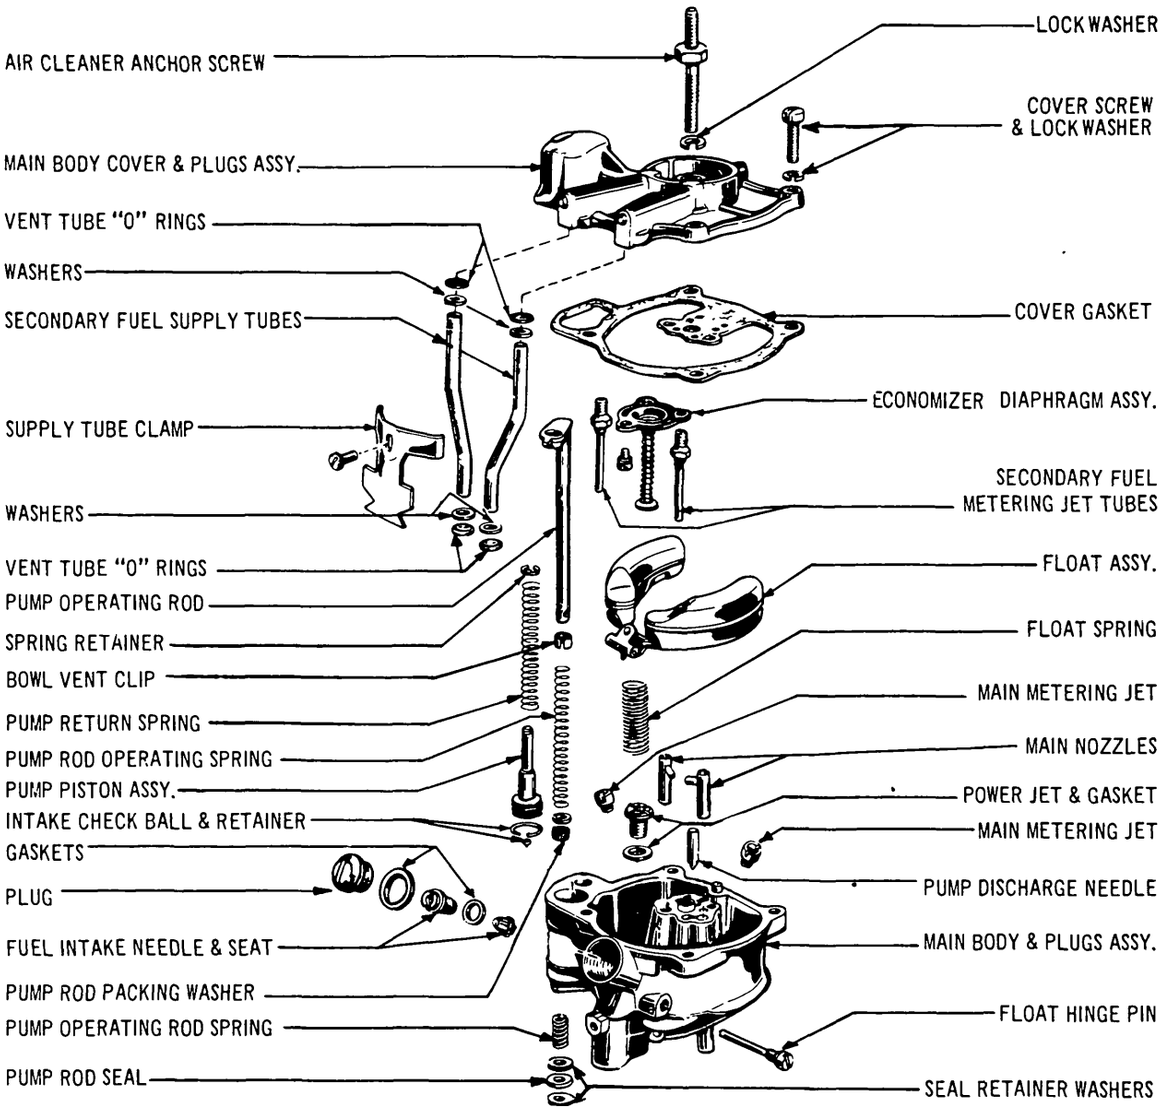
Automatic Choke Setting: *(NOTE—Automatic choke thermostatic coil housing is now located on air horn and directly connected to choke valv shaft, eliminating the necessity of choke rod adjustment).* Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retaining screws and rotating cover assembly.

Spark C ntr l Valv : No adjustment required. If operation not satisfactory, remove and inspect valve for free movement of stem and inspect passage in adapter screw.

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY CENTRI-QUAD (Cont.)

OVERHAUL: Check Secondary Throttle Operating Diaphragm before disassembling carburetor (see below). Then disassemble and overhaul carburetor as follows:



►*SECONDARY THROTTLE OPERATING DIAPHRAGM CHECK (Before disassembling carburetor):* Fully open secondary throttle valves and block off diaphragm passage at opening in primary stage venturi (use eraser end of a pencil) BEFORE releasing secondary throttle valves. Valves should remain open as long as venturi opening is blocked off. If valves do not remain open, diaphragm or gasket seal between diaphragm assembly and throttle body may be defective. Remove assembly from carburetor, disassemble, and inspect. Also inspect ball check valve located in diaphragm cover.

Disassembly (Secondary Throttle Operating Diaphragm): Take out attaching screw and remove vacuum diaphragm assembly cover plate. Remove retainer securing diaphragm rod to pin on lever and screw holding diaphragm lever on secondary throttle shaft, remove lever. Take out three screws retaining diaphragm housing on carburetor throttle body, remove diaphragm assembly and gasket.

Main Body Disassembly: Remove center stud, and lockwasher. Remove cover retaining screws, then lift cover off main body. Remove screw and bracket retaining secondary fuel tubes. Remove secondary fuel tubes by gently pulling them from throttle body *(CAUTION* - Do not bend secondary fuel tubes). Remove accelerator pump link from operating rod and throttle lever. Remove stud and vent clip from lower end of pump operating rod, then lift pump assembly out of main body. Remove pump rod dust seal, washer and spring. Remove pump rod upper seal and washer. Lift main discharge nozzles out of main body with a pair of needle nose pliers. Use care not to damage nozzles. Invert carburetor and catch pump discharge needle as it falls out. Remove float inlet needle seat spring and seat. Unscrew float hinge pin and lift float assembly out of main body. Remove float damper spring. Remove main jets, then remove power valve. Make a small hook on a suitably sized wire, then lift accelerator pump inlet check ball retainer out of pump well. Invert carburetor and catch inlet check ball as it falls out. Remove secondary jets from main body cover, remove power valve diaphragm retaining screw, then remove diaphragm and stem assembly. If necessary, disassemble accelerator pump assembly. Slip piston cup off end of piston stem. Compress stem spring, pry off stem retainer; then remove the stem and spring from operating rod. Remove air horn to throttle body screw. Invert carburetor and remove two throttle body to main body screws. Lift off the main body and remove main body gasket. Lift air horn off throttle body, and disengage choke actuating lever from choke plate.

Throttle Body Disassembly: Remove idle fuel adjustment needles and springs. Remove the three choke retaining screws, then remove cover and gasket. Remove choke heat shield. Remove thermostatic spring lever, and the small wire connecting rod. Remove three choke housing retaining screws and remove choke housing and gasket. Remove nut, lockwasher and spacer, then slip choke piston assembly out of housing. Remove lever from back side of choke housing. Remove fast idle cam. Remove spark control valve and gasket. Remove fuel inlet fitting, gasket, filter screen, and spring. Remove secondary fuel system check ball retainers, then invert throttle body and catch the two balls as they fall out. Remove vacuum passage check ball retainer from bottom of throttle body, and shake out the check ball. If so equipped, remove dashpot and bracket assembly. *NOTE* - If it is necessary to remove throttle plates for cleaning or repair, each plate must be identified as to bore from which it was removed (left or right) so that plates can be installed in their original positions.

Air Horn Disassembly: Remove choke plate screws, and choke plates. Slide choke plate shaft out of air horn. Remove lock wire from booster venturi screws, then remove the screws.

FORD, LINCOLN, MERCURY CENTRI-QUAD CARBURETOR MAIN BODY ASSY.

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY CENTRI-QUAD (Cont.)

Cl aning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*–Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, nylon distributor passage ball, dashpot assembly, or secondary throttle operating diaphragm). Blow out passages in castings with air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jet, and idle tubes for wear or clogged passages *(CAUTION*–clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts.

R assembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Throttle Plate Installation–In addition to replacing each plate in its original position, place a .004" piece of shim stock 1/8-3/16" wide between the upper side (viewed from top) of each secondary throttle plate and the throat. Hold throttle plates closed against shim stock and tighten throttle plate screws. This assures maximum manifold vacuum for smooth efficient engine idle.

Acc l rating Pump–Drop check ball into cylinder bore and tap lightly, using brass rod and mallet, to seat ball. Ball spring retainer projection must be placed over ball, and spring must bottom in cylinder bore groove.

Float Installation–Float spring must seat over boss in main body. Clip must hook the under side of float tab.

Main Body Cover Gasket–Make sure all holes have been punched in new gasket and that no foreign material has adhered to it. Never use any gasket sealer or any form of sealing compound on carburetor gaskets.

Power Valve Diaphragm Installation–Place new assembly on main body cover, position clamp, install the screw and secondary supply jets finger tight. Compress power valve stem to full limit of its travel, then tighten retaining screw and secondary supply jets. *NOTE*–Screw and tubes must be tightened while stem is in the compressed position to insure full travel of the power valve stem.

►*AIR CLEANER ANCHOR SCREW TIGHTENING CAUTION:* Over tightening may cause distortion of the carburetor main body and affect calibration of the metering passages.

Carburetor Adjustments–Make all adjustments listed in ADJUSTMENTS above.

CARBURETOR INSTALLATION ON ENGINE: Install carburetor exactly as follows:

►*CAUTION: DO NOT use gasket sealer or compound on carburetor mounting gaskets.*

1) Position carburetor over choke fresh air tube and and manifold studs. Start fuel and vacuum lines. Install carburetor to manifold attaching nuts and alternately tighten each pair of nuts in a crisscross pattern to a torque of 12-15 ft. lbs.

2) Attach throttle rod to carburetor lever and secure with a clip. Tighten choke inlet tube fitting, distributor vacuum lines and fuel line connection at carburetor. Install air cleaner.

SERVICE PARTS: *CAUTION–Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude).*

Gasket Set – Ford No. B6A-9502-C (Ford Carb.). Continental, Lincoln, Mercury No. MGK-9502-A (All carburetors).

Repair Kit (With Std. Metering Rods) – Ford No. B6A-9590-C (Ford Carbs.). Mercury No. MGK-9590-A (Mercury Carbs.). Lincoln & Continental No. HGK-9590-A (Lincoln & Continental Carbs.).

FORD V8 DUAL DOWNDRAFT

FORD V8 PASS. CARS	Ford Carburetor No.
1956 Synchro-mesh	B6A-9510-J
1956 Fordomatic	B6A-9510-K
FORD V8 TRUCKS	
1956 (272 ECY-W, Exc. Fordomatic)	B6Y-9510-A
1956 (272 ECY-W, Fordomatic)	B6C-9510-C

►CHANGES, CAUTIONS, CORRECTIONS

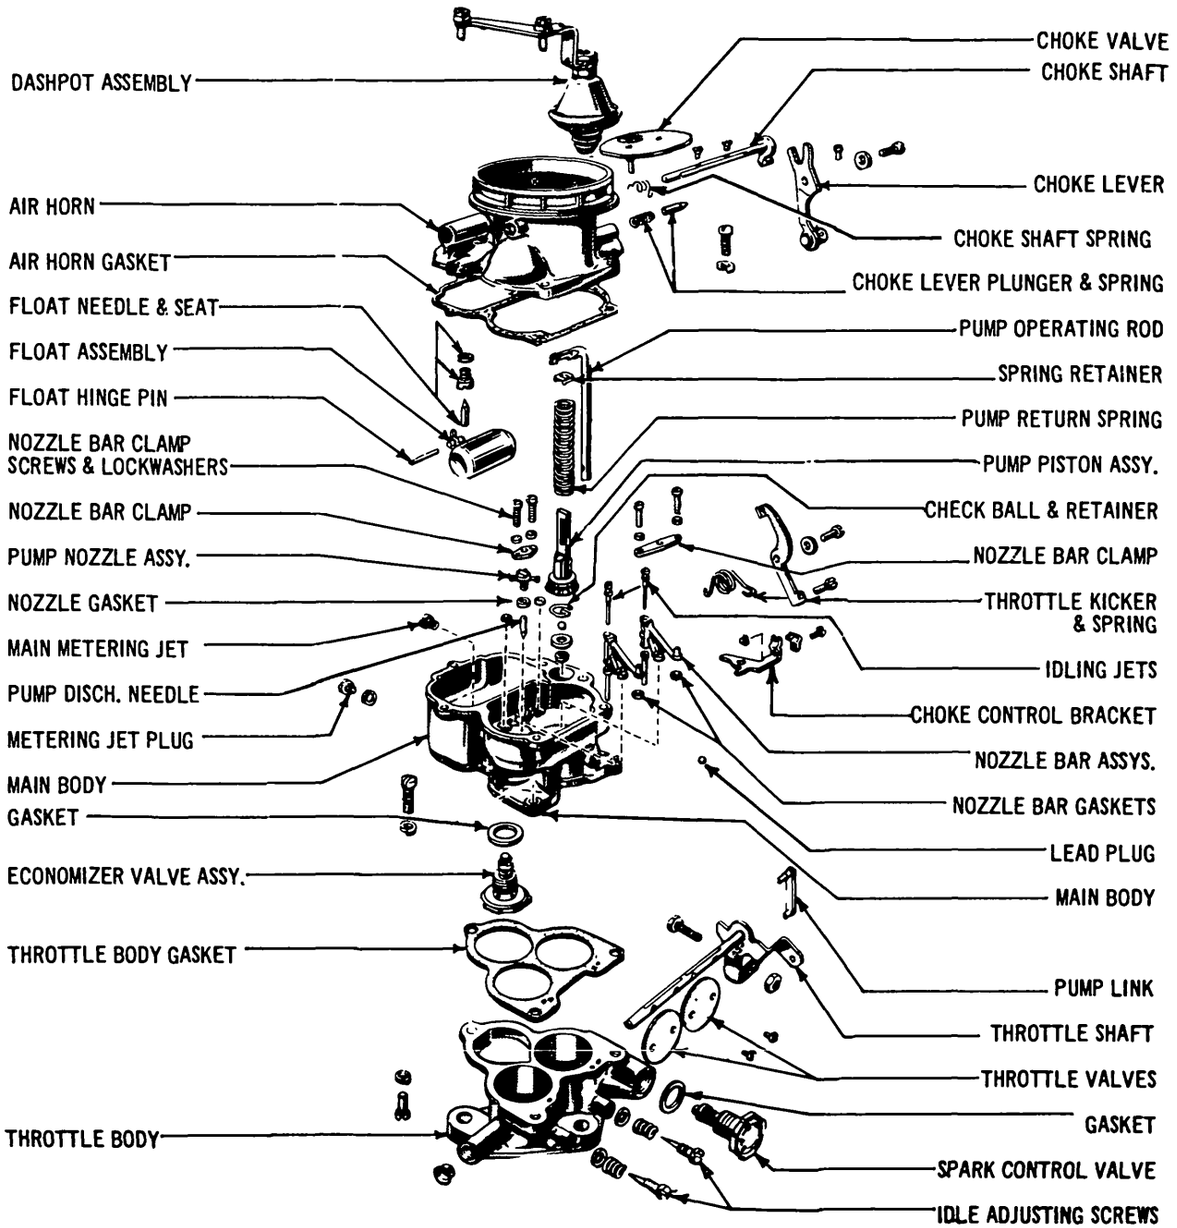
►*1956 HARD STARTING (272 Pass. Car Eng.):* New choke thermostat with new bi-metal spring, Ford No. B6A-9848-D (identification mark "56F1"), can be installed to replace choke thermostats with identification "56F" or "56D".

►*1956 ACCELERATOR PUMP PISTON ROD STICKING CORRECTION (272 Eng.):* When this rod sticks or binds, install new rod Ford No. B6A-9531-A, identified by deep blue color. Old rod was zinc plated. Free carburetor of burrs or foreign material when installing new rod.

►*HARD STARTING WHEN ENGINE HOT NOTE:* Move pump link to shortest stroke position in throttle shaft plate.

►*HARD STARTING (Due to choke bind):* To correct binding condition check for bent choke shaft or shaft misaligned with choke plate on the choke shaft. If either condition found, replace air horn assembly. When choke plate operates hard manually and no binding exists, check automatic choke piston gasket. Slot must be properly aligned to permit choke plate to completely close.

►*1956 NOZZLE BAR CLEANING CAUTION:* Use only a solvent that will not affect rubber seals when cleaning bar assemblies.



DESCRIPTION: Dual or double barrel downdraft type of same design used on previous models with distributor control vacuum connection and anti-stall dashpot (with Fordomatic Transmission only). These carburetors have Spark Control Valve in Carburetor throttle body.

ADJUSTMENT: Set these carburetors to following specifications:

IDLING ADJUSTMENT

Idle Mixture - To start engine, turn screws in to bottom lightly, then turn screws out 1 turn. Run engine for 20 minutes at fast idle speed to bring it to normal operating temperature. Make sure fast idle cam is in slow position. Turn each screw in equally until engine begins to run rough from lean mixture, then turn each screw out equally until engine begins to "roll" from rich mixture. Then turn each screw in an equal amount until engine runs smoothly. Always favor a rich mixture rather than a lean setting. *NOTE* - It may be necessary to reset idle speed after idle mixture adjusted.

Idle Speed - 475-500 RPM (Synchro-mesh Cars & Trucks), 475-500 RPM (Fordomatic in Neutral). *NOTE* - Adjust idle speed in Neutral to obtain 425-450 RPM in DR (drive) range on all Fordomatic Cars & Trucks. *CAUTION* - If anti-stall Dashpot adjusting screw holds throttle open and prevents proper idle adjustment, loosen locknut, turn Dashpot adjusting screw clockwise until idle speed can be adjusted, then readjust Dashpot setting, see below.

HOLLEY (FORD) V8 DUAL DOWNDRAFT CARBURETOR

ANTI-STALL DASHPOT

Setting - After idle speed adjusted (above), turn off ignition, loosen locknut on dashpot adjusting screw stud, turn screw out or counter-clockwise until screw pushes dashpot rod up to the end of its travel, then turn screw in or clockwise 1½-2 turns and tighten locknut. This will provide correct clearance of .045-.064" between dashpot rod and adjusting screw (when rod bottomed in dashpot).

VACUUM SPARK CONTROL VALVE

No adjustment required. Calibrating spring in valve is set to allow the valve to operate at 7-8" of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in adapter screw.

CONTINUED ON NEXT PAGE

FORD V8 DOWNDRAFT (C nt.)

ACCELERATING PUMP

Setting - Engage pump link in throttle plate as follows: Shortest stroke for hot weather, medium stroke for average conditions, and long stroke for cold weather operation.

ECONOMIZER (POWER VALVE)

Opens at 7.9-9.0" of manifold vacuum. No adjustment.

FLOAT LEVEL

Fu l L v l - Install Tool T56L-9562-A in one of main jet plug holes. Operate engine at idle speed. Fuel level should be at "LO" pins in gauge cap. If not correct, remove carburetor air horn and set float level.

Float Level - Invert air horn assembly so float will be in closed position. Distance from flanged surface of air horn to edge of soldered seam on bottom side of float should be 1.437-1.500" and equal on both sides of float. To correct, bend float lever arm.

OVERHAUL: *See 1955 Annual Data or later Manual edition.*

SERVICE PARTS: Gasket Set - Ford No. B6A-9502-B (B6A-9510-J,K; B6Y-9510-A, B6C-9510-C).
Repair Kit - Ford No. B6A-9590-B (B6A-9510-J,K; B6Y-9510-A, B6C-9510-C).

FORD 6 "VISI-FLO"

FORD 6 CYL. CARS	Carburetor No.

1956 Economy Special	B5A-9510-S,V

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 MAIN METERING JET PRODUCTION CHANGE:* Main metering jets changed approximately June 1, 1956. *See Jet Specification Table.*

► *1956 ACCELERATOR PUMP DISCHARGE NOZZLE DESIGN CHANGE & CAUTION:* Accelerator pump discharge nozzle pressed into main body recess and is locked in place with a pin. If nozzle becomes loose, replace the main body.

► *1956 HARD STARTING, ENGINE STUMBLING OR HESITATION DURING WARM WEATHER CAUTION:* During warm weather, the accelerator pump link should be placed in the hole in throttle shaft plate (hole nearest throttle shaft) giving the shorter stroke.

DESCRIPTION: "Viso-flo" Carburetor. Of same design as used on previous models.

ADJUSTMENT: For tune-up on the car, adjust as follows:

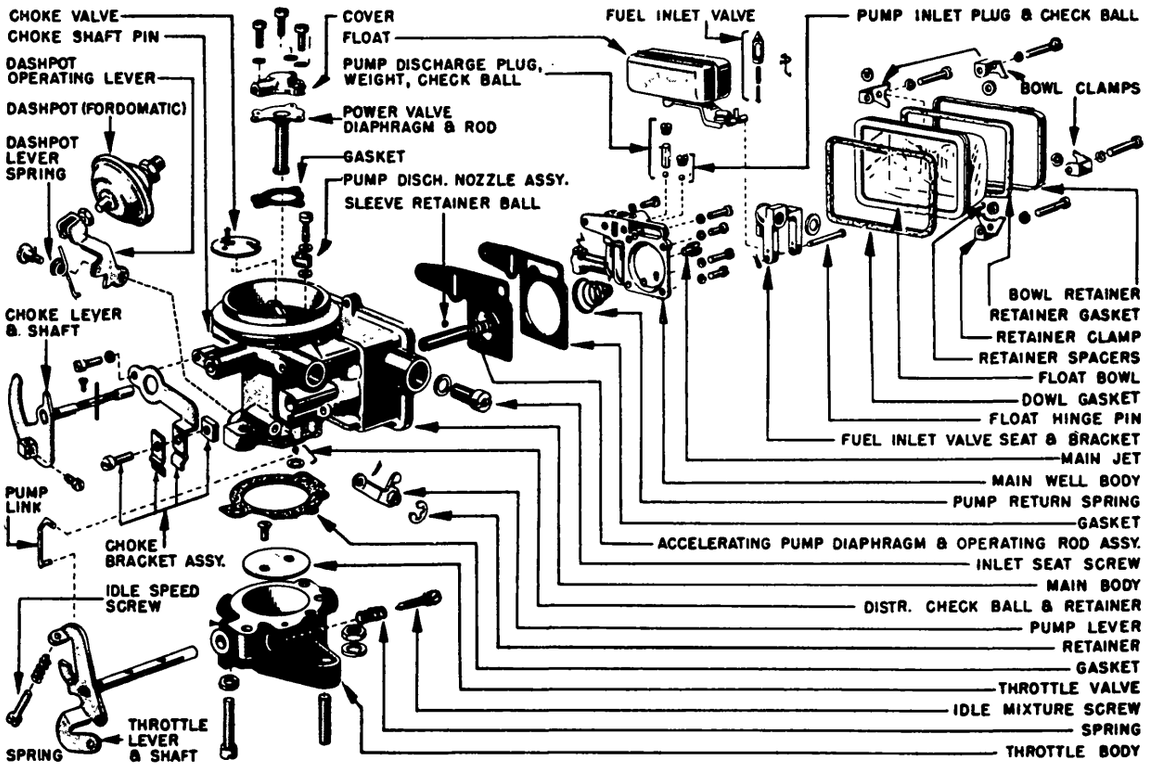
Idle Mixture - To start engine, turn screw in to bottom lightly, then turn screw out 1½ turns. Run engine for 20 minutes at fast idle speed to bring it to normal operating temperature. Make sure fast idle cam is in slow position. Turn screw in until engine runs rough from lean mixture, then turn screw out until engine begins to "roll" from rich mixture. Finally turn screw in until engine runs smoothly. Always favor a rich mixture rather than a lean setting. *NOTE* - It may be necessary to reset idle speed after idle mixture adjusted.

Idle Speed - 475-500 RPM (Synchro-mesh Cars & Trucks), 475-500 RPM (Fordomatic in Neutral). *NOTE* - Adjust idle speed in Neutral to obtain 425-450 RPM in DR (drive) range on all Fordomatic Cars & Trucks. *CAUTION* - If Anti-stall Dashpot adjusting screw holds throttle open and prevents proper idle adjustment, loosen locknut, turn Dashpot adjusting screw clockwise until idle speed can be adjusted, then readjust Dashpot setting, see below.

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather operation.

Fuel Level - 11/16"±1/32" below power valve mounting surface. To adjust, remove fuel bowl cover, bend float tab which contacts float needle spring.

Float Level—Can be checked with Gauge No. T52L-9550-AEE (Gauge, Bending Tool, and Dummy Fuel Bowl), or with cardboard gauge (furnished in repair package) as follows:



Using Gauge 9550-AEE—Remove regular carburetor fuel bowl, install dummy fuel bowl (with open top) using regular fuel bowl gasket and three of the retaining screws. Remove power valve cover and diaphragm assembly, install fuel gauge No. T52L-9550-AEE in this opening. Fuel in bowl should touch tip of "LOW" gauge pin, but should not touch tip of "HIGH" gauge pin. Adjust by bending float arm tab using special slotted bending tool.

Dashpot (Fordomatic Cars & Trucks): After engine idle speed adjustment completed, turn ignition off, loosen dashpot adjusting screw locknut (on dashpot operating lever), hold throttle in closed position and turn adjusting screw out or counter-clockwise until the head of the screw pushes the dashpot rod up to the limit of its travel, then turn adjusting screw in or clockwise 1½-2 turns, tighten locknut. This will provide correct clearance of .045-.064" between dashpot rod and adjusting screw (apparent only when rod bottomed in dashpot).

OVERHAUL: *See 1955 Annual Data or later Manual edition and note the following:*

Acc l rating Pump Discharg N zzl - Do not remove. If loose, replace the main body. *See "Caution" above.*

SERVICE PARTS: Gask t Kits - Ford No. B6A-9502-A.
R pair Kit - Ford No. B6A-9590-A.

FORD 6 "VISI-FLO" CARBURETOR

FORD V8 TRUCK DUAL CONCENTRIC)

FORD V8 TRUCKS — **Carburetor No.**
1956 272 (ECR) — B6T-9510-A

DESCRIPTION: Concentric, dual, downdraft carburetor with main body enclosed within air cleaner on all models except Cab Forward. On Cab Forward models main body enclosed in carburetor air cleaner horn. Choke plates mounted in air horn and booster venturis used in main body.

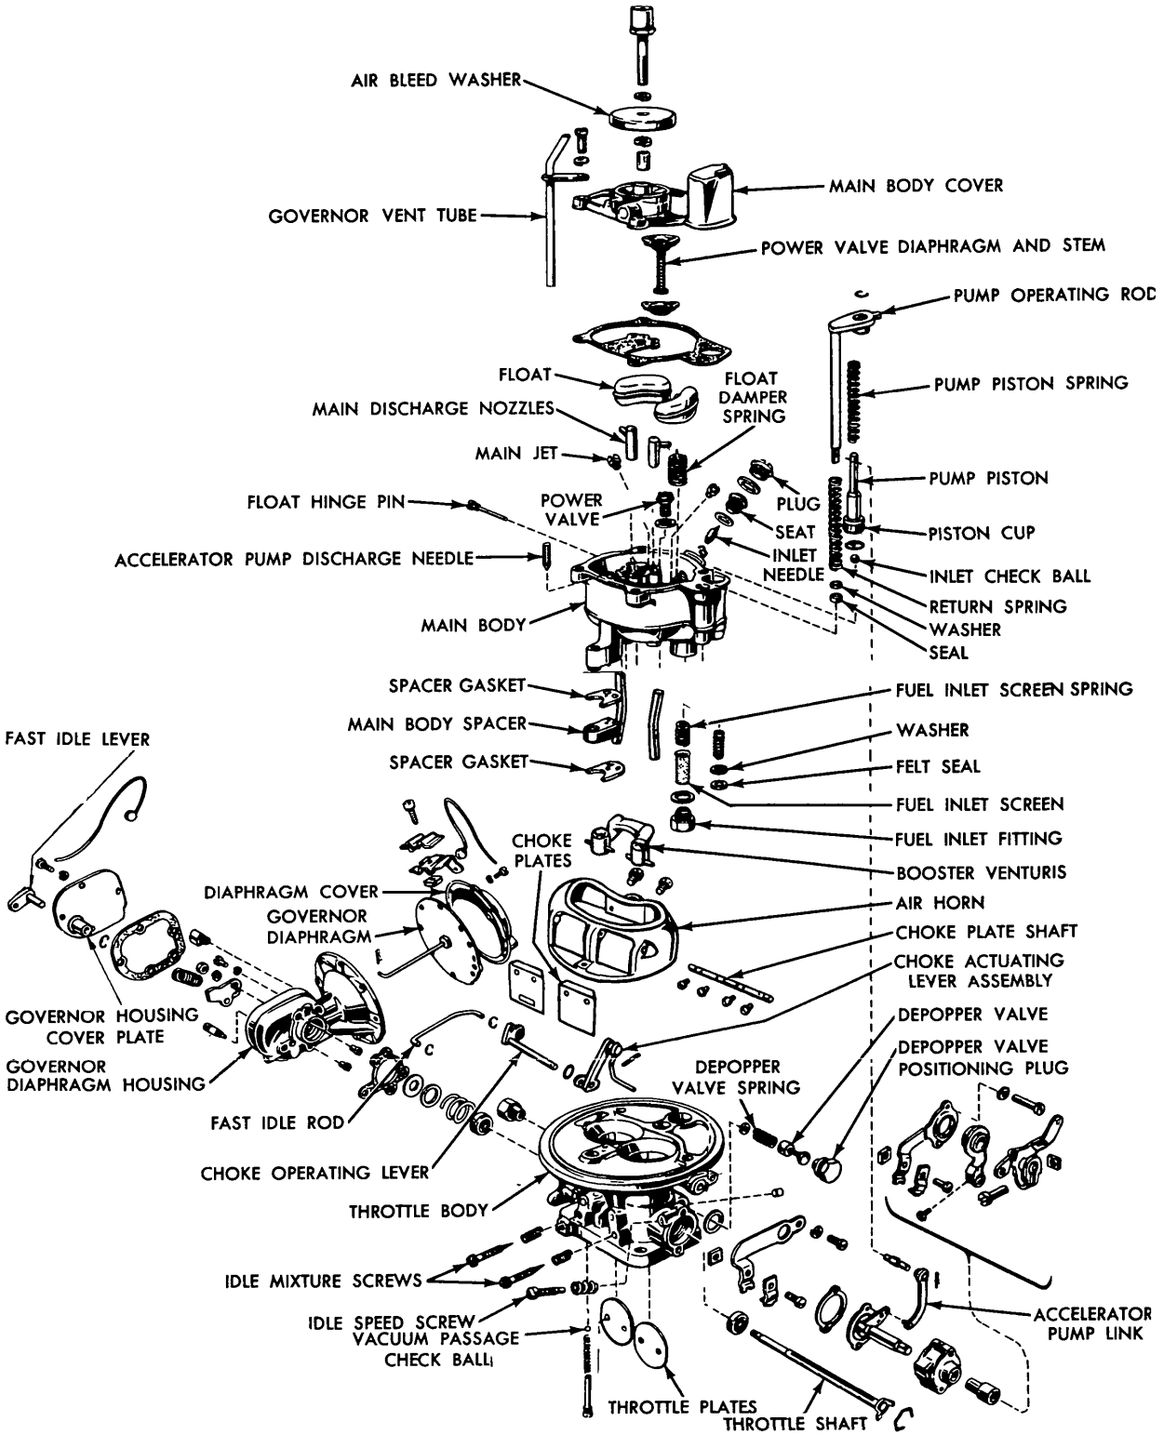
Governor Assembly—Governor unit is mounted on throttle body and linked directly to end of throttle valve shaft. Throttle body is modified for governor mounting and throttle valve shaft is special type for governor connection

Depopper Valve—Consists of a spring-loaded piston type valve built in the throttle body This valve controls a by-pass through which part of the idle air supply passes around the closed throttle valves (a conventional idle system with idle mixture adjusting screws is used to supply the engine idling fuel supply in the usual manner). Valve is normally open during engine operation but closes when manifold vacuum rises to 22" (when throttle is closed). Closing of the valve enriches the idle fuel mixture to the point where it will not support combustion in the engine or exhaust system thus eliminating any "popping." An adjusting screw is provided for Depopper adjustment See ADJUSTMENTS below.

Choke Control—Convention manual type (automatic choke not used).

ADJUSTMENTS: Make all adjustments as follows

Idle Setting - Turn adjusting screws in to lightly seat and back off each screw ½ turn. Run engine until operating temperature is obtained, then turn mixture screws in until engine begins to run rough from lean mixture. Turn screws out until engine begins to "Roll" from rich mixture. Turn screws in until engine runs smoothly. Always favor a rich mixture rather than a lean setting. Reset idle speed after an idle mixture setting. See Depopper valve adjustment below.



Idle Speed Setting - 475-500 RPM (Synchro-mesh), 475-500 RPM (Fordomatic in Neutral). *NOTE* - Adjust idle speed in Neutral to obtain 425-450 RPM in DR (drive) range on all Fordomatic Trucks

► *CAUTION:* If Anti-stall Dashpot adjusting screw holds throttle open and prevents proper idle adjustment, loosen locknut, turn Dashpot adjusting screw clockwise until idle speed can be adjusted, then readjust Dashpot setting, see below.

Accelerating Pump Adjustment—Fuel discharge controlled by position of pump link in throttle lever holes (two). Closest hole for hot weather, longer hole for cold weather

Fuel Level Setting—Use Gauge T54L-9950-C. Remove air cleaner, main body cover plate and gasket, run engine to secure normal fuel level, check fuel level with tool. Distance from fuel to top of machine casting of bowl should be ½" ± 1/32" To correct level setting bend float lever tab up or down to bring level within limits.

FORD V8 TRUCK DUAL CONCENTRIC CARBURETOR

FORD V8 TRUCK DUAL CONCENTRIC) (Cont.)

Depopper Valve Adjustment—Adjust throttle screw to close throttle plates to where they will not bind in bores. Turn depopper valve adjusting screw inward (clockwise) until valve seated (closed). CAUTION—Do not force valve against seat. Turn depopper valve adjusting screw outward (counter clockwise) ⅜-½ turn. Make **Idle Setting & Idle Speed Adjustment** as given above. If engine fails to run when throttle released, increase idle speed sufficently (Idle stop screw) to maintain operation of engine. If popping is evident after high road speed or maximum engine RPM, upon deceleration without brake action, check depopper valve piston actuating spring as follows:

Depopper Piston Spring Test—Use Tool No. T54T-9976-A to check calibration of spring and proceed as follows: Remove air cleaner, depopper retainer and valve adjusting screw from throttle body. Install screw adapter in throttle body, install sleeve on screw adapter until pointer reads approximately 16 ounces. Pull back runner (rod protruding from gauge) and release gently. Then push runner forward. NOTE—The pointer will move indicating that valve is not seated. Screw sleeve in until pointer reads 16½ ounces. Repeat step of pulling runner back, releasing runner gently and pushing runner forward in ½ ounces increments until pointer will not move when pushed forward. The pointer should then read within 21.0-21.5 ounces. NOTE—If reading is not within specifications of 21.0-21.5 ounces, adjust depopper piston spring tension adjusting screw and repeat above procedure. Turn adjusting screw clockwise to increase tension and counter clockwise to decrease tension.

Alternate Method (Tool not available)—This will give approximate adjustment for emergency operation. Connect vacuum gauge to intake manifold. Increase engine speed manually to approximately 2000 RPM. Close throttle quickly and notice vacuum reading when hissing sound of air is first heard in carburetor. This is point when depopper valve opened. If vaccum reading was not between 22.5-23.5 inches of mercury, the piston spring tension adjusting screw should be turned until correct vacuum reading is obtained.

►*DEPOPPER CLEANING NOTE:* If necessary to clean depopper valve with carburetor on engine apply light grease to center section of spring tension washer to hold it in place on end of tension adjusting screw during assembly. Add light application of grease to end of spring to hold it in valve recess so valve and spring can be installed together without dislodging washer from end of adjusting screw.

DISASSEMBLY: Divided into three sections as follows:

►*DISASSEMBLY CAUTION:* Use separate container for component parts: throttle body and main body. DO NOT remove throttle plates and choke plates (unless necessary) to prevent difficulty in correct positioning. Remove booster venturis only when damage makes replacement necessary.

Main Body Disassembly - Remove center stud, two lockwashers, and air bleed washer, cover retaining screws, lift out governor vent tube from air horn, remove cover and gasket. Remove accelerator pump link from operating rod, lift pump assembly from well. Remove pump rod dust seal, washers, and spring. Lift out main discharge nozzles carefully, invert carburetor and catch pump discharge needle. Remove float inlet needle plug, inlet needle seat spring, and seat. Unscrew float hinge pin, lift float assembly out and remove float damper spring. Remove main jets and power valve. Lift accelerator pump inlet check ball retainer out of pump well with hooked wire. Invert carburetor and catch inlet check ball. Remove three power valve diaphragm retainer screws from main body cover, and remove power valve diaphragm assembly. To disassemble accelerator pump assembly when necessary, slip pump piston cup off end of piston stem, compress stem spring, pry off stem retainer, then remove stem and spring from operating rod.

Main Body, Air Horn & Throttle Body Separation - Invert carburetor, remove fuel inlet fitting, two screws retaining main body to throttle body, lift main body off air horn removing main body spacer and two gaskets at the same time. Remove air horn to throttle body retaining screw, lift air horn off throttle body. Disengage choke actuating lever from choke plate using care not to bend lever.

Throttle Body Disassembly - Remove idle fuel adjusting needles and springs, disconnect fast idle rod from choke lever, and remove governor cover plate and gasket. If necessary, pry off fast idle shaft retainer and remove shaft from cover plate. Remove governor spring and cotter pin from vacuum rod, push rod out of governor lever. Remove governor lever nut, lockwasher, and lever. Remove three retaining screws, then remove governor housing and diaphragm. Remove throttle shaft seal, retainer, and spring, throttle lever and throttle pick-up lever. Remove hand throttle control wire bracket screws, then remove bracket, throttle shaft housing, operating shaft assembly, and gasket. Throttle plates and shaft should not be removed from throttle body. To remove choke lever assembly, when necessary due to binding or damage, remove cotter pin from choke shaft and actuating lever assembly, slide choke shaft out of throttle body, remove actuating lever assembly and washer. Remove depopper valve positioning plug, depopper valve, tension spring, and tension spring washer. DO NOT REMOVE spring tension adjusting screw from throttle body.

Air Horn Disassembly - Remove choke plate screws, choke plates, slide choke plate shaft out of air horn. Remove lock wire from booster venturi screws, remove screws.

REASSEMBLY: Assemble by reversing disassembly procedure and following sequence below:

1) Assemble all parts of Air Horn.
2) Assemble all parts of Throttle Body.
3) Assemble the Main Body with the Air Horn and Throttle Body.
4) Assemble all parts of Main Body.

Reassembly Notes - 1) Chokeplates must be free of any bind in Air Horn.
2) Be sure fast idle lever is properly positioned in choke lever and fast idle lever.
3) Use light application of grease to hold main body spacer (with gasket on each side) to boss on main body while installing main body on air horn.
4) Hold float in closed position and measure distance from gasket surface on main body to toe of float. Bend float lever tab to obtain 1/4" float level. Float toes must be at same level.
5) Be sure main discharge nozzle tips are pointing away from each other after installation.

SERVICE PARTS: Gasket Set - Ford No. B6A-9502-B. **Repair Kit** - Ford No. B6T-9590-A.

ROCHESTER 4GC 4-BARREL CARBURETORS

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 BUICK PRIMARY MAIN METERING JET CHANGE (To Improve Performance in Part Throttle Range)* Leaner jets, Part No. 7001860 are used in later production carburetors having a "D" stamped on identification tag. If new jets are installed on early carburetors, use the later type jets.

►*1956 BUICK STUMBLE CORRECTION (ON EARLY CARS):* This condition is noticeable on light acceleration under cold operating conditions and may be caused by the accelerating pump spring being too light. Correct by installing Accelerating Pump Spring, Part No. 7009651 having a .042" diameter wire. Production carburetors having the later type spring are identified by C6, D6, etc., date stamp following the carburetor part number

►*1956 BUICK PRIMARY MAIN METERING JET PRODUCTION CHANGE (For Increased Fuel Economy):* In later production, Rochester Primary Main Metering Jet, Part No. 7001860, (size .055") is being used and can be used for service replacement. Carburetors having the later type jet can be identified by the letter "D" stamped on the carburetor identification tag.

►*1956 BUICK ACCELERATING PUMP ASSEMBLY CHANGE (To Correct Hesitation on Light Acceleration):* Install Pump Assembly, Part No. 7009129, replacing Part No. 7009279.

►*1956 BUICK COLD ENGINE STALLING & LOADING UP (First Cars):* This condition can be eliminated by installing all parts furnished in special kit, Buick No 7009948 (Choke Housing, Thermostat Cover & Gasket, Choke Housing Gasket, Choke Piston, Pin, and Lever & Link Assy). When these parts installed, set carburetor to following specifications.

1) Choke Setting—Centered (At Index)

2) Fast Idle Setting—1700 Engine RPM (hot engine with fast idle screw on high step of fast idle cam)

3) Unl ad r S tting—Unloader must operate correctly. See Choke Rod & Unloader Adjustment below.

NOTE—When above changes made, stamp letter "C" in lower left hand corner of brass identification tag. Production carburetors on which this change made will also be stamped "C"
